Mr. Solomon J. Solomon, A.R.A., first dealt with certain objections raised by architects when discussing decoration. With regard to the argument that the finances at the architect's disposal did not admit of the inclusion of the painter's art into his schemes, he suggested that as the edifice would outlive its author he might be permitted to provide for its future. Take a building of a national character: he should be permitted to allot some spaces, to indicate to future generations the lines upon which the work should be carried on; in fact, broadly to indicate the kind and style of decoration he would have others introduce. Another fault found was that our variable climate played tricks with existing canvas decorations, causing them to sag and loosen. The fault lay with the use of too large a surface of canvas, when sometimes the architectural features which should be real are imitated by the painter. Again, few practical men would use a fresco ground for painting when the "matt" surface, its chief quality, can be obtained by the use of suitable mediums, and when far greater richness of effect can be produced by other methods ready to our hands. In France most public buildings are decorated by the painter, and none of the technical troubles complained of here were apparent. The author asked the attention of the Institute particularly to his suggestion for the promotion of a school of decoration, not with the object of competing with existing schools, but of supplementing them. His idea was that it should be a school common to the architect, the sculptor, painter, glass designer, and woodcarver, for the use not only of the advanced student but equally for the full-fledged craftsmen in the various arts who desire a special training in the arts of decoration. Professors there would be representing all the branches concerned to lecture and teach; studios furnished with reduced models, or studios of pictorial decorations in their settings, applied sculpture, glass, woodwork, &c.; all conceivable facts, measurements, scale, proportions, anything and everything for the use of the student that could be collected, carefully tabulated and arranged; the creation of travelling studentships, enabling students to travel in pairs—an architect with a painter, an architect with a sculptor, and so on, with provision to make reduced copies of fine examples of art in their settings—the results going to enrich the school collection, so that by degrees these models might replace the photographs or other less useful authorities.

A discussion followed in which Sir Aston Webb, Prof. Beresford Pite, and Messrs. H. Heathcote Statham, J. D. Crace, E. W. Hudson and John Belcher took part.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

City and Guilds Examinations.

S. T. P. writes: "Where can I obtain past examination questions for the City and Guilds in Honours, Quantities?"

From Mr. John Murray, Albemarle Street, London, W.

Fractured Stone Mullions.

BOLTON.—WARDEN writes: "The stone mullions of a five-light stained-glass window at the east end of a church are fractured at the joints, by reason of the corrosion of the 1½in. by 3in. iron bar which goes across the window. Do you advise new mullions, or do you consider the present ones could be repaired so as to make a satisfactory job? I should like to avoid taking out the stained glass if possible. Sketch sent (not reproduced)."

We think the mullions should be replaced. The stained glass can be removed without damage.

Buildings to Measure near Farnham and Horsham.

X writes: "Is there anything near Farnham (Surrey) or Horsham suitable to measure for the R.I.B.A. final examination?"

Most of the churches in the districts named possess good features to measure. Rickman mentions churches at Horsham and Chiddingfold as being Early English, Petworth as Decorative, and Billingshurst as Perpendicular. Chichester, about 45 minutes' journey from Horsham, would furnish you with ample field for selection. Bromshill House, about 10 miles from Farnham, is an excellent example of Elizabethan work. It was built for Henry, Prince of Wales, by Inigo Jones, and is the best of his earlier works. M.

Lincoln Cathedral.

LINCOLN.—S. P. D. writes: "What portion of Lincoln Cathedral—easily accessible—do you recommend to measure and make a drawing of?"

If only a small fragment is needed, some of the internal wall arcading would suffice, but much more is to be learnt from the rich door to the chapter-house; while there is no great difficulty, by utilizing the triforium, in measuring a bay of the nave arcade. The best thing to do is to go there and select for yourself on the spot. All is so good that it is difficult to make a mistake.

G. A. T. M.

Tenancy.

DELA writes: "A certain house is under lease for three years, and the option of a further period of six years, with the exception of a room facing the street and another room at the rear, which are let under a yearly tenancy expiring next March. Since the granting of the lease the property has changed hands, the present owners wishing to convert the front room into a shop, thus making it necessary to have the use of the room above for a week. The lessee, however, refuses to allow us the use of the room over, and further will not meet us even to discuss matter of compensation. No mention is made in the lease of any suggestion to turn the premises into a shop. (1) What course would you suggest we should adopt? (2) Can the lessee be compelled to allow the owners to enter his room for such purposes?"

Unless there is some clause in the lease—as I fear is unlikely—enabling the lessor to enter for such a purpose, the owner cannot disturb the lessee in the way suggested; the property is in fact his (subject to the reservations in the lease) until the end of his term. The fact that the personality of the lessor has changed does not affect the matter in the least, and I can only suggest that you should appeal to the lessee's good feeling, and should endeavour to induce him to accept reasonable compensation for the disturbance to which he will be subjected. F. S. I.

Rooms Partly in Roof.

DERBY.—ARCHITECT writes: "The by-laws of an urban district council in whose district I am doing some work stipulate that 'every person who shall erect a new building and shall construct any room therein so that it may be used for human habitation, shall comply with the following requirements:—If such a room is not an attic or a room wholly or partly in the roof of such building he shall so construct such room that it shall be not less in height than 9ft. in any part thereof. If such room is an attic, or a room wholly or partly in the roof of such building, he shall construct such room so that it shall be not less in any part than 5ft. in height, and so that it shall not be less than an average height of 8ft. to the extent of half the superficial area of the floor.' In administering this by-law the council insist that every room on the first floor, even of cottages let at 5s. 6d. per week, shall be 9ft. high throughout. I am not allowed to drop the wall-plate in any way, and the ceiling must be flat. It seems to me that this is going further than the Act ever intended. The council do not consider that rooms on the first floor can be put 'partly in the roof.' What is your opinion?"

The council is undoubtedly in the wrong, and there is nothing in the by-laws to prevent the building of a one-storey, two-storey or three-storey house. You may of course choose to build a house of ground and first floor only, and may certainly put the bedrooms "partly in the roof of such building." F. S. I.

A MODEL BAKERY.

A MODEL bakery at Stirchley, near Birmingham, has just been completed for the Ten-Acres and Stirchley Co-operative Society, from designs by Mr. Francis B. Andrews, A.R.I.B.A., of Birmingham. The building consists of a main block of three storeys, the top floor being used for flour stores, the second for the general machinery for flour-mixing, dough-dividing, cake machines, &c. (with a portion screened off and specially heated for dough proving), and on the ground floor for the bakery and the ovens, two of which only are put in as yet, though space remains for two more; they are Baker & Sons' patent draw-plate, double-decker continuous pattern, costing £350 each. Adjoining the main block is, on the north, the oven block, with a stoking passage at the rear of the ovens and a fuel store; while on the east side is the entrance and staircase, off which are bathrooms, men's mess-room, &c. Floor loads have been taken off the walls and conveyed to the concrete footings direct by a system of steelwork built into the walls. For this and the floor girders the new wide-flange heavy-section "Differdange" beams have been employed, those for the main spans bearing 38ft. and being placed in bays at 10ft. centres. The floors are of concrete reinforced with steel angle-iron and wire mesh and rods, and finished with granolithic paving. The cost of the work has been £3,400 (exclusive of ovens). It has been carried out by Mr. W. Harvey Gibbs, builder, of King's Heath, Birmingham, the steelwork being by Mr. Frank W. Suffield, of Birmingham.

Keystones.

M. Rodin is to prepare a bust of Mr. Balfour: but the great work which he has now in hand is a life-size figure of Joan of Arc

New Baptist Church and Schools at Rugby are being built in St. Andrew's Street from designs by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, W.C. The church will accommodate about 760 persons, and the school about 800. The contract (£5,881) has been let to Messrs. Linnell & Son, of Rugby.

Students to decorate South Kensington Museum.—The students of the Royal College of Art are to have an opportunity of participating in the decoration of the new buildings of the Victoria and Albert Museum. Those of the modelling school will be allowed to submit sketches for four of the statues which are required, and if approved these will be carried out by them under the direction of Professor Lantéri.

Architects' Assistants wanted for Chicago.—An architect practising in Chicago asks the secretary of the Institute to put him into confidential communication with some good scholarly architectural assistants, from twenty-five to thirty-five years of age, who are Associates of the R.I.B.A. Chicago architects, he states, suffer from the scarcity of assistants, especially those with good English training, who are always welcome in Chicago offices. Familiarity with American methods of building is quickly acquired. Applications should be addressed to the secretary, R.I.B.A., 9, Conduit Street, W.

Association of Teachers in Technical Institutes: Building Section.—At the first ordinary meeting held on March 11th at the Regent Street Polytechnic (presided over by Mr. Hugh Davies, head of the Architectural and Building Trades' Department, Northern Polytechnic) a paper on "The Training of a Craftsman" was read by Mr. E. L. Bates, of the L.C.C. School of Building, Brixton, S.W. The paper reviewed the past training of the craftsman as set forth in the charters of several of the city companies, emphasized the entire lack of any systematic training at the present time, the difficulties of teachers and students under present conditions, and made suggestions for the efficient training of future craftsmen. Discussion of the paper was adjourned to the next meeting of the section, which will be held on April 1st.

Manchester Infirmary Site.—Two or three years ago, when it was decided to build a new infirmary at Manchester, and when the Corporation decided to purchase the site of the old infirmary, suggestions were put forward as to how the site might be utilized. The two chief of these were either to leave the site as an open space or to erect upon it a combined art gallery and reference library, the existing art gallery and reference library being inadequate. This latter scheme is now under consideration by a special committee of the Corporation. For his own delectation Mr. Paul Ogden, F.R.I.B.A., has prepared sketch plans, sections, elevations and perspectives of a building of a monumental character, and suitable for an art and sculpture gallery, museum, loan and reference library, reading and newspaper rooms, and municipal council-chambers.

Birmingham Architectural Association.—At the meeting held on March 3rd Mr. Arthur T. Bolton, A.R.I.B.A, read a paper on Ingram House, a residential club for young men in the South of London, arrangements to visit which are now being made by the Association. On March 10th a special general meeting was held, when Mr. A. W. S. Cross, M.A., and Mr. George Hubbard, F.S.A., read papers on architects' registration. A discussion followed, Mr. J. L. Ball, vice-president, speaking in support of the movement, while

Mr. C. E. Bateman proposed an amendment that registration was inadvisable. Finally a resolution was carried approving the general principle advocated and wishing Messrs. Cross and Hubbard every success in their endeavours to bring about, through the most appropriate channels, suitable legislation upon the subject.

Fleet Street is proposed to be widened to 60ft. between Nos. 53, 68 and 69.

The new War Office is expected to be ready for occupation in about twelve months' time.

The Carpenters' Company has voted the sum of twenty-five guineas towards the Architectural Association Building Fund.

A new Congregational Chapel at Pontypool has been erected at a cost of about £6,700. The architects were Messrs. Swash & Bain, of Newport.

Mr. Edwin J. Dod, of Birkdale, has been appointed architectural assistant on the staff of the Director of Public Works for British East Africa.

New Schools in Guernsey are to be erected at a cost of £10,000 from designs by Mr. Frank Whitmore, of Chelmsford. Accommodation will be provided for about 800 children.

A new Police-court and Station has been erected near the southern end of the Tower Bridge. It has a granite base and upper parts of Portland stone and red brick. There are two courts. The floors of the cells are of asphalt, and the walls have high dadoes of glazed brick. The architect of the building was Mr. J. Dixon Butler. The cost has been about £45,000.

Cardiff, South Wales and Monmouthshire Architects' Society.—At the annual dinner held last week at Cardiff, Mr. John Belcher, A.R.A., P.R.I.B.A., presented a gold badge of office to the president, Mr. C. James, who presented Mr. Belcher with a jewel as a memento of the occasion. The badge is the gift of Lord Windsor, Lord Tredegar and Sir W. T. Lewis. Mr. A. W. S. Cross and Mr. George Hubbard read papers on registration before the Society last week.

Nelson Library Competition.—The award of the assessor (Mr. Willoughby) on the designs submitted for a Carnegie public library at Nelson, to cost £7,000, is as follows:—First premium (£50), Messrs. W. Brandeth Savidge and J. R. Poyser, Nottingham; second (£25 each), Mr. David Bird, Manchester, and Mr. G. Fox, London; third (£15), Mr. T. Rees, Liverpool. It will be noticed that an extra second prize was awarded. More than 200 designs were received.

Royal Academy Prize Competitions.—The subject for the gold medal and travelling studentship of £200 for historical painting—the blue riband of the Academy schools—is "Ulysses recognized by the Nurse, Euryclea." Competing pictures must be on canvases 4ft. 2ins. by 3ft. 4ins., and the principal figure must be not less than 2ft. high. The subject for the gold medal and travelling studentship in sculpture is "Prometheus bound to the Rock in the presence of Force and Strength," the model to consist of two or more figures, the principal one to be 3ft. high. In the similar competition for architecture the subject is a "Design for a British Embassy in a Foreign Capital." "Commerce" is the subject of the competition for a prize of £40 for the best design in water-colour or tempera for the decoration of a portion of a public building. The competition for this prize is always keen, as it carries with it the chance of executing the design at the expense of the Royal Academy. The wall-paintings in the refreshment-room at Burlington House were executed by successful students in this competition.

Right of Way at Stonehenge. — The Attorney-General is bringing an action against Sir Edmund Antrobus for the removal of the fences and obstructions placed across certain highways upon Stonehenge Down, in Wiltshire. The case will come before Mr. Justice Farwell on March 28th.

The famous Tower of Galileo, which for centuries has been so conspicuous an object on the beautiful hill of Arcetri above Florence, is now practically destroyed. For some months past it has been concealed by scaffolding set up with the object of adding one-third to its height, of placing in its walls two new tiers of windows, of adding a loggia, and, in short, of converting the world-famous "Star Tower" into a pretentious modern erection to serve the purpose of a café-restaurant.

The Rhodes Memorial.—After much discussion the Rhodes Memorial Committee have decided that the memorial shall be erected on the Groot Schuur estate, on a projecting ledge on the slope of the mountain. The front of the memorial is to take the form of a bastion with steps on either side, while in the centre of the platform, upon a pedestal, it is hoped that it may be possible to place the famous equestrian group by the late Mr. G. F. Watts, R.A., in bronze, known as "Physical Energy." At the back or mountain side it is proposed to build a peristyle or colonnade to form a suitable architectural background to the central work, and around the pedestal to place bronze panels illustrating episodes in Rhodes's life.

Builders' Notes.

Messrs. W. Summerscales & Sons, Ltd., of Phœnix Foundry, Keighley, have been selected to supply the laundry machinery to the King's Sanatorium at Midhurst.

Employment in the Building Trades continued dull during February. On the whole it showed little change as compared with a month ago, but in certain districts a slight improvement was apparent. It was worse than a year ago.

London Building Acts Amendment Bill.—At last week's meeting of the London County Council, Dr. Napier, chairman of the Building Act Committee, said that "in order to avoid a fight on the second reading, all the Bill, with the exception of the fire clauses, is to be dropped." Accordingly the Bill was read a second time in the House of Commons on Tuesday, March 14th, and referred to a Select Committee.

CHEAP COTTAGES EXHIBITION.

THE Committee of the Exhibition of Cheap Cottages to be held at Letchworth, Hertfordshire, in July, announce that prizes to the value of £100 will be given in each class of the building competitions, *i.e.*, for detached cottages, pairs, groups, &c., built at a cost not exceeding fixed sums. There will also be a special prize of £100 for the best and cheapest all-round cottage suitable for an agricultural labourer, and there will probably be a further substantial prize for the best cottage of concrete. The Committee will consider plans for cottages to be built at the exhibition if received before April 15th, but competitors are urged to send them at once (Saturday next was advertised as the final day) for their own advantage, since more than fifty of the best sites are already allotted, and also in order that they may not be handicapped by beginning to build later than others. The funds of the exhibition have steadily increased through the generosity of the public, but the Committee are still open to receive donations which will make the prizes more numerous and substantial.

Competitions Open.

BOROUGH OF SWINDON.

COMPETITIVE PLANS FOR PUBLIC ELEMENTARY SCHOOL.

The Education Committee of the Town Council of Swindon propose to erect a PUBLIC ELEMENTARY SCHOOL, with accommodation for 840 scholars, and invite PLANS from architects.

A block plan of the site, together with conditions and instructions, may be obtained from Mr. W. SEATON, Secretary to the Education Committee, Education Office, Town Hall, Swindon.

No premium is offered, but the author of the selected Plans will be entrusted with the carrying out of the work at a commission of £5 per cent.

Plans to be delivered by 14th APRIL, 1905

ROBERT HILTON,
Town Clerk.

Town Hall, Swindon,
2nd March, 1905.

Contracts Open.

BOROUGH OF KEIGHLEY.

BRICK SEWER.

The Special Drainage Committee invite tenders for the construction of about 575 yards of eggshaped and circular brick sewer. Tenders to be received by the 4th April. Full particulars from the undersigned.

W. H. HOPKINSON, A.M.I.C.E.,
Borough Engineer.

SKETTY, SWANSEA

TO BUILDERS AND CONTRACTORS.

The Trustees of the Coedsaeson Building Club are prepared to receive Names of Persons willing to TENDER for the ERECTION of about 10 PAIRS OF VILLAS, according to Plans, Specifications, and Quantities prepared by Mr. B. C. DEACON, Architect, Central Buildings, Liverpool, to whom applications should be sent not later than MARCH 31st, 1905.

W. NICHOLS, Secretary.

TENDERS WANTED for permanent Canvas Erection, as CONCERT PAVILION.—Particulars, &c., on application to PAVILION, Box 1002, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

METROPOLITAN BOROUGH OF FULHAM.

NORTH BRANCH LIBRARY.

The Council of the Borough of Fulham invite TENDERS for the ERECTION of a BRANCH LIBRARY in Lillie Road.

The drawings and specification can be seen at the office of the Borough Engineer and Surveyor, Mr. FRANCIS WOOD, A.M.I.C.E., F.G.S., Town Hall, Fulham, S.W. Quantities will be supplied to each person tendering on the deposit of three guineas, which will be returned on the receipt of a bonâ-fide Tender.

The Contractor will be required to sign a declaration that he pays the Trade Union rate of wages, and observes the hours of labour recognised in the London district as applying to the several trades employed on the works.

Sealed Tenders endorsed "North Branch Library" are to be delivered to my office before 7 o clock p.m., on Wednesday, the 29th MARCH, 1905. The lowest or any Tender will not necessarily be accepted.

R. M. PRESCOTT,
Town Clerk.

Town Hall, Fulham.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.
2. The charge of one penny will be made for each additional word.
3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.
4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.
5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.
2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.
3. Correspondents are particularly requested to be as brief as possible.
4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.
2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, F.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

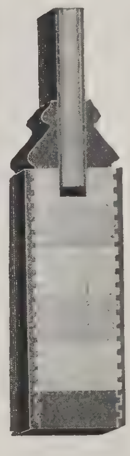
THE GILMOUR DOOR·Co LTD.

Factories
Trenton
Canada

53 BERNERS STREET
LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

Electrical Notes.

Explosions in Street Boxes.—Replying to a question in the House of Commons last week, Mr. Akers Douglas said that during the three years ended December 31st, 1904, the Metropolitan Police reported six explosions as having been caused by gas escaping into a telegraph inspection chamber and coming into contact with a leakage in an electric wire, and a seventh case in which a similar explosion of gas in a telegraph inspection chamber was supposed to have been caused by a lighted match. In addition to these seven cases, the police reported twenty-three similar accidents in which explosions occurred through the accumulation of gas in electric light or supply boxes.

Electric-driving in Cotton Mills.—Important experiments are taking place in Lancashire in regard to electric-driving in cotton mills. A new weaving shed which has been built for the Hesandford Manufacturing Co. at Burnley is the first cotton mill in this or any other country driven wholly by electricity. The power scheme was prepared by Mr. J. M. Hewitt, of Manchester; and though the mill has been running only a few weeks, highly successful results are being obtained. Despite the fact that the whole scheme is not yet completed, it is understood that, compared with other mills of the same size not driven by electricity, this pioneer effort is showing a saving of 10 per cent. in fuel. The engine which drives the mill is a vertical triple-expansion one of 1,000-h.p., and it is claimed to be the most efficient and economical reciprocating engine ever built, approximating as it does to the ideal of 1 lb. of coal per indicated horse-power. The three-phase motor system is employed, wits a pilot engine working a smaller continuous-current dynamo for lighting and other purposes after the main engine has been stopped, the three-phase dynamo, however, providing both for light and power when running. On small platforms ranged around the weaving-shed are twenty-three motors of 25-h.p. each, serving the looms, and the remaining motors are employed in the preparatory department. At Pendlebury, too, a new mill is being erected which is to be electrically equipped. If the ultimate results at these two mills are what the experts expect them to be, enormous possibilities will be opened up.

London Electricity Supply.—The battle of the electricity supply companies was begun in Westminster Hall on Friday before a House of Lords Committee. Forty counsel are engaged in the fight, and nine companies are struggling for the right to supply electrical energy either to the whole or to part of London. The companies are opposed by the L.C.C., borough councils and existing companies. The first and largest of the schemes is the Bill for the creation of the Administrative County of London and District Electric Power Co., with a capital of £5,000,000.

Electric Tramways in the Midlands.—The electric tramways of Northampton, Leicester, Gloucester and Derby are practically finished. About £400,000 has been spent during the past two years. The overhead trolley system is the favourite in the Midlands, although very good accounts are given of the surface-contact system of Wolverhampton. Aston Manor, Lincoln, Handsworth (Staffs.) and Stoke-on-Trent are busy with new traction systems or extensions.

ARCHITECTS' ASSISTANTS.

951.—Architect's Junior Assistant, completed 3½ yrs. articles. Tracer and colourist. Prob. R.I.B.A., 20s. sal.

952.—Architect and Surveyor's Assistant. 10 yrs. exp., quantities, specifications, ex. refs.

953.—Architectural Draughtsman, 6 yrs. exp.; designer, spec. of work sent; perspectives, quantities and pricing.

954.—Architect's Assistant, age 25; wkg. drawings, details, specifications, surveying and levelling.

959.—Architect's Assistant, 10 yrs. exp.; contract dwgs.; details, designs, specifications.

970.—Architect's Assistant (27); 11 yrs. exp. wkg. drawings, details, designs, specifications, quantities and levelling.

975.—Architect, A.R.I.B.A., ex. exp.; estate development, roads, &c.; would assist Arch. or Bldrs.; refs., mod. terms.

977.—Architect's Assistant (24). Contract drawings, details, &c. Surveying assistance with quantities.

983.—General Assistant (23), seven yrs. exp. wkg. drawings, specifications, quantities, levelling, surveying; good refs. Honours, Pt. I. Bldg. Cons., Architecture, Perspective and Geom. certificates.

984.—Architect's Assistant. 12 yrs. exp., reliable and competent in all branches.

986.—Architect's Assistant (24), wkg. drawings, details, quantities, specifications, surveying, levelling and construction draughtsman. St. R.I.B.A.

992.—Architect and C.E.'s Assistant, 10 yrs. prac. exp. of surveys, drawings and quantities, ex. refs.

1000.—Architect's Assistant. Details, contract drawings, surveys, levelling, quantities and specifications; mod s.

1005.—Architect's Junior Assistant, 4½ yrs. exp., age 23; good refs., mod. s.; good London office.

1012.—Architect's Junior Assistant, good draughtsman, details from sketches; good refs., mod. s.

1013.—Architect and Surveyor, 16 yrs. London and Prov. exp., thoroughly competent in all branches, steel construction; view to purchase partnership in well estab. practice.

1016.—Architect's Assistant, 9 yrs. London and Prov. exp., designs, wkg. drawings, quantities and perspectives.

BRICKLAYERS.

968.—Brickwork, Gaugework, Tiling & Pointing. Labour only; large job preferred, ex. London refs.

971.—Brickwork or Pointing by rod or job; distance no object.

CARPENTERS AND JOINERS.

944.—General Joiner. Alterations, &c., or otherwise. Town or country, all-round exp. Trade, carpenter and joiner; mod. s.

973.—Carpenter. young. Bench or jobbing; town or country.

1001.—Joinery—High Class. Staircases wanted; sections, specifications and quotations.

CLERK OF WORKS.

945.—Clerk of Works, practical, exp. and reliable; 3 yrs. last job, mod. s. Town and country.

966.—Clerk of Works. Thoroughly competent. Just completed £40,000 contract; abstainer, ex. refs.

DESIGNERS, TRACINGS, &c.

993.—Assistance given on designs for Hospitals and Schools; successful competitor; mod. speculative terms.

CLERKS.

946.—Builder's Clerk, P.C. accounts, bookkeeping, drawings, quantities and office routine, mod. s., ex. refs.

955.—Builder's Clerk. Bookkeeping, time sheets, &c.; draughtsman; town or country; mod. s.

990.—Clerk Bookkeeper, 15 yrs. exp., smart and energetic; good refs., age 34; home or abroad.

MANAGERS AND FOREMEN.

943.—General Foreman, practical. Knowledge of all branches of building trade; 20 yrs. exp., good refs. Carpenter and joiner, abstainer.

956.—Working Foreman. Painter and Decorator, age 32; estimator; colourist; good refs.; abstainer.

958.—Quarry Manager or Foreman Mason, 20 yrs. exp. mining and quarrying; detail, draughtsman.

960.—Gentleman experienced in cement trade, as London Manager, Branch Superintendent or other responsible position

961.—General Foreman, practical and experienced in all branches, age 48 trade, carpenter and joiner.

963.—Managing Foreman and Estimator, 16 yrs. in father's business; practical exp. as foreman. Estimator.

967.—Foreman Mason or Manager. Bldg., church work, marble or stone; experienced in quantities and estimates.

985.—Shop or General Foreman, used to first-class work; joiner; good refs.

988.—Shop Foreman of Joiners. Setter out, draughtsman, quantities and p.c., mod. s.; abstainer, energetic and punctual.

989.—Wkg. Foreman Painter. Colourist, 30 yrs. exp, used to sub-contracts.

1008.—General Foreman, carpenter, practical, good manager; plans and details; country preferred.

1015.—Shop Foreman, Joiners, 1st class London exp.; cabinet and genera joinery, good manager, setter out, abstainer, good refs.

MISCELLANEOUS.

942.—Builder's Assistant, age 23. Competent, office or outside; books, quantities; estimating; abstainer. Draughtsman, ex. refs.

972.—Plans, Designs, Specifications, &c., prepared, mod. terms.

987.—Staircase Hand. Handrailer and setter out.

1006.—Builder's Assistant, age 26, P.C. accounts, estimating for and supervising decorative and jobbing work; ex. refs., mod. s.

1010.—Machinist, Spindle, general joiner, four cutter, grind, make own tools; gas engine; do own repairs.

1014.—Builder's Son as Timekeeper or Yard Foreman; 6 yrs. last firm, used to large jobs.

PAINTERS, PAPERHANGERS, &c.

974.—Paperhanging, Painting, Distempering. Lowest prices; estimates given.

979.—Paperhanger, plain and decorative grainer and decorator; day, piece or working foreman; town or country; ex. refs.

PLUMBERS & FITTERS.

969.—Plumber's Improver. Exp. wanted, 5 yrs. at trade.

QUANTITY SURVEYORS.

957.—Quantity Surveyor's Assistant. Taking off, &c. &c., or would accept appt.; ex. refs.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

March 29, 1905. Vol. 21, No. 529. 6, Great New Street, Fetter Lane, E.C.

Summary.

The appeal in the case of *Gibbon* v. *Pease* has been dismissed by the Court of Appeal, thus re-affirming that plans and specifications belong to the client, not to the architect. (This page and p. 168.)

The palace outlined in Bacon's essay "On Building" is the subject chosen for the Soane Medallion next year, an open-air swimming bath for the Tite Prize, and a stone skew bridge for the Grissell Gold Medal. (Page 165.)

The competitions for new schools at Swindon and a new technical institute at Rochester are unsatisfactory. (Page 165).

Mr. Alan E. Munby, M.A., F.C.S., suggests the formation of an information bureau for the building trades, which would collect, correlate and systematize facts, bring together a collection of manufacturers' samples, with reports thereon, and gather statistics from relevant work of societies, testing institutions and private experts. The bureau would be primarily in the hands of architects, contractors and those engaged in the sale of building goods (but not manufacturers). (Page 164.)

Mr. Needham Wilson read a paper on sketch plans and working drawings before the Architectural Association last Friday, in the course of which he referred to the great advance which had been made in water-colour work. It used to be a complaint that the drawings on the walls at the Royal Academy were the work of specialists employed to give fictitious merit to the designs. The fictitious merit might still be there, but at least it was now most usually the work of the designers themselves. (Page 169.)

The architectural exhibits at the Royal Institute of Fine Arts, Glasgow, are of very good average merit, but there is nothing outstanding. Some excellent photographs are shown. (Page 161.)

Resolutions in favour of architects' registration have been passed by the Leicester and Leicestershire Society of Architects and the York Architectural Society. (Pages 161 and 165.)

It may be considered safe to assume that a distributed live load of 40 lbs. per. sq. ft. will be sufficient to provide for a crowd of people as well as for the ordinary loads carried on floors used for offices or similar purposes, but for places where strong vibrations may be expected, such as ballrooms, drill-rooms, gymnasia, &c., 100 per cent. should be added to the uniform live load for impact and vibration, and the depth of the beams and girders should be limited to $\frac{1}{15}$ of their span. (Page 166.)

The central span of the new Vauxhall Bridge was set in position last week. (Page 165.)

A new theory about masonry dams is put forward. It is affirmed that vertical sections are liable to crack, though the horizontal sections may be sound. (Page 165.)

Ownership of Drawings. As will be seen by the report on p. 168 of this issue, the Court of Appeal has, unfortunately, upheld the decision of the lower court in the case of *Gibbon* v. *Pease* and confirmed in more unmistakable terms the legal view that architects' drawings are the property of the client. It is most important that the matter should not be allowed to rest here, but the case carried still further, and, if the House of Lords decides similarly, to promote legislation to give the architect his just rights. The case should be decided on equity, not on law. Our judges seem to think that an architect is paid for his plans. He never is, for they embody hard-earned knowledge and experience which the small percentage in no way equates. If an architect had a copyright in his designs the matter would be different. The fallacy that plans are the be-all and end-all of architectural design would be apparent if lawyers could only see that a building could be constructed from an architect's instructions without them. An architect is paid for advice, invention and supervision, not to prepare drawings *per se*.

Planning of Suburbs. The housing problem has been talked about so much and so often that it is now seldom any new light is thrown on the subject, but the resolution passed at the conference held at the Passmore Edwards Settlement last Saturday under the auspices of the National Housing Reform Council to consider the question of "the better planning of new housing areas in Greater London" supports what we have often advocated, and should lead to some reform of the present system. It is as follows: "That this conference desires to draw the attention of local authorities in the suburban area of Greater London to the grave evils resulting from the lack of proper foresight in the planning of new housing areas, and to the pressing need for the preparation and adoption of new by-laws, to ensure the ample provision of light and air-space, gardens, &c., for workmen's cottages; further, this conference is of opinion that Parliament should confer on local authorites various new municipal powers in regard to the preparation of building plans, the taxation of land values, and the purchase of municipal estates, similar to those powers already possessed by cities in the German Empire." Mr. T. C. Horsfall, of Manchester, who moved the resolution, emphasized the need for the granting of powers to the county councils in this country to make their own building plans, and also for local authorities to buy land in the open market without going to Parliament for powers to do so.

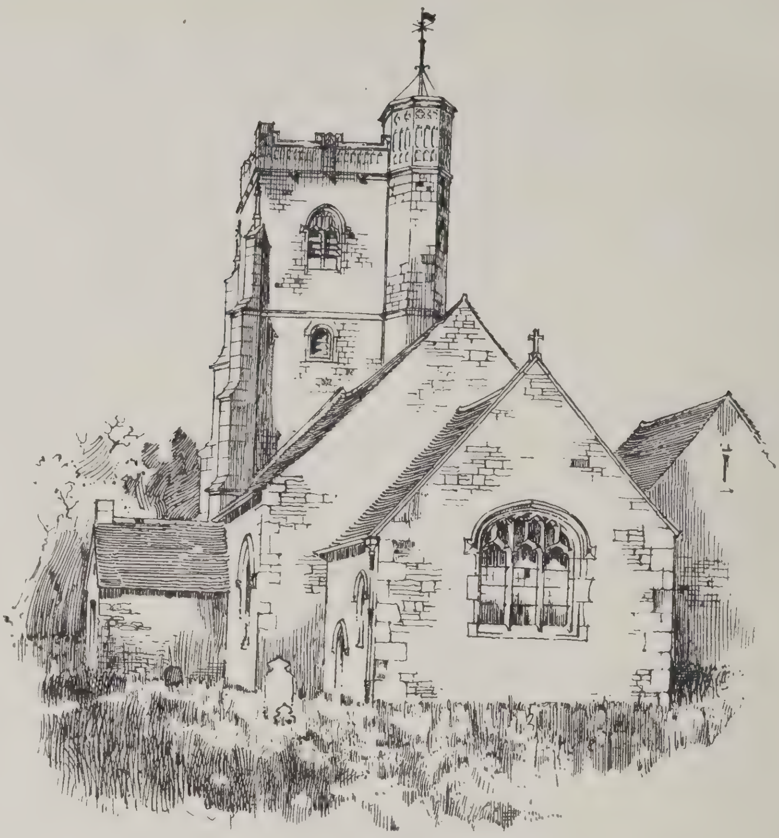
The Stuffy House. The ventilation of the House of Commons may be regarded as a perennial subject for an official report, and it is therefore with no surprise that we find another such report before us now: in fact, it may be said that the history of ventilation begins with the attempts at ventilating the Houses of Parliament in 1660 by the architect, Sir Christopher Wren, and that as almost every device has been tried in its halls at one time or other the history of the attempts is almost equivalent to a history of the science of ventilation. The several recommendations in the present report are doubtless of interest to members and to the staff responsible for preserving an equable atmosphere in the Chamber, but it is no moment to the outside world that not even the policeman shall walk over the inlet grating, that the steam pipe in the cotton-wool filter under the Speaker's chair should be covered with asbestos, or that the ventilating men should be clad in white overalls and wear felt slippers. There are many facts in this report, however, which are of the greatest general interest to all concerned with ventilation; and these we may briefly summarize. It may first be stated that the report is presented by Dr. M. H. Gordon, M.A., B.Sc., assisted by Mr. W. H. Hurtley, D.Sc., demonstrator of public health chemistry at St. Bartholomew's Hospital, and Dr. John Aitken, F.R.S., who was the first to demonstrate that fog was due to the condensation of moisture on dust particles in the air and the first to invent a method of counting them. The investigation was carried out between May and August last year, when the House was sitting. The most interesting statements in the report are undoubtedly those relating to the temperature and humidity of the air. So far as the former is concerned it is satisfactory, being, on an average, 63 degs. Fahr. in the equalising chamber; but as regards humidity it is found to have only 63 per cent. of saturation as compared with 70 to 80 per cent. as recommended by de Chaumont and 73 to 75 per cent. by Wilson; moreover, the percentage of humidity of fresh air at the inlet was 71 per cent., and the vapour required to saturate a cubic foot of fresh air was 1·6 grains at the inlet and 2·4 in the House. Thus, it seems to be clear that the stuffiness and deadness which causes members to sink wearily on their benches is very largely attributable to this want of humidity. In other respects the air is comparatively satisfactory, though it is somewhat polluted by the bacteria brought in on members' boots and by the insanitary condition which the hair matting on the floor gets into.

ST. BRIDE'S, WENTLOOG.

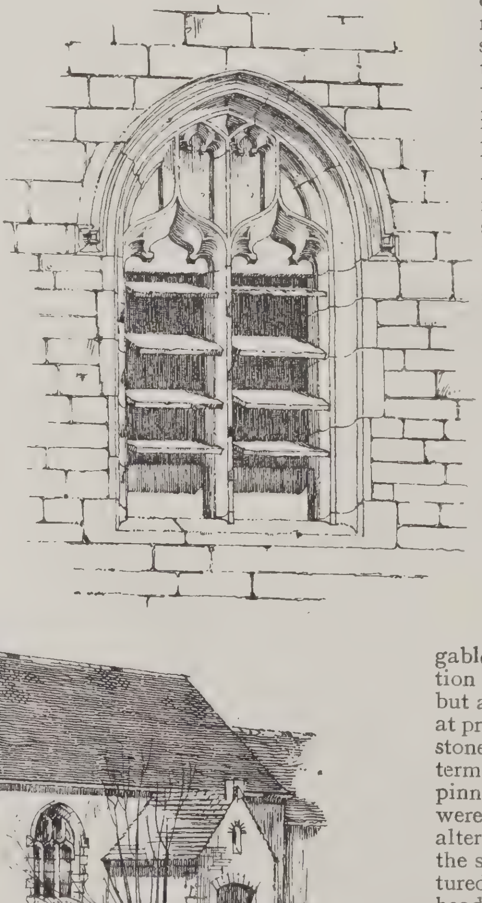
By H. T. REES.

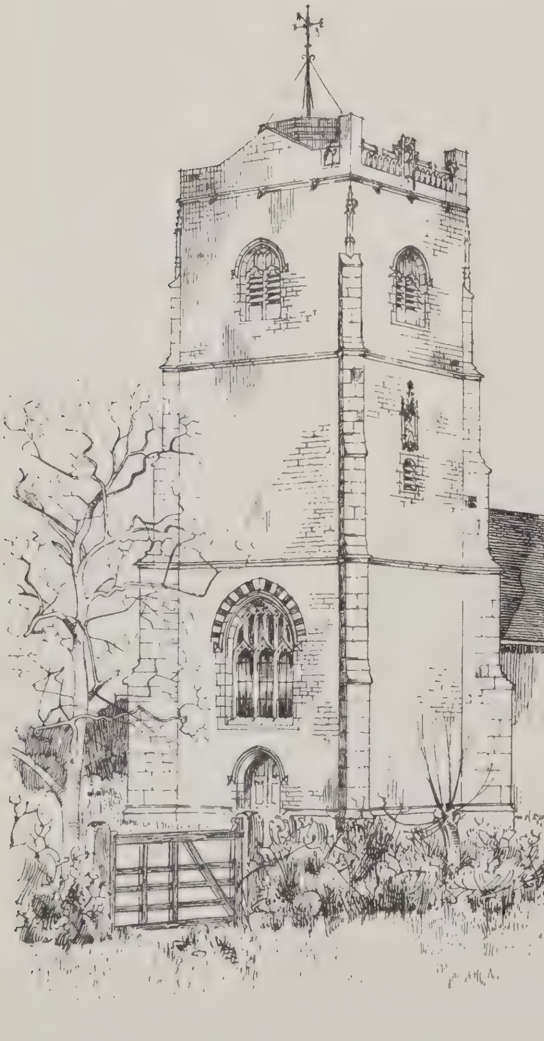
IN the south of Monmouthshire, with the Bristol Channel on one side and shut in by a range of hills on the other, stretches a broad flat expanse of fertile country known as the Wentloog Level. In every direction it is intersected by reens and dykes, which, lined with pollard willows and crossed at intervals by small bridges of brick or stone, weather-worn and lichen-covered in numerous instances, form picturesque subjects for the artist: and over it, in a sinuous line, stretches the old coach road. Until comparatively recent times large slices of this country were periodically washed away by the sea, which, continually undermining the base, caused subsidences and threatened to make an appreciable difference in the area of the land, until the farmers of a couple of generations ago proceeded to erect sea defences taking the form of training walls, the extent of each man's work being recorded on tablets built into the wall, stating the number of perches undertaken and the date of erection.

The district is rich in churches, some of considerable architectural merit and all having features of interest well worth the consideration of the student.



The example selected for illustration in this article is dedicated to St. Bride, and gives its name to the neighbouring hamlet. It has been chosen on account of the excellence of its tower, which, with the main body of the church, is of the Perpendicular period. The plan is of a type peculiar to this part of the country, in that it has an aisle on one side of the nave—in this instance on the north side—and extending for two bays only; the arcading has, however, been filled in with brickwork during the last century, thus shutting the aisle off from the nave and converting it into a separate compartment. The church is built of lias-lime stone rubble, which is still obtained in this and the neighbouring counties, and the visitor is told of the string of strong men passing the stones from hand to hand from the quarry in the vicinity to the site of the church. The buttresses, windows, &c., and the parapet and turret of the tower, are of a limestone similar to Bath stone, which is exceedingly well preserved. The quality of the workmanship in the tower is far superior to that in the rest of the structure, the walling being of squared regular-coursed rubble and the tracery and mouldings of much better design. At the north-east corner is an octagonal stair turret, the upper part ornamented with cusped panelling (see next page). The parapet on the south and east sides is also panelled, and there is evidence of this having been continued around the tower. In the centre of the panelling are niches, which probably occurred on each side, but those on the west and north sides have disappeared, plain walling having been substituted for the panelling. On the west side is a small gable of low pitch, which suggests an intention of covering the tower with a ridged roof, but all traces of this have disappeared, that at present existing being a pyramidal one of stone tiles. In all probability the square terminations at the corners were the bases of pinnacles, but these have either fallen or were removed at the same time as the alterations were made to the parapet. On the south side of the tower, in a small sculptured niche, is a figure of the Virgin, but the head has been removed, as have also those from the figures in the niches of the parapet—a reminder of the Commonwealth. The west window, although smaller than many others in the district, is a fine specimen of the style, and is rendered more effective by having voussoirs of red sandstone alternating with the grey limestone in the arch surmounting the label. The chancel is of a later period, and debased in style, having a low four-centre arched east window with a





heavy hood-mould. It has, however, a very quaint appearance with its weather-stained walls and stone-tiled roof. Over the door of the porch is a stone sundial, and inside, on the right of the inner door, is a mark 4ft. 6ins. above the floor, showing the height of the flood which covered all the surrounding country in the great inundation of 1607.

The tower is out of the perpendicular to an extent of at least 3ft., leaning to the north-west, probably through insufficient foundations for the yielding nature of the ground. In my opinion it must have settled during the course of erection, as there is evidence of attempts having been made to correct the want of verticality, at least three lines of direction being observed at the junction of the north-west buttress with the walls of the tower, in addition to the square blocks in the parapet, and other features, being kept upright. Despite this defect, it stands firm enough to-day, and forms a landmark for miles around, having weathered to a fine clean grey colour.

[Serious damage to the tower of Peterstone Church, Wentloog, has been caused by recent storms, and an appeal for its repair is now being made. The body of the church, which is Norman in style, was restored some years ago, but the tower was left untouched.]

THE ROYAL INSTITUTE OF FINE ARTS, GLASGOW.

Architectural Exhibits.

THE forty-fourth annual exhibition of painting, sculpture and architecture of the Royal Institute of Fine Arts is now being held in the Institute's new galleries in Sauchiehall Street, Glasgow. The show this year is a good one. Many very fine pictures hang on the walls, while some of the sculpture pieces exhibited are of more than average interest.

The architectural drawings and photographs this year are shown in one of the long galleries together with some of the black-and-white and other minor works. This is a distinct improvement on the arrangement of former years, which tended to crowd the architectural works into a dismal little room by themselves, and even thrust them out on to the stair landing.

But while this year the works are better hung and of very good average merit, there are no outstanding exhibits which compel attention. Probably the best drawing shown is the coloured study of St. Mary's Church, Oxford, by Mr. James B. Fulton, but in pure line work Mr. Alexander McGibbon shows to good advantage in many perspectives.

Taking the exhibits in the catalogued order, the first is the new theatre at Kilmarnock by Mr. Alex. Cullen, F.R.I.B.A. This is a somewhat unsatisfactory front, and cannot be compared with the other exhibit by the same architect—the new municipal buildings and public library at Hamilton. This latter is a good piece of Renaissance design, well-drawn, and accompanied by a plan.

Next Mr. D. W. Sturrock shows a clean drawing of an Arran house, and Mr Fred Rowntree a picturesque lodge at Torquay. M. A. N. Paterson is represented by a series of nine photographs of a small country house, with carefully-wrought detail. The same architect also exhibits a large pencil drawing (touched up in the foreground with coloured chalks) of the Kyles of Bute Hydropathic, a design in the Scottish baronial style.

Messrs. H. & D. Barclay show the large warehouse in Queen Street for which they are responsible and a competitive design for a church. Neither of these, however, is satisfactory. The same criticism applies to Messrs. Honeyman, Keppie & Macintosh's block for Messrs. Annan, the well-known photographers, and an Ayrshire library. Six photographs illustrate the former.

Two photographs are exhibited of the music-room and stair of SS. Jongaia by Mr. J. M. Crawford, I.A. The detail is a trifle fanciful. Mr. James Lindsay is represented by the Baptist Church at Springburn and a district library and municipal offices: the drawing, however, is hard. Messrs. Miller & Black show Kennyhill House, while Messrs. Watson & Salmond exhibit a very picturesque drawing of a gate lodge for Tulliallan Castle. The same architects also sign a sketch for a library at Montrose.

Messrs. Peddie & Washington Browne have sent a large elevation of the North British and Mercantile Insurance Co's. new head-office in Edinburgh, a scholarly design on safe lines.

The competitive design for the Glasgow Technical College by Messrs. Thomson & Sandilands is shown, and, as far as elevation at least is concerned, is superior to what is being erected.

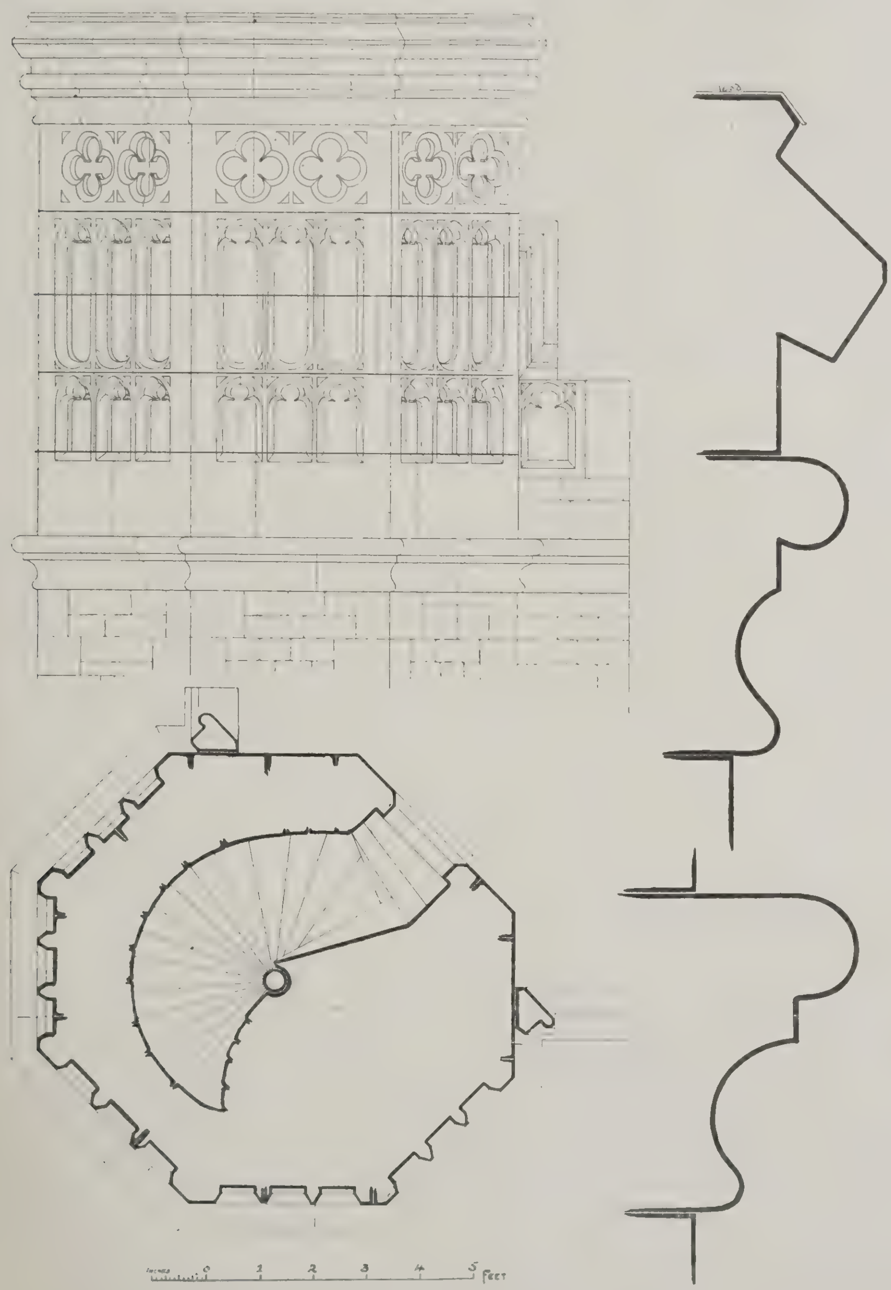
Messrs. Walker and Ramsay exhibit elevations of town hall and council-chambers, Kirkintilloch, Messrs. Beattie & Morton photographs of Nordheim, Bearsden, and Messrs. Salmon, Son & Gillespie the nurses' home at Woodilee, Lenzie, already illustrated in these columns.

In the Hill House, Helensburgh, the "Macintoshy" style is decidedly overdone. Messrs. Leadbetter and Fairley show Dalveah, Loch Ard, which was illustrated some months ago in THE ARCHITECTURAL REVIEW, as also the work of Mr. R. S. Lorimer at Craigmyle, Aberdeenshire. The work is in the usual scholarly style which we associate with this architect. The gatehouse is also illustrated.

An unusually large number of photographs of work are shown this year, among the best of these being Mr. E. A. Sutherland's premises, Paisley, Mr. A. Balfour's Normanhurst, Bearsden, and Mr. John Nisbet's architectural interiors and doors, the last two fantastically shaped.

In addition, there are a number of drawings that are so "skied" as to be practically beyond criticism.

Leicester and Leicestershire Society of Architects.—At the general meeting held on March 15th to discuss the subject of the statutory qualification and registration of architects the Society's resolution of June 3rd, 1904, was re-affirmed, and the opinion was expressed "that it is the duty of the Council of the Royal Institute of British Architects, as representing the profession, to make serious and immediate effort to obtain Parliamentary powers for the purpose of establishing statutory qualification of architects."



ST. BRIDE'S CHURCH, WENTLOOG, MONMOUTHSHIRE: TURRET ON TOWER.
MEASURED AND DRAWN BY H. T. REES.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Bevels for Hip Tiles.

Prof. Henry Adams writes to point out a slight mistake in his reply to the enquiry about bevels for hip tiles on p. 136 of our issue for March 15th. Instead of drawing K L perpendicular to D E, J L should be made equal to J K.

Cemetery Chapels.

PERTH.—GOTH writes: "What are the requirements of a cemetery chapel for Episcopalian worship? Is an altar necessary? Where is the bier placed? Is a lectern used during the service?"

An altar should be provided, raised three steps above the general level of the floor and allowing a width of 3ft. in front thereof and 18ins. for the two treads. The coffin is placed on a bier in the middle alley with the feet towards the altar, and should be surrounded with candles, four on each side, in large candlesticks standing on the floor. Ample passage space must be left all round. A lectern is a great convenience from which to read the lessons.

CHARLES SPOONER.

Cost of Central Hall in Elementary School.

WATERFOOT.—BETHEL writes: "The Board of Education give the limit of cost for elementary schools as £10 per scholar, but state that an additional allowance will be made for the cost of a central hall not calculated in the accommodation. Can you give me any idea as to the amount of this extra allowance?"

In the old days the Board of Education permitted a class to be taught in the central hall. Therefore they advanced the limit per scholar for that class. They may do so still, but this is a matter which must be decided by the Board only, and you must state your case to them. In the conditions of recent competitions the sum of £10 per scholar is invariably made to cover the cost of the central hall.

T.

Wind-pressure on Roofs and Walls.

LONDON.—SURVEYOR writes: "In calculating the thickness of wall for a building 6oft. long by 30ft. wide, with a roof of glass and galvanized iron supported on eight steel roof-trusses, the direction of the reaction of the fixed end of each truss was found to be 58° 53″ with the horizontal and acting with an intensity of 3,776 lbs.; the walls supporting roof are 9ft. high. The wind-pressure on roof acting normal to its surface ($p \sin. \theta$) and on wall is taken at 40ft. per ft. super., and equating the overturning moment with the moment of stability the wall should be at least 2ft. 3½ins. thick. The Building Act requires a 14in. wall, and from experience I should think that this would be enough. Is 2ft. 3½ins. the thickness of the two walls? The calculated thickness of wall is to withstand a pressure of wind acting with an even pressure of 40 lbs. over each square foot of the resistance area. It seems to me that this might be so in a very exposed position. Is it probable that such a pressure would be reached in a town except in the case of high buildings, such as towers?"

The pressure of the wind is taken by various authorities at 56, 40 or 42, and 28 lbs. per sq. ft. against a plane surface perpendicular to its direction. The former could be reached only in a very exposed position, and the latter is usually sufficient for all cases in a town. By the writer's empirical formula based upon a full consideration of the whole question $\log. p = 1{\cdot}125 + 0{\cdot}32 \log. g - 0{\cdot}12 \log. l$, where p = ultimate wind-pressure in lbs. per sq. ft. necessary to be allowed for against a plane surface perpendicular to the direction of the wind, g = height of centre of gravity of surface considered—above ground-level in feet, l = length in feet of part to be taken as one surface. Assuming the roof in question to be 30ft. span, rise ¼ span and trusses 7ft. 6ins. apart, the horizontal pressure to be resisted by each truss would be $\log. p = 1{\cdot}125 + 0{\cdot}32 \log. \left(\frac{7{\cdot}5}{2} + 9\right) - 0{\cdot}12 \log. 7{\cdot}5 = 1{\cdot}125 + 0{\cdot}32 \times 1{\cdot}10551 - 0{\cdot}12 \times 0{\cdot}87506 = 1{\cdot}125 + 0{\cdot}3537632 - 0{\cdot}1050072 = 1{\cdot}373756$, whence $p = 23{\cdot}64$ lbs. per sq. ft. horizontally. For the wall $\log. p = 1{\cdot}125 + 0{\cdot}32 \log. 4{\cdot}5 - 0{\cdot}12 \log. 7{\cdot}5 = 1{\cdot}125 + 0{\cdot}2090272 - 0{\cdot}1050072 = 1{\cdot}22902$, whence $p = 16{\cdot}94$ lbs. per sq. ft. Then the effect normal to the roof will be $p \sin. 26\frac{1}{2}^\circ = 23{\cdot}64 \times {\cdot}4462 = 10{\cdot}5482$ lbs. per sq. ft. The length of rafter under wind-pressure will be $\frac{30}{2} \sec. 26\frac{1}{2}^\circ = 15 \times 1{\cdot}1174 = 16{\cdot}76$ft.; and the centre distance of trusses being 7·5ft., the total pressure will be $16{\cdot}76 \times 7{\cdot}5 \times 10{\cdot}5482 = 1{,}326$ lbs. Assuming the trusses to weigh 675 lbs. each, and the covering to weigh 14 lbs. per ft. super., the total dead load on each truss will be $675 + 16{\cdot}76 \times 2 \times 7{\cdot}5 \times 14 = 4194{\cdot}6$ lbs. These results are shown by Fig. 1, and the reactions by funicular polygon are found to be 2,460 lbs. and 2,940 lbs. The wind-pressure against the wall will be $16{\cdot}94 \times 9 \times 7{\cdot}5 = 1143{\cdot}45$ lbs. and the weight of wall at 112 lbs. per cub. ft. $= 9 \times 7{\cdot}5 \times 1{\cdot}125 \times 112 = 8{,}505$ lbs. The resultant of pressure from roof and wind-pressure, as shown in Fig. 2, will be 3,250 lbs., and this compounded with the weight of the wall will be 11,580 lbs., which will cut the base at the edge. But it is fair to take the two walls as acting together, as in Fig. 3, when the final resultant is found to be 22,500 lbs. acting at 11ins. from the edge. Then $\frac{W}{A} + \frac{M}{Z} = \frac{22400}{2{\cdot}25 \times 7{\cdot}5} + \frac{22400\left(\frac{2{\cdot}25}{2} - \frac{11}{12}\right)}{\frac{1}{6} \times 7{\cdot}5 \times 2{\cdot}25^2}$, whence the maximum pressure will be 2064·8 lbs. per sq. ft. on the outer edge. In Figs. 2 and 3 the force scale is reduced as the values increase, so that the lines may not be an unwieldy length, and W in the formula above is the vertical component of the resultant.

HENRY ADAMS.

A Curious Claim for Rates.

ENQUIRERS write: "A client purchased a house which he entered on December 10th last year. About November 1st, the client having decided to carry out some alterations, we fitted up a room in the house as an office for the use of our resident draughtsman, so that he might make a survey of the house preparatory to making contract plans. In January contracts were accepted and the builders began operations, which are now in progress. Of course, our assistant did not live on the premises. Now, because of the above proceedings, the local tax collector has called upon our client to pay occupier's rates. We should like to have your opinion as to whether our action constitutes an occupation within the meaning of the statute under which such rates are levied, and if so whether we are liable for a full half year. The work is in an urban district in the north of England."

I assume that the house in question was empty (*i.e.*, unfurnished). In no case could your client be charged rates for a longer period than he actually occupied the premises; but in this case I am of opinion that

there was no such "exclusive and beneficial occupation" as would render the premises liable to be rated. Houses under construction are exempt from rating, and although there is of course an occupation of land during the building there is not the "beneficial occupation" which must take place before liability to rating is incurred.

F. S. I.

PAST TRADITION AND MODERN DESIGN.

IN the course of a paper on this subject which he read before last Thursday's meeting of the Leeds and Yorkshire Architectural Society Mr. Percy S. Worthington, of Manchester, said that although in our professional education we were certainly behind some other countries, the work now being done in this country was equal to, if not better than, the average work of any other country, France perhaps excepted. The student or apprentice of the fifteenth, sixteenth and seventeenth centuries was trained in the three arts of sculpture, painting and architecture, and in after-life practised all three. Buildings were books then as now, and their measurement formed the self-education of the architect, whether he did it as Peruzzi did with an eye to the composition of his architectural backgrounds, or as Brunelleschi with the definite idea of constructing his dome at Florence. With us in England it was different, but we could hardly afford to ignore their experience, and we might take it as an axiom that for the intelligent study and practice of design a knowledge of the history and architecture of past times was essential. Taste might be acquired to a degree by education and experiment without being inborn, and this was within the reach of all. As an example of trying experiments with antiquity, one might cite that fine and distinguished work, the new Westminster Cathedral. With regard to planning, certain types of plans were still more or less traditional, that, for instance, of places of public worship, though even here one saw no reason why some modern type might not be evolved which might appeal to religious instincts as much as old.—The following were elected officers of the Society for the ensuing session:—President, Mr. G. B. Bulmer; vice-presidents, Messrs. H. S. Chorley and R. A. Smithson; hon. secretary, Mr. R. P. Oglesby; hon. treasurer, Mr. W. H. Thorp; hon. librarian, Mr. G. F. Bowman; council, Messrs. R. Marshall, F. Musto, A. J. Hill, H. A. Chapman, P. Robinson and G. E. Reason.

THE RECTILINEAR PERIOD.

AT last Thursday's meeting of the Sheffield Society of Architects and Surveyors Mr. W. J. Hale, F.R.I.B.A., delivered a lecture on the "Rectilinear" period of Gothic architecture, extending from 1360 to 1547, that is, from the latter part of the reign of Edward III. to the close of the reign of Henry VIII. The skeleton forms on which rectilinear tracery was based were shown by diagrams, and it was argued that the introduction of a vertical line into the window head was a natural step, which tied the composition of the whole window together in a logical manner; and it was claimed that this method fulfilled Ruskin's aphorism, "Tracery must not be considered or imagined as flexible." With further diagrams the development of vaulting was traced from the rib to the true fan vault, and the method of construction and the principle of its stability were explained. It was also contended that although in fan vaulting the rib and the panel were not separate, the method was truly constructional, and that the sinking of panels in the stone, with the ribs emphasizing the lines of resistance, was a correct method of reducing the weight and ornamenting the surface. Attention was called to the influence of the chamfer plane on the form of the mouldings, common to the period, and allusion was made to the tapering outline which was produced by the repeated set-back of the buttresses, particularly those to towers, which gave a feeling of repose and stability.

OUR PLATE.

THE children's colony of the Hackney Guardians at the quiet little town of Chipping Ongar, in Essex, shows that, so far as creature comforts are concerned, the lot of the workhouse child is not devoid of its advantages. It is indeed a question whether, in the revulsion of feeling from the former severity with which boards of guardians were wont to regard their hapless wards, they have not allowed solicitude for their welfare to urge the pendulum unduly in the other direction.

The buildings provide for 300 children (the maximum number sanctioned by the Local Government Board for any one group of this kind), and have been so designed as to be capable of use by either boys or girls. The accommodation is provided in eight blocks—two pairs of cottages, each for fifteen children, and six houses for forty children.

In addition to these there is a probationary cottage for twenty children, common to the use of boys and girls, and an infirmary with a central block containing kitchens, dispensary, and nurses' quarters, separating wings, each comprising an eight-bed ward with duty-room adjoining, and isolation room for two beds.

The fact that the resources of the town would be somewhat severely taxed by so large an addition, amounting to nearly half its population, has caused the administrative block to assume somewhat important proportions, sufficient, in fact, to ensure almost complete independence. Here it has been necessary to provide extensive storage accommodation, pumping machinery to supply the various buildings with water, and electric plant for lighting and power worked by gas-engines.

The workshops provided are intended solely for repairing work, as it is not contemplated that any instruction will be given except in home duties, one of the fundamental ideas in such cottage homes being that the children receive an ordinary education with others of their class at outside schools. The machine laundry deals with the clothing from the larger houses, infirmary, receiving home, &c., a small detached hand laundry being provided in the rear of each of the cottage blocks for the use and instruction of the elder girls, for whom these cottages are intended. In the administrative block small bedrooms are provided for the girls who act as servants to the superintendent's house and receive finishing touches under the supervision of the matron before passing out to service.

It seems unfortunate, architecturally, that the Guardians—for administrative reasons presumably—should have fixed as the number to be housed in the larger blocks so many as forty. This is very prejudicial to the "cottage" character so far as these buildings—the major part of the scheme—are concerned. Even so, it is open to question whether a result more satisfactory could not have been attained without increase of cost or sacrifice of efficiency by a design comprising two storeys only.

The buildings have been erected by Messrs. McCormick & Sons, of Northampton Street, Essex Road, from the designs and under the superintendence of Mr. W. A. Finch, of 16, Finsbury Pavement, E C. The contract amounted to £45,987.

Views and Reviews.

Kidder's Pocket-book.

The first edition of this valuable American pocket-book for architects, structural engineers, builders and others was published nearly twenty years ago and contained but 586 pages. The present edition, the fourteenth, containing 1,656 pages, is a completely rewritten one and has taken three years in preparation. The author in his revision has kept the following points in view:—(1) A reference-book which should contain some information on every subject (except design) likely to come before an architect, structural engineer, draughtsman or master-builder, including data for estimating the approximate cost; (2) to as thoroughly cover the subject of architectural engineering as is practicable in a handbook; (3) to present all information in as simple and convenient a form for immediate application as is consistent with accuracy—to which end a great many new tables arranged and computed by the author have been inserted. In these objects it must be said Mr. F. E. Kidder has succeeded. The book is of course

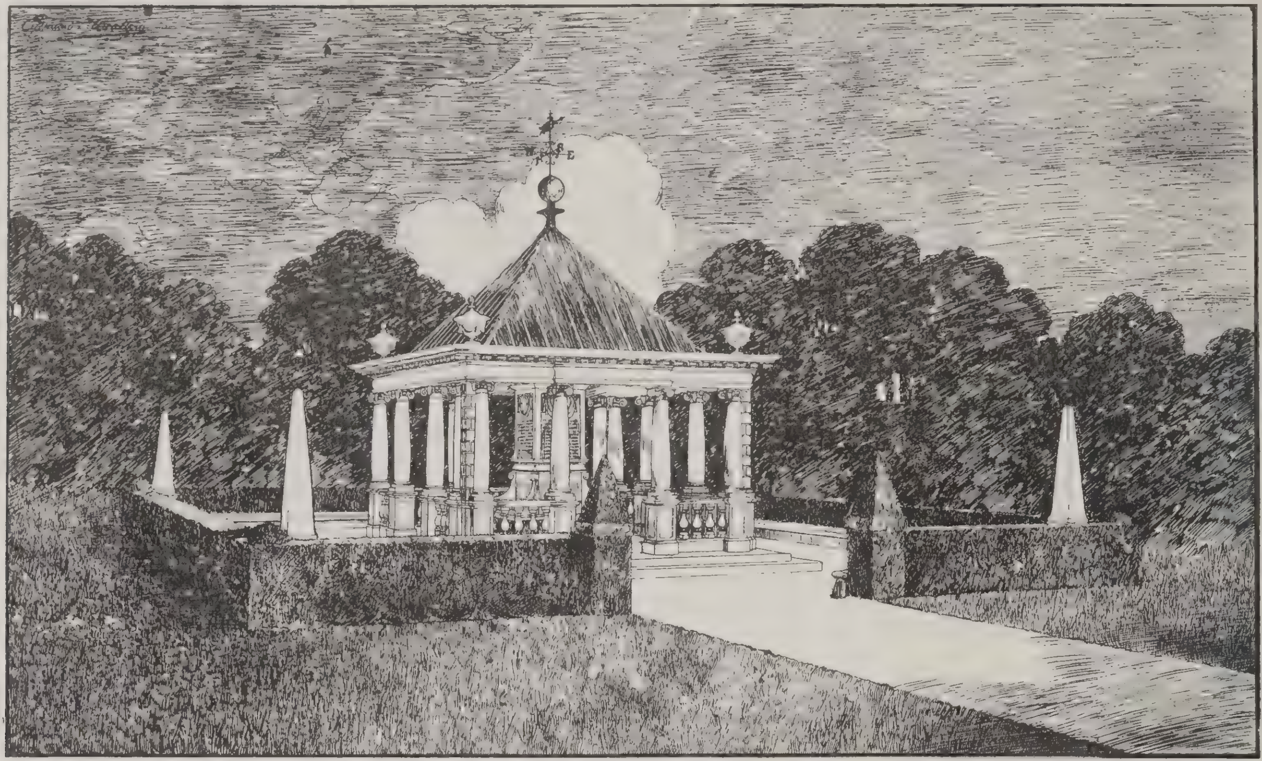
Too Large for the Pocket,

but few persons ever carry these small aid books in their pockets, the merit in them being their handy size, and in this respect no exception can be taken to Kidder's Pocket-book. The author has fulfilled his aim in giving architects and builders a handbook in its field as usual and reliable as Trautwine's has been to civil engineers. It is incomparably superior to the pocket-books and small handbooks published in this country, and should be in every architect's library; for though designed primarily for America, it contains much information of universal application. The book is particularly valuable to us in the direction of providing information on structural engineering, which is now so all-important in American building practice, because in this country we are rapidly developing in the same direction. In Mr. Kidder's words, "To-day structural and architectural engineers are concerned almost exclusively with building construction, and their work is more closely allied to that of the architect than to that of the civil engineer; hence the author has had in mind the needs of the structural engineer and draughtsman as well as those of the architect and builder, and the book should be of nearly equal value to both." In the book all the special features of

Skeleton Construction

which we have shown our readers in our articles on the Ritz Hotel will be found dealt with, such as cantilever foundations, column details, wind-bracing, &c. The instruction in structural calculations is particularly clear and well done. Where it is impossible for lack of space to go extensively into any subject, references to other books or sources of information have been given. Part I. of the book is devoted to mensuration rules, weights and measures, &c., Part II. deals with the strength of materials and the stability of structures, and Part III. gives miscellaneous useful information on such subjects as heating, ventilation, chimneys, hydraulics and plumbing, gas and electric lighting, data for estimating cost, and (useful in preparing plans) a glossary of technical terms, with legal definitions, &c. Important proprietary systems and materials are dealt with—not neglected as usual; this is a good feature and shows the book to be a really live one, concerning itself intimately with everyday practice. It is well printed on excellent paper, and the 1,000 illustrations are clear.

"The Architect's and Builder's Pocket-book," by Frank E. Kidder, C.E., Ph.D., F.Am.I.A., &c. New York: John Wiley & Sons. London: Chapman & Hall, Ltd., price 21s.



DESIGN FOR A MEMORIAL. EDMUND L. WRATTEN, ARCHITECT.

Freestone is intended to be used for this memorial, with a copper-covered roof and wrought-iron weather vane on a gilt ball. Oak seats are arranged inside around a square central pier bearing inscriptions on copper plates. Within the dwarf yew hedge surrounding the memorial is a low wall with a flat stone coping, arranged to be used as a seat.

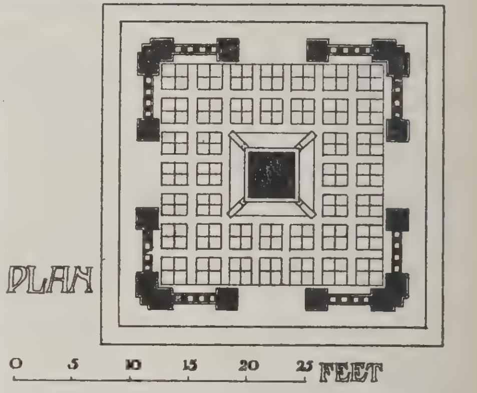
AN INFORMATION BUREAU FOR THE BUILDING TRADES.

MR. ALAN E. MUNBY, M.A., F.C.S., read a paper before the discussion section of the Architectural Association on March 22nd in which he suggested the formation of an information bureau on the products of the building trades' industries. He pointed out that fifty years ago new methods of construction were few and building materials displayed but little diversity as compared with the conditions of to-day, one proof of which was afforded by the number of patents taken out in connection with the building trades, these patents being now about 2,000 annually as against 250 in 1853. The architect could not possibly be expected to know the merits of all these numerous new materials and methods of construction, and in practice he usually confined himself to a few well-trodden paths, making new roads but slowly, and sometimes with disastrous results. There was no opportunity for rapidly obtaining reliable information on the multitudinous novelties introduced. The firms exploiting them were of course ready enough to furnish particulars, but that information could hardly be regarded as unbiased. Therefore, the establishment of an authoritative and trustworthy Bureau would be of inestimable service. It would collect, correlate and systematize facts; it would form a collection of manufacturers' samples, reported upon and classified in conformity with the data obtained; and it would gather statistics (in a readily intelligible form) from relevant work of societies, testing institutions and private experts, and would enter into conference to aid the establishment of standards. Some kind of laboratory and testing department, conducted on utilitarian lines, would certainly be a necessary adjunct to the Bureau. The more elaborate and scientific tests would still be left to private experts, whose *clientèle* would thus be increased rather than diminished by the existence of the Bureau.

Institutions Abroad.

In considering the merits of the scheme it was natural to enquire whether any means for attaining its objects already existed. This enquiry disclosed the fact that extensive and highly valuable work in testing was being carried out by such State-supported, or partially State-supported, institutions as the Reichsanstalt and Versuchenstalt in Germany, the Laboratoire d'Essais in France, the Bureau of Standards in the United States, and our own National Physical Laboratory at Bushey: but though building materials were dealt with by these institutions the great mass of their work lay in testing and research upon scientific instruments and matters more in the field of engineering. Enquiries at the American, French and German consulates in London led to the belief that no institution corresponding to the proposed Bureau existed in these countries. A society called Le Chambre Syndicate des Constructions Metalliques et Industrielles existed, it was true, in Paris, but enquiries as to its work had met with no response. The work of engineering societies, though it rendered valuable assistance, did not cover the field in view; and although the Royal Institute of British Architects, the London Master-Builders' Association and other important bodies had at times done much in connection with some of the objects under discussion, the diversity of their work in other directions hardly rendered it likely that anything in the permanent and organized form proposed could be expected from them. The Yorkshire Federation of Building Trade Employers had a Builders' Exchange at its Hull branch, where there was a collection of building materials, but, it was believed, without any reports thereon, so that the analogy to the suggested Bureau was only slight.

Direction of the Bureau.



The direction of the Bureau would be primarily in the hands of architects, contractors and those engaged in the sale of building goods (but not manufacturers), while, as to its finance, there would be three sources of possible revenue, namely, members' subscriptions, fees paid by makers for reports on their goods, and, possibly, rentals paid by them for space for goods exhibited. If 20 per cent. of London architects and 10 per cent. of London builders and contractors became members at an annual subscription of one guinea, that would furnish about £850; and if 10 per cent. of the remaining architects and 5 per cent. of the contractors in Great Britain contributed half a guinea, an additional £700 would be available; while the subscriptions of those interested in the sale of materials might bring the income up to £2,000. If, in addition, a rental could be charged to manufacturers exhibiting, there would be no difficulty, financially, in the scheme being realized.

From the Census of 1901.

At the conclusion of his paper Mr. Munby gave some figures of patents taken out for building inventions, as well as a list of important materials under trade headings, and the following returns from the census of 1901:—

	County of London.	Rest of England and Wales.
Architects over 25 years of age	1,294	3,550
Building employers	3,040	19,022
Manufacturers of bricks and tiles	29	1,797
,, plaster and cement	19	156
Dealers in timber	443	2,759
,, stone and slate	98	1,419
,, ironmongery and hardware	601	4,790
,, bricks, cements, pottery and glass	310	1,063

[This list represents individuals, not firms, and no allowance is made for agents.]

A discussion followed, opened by Mr. Louis Ambler. Professor Simpson, of University College, was the special visitor in place of Mr. Searles-Wood, who was unable to attend but wrote offering to co-operate in the scheme should any steps be taken. Mr. Smith, Mr. Lishman and Mr. T. H. Russell also spoke. Though some difficulties were suggested in the carrying out of the scheme in its entirety, all the speakers were in favour of the proposals, and the paper was very cordially received, though the attendance of members was small.

Keystones.

A Receiving House for Children is about to be erected in Acton Lane from designs by by Mr. A. Saxon Snell, F.R.I.B.A.

Bishopsgate Churchyard is proposed to be partly built over with shops facing the street, and office accommodation at the rear. Needless to say, the scheme will be strenuously opposed by a large number of the inhabitants, who regard it as wholly uncalled for.

Architects' Registration.—Mr. A. W. S. Cross and Mr. George Hubbard read papers on architects' registration before the York Architectural Society last week, and a resolution was passed declaring emphatically that the Institute should make earnest and immediate effort to secure the desired end.

A new Theatre in Edinburgh is to be erected in Home Street and Leven Street, at an estimated cost of between £60,000 and £70,000, from designs by Messrs. J. D. Swanston & Syme, of Kirkcaldy, the contractors being Messrs. W. S. Cruikshank & Son, of Edinburgh.

A new Salford Day School is being erected in Devonshire Street, Higher Broughton. It will provide accommodation for 280 infants and 500 boys and girls. On each floor there will be a central hall, seven classrooms, and provision is made in separate buildings for the teaching of cookery and manual instruction. The school is estimated to cost £12,380. The site has cost £3,000.

Scottish National Gallery Site Question.—A memorial signed by a number of prominent Edinburgh citizens, including Sir Rowand Anderson and Prof. Baldwin Brown, has been sent to the Secretary for Scotland opposing the suggested removal of the National Gallery to either the High School or Calton Hill. Both of the structures on the Mound are submitted as being better than those named above.

Competitions for Swindon Schools and Rochester Technical Institute.—The Competition Reform Society disapproves of the conditions in these competitions because there is no undertaking that the successful competitors will be employed nor that the assessors' awards will be adhered to, and in the case of the Rochester Technical Institute the remuneration is insufficient. Members are requested to abstain from competing unless the conditions are satisfactorily revised.

Demolishing Adam Houses.—The Penrith Urban Council has decided to proceed with the work of demolishing the houses supposed to have been designed by Robert Adam and recently purchased by them for the purpose of adaptation as a town hall, in spite of the protests of the National Trust, the Society for the Protection of Ancient Buildings, the Right Hon. J. W. Lowther, M.P. for the division, and a petition signed by 250 of the inhabitants. This action is taken on the ground that it is now too late to stop it, the buildings having been purchased and the contracts partly executed.

The R.I.B.A. Prizes and Studentships for 1905-6 are as follows:—*Essay Medal:* "The biography of a British architect (deceased) practising in the nineteenth century." *Soane Medallion:* Realization of the ideal mansion described in Bacon's essay "On Building" (given on p. 352 of THE BUILDERS' JOURNAL for June 13th, 1900), beginning at the words "First then, I say, you cannot have perfect a palace except you have two several sides." *Tite Prize:* Design for an open-air swimming bath with an arcaded or colonnaded enclosure. *Grissell Gold Medal:* Design for a stone skew bridge. Other prizes as hitherto. Full particulars of each are given in a pamphlet issued by the Institute, price 3d.

A new Outpatients' Block at Leicester Infirmary was opened by the Marchioness of Granby last Wednesday. The architects were Messrs. Everard & Pick, and the contractor was Mr. Charles Wright.

The Chapel of the Royal Bavarian Embassy in Warwick Street, Regent Street, W., is being lavishly decorated. In the dome of the apse is to be placed a large mosaic designed by the late Mr. Bentley, architect of Westminster Cathedral.

The largest Rowton House yet built is now practically completed at Camden Town. It will contain 1,100 beds. A new wing is to be added to the Rowton House in King's Cross Road, increasing the accommodation from 678 to 950 beds.

New Board Schools for Edinburgh.—Two new Board schools are about to be erected in Edinburgh—one at Gillespie Street for 1,524 scholars in twenty-six classrooms, and the other in Drummond Street for 652 children in twelve classrooms.

Extensions to the Middlesbrough Isolation Hospital have been erected from designs by the borough surveyor, Mr. Frank Baker. They comprise two additional pavilions accommodating sixty patients, with an allowance of 2,000 cub. ft. of air-space each. The cost of the work has been about £11,500.

A Riding School for the Hull (A) Squadron of the East Riding of Yorkshire Imperial Yeomanry has been built in Walton Street from designs by Messrs. Thompson & Kirton, architects and surveyors, of Hull. The school is what is known as a three-quarter size one —120ft. by 45ft. The floor consists of a ground-work of willows with tan covering. Four arc lamps of 1,000 c.p. each are provided, enabling drills to be carried out with comfort at night time. The total cost, exclusive of furnishing, has been £1,600.

Proposed Ruskin Park.—The Parks Committee of the London County Council recommend the Council to contribute £25,000, half the cost of acquiring twenty-four acres of land at Denmark Hill for the purpose of a public open space to be known as "Ruskin Park." The price asked for the land is at the rate of £2,000 an acre, which the committee are advised is reasonable. The cost of fencing and laying-out will not exceed £5,500, and the annual cost of maintenance will be about £1,000.

Asphalt Pavements.—Observations have recently been made in New York by the Barber Asphalt Paving Co. with the object of ascertaining how much the traffic has increased since 1885, when a similar investigation was made, and how large a tonnage asphalt pavement (in Fifth Avenue) might be able to carry without disintegration. The vehicles in 1885 were 5,460; in 1896, before the street was paved with asphalt, 6,300; and in 1904, 11,789. The average weight per vehicle for 1886 was 0·68 tons, while in 1904 it was 1·64 tons. On Broadway in 1886 it was 1·39 tons and in 1904 1·97 tons. Figures show that a well-constructed asphalt pavement will sustain the heaviest traffic.

A new Theory about Masonry Dams is put forward by Mr. L. W. Atcherley and Mr. Karl Pearson, respectively demonstrator in applied mechanics and professor of applied mathematics and mechanics at University College, London. Briefly stated, the theory is that the vertical sections of a dam under water pressure are more severely strained than the horizontal sections, and that while a dam designed under the rules hitherto applied may be safe as regards cracking horizontally, it may nevertheless be liable to do so vertically. The matter is now engaging the study and attention of the principal mathematicians and hydraulic engineers in England and France. Meanwhile the scheme for raising the Assuan dam is postponed.

Clapham Baths Competition.—We are asked to correct a misunderstanding regarding the Clapham baths, which are to be built for the Wandsworth Borough Council. The accepted design was prepared by Mr. Henry Druery, M.S.A., architect, of 26, Great James Street, Bedford Row, W.C., who was responsible for the architectural work, and by Mr. E. R. Dolby, M.I.C.E., of the firm of Messrs. Dolby & Williamson, consulting engineers, 8, Princes Street, Westminster, S.W., who are responsible for the design of the engineering work. The Wandsworth Borough Council are employing Messrs. Druery and Dolby to carry out the work, and have also instructed them to prepare designs for the proposed Tooting baths. There is, however, no such firm as Messrs. Druery & Dolby, and these gentlemen are only connected in the manner described above.

The Architects' Library.—Messrs. Longmans have a new series of illustrated handbooks in preparation entitled "The Architects' Library," edited by Prof. F. M. Simpson, of University College, London. The series will begin with a three-volume "History of Architectural Development" by the editor, the first volume of which, it is hoped, will be ready this spring. Messrs. Routledge also announce an illustrated "Descriptive Handbook of Architecture" by Mr. M. A. Buckmaster, Art Master at Tonbridge School, intended primarily for those who have no special knowledge of the subject. A book on "Roofs and Floors of New Buildings: Their Structure and Stability," by Mr. Ernest H. Essex, A.M.I.C.E., assistant engineer and surveyor, Leyton, E., will be published shortly by the St. Bride's Press, Ltd. It will give in a concise manner the calculations necessary for the strengths of timbers in floors and roofs.

Decay of Stone and Dry-rot in Timber.—Speaking on this subject on Friday last at the closing meeting of the session of the Glasgow Technical College Architectural Craftsmen's Society, Mr. Alex. Cullen, F.R.I.B.A., insisted on the importance of a proper understanding of the causes of such decay to all engaged in the arts and crafts. The chemical structure of stone was explained as being very closely connected with its weathering properties. The germ theory was also touched upon, as opposed to the action of chemical agencies, in being responsible for decay in stone, the lecturer, however, favouring the older belief. The proper seasoning of stone before its introduction into building was held to be essential. Dealing later with "Dry-rot in Timber," the vegetable growth or fungi causing the disease was described in detail in its origin, its growth, and in its character and appearance. Methods for its prevention and elimination were discussed.

Vauxhall Bridge.—On Tuesday of last week the great steel girders of the central span of the new Vauxhall Bridge, weighing 300 tons, were placed safely in position. An unusually high tide facilitated the work. The girders were floated up on a wooden staging with the flood tide and swung into position. As the tide ebbed they were lowered into position and made secure. It will be remembered that the original plan of the London County Council was to erect a masonry bridge, but this project had to be abandoned as the arches would not have allowed the necessary headroom in accordance with the Vauxhall Bridge Act of 1895. In the amended scheme the masonry piers will rise no higher than is required for the support of the segmental arch structure of steel, and will not be carried up as a decorative feature of the bridge. Over each of the piers the line will be broken by a panel with figures in high relief, and pylons will be erected at the Westminster end of the bridge. It is estimated that the steel superstructure will cost £192,690, and a good many months must elapse before the new bridge is opened for traffic.

LIVE AND DEAD LOADS IN BUILDINGS.

By C. C. SCHNEIDER, M.Am.Soc.C.E.

AN interesting and valuable paper on "The Structural Design of Buildings" was read a short time ago by Mr. C. C. Schneider before the American Society of Civil Engineers, from which we have extracted the following particulars relating to live and dead loads in buildings of the modern type, in which steel forms part of the construction :—

Attention has been called to the great difference in the live loads specified by the various building laws for buildings to be used for the same purpose, the differences being in some cases more than 100 per cent. These differences should be harmonized, and a more rational method of loading devised which would produce a structure of ample strength, more particularly in its details and connections, without waste of material in places where it is not needed.

The writer's attention was first called by Theodore Cooper, M.Am.Soc.C.E., to the irrational practice of specifying a uniform live load per square foot; he thought the specified live loads should be a little more than mere guesswork. Since then the writer has been working in accordance with these suggestions, following the lines which have been recognized for years by engineers in specifying live loads for bridges.

The possible maximum superimposed or live loads on buildings for special purposes, such as warehouses or stores for particular kinds of goods, power-houses, department-stores, &c., after their interior arrangement has been decided upon, can be accurately determined.

However, there are classes of buildings the rooms of which may be occupied for various purposes at various times, such as office buildings, stores, hotels, apartment-houses, dwelling-houses &c. Dwelling-houses are sometimes used for offices, and rooms in office buildings for light manufacturing purposes.

While it is impossible to foresee and provide for all possible contingencies, it is within the limits of possibility to provide for the varying conditions of loading which may occur in a building if used for the purpose for which it was intended.

Live Loads on Floors.

Mr. C. H. Blackall states: "The writer has repeatedly counted the number of persons in the various portions of theatres and music-halls, without once finding, even in crowded aisles and standing-room, an average of more than 40 or 50 lbs. per. sq. ft. extended over more than a few square feet."

This agrees also with the writer's observations.

A live load of 40 lbs. per sq. ft., therefore, may be considered the maximum load to be provided for as a distributed load for all floors on which crowds of people may be expected to congregate, such as all kinds of rooms in dwelling-houses, apartment-houses, hotels, office buildings, schools, churches, theatres, concert-halls, ballrooms, drill-rooms, &c.

Mr. Blackall, in conjunction with Mr. A. G. Everett, made a thorough investigation of the actual existing live loads of three office buildings in Boston. These loads were obtained by taking the actual weights of the furniture and contents and the greatest number of people known to be at any one time in an office, the average weight of one person being estimated at 150 lbs. The greatest load was found in one of the offices of the Ames Building, amounting to 40·2 lbs. per sq. ft.

In only 12·4 per cent. of the offices was the floor load in excess of 25 lbs. per sq. ft., and in only 26 per cent. did it exceed 20 lbs. per sq. ft. The greatest maximum average for all floors of any one of the three buildings was 17 lbs. per sq. ft.

In accordance with these data, it may be considered safe to assume that a distributed live load of 40 lbs. per sq. ft. will be sufficient to provide for a crowd of people as well as for the ordinary loads carried on floors used for offices or similar purposes.

The writer has investigated this subject and endeavoured to discover extreme cases in order to find a method of concentrated loading to cover the same.

For this purpose weights of all kinds of furniture were collected and their contents estimated. The weights were not taken as they actually existed, but as they would be if completely filled with the material for which they were intended.

Furniture: Safes.

It was found that the ordinary furniture, such as desks, tables, wardrobes, counters, chests, small safes, &c., may be discarded for extreme loads. The heaviest concentrated loads found in any office were safes.

The portable safes used in offices rarely ever weigh more than 5,000 lbs., with contents. This load may be carried by one beam, and as a safe of this weight is likely to be placed in any office every floor joist should be calculated for a concentrated load of 5,000 lbs. in any position. The maximum weight of safes generally used in dwelling-houses is 2,000 lbs. The heaviest portable safe manufactured weighs 16,000 lbs., and occupies a floor-space of 69ins. by 45ins. Safes of such excessive weight, however, are not placed on floors of office buildings in which no special provisions are made for them, unless arrangements are made to distribute the load over at least several beams. In offices the weights of all other furniture, with contents, do not approach that of safes.

Drawing-office Cases; Bookcases.

Only a few cases of combinations of extreme loads were found to produce results similar to that of a concentrated load of 5,000 lbs.

In a large room used as an engineering office a number of cases with drawers holding drawings were placed in a double row, back-to-back, in the middle of the room, and used as a table on which to spread drawings. These cases were 31ins. wide and 36ins. high, weighing when completely filled 160 lbs. per lin. ft., or both together 320 lbs. per lin. ft.; but as their total width was 62ins., they may be considered as being carried by two beams.

TABLE 2.—LIVE LOADS ON FLOORS.

Classes of buildings.	Live loads, in lbs.		
	Distributed load.	Concentrated load.	Load per linear foot of girder.
Dwellings, hotels and apartment-houses - - - - - - -	40	2,000	500
Office buildings - - - - - - - - - - - -	40	5,000	1,000
Assembly rooms with fixed seats, like theatres, churches, schools, &c. -	40	5,000	1,000
Assembly rooms without fixed seats, like ballrooms, gymnasia, armouries, &c.	80	5,000	1,000
Stables and carriage houses - - - - - - - - -	70	5,000	1,000
Ordinary stores and light manufacturing - - - - - - -	40	8,000	1,000
Pavements in front of buildings - - - - - - - - -	100	10,000	—
Warehouses and factories - - - - - - - - - -	from 120 up	Special	Special
Charging floors for foundries - - - - - - - - -	,, 300 ,,	,,	,,
Power-houses for uncovered floors - - - - - - - -	,, 200 ,,	The actual weights of engines, boilers, stacks, &c., shall be used, but in no case less than 200 lbs. per sq. ft.	

A case of drawers for drawings, 31ins. by 44ins. and 5ft. high, if completely filled, would weigh 1,200 lbs. As there is a possibility of having a whole row of such cases placed along a partition, this would give a load of 326 lbs. per lin. ft., which may extend the whole length of a beam.

A row of bookcases might be placed on each side of a partition for the whole length of the room, in which case the load would be 340 lbs. per lin. ft. If the partition, instead of running parallel to the beams, should be placed at right angles to them, and if the beams are spaced at the usual distance of 5ft. or 6ft. apart, the concentrated load would be only from 1,700 lbs. to 2,040 lbs. on each beam.

These investigations appear to indicate that a concentrated load of 5,000 lbs. on any point of a beam, and a uniform load of about 340 lbs. per lin. ft. of beam, will probably cover all possibilities of extreme loading of floors used for office purposes.

A concentrated load of 5,000 lbs. is equivalent to the following uniform loads per lin. ft. of beam of different spans :—

Spans - - - -	10	20	30	40
Uniform load per lin. ft.	1,000	500	333	250

If the span of the beam is 30ft. and more, then the load of 340 lbs. per lin. ft. would govern. However, as offices are rarely more than 30ft. long, and as the probability of having an available continuous space of more than 30ft. on each side of a partition fully occupied with bookcases, completely filled, is extremely small, and when it is considered that this load will not be carried entirely by one beam, the floor acting as a distributor, this may safely be neglected, and it may be assumed that a concentrated load of 5,000 lbs. covers all ordinary contingencies.

In order to have a comparison between the system of concentrated loading and the uniform loads usually specified, Table 1 gives the equivalent loads per sq. ft. for beams of different lengths and spacing.

TABLE 1.

Span of beam, in feet.	Distance between centres of beams, in feet.			
	4	5	6	7
10	250	200	166	143
15	166	133	111	95
20	125	100	83	71
25	100	80	66	57
30	83	66	55	48
35	72	57	48	41
40	62	50	42	36

The application of a concentrated load to each beam has the additional advantage of having all beam-connections proportioned for a load of 5,000 lbs., and, therefore, not only obtains stronger connections and additional stiffness, but also makes provision for excessive concentrated loads during erection.

A concentrated load of 5,000 lbs. applied to floor girders, that is, girders which carry beams, is not sufficient to cover all cases of extreme loading.

By laying-out a great number of arrangements of office floors, with different spacings of columns and beams, and by applying different combinations of maximum loads, it was found that a uniform load of 1,000 lbs. per lin. ft. of girder will generally cover all possible contingencies, unless the uniform load of 40 lbs. per sq. ft. gives greater results.

The floor girders, therefore, have to be tried by three methods in order to ascertain which gives the greatest result:—

(1) For a concentrated load of 5,000 lbs.

(2) A uniform load of 1,000 lbs. per lin. ft.

(3) A uniform load of 40 lbs. per sq. ft. of floor area.

This method of loading as specified for office buildings will also provide ample safety if any rooms should be used for light manufacturing purposes.

By applying, in actual examples, the rules for floor loads of office buildings, as recommended by the writer, it is found, if the columns are spaced at 20ft. between centres in either direction, and the beams at 5ft. between centres, that the live load on the beams will be equivalent to 100 lbs. and on the girders 50 lbs. per sq. ft. of floor area.

If the columns were spaced at 25ft. between centres, and the beams 5ft. as before, the live load would be equal to 80 lbs. per sq. ft. on the beams and 40 lbs. per sq. ft. on the girders.

For buildings occupied as dwellings a concentrated load of 2,000 lbs. is recommended for beams and a uniform load of 500 lbs. per lin. ft. for girders, in connection with a uniform floor load of 40 lbs. per sq. ft.

As it has been demonstrated that a uniform load of 40 lbs. per sq. ft. will scarcely ever be exceeded by a crowd of people, this load, with the excess loads specified for office buildings, will be sufficient for floors of schools, churches, theatres and places where seats are provided, but for places where strong vibrations may be expected, such as ballrooms, drill-rooms, gymnasia, &c., 100 per cent. should be added to the uniform live load for impact and vibration, and in order to reduce the deflections, and consequently the vibrations, the depth of the beams and girders should be limited to $\frac{1}{15}$ of their span.

Loads on Columns.

It has been the practice of many engineers and architects to allow smaller live loads on columns than those specified for the floor system, or to reduce the loads per square foot of floor area on columns from storey to storey downward toward the foundations. Rules to that effect are also incorporated in some building laws.

In the specifications proposed by the writer the rules of the New York building laws have been adopted, viz., to reduce the live load on columns in buildings more than five storeys high 5 per cent. for each storey (commencing with the columns carrying the second floor from the top) until a reduction of 50 per cent. is reached.

In order to provide for any possible excessive loads, and to keep the dimensions of the lighter columns within reasonable limits, it is specified that columns carrying floor loads shall be proportioned for a minimum live load of 20,000 lbs., and the proportion of length divided by least radius of gyration of section shall be limited to 125.

Applying these rules to the columns of an office building gives for the columns carrying the top floor a live load of 40 lbs. per sq. ft. of floor area (unless this load is exceeded by the concentrated load of 20,000 lbs.), which is reduced to a minimum load of 20 lbs. per sq. ft. This agrees very closely with the investigations of Messrs. Blackall & Everett, who found the average maximum live load on any one office floor to be 40·2 lbs. per sq. ft. and the average total maximum for any one building to be 17 lbs. per sq. ft.

Loads on Foundations.

Several failures which have resulted from unequal settlement of foundations have demonstrated that it is of the utmost importance that foundations should be proportioned properly, more particularly those not on solid rock or where a settlement is to be expected. The reason for some of these failures was that the foundations were proportioned for the theoretical live loads, which never occurred. During construction, when the dead loads caused a settlement, those foundations which received the smallest amount of live load, therefore, were strained nearly to the limit of the permissible pressure, while those with a large amount of live load received a very much smaller pressure per sq. ft., thus causing unequal settlement.

For many years it has been the practice to reduce the live loads on foundations to less than the amounts allowed on the footings of columns, a provision which also exists in some building laws. However, as the average live load in a fireproof building is only 20 lbs. (or less) per sq. ft., and the dead load on the interior columns approximately 100 lbs. per sq. ft., and on exterior columns considerably more, and as the foundations have generally reached their maximum settlement before the building is occupied, it seems that the logically correct way to proportion foundations would be to consider the dead load only, but reduce the pressure per sq. ft. so that the permissible pressure for combined dead and live load will not be exceeded. For example:—

The base of that foundation which gets the greatest live load in proportion to the dead load has—

lbs.	
100,000	live load.
400,000	dead load.
500,000	

The permissible pressure on the base of the foundation is 2 tons, or 4,000 lbs. per sq. ft., and this foundation therefore would require an area of 500,000 divided by 4,000, equalling 125 sq. ft., which, if the live load be omitted, would give a pressure of 3,200 lbs. per sq. ft. for dead load alone. Therefore all foundations in this building should be proportioned so that the pressure from the dead load alone will not exceed 3,200 lbs. per sq. ft.

Wind Loads.

All structures are exposed to high-wind pressures occasionally, and there have been many disasters caused by structures having been blown down by the wind. All cases of this kind can be traced to inadequate provision in the design to resist these forces. It is not sufficient to compute the wind strains on the exposed surface of the finished building and depend upon the walls and partitions for bracing. The steel frame of a building is generally run up ahead of the walls and partitions. In several instances the framework of buildings has been wrecked during erection, or has been blown out of plumb and has had to be pulled back into place. Sometimes temporary wooden braces or temporary adjustable rods have been used to hold the framework in line during erection. In one case the framework was so flimsy and shaky that the erectors were afraid to work on it, and in order to make it safe during erection tied it together with wire ropes. Certainly this was not good practice. The steel frame of a building should be treated as an independent structure, the same as the towers of a viaduct, and should be able to resist the wind forces on all surfaces exposed during erection. This should be accomplished by substantial bracing, or by designing the columns and connections so that they may be able to resist the bending strains produced by wind-pressure. No temporary makeshifts should be allowed. This method has the advantage of imparting additional stiffness to the framework.

In proportioning the members of the structure for these temporary wind strains it is permissible to allow a higher unit strain than for permanent work, say 20,000 lbs. per sq. in., or about two-thirds of the elastic limit.

Unit Strains.

The permissible pressures allowed on foundations on different kinds of soil, on concrete, masonry, brickwork, &c., have been compiled from different sources

The permissible unit strains on steel are specified as 16,000 lbs. per sq. in., which is approximately one-half of the elastic limit; therefore giving a factor of safety of 2. This is in accordance with the best practice now in vogue for bridge work.

Foundations. — Permissible pressure on foundations, in tons per sq. ft.:—

Soft clay and wet sand	1
Ordinary clay and dry sand mixed with clay	2
Dry sand and dry clay	3
Hard clay and firm, coarse sand	4
Firm coarse sand and gravel	6

Masonry.—Permissible working pressure in masonry, in tons per sq. ft.:—

Common brick, lime mortar	7
Common brick, Rosendale cement mortar	8
Common brick, Portland cement mortar	10
Hard-burned brick, Portland cement mortar	12
Rubble masonry, lime mortar	5
Rubble masonry, Rosendale cement mortar	6
Rubble masonry, Portland cement mortar	8
Coursed rubble, Portland cement mortar	[illegible]

Concrete for walls:—

Rosendale cement, 1-2-5	8
Rosendale cement, 1-2-4	9
Portland cement, 1-2-5	[illegible]
Portland cement, 1-2-4	[illegible]

Pressure on Wall-plates.—Pressure of beams, girders, wall-plates, column bases, &c., on masonry not to exceed the following:—

	lbs. per sq. in.
On brickwork with cement mortar	150
On rubble masonry with cement mortar	150
On Portland cement concrete	250
On first-class masonry, sandstone	200 to 300
On first-class masonry, limestone	300 to 500
On first-class masonry, granite	400 to 800

Bearing Power of Piles.—Maximum load carried by any pile not to exceed 40,000 lbs. Piles driven in loose wet soil not to be strained to more than 350 lbs. per sq. in. of their average cross-section. The safe load on wooden piles to be determined by the following formula:—

$$P = \frac{2\ WH}{s \text{ plus } 1}$$

where P = safe load on pile, in tons;

H = distance of free fall of hammer, in feet;

s = penetration of the pile for the last blow, in inches.

Permissible Strains in Steel.—All parts of the structure to be proportioned so that the sum of the dead and live loads, together with the impact, if any, shall not cause the strains to exceed the following:—

	lbs. per sq. in.
Tension, nett section	16,000
Direct compression	16,000
Shear, on rivets and pins	12,000
Shear, on bolts	8,000
Shear, on plate-girder web (gross section)	10,000
Bearing pressure, on pins and rivets	24,000
Bearing pressure, on bolts	16,000
Fibre strain, on pins	24,000

For wind bracing, and the combined strains due to wind and the other loading, the permissible working strains may be increased 25 per cent., or to 20,000 lbs. for direct compression or tension.

Permissible Compression Strains.—For compression members, the permissible strains of 16,000 and 20,000 lbs. per sq. in. to be reduced by the following formula:—

$$p = 16{,}000 - 70\frac{l}{r}$$

$$p = 20{,}000 - 90\frac{l}{r}$$

where p = permissible working strain per sq. in. in compression;

l = length of piece, in inches, from centre to centre of connections;

r = least radius of gyration of the section, in inches.

Loads on Roofs.

Flat roofs of office buildings, hotels, apartment-houses, &c., which are likely to be loaded by crowds of people, need to be treated as floors, and the same live loads used as specified for hotels and dwelling-houses.

Ordinary roofs should be proportioned to carry the following loads per sq. ft. of exposed surface, applied vertically, to provide for dead and live loads combined :—

Gravel or composition roofing :—	
On boards, flat pitch, 3ins. to 12ins. or less	45 lbs.
On boards, steep pitch, more than 3ins. to 12ins.	40 lbs.
On 3in. flat tile or cinder concrete	55 lbs.
Corrugated sheeting, on boards or purlins	50 lbs.
Slate :—	
On boards or purlins	50 lbs.
On 3in. flat tile or cinder concrete	65 lbs.
Tin on steel purlins	55 lbs.

[For roofs in climates where no snow is likely to occur, the foregoing total loads may be reduced by 10 lbs. per sq. ft.]

Large roofs, such as train-sheds, armouries, public halls, &c., should be proportioned to carry, in addition to their own weight—

A live load, representing snow, per horizontal sq. ft. of roof of—

15 lbs. for all slopes not exceeding 35 degs.

10 lbs. for all slopes between 35 degs. and 45 degs.

The possibility of a partial snow loading has to be considered. The snow load can be neglected in certain climates, also in roofs having slopes exceeding 45 degs., if there are no snow-guards or other obstructions.

The timber parts of the structure to be proportioned in accordance with the following :—

UNIT STRAINS, IN LBS. PER SQ. IN.

Kind of timber.	Transverse loading.	End bearing.	Columns under 12 diameters.	Bearing across fibre.	Shear along fibre.
White oak	1,300	1,300	1,000	500	500
Long-leaf pine	1,500	1,500	1,000	350	100
White pine and spruce	1,000	1,000	700	200	100
Hemlock	800	800	650	200	100

Columns, the length of which exceeds twelve times their least diameter, to be proportioned by the following formula :—

$$p = \frac{C}{1 + \frac{l^2}{1{,}000d^2}}$$

where C = unit strains, as given in above table, for short columns ;
c = length of column, in inches ;
d = least side of column, in inches.

(*To be concluded.*)

Obituary.

Mr. Edward M'Geoch, retired builder and contractor, of Seacombe, Liverpool, died recently.

Mr. Thomas Cosham, builder, of Newark, inventor of the Cosham precipitating tank system of sewage-disposal, died recently.

Mr. J. B. Arding, A.R.I.B.A., senior member in the firm of Arding, Bond & Buzzard, architects and surveyors, London, W.C., died on March 10th, aged 76.

Mr. Charles Pertwee, A.R.I.B.A., formerly surveyor to the Chelmsford Corporation, died on March 19th, aged 73. He was architect of many churches, chapels, hospitals and schools.

Mr. F. S. Waller, architect, of Gloucester, died last Wednesday evening, aged 82. For many years he had charge of Gloucester Cathedral, and was associated with the late Sir Gilbert Scott and Mr. J. L. Pearson on the restorations carried out from time to time. He was also largely associated with church restoration in the diocese and elsewhere.

Mr. Ellis H. Pritchett, F.R.I.B.A., F.S.I., died recently, aged 47. He was chief officer of the Swindon Fire Brigade, member of Council of the National Fire-Brigades' Union, and a member of the Executive of the British Fire Prevention Committee. He was a member of the Committee's special fire commission which visited the principal cities of Central Europe last year, and was the holder of the Royal Humane Society's medal for saving four lives.

Law Cases.

Ownership of Drawings : Important Appeal.—The case of *Gibson* v. *Pease* came before the Court of Appeal on Friday last. This was an appeal from the judgment of Mr. Justice Ridley on the trial of an action without a jury. The action was brought by a building owner to recover possession of certain plans and specifications from an architect. The facts were as follows :—In September, 1902, the plaintiff engaged the defendant as architect and surveyor to carry out the conversion of the upper parts of some houses in Queen's Road, Bayswater, into residential flats—at the usual 5 per cent. commission. The defendant prepared plans and specifications and superintended the work of conversion, which was completed in June, 1903. The plaintiff paid defendant his fees and claimed to have the plans and specifications handed over to him. The defendant, on the other hand, claimed to be entitled to retain them. Thereupon this action was brought; and at the trial evidence was tendered on the part of the defendant of a custom in the profession by which, in circumstances like those of the present case, the plans and specifications were the property of the architect. Mr. Justice Ridley refused to admit the evidence, being of opinion that the case was governed by the authority of *Ebdy* v. *McGowan* (2 Hudson on Building Contracts, 7). The learned judge gave judgment for the plaintiff, but granted a stay of execution pending an appeal. The defendant appealed. The Court dismissed the appeal.—Counsel for the defendant said the case raised a point of law on which the Royal Institute of British Architects desired to have the judgment of the Court. The contract made by an architect was not to sell a plan but a contract for work and labour. Generally, an architect undertook to prepare plans and to see that they were properly and skilfully executed for his employer. No doubt the building owner was entitled to the benefit of the use of the plans, but the pieces of paper on which they were drawn did not belong to him. There was no reason why the architect should not be entitled to make use of the plans in his future work for other clients. When the work was carried out the property in the plans remained in the architect. In France and Germany the law was that the architect kept the plans but was bound to supply the client with copies. They were not now concerned to consider whether there was any such obligation on an architect in this country; the only question was as to the property in the plans. They contended that the defendant was entitled to retain these plans.

The Master of the Rolls

said that, in his opinion, this case was clearly covered by the principle of the case of *Ebdy* v. *McGowan*. The principle on which counsel for the defendant relied in support of the alleged right of an architect to retain plans was that the architect's contract was not a contract for the sale of a chattel but for work and labour, and that the contract was performed when he had superintended the building of the house. Was that principle involved in *Ebdy* v. *McGowan*? There the plaintiff was an architect who had been employed by the defendant to prepare plans and get tenders for a vicarage. The payment was to be 5 per cent. on money expended if the vicarage was completed ; if tenders were obtained and work not commenced, 3 per cent. on the estimated cost ; if no invitations for tenders issued, 2½ per cent. The plans were prepared, but the defendant changed his mind and declined to proceed, and wrote to the plaintiff offering to pay, and asking for the plans. The architect declined to give up the plans, but sued for payment, and set up a custom among architects to retain their plans if the work was not proceeded with. It was held by the Court of Exchequer that such custom, even if proved, would be unreasonable, and that the defendant need not pay for the plans unless he got them. In his opinion the principle relied on by counsel for the defendant was just as much involved in that case as in this. If the custom had been justified in that case, it must have been justified on the same contention as that on which it was sought to justify it here. If the custom was bad in one case it must be equally bad in the other. The decision seemed to him to be good law, and he thought they ought to follow it. In his opinion, therefore, Mr. Justice Ridley was right and the appeal must be dismissed.—The Lords Justices delivered judgment to the same effect.

THE NEW ADMIRALTY BUILDINGS.

THE second visit of the Northern Polytechnic Building Students' Association took place on Saturday last at block III. of the new Admiralty buildings, St. James's Park, by kind permission of the architects, Messrs. Leeming & Leeming, FF.R.I.B.A. A splendid set of drawings was shown by Mr. Spencer Green, the clerk of works, great interest being evinced in the drawings of the underpinning to the old Admiralty building. The ground floor of the new building consists of the entrance hall running from front to back, on either side of which are offices. From this floor two main staircases communicate with the upper floors. Above the ground floor the building has a large open area in the centre, lined with glazed bricks, which lights the offices and corridors, besides supplying light to the entrance hall and rooms on the ground floor by means of double top-lights. Ventilation is provided for by means of inlets in the external walls at about 7ft. above the floors, and extracts in the ceilings connected to the main trunk to be carried up in the towers. The heating system is not at present commenced. Provision is made for all wires, &c., to run in channels in the floors, and for all plumbing work to be carried in chases in the walls. The whole of the building to St. James's Park is faced with Portland stone, the back elevation being faced with red rubbers with stone dressings. Fire-resisting construction is adopted throughout, Fawcett's patent tiles being used in the floors and all partitions and roofs being composed of coke-breeze concrete. Great care had to be taken in connecting the new building with the old, as the old walls were for the most part outside casings of brickwork filled in with brick-rubbish. The work of underpinning the old structure was doubtless one of the largest works of its kind ever undertaken in London, it being no less than taking the whole of the footings of the old building down in solid concrete to the London clay at a depth of 50ft. below the level of Whitehall. This was occasioned by the nature of the subsoil not being able to support the extra weight of a new tower. The subsoil in Westminster is saturated with water, which finds its way down from North London, the water normally standing at a height of 24ft. above the London clay level. The whole of the new building stands in a concrete basin resting on the London clay. The contractors for the addition are Messrs. Holloway Brothers.

Mr. Douglas Wiles, in the borough engineer's office at Norwich, has been appointed architect and surveyor to the Denbighshire County Council at a salary of £650 and expenses.

Mr. Benjamin J. Greenwood has been elected president of the Institute of Builders for the current year, and Messrs. Woodman Hill and James Carmichael vice-presidents.

THE ARCHITECTURAL ASSOCIATION.

Mr. Needham Wilson on Sketch Plans and Working Drawings.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

The following additional donations to the New Premises Fund were announced :—

	£	s.	d.
Carpenters' Company	26	5	0
F. & H. Higgs	25	0	0
Charles Smith & Co.	10	10	0
Bath Stone Firms	5	5	0
R. C. Murray	5	5	0
Nottingham Architectural Society	5	5	0
G. P. Bankart	4	4	0
Holliday & Greenwood	3	3	0
G. Lucas	2	12	6
T. J. Wetherall	2	12	6
J. B. Chubb	1	1	0
Ewart & Son	1	1	0
W. H. Hewish	1	1	0
E. E. Lofting	1	1	0
H. P. G. Maule	1	1	0
Maurice E. Webb	1	1	0
T. H. Russell	1	1	0
C. E. Varndell	1	1	0

Votes of condolence were passed with the relatives of Mr. C. B. Arding and Mr. H. D. Aubrey. Mr. Arding was the oldest member of the Association, having first joined in 1848.

Mr. A. Needham Wilson, A.R.I.B.A., then read a paper on "Sketch Plans and Working Drawings." These, he said, furnished one of the compensations of architectural practice. Yet they had their drawbacks, for when those first enthusiastic conceptions, so brilliantly drawn, came back mutilated beyond recognition, and the architect was bidden to carry out the building from the poor remains, then indeed he felt this was a hollow world. It was astonishing, however, how great a sense of gratification might be derived from a good drawing. The dullest routine work became interesting, and even a detail of a riveted girder could be made attractive in skilful hands. That was how he looked at it. How the client looked at it was another matter; but how the builder looked at it was soon found out if enthusiasm had led one astray from the path of working-drawing veracity.

The Consideration of the Means by which an architect translated his ideas and conceptions into hard matter-of-fact bricks and mortar must always be of interest to architects, if not to anyone else.

How many outside the profession had the smallest conception of the process which had to be gone through to enable the architect to erect his building? Even those who were best informed had no idea that an architect did anything more than spend a pleasant hour or two occasionally in toying with a pencil and colours and producing pretty sketch plans which, when approved, were handed over to the clever builder, who turned the thing into a structural success. The ring of the trowel, the hammer's thud, the crisp sound of sawing, were realities —something tangible—whereas the means by which the architect achieved his end were a silent unseen force, and therefore unknown. It never struck the client that **the Slight Sketch Plans,** with everything so perfectly arranged, were the result of much anxious thought and expenditure of midnight oil. He never dreamt that the ingenious arrangements which fitted together so well were integral parts of a harmonious whole, and he would probably indulge in some cheeseparing economies which upset the balance of the architect's scheme. It was nothing to him that the features he wiped out so light-heartedly had cost hours of patient labour and thought, and that the architect must again draw together his scheme and endeavour to cast over the mutilated remains the glamour of his individuality. And if this were so of the sketch plans, which the client necessarily must see, what of the working drawings, which he only saw when signing the contract? Yet the architect plodded on, taking delight in his obscure sketch plans, and he sent his dashing sketch to the client, not wholly actuated by sordid motives, but anxious to express his ideal in as favourable a manner as he could for the very love of it. Nevertheless, these sketches and sketch plans had a great deal to answer for; they had, in fact, been known to induce a client to spend more money than he originally intended; and unless this were artfully worked it led to trouble, for the client said to his friends, "Most expensive man, that architect fellow; made me spend far more than I wanted." Still, it was surprising how a client might be led on by a judicious succession of sketch plans.

Ownership of Drawings.

On the other hand, they might lead him to expect something that he did not get. Then he was dissatisfied and felt defrauded. Also, sketch plans occasionally led to costly estimates and the abandonment of the work. Then the would-be client declined to pay for them, and the architect had to decide between a lawsuit and endeavouring to live on what pleasure he could extract from making beautiful drawings. This, said Mr. Needham Wilson, was what he was told; but he did not believe it. Indeed, he saw sometimes from the papers that clients liked the plans so much that they insisted on keeping them. Some, indeed, claimed a legal right to do so. Why, when they bought a picture, did they not claim the painter's colours and brushes? "As the opposite to the man with a passion for architects' plans, commend me to the man who does without plans, and who employs a builder to erect a *pot-pourri* of details sneaked from other buildings, and who pats himself on the back in appreciation of his cleverness in saving architects' fees."

Advance in Water-colour Work.

The great advance that had been made in water-colour work was not the least striking sign of development in the profession. The lecturer said he could well remember the time when the power to turn out a water-sketch of real merit was in the hands of a few men of conspicuous ability.

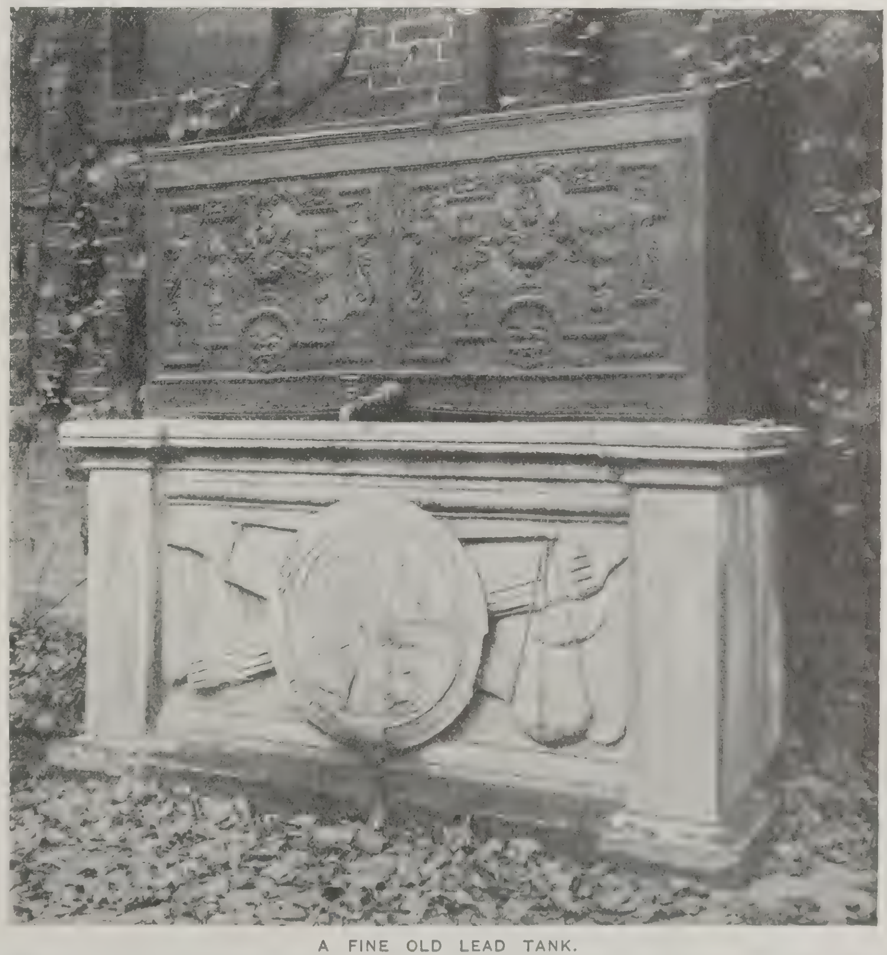
To-day almost every man could handle a brush, and more often than not in a most creditable way. To this desirable end the Association had contributed much. It used to be a complaint that the drawings on the walls at the Royal Academy were the work of specialists employed to give fictitious merit to the designs. The fictitious merit might still be there, but at least it was now most usually the work of the designers themselves. Personally he did not think working drawings and details should cover the walls at the Royal Academy. He thought the buildings should be represented there as they would appear when executed.

Unnatural Points of View.

It was natural that the average client should wish to see how his building would look when completed, and from an actual point of view and in its actual surroundings. He should not be expected to transform himself into a bird for the time being, or to view the building from the upper floor of an adjoining building. How many architects took the trouble to sketch the actual setting for their building—so essential to the ultimate effect?

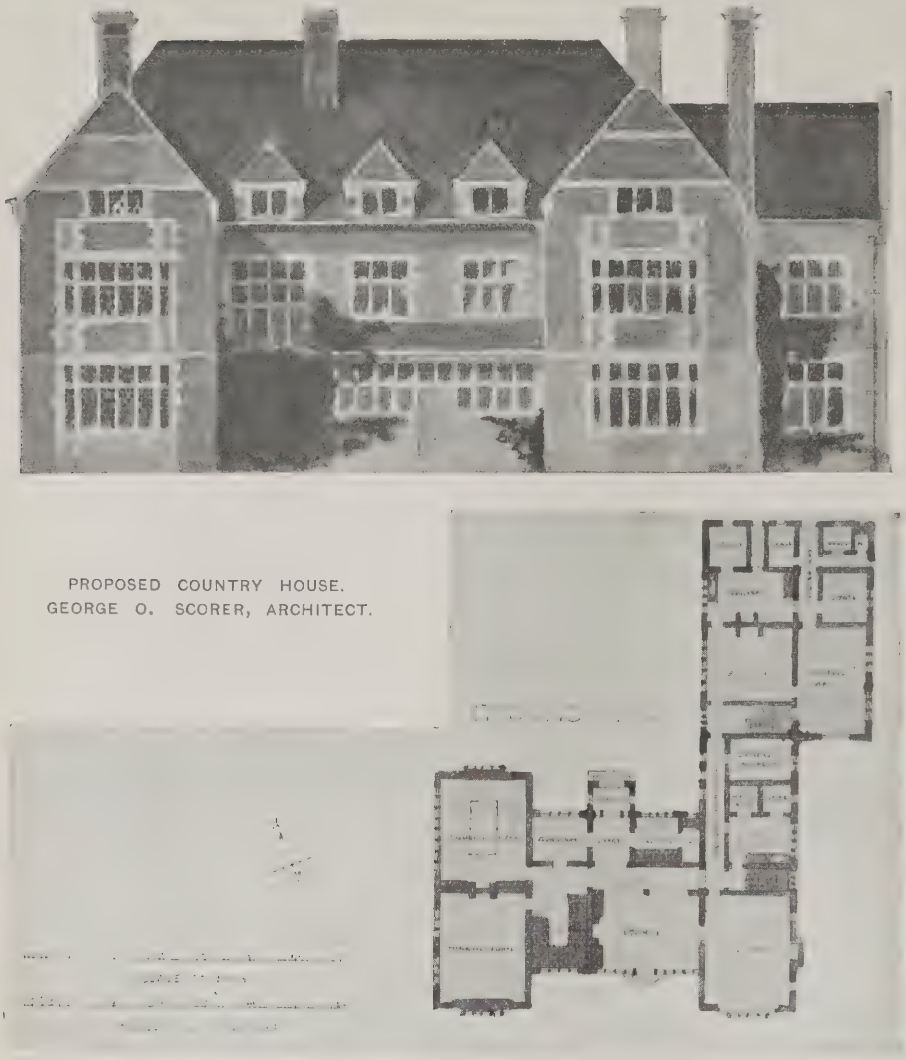
Details.

It would scarcely be denied that the art of the draughtsman had made enormous progress during the last twenty years or so. But this progress had somewhat outstripped the advance in our architecture, and in examining the work of students of late he found a decided tendency to slur over the study of details. Careful consideration of parts was sacrificed to effect in the drawing, and the



A FINE OLD LEAD TANK.

This fine old tank, dated 1745, is situated in a garden at the back of one of the houses in Great Ormond Street, W.C., next to the Hospital for Sick Children. The house was once occupied by Lord Chancellor Thurlow (1732-1806)—hence the emblematical representations on the stone pedestal of the tank.



PROPOSED COUNTRY HOUSE.
GEORGE O. SCORER, ARCHITECT.

architecture was subordinate to a prettily-coloured sketch.

Crude Working Drawings.

But what should be said when these methods were applied to working drawings; when the traditional manner of distinguishing materials gave place to artistic colouring, and thick ink lines left a considerable margin for conjecture on the part of the quantity surveyor or builder!

Only recently he heard of an instance where the skilful artist who prepared certain drawings contrived to tint some stonework to that the unlucky surveyor confidently took it as timber. Anyone who had seen a disconsolate foreman trying to scale with a 2ft. rule from a ⅛in. plan drawn by a modern draughtsman would readily understand that the architect must not be too particular to 3ins. or so.

The Moral.

The moral was that the methods which were legitimate in sketch plans required modification in working drawings—no difficult matter in these days of sun prints. Probably the process by which careful and accurate working tracings were made from the sketch plans commended itself to many, and better preserved the spirit of the original conception than a translation into a series of carefully-worked-out pencil drawings prior to such tracing. He thought it would be generally agreed that a surprising loss of original freshness and spice might occur when the first conception was filtered through a number of re-drawings.

Every Man His Own Method.

In such a paper as this any attempt to lay down rules for others would savour of impertinence. Indeed, criticism would be out of place. Each man must necessarily use the means which he found best suited to his purpose, and the mere observer could only comment; for between the man who supplied his builder with the slightest material in the shape of working drawings and the man who furnished him with elaborate and fully figured and written-up drawings lay such a wide field of experience and custom working towards the same end that any attempt to harmonize them would be futile. The one man expected his builder to enter into his mind and identify himself with the thoughts of which the drawings were only the expression—maybe an inadequate expression. Neither the builder nor the builder's men had been trained to this, and the question of success might largely depend upon how the architect could imbue them with his individuality, how fire them with his enthusiasm, how stamp his work with that indefinable something which could not be expressed on paper. The other man, practical to his fingers' ends, found himself in conflict with a building financier and workmen trained in technical schools, and in an honest attempt to combine art and practice succeeded in imparting a certain hardness to his work which he found displeasing and which he could not understand.

Training of Workmen.

There could not be two opinions as to which of the two methods was preferable, but, unhappily, until we trained our workmen differently and something of our old craftsmanship methods could be recovered we were labouring under great disadvantages. It seemed to the lecturer that two forces were operating—an artistic force and a technical force—and on conflicting lines. Nor were we doing much to harmonize these forces. He thought that, as a body, we should have a far larger say in the training of our workmen and should turn the effort for technical instruction in the right direction. New constructional methods born of the technical schools were creeping into use mainly where the architect ignored such points in his artistic working drawings; and, personally, though desiring to be progressive, Mr. Needham Wilson said he had grave doubts whether these new methods were improvements on the old, and he was sure the actual workmanship was inferior. Did not many draughtsmen seem to fear that they would lose the beauty and interest of the design if the working drawings were elaborated? In detailing, no time was begrudged to the strictly architectural part, but too often the constructional niceties were left to the imagination. It was a hardship, perhaps, to imply that the little tricky methods and mannerisms which lent spice to a drawing should be abandoned; but were not many of them meretricious and meaningless, and confusing to the builder?

Old-New Buildings.

It was a sore temptation to give to one's working drawings the little deft touches which suggested that the hand of Time had already dealt kindly with the building as yet on paper only. The "cocked-up" apex of a gable, caused by the sagging of weak timbers, certainly added piquancy to an old building, and on a drawing one was tempted to exaggerate the tilt of a double cube verge to soften the stiffness of straight lines, but the deliberate imitation of such effects by false construction was bad in principle.

An Example.

He knew of an unfinished house where the architect had not only suggested that his ridges had dropped a foot below the gables, but had by artificial means given a wavy line to the main ridge and a sagged appearance generally to portions of the roof. He might have built his walls out-of-plumb while he was about it, laid his floors out of level, and thrown in a few settlements. What was the effect? That of an interesting piece of architecture, with all the glamour of age to soften its angularities? Not at all. It suggested an ordinary bit of modern work with an extremely ill-constructed roof. He only trusted it might be condemned as a dangerous structure by the local surveyor. Such methods were a dragging of architecture in the mire, and totally unworthy of the high ideals we ought to sustain. But were they not the logical outcome of the new draughtsmanship pushed to extremes?

He did not in any sense advocate a return to the old methods. He did not desire for a moment to return to the days of "hair" lines and stock colours of distressing rawness to indicate materials. He only advocated the keeping of the great development in draughtsmanship within legitimate limits without the aid of false and tricky methods.

The French and the Americans.

The French beat us handsomely with their official work and, despite their academic training, without slavish adherence to Classic prototypes. But we had not much to learn from them in the matter of draughtsmanship, unless it were the scrupulous care with which their drawings were prepared. We might certainly gain something by an examination of their studies for carving.

In America they were considerably ahead of us in draughtsmanship, despite French training, and they had struck out on vigorous lines characteristic of the nation.

There would be an immense field before the man who could invent a method

For Registering Our Thoughts

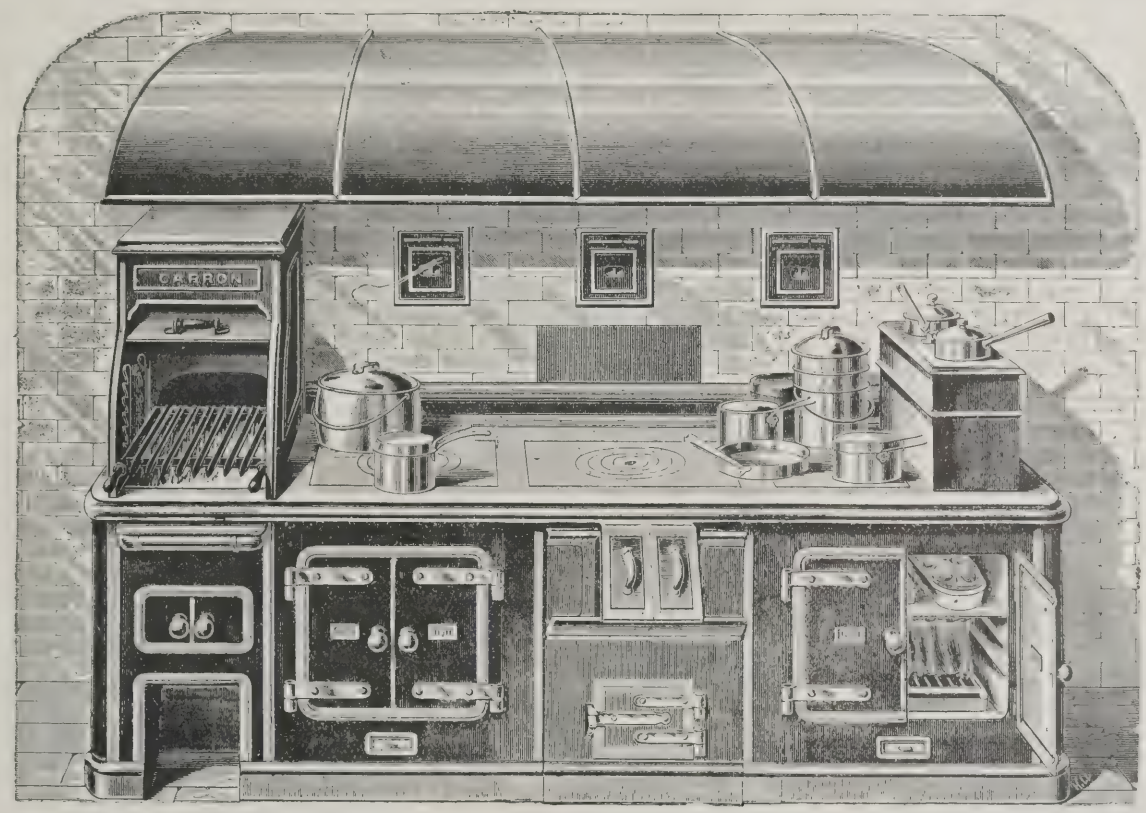
as the camera registered the desired view. It would save much distasteful routine work. We did not know what the science of the future might have in store for us, but it was to be hoped no savant would devise means for thinking a building into existence, for then we should lose much that delighted and compensated in our sketch plans and working drawings.—A discussion followed.

CARRON

COOKING APPARATUS

FOR

Clubs, Hotels, Restaurants, Institutions, etc.



THE RESTAURATEUR RANGE

With Double Ovens and Coke Grill. Can be supplied with canopy as shown and with Prissun Boiler if desired. Well fitted and finished throughout. Sizes 9′ wide × 2′ 7″ high × 2′ 6″ deep. Other sizes to order.

ASK FOR DRAWINGS AND ESTIMATES.

The specification of the works can be seen at the Hotel.

March 22nd, 1905.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

(Continued on p. xx.)

HALL'S Sanitary Washable DISTEMPER

Made in 70 Colours

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

Sample and Shadecard on application to Sissons Brothers & Co., Ltd., Hull. London Office—199B Boro' High Street, S.E.

CAUTION—See the name Hall's Distemper on all tins; refuse imitations, which are inferior.

BUILDERS' JOURNAL SUPPLY DEPARTMENT,

Builders' Journal Office,

GREAT NEW STREET, FETTER LANE, E.C.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

April 5, 1905. Vol. 21, No. 530.

6, Great New Street, Fetter Lane, E.C.

Summary.

The new Waldorf Theatre on Aldwych will seat 1,300 persons. It is a three-tier house. The curved girder of the second circle is built up of sixteen plates and weighs 21 tons. (Page 172.)

The largest reinforced concrete arch bridge is the Gruenwald Bridge over the Isar, near Munich. It has two main spans of 230ft. each, with a rise of 42ft., and five girder spans of 28ft. each. It has been designed for a live load of 82 lbs. per sq. ft. and a 22-ton steam roller. (Page 181.)

About 150 manufacturers of galvanized roofing sheets met last week in London and discussed proposals for combination to prevent over-production and to regulate the market: and as the outcome a combine has been effected and prices have been raised. The industry has been far from satisfactory for a long time past. (Page 181.)

In the huge water-supply undertaking for Coolgardie, Western Australia, a locking-bar pipe is used which is cheaper than welded pipe and (strength for strength) than riveted pipe. It has a protective coating of asphalt and coal-tar. (Page 173.)

The maximum weight of crowds is given as 150 lbs. to 160 lbs. per sq. ft. Experiments with students showed that 156 lbs. per sq. ft. was attainable without any attempt at selecting the men or crowding them to any degree of personal discomfort; and though 150 lbs. per sq. ft. can be reached only rarely, 80 lbs. or 100 lbs. per sq. ft. must be realized far more often than is commonly supposed. (Page 178.)

At the meeting of the R.I.B.A. on Monday evening Prof. Beresford Pite and Mr. J. W. Simpson read papers on the planning of cities and public places. There is no reason, either practical or artistic, why our streets should have monotonous parallel sides. A varying line is picturesque and advantageous to the buildings, and affords exactly those spaces for the cab-stands, telephone and fire-escape kiosks, and other constantly increasing requirements which are difficult to provide for and cause obstructions in uniformly regular streets. (Page 180.)

Particulars of building stones are wanted by the Architectural Association. (Page 182.)

St. Mark's, Venice, is in a graver condition than was supposed. The weakest points are the "Paradise" and "Apocalypse" vaults. (Page 182.)

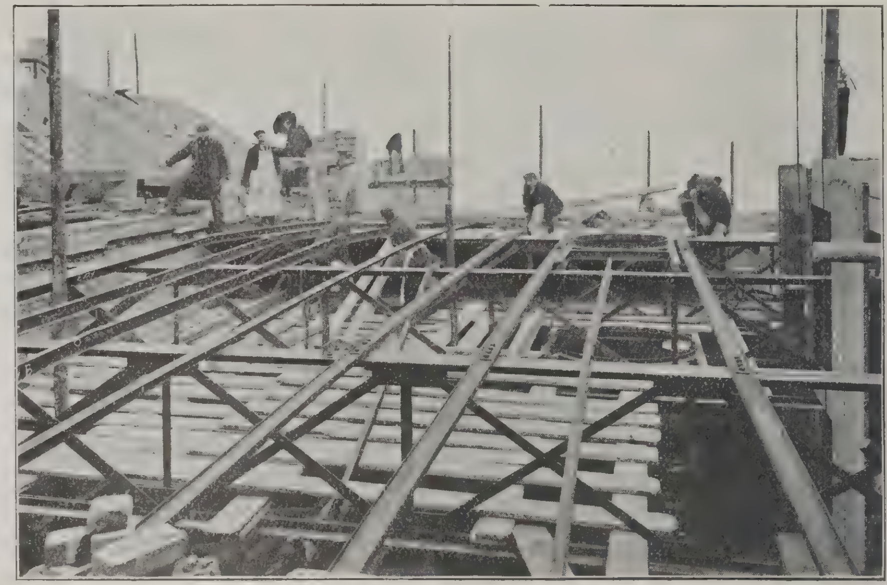
Floors for Hospitals. With the exception of operating theatres, which are almost invariably floored with terrazzo, it is generally the rule to use teak or other hardwood blocks for the wards of hospitals. Opinions differ on the matter, however, and it is recognized that wood is not faultless: hence the introduction in recent years of various kinds of composition flooring applicable to any surface. In this particular connection we may draw attention to a communication addressed to the Commercial Intelligence Branch of the Board of Trade by the British Vice-Consul at Belgrade (the Hon. W. G. Thesiger, D.S.O.) in regard to the flooring for the wards and passages at the new military hospitals now being erected at Belgrade. Wood is held to be undesirable, as not being sufficiently easily cleaned, and linoleum is considered not lasting enough. Some sort of flooring is required which shall have the properties of being antiseptic, easily cleaned and very durable. The matter is of special interest to manufacturers who have any patent flooring which fulfils these conditions. Communications should be addressed to the British Vice-Consul, Belgrade.

Yet Another Building Act Bill. The practically unanimous opposition to the Building Acts Amendment Bill forced the London County Council to drop the general clauses, about which there was most contention, and to proceed this session with the clauses relating to means of escape from fire only. It is now proposed to try again next year, the Building Act Committee recommending: "That with a view to the introduction in the session of 1906 of a Bill to amend the London Building Acts, copies of the document prepared by the Parliamentary Committee showing the effect of the London Building Acts (Amendment) Bill, 1905, on the existing Acts be sent to the Corporation of the City of London, the councils of the metropolitan boroughs, and the various professional and other bodies concerned, with an intimation that the Council would be glad to be acquainted before June 10th, 1905, with any observations which they may make on the suggested amendments to the London Building Acts, and that a copy of a memorandum on the subject to be prepared by the chairman of the Building Act Committee be sent to each member of the various bodies referred to." This seems to suggest that the London County Council intend to adopt not quite such an independent attitude as hitherto, and that they desire to minimize opposition by compromise. It is important that the present Acts should be revised, and we consider the Council will be well advised not to wait longer than next year. We hope no half measures will be attempted, but that the old Acts will be repealed and a comprehensive new Act brought in, because the present Acts and amendments are quite confusing enough to professional men; a building ordinance should be business-like in form. Hitherto the suggestions of professional bodies have been treated with scant courtesy. After receiving suggestions the Building Act Committee should send their altered clauses for further suggestions, and not try and rush through a Bill in defiance of all interested bodies.

Ca' canny in the Country. On Saturday last at the Guildhall there was a conference on housing and small holdings in Surrey, Hampshire and West Sussex, and Sir William Chance then took occasion to ascribe the reason for the dearth of cottages to the working man not doing so much work as he formerly did. He said there was a kind of idea among the working classes that the longer they took to carry out their work the more work there would be for others to do, though he believed the quicker they did their work and built the cottages the more work there would be to do; and he added that a number of people would be glad to have cottages built if it were not for the fact that the work was done so slowly. This is not the first occasion on which the same argument has been advanced. We hold no brief for the working man, but this is not the primary cause of the rise in cost, which is traceable to the by-laws and increased wages. "Ca' canny" as an accepted principle does not exist in country districts, but the natural instinct of self-interest does, and always has. By this we mean that with precarious employment, such as must inevitably exist in the building trades, when a man is in a job he lasts it out as long as he possibly can, because he does not know how long he may be out of another. In the building of cottages in the country we have always urged the adoption of the piecework system. As soon as time-work is introduced open competition goes. Piecework is not against the interests of the working man. It only ensures fair conditions and that the better-trained and more sober man gets the better wage.

THE WALDORF THEATRE.

WE publish this week several photographs of the new Waldorf Theatre which is now rapidly approaching completion on Aldwych—the crescent of the Holborn to Strand street. Mr. W. G. R. Sprague is the architect. The photographs, specially taken by us, show the building in various stages of construction and illustrate the erection of the more usual type of theatre. It is a three-tier house, the front of each tier receding from the one below, thus securing good sight lines and a better-looking front to the house. The frontage to Aldwych is 70ft. and to Catherine Street 160ft. The stage is of a good size; it has a width of 70ft. and a depth of 40ft. The theatre will seat 1,300 persons, and there is also standing room for another 500 or 600. The main entrance is at the Aldwych corner and leads from a spacious vestibule into a crush-room. The decoration of the interior is now being rapidly completed, the ceiling paintings and gilding, &c., of the mouldings and proscenium arch and gallery front being practically finished; the exterior, too, is almost completed.



CONSTRUCTING ROOF OVER AUDITORIUM. *(January 30th, 1905.)*

The two photographs taken on November 3rd last year show the state of the job at an early stage, when it was only up to the first-tier level. In the large view on p. 174 the two legs of the tower gantry will be noticed and also the steelwork of the first tier. There is nothing very special about this: it is the usual straight girder with the curved front formed by cantilevers projecting beyond. The stays for the fronts will be seen fixed in the left-hand corner. The opening on the right is for an exit staircase. The other view taken on November 3rd is from the auditorium looking towards the stage and shows one side of the proscenium and a stage-box opening. The heavy timbering belongs to the platform used for taking the steelwork, which was brought in from the stage end, and served to allow of its easy moving into position.

The view on page 175, taken from the back of the stage, shows this timber platform and the use to which it was put, the large plate girder of the second tier (referred to below) being visible in the foreground in process of being moved. This photograph also shows the lattice girder supporting the flies, the floors of which have been constructed in concrete so as to resist fire.

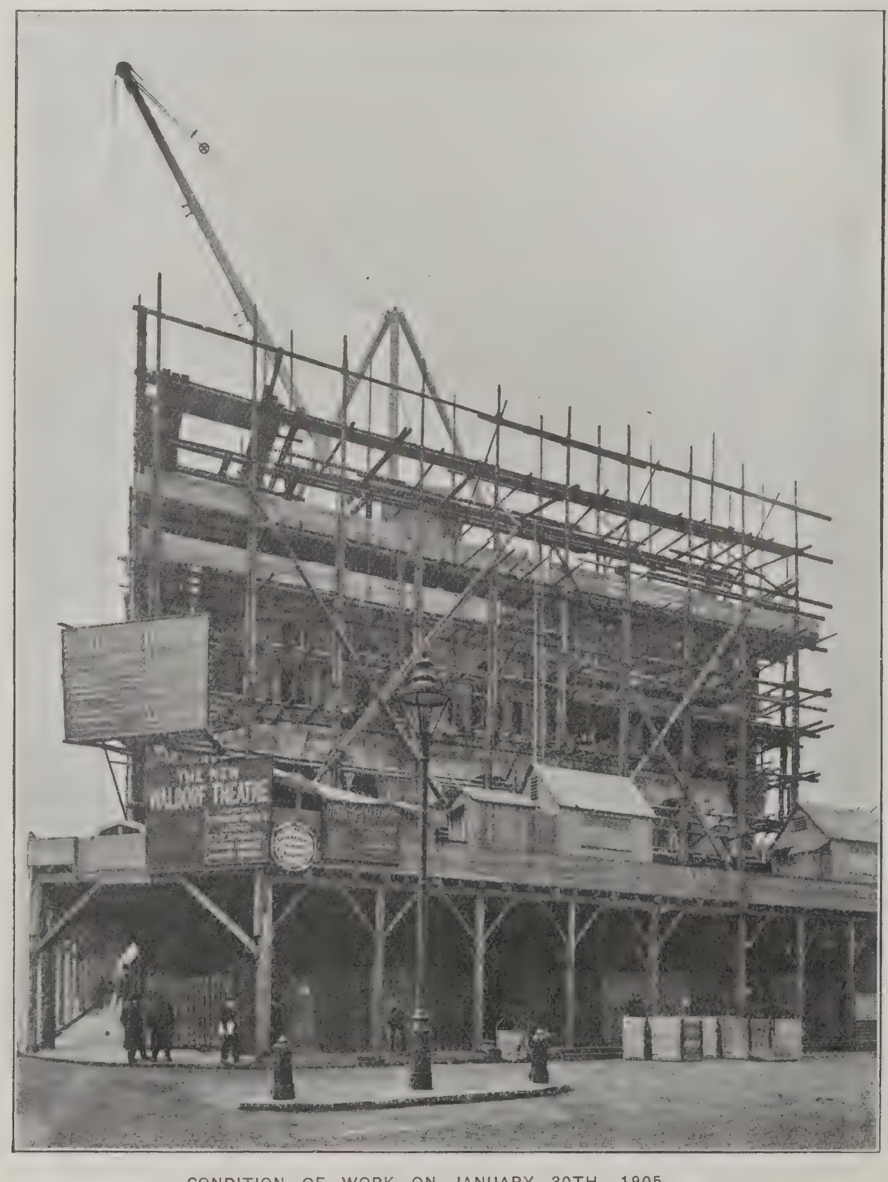
The views taken on January 30th last show that considerable progress had been made by that date. The crane seen in the general view is the one which broke recently, with such alarming (though happily not fatal) results. The view of the roof over the auditorium shows the proscenium wall on the left and the skylight over the stage. The third view (on p. 174) shows the underside of the second or grand-circle tier and clearly illustrates the cantilever construction. The curved girder is a very heavy one. It weighs 21 tons and has sixteen plates; its shallow depth will be noted; it is only 16ins. deep in the centre and tapers to 2ins. at the ends.

The steel construction was designed, supplied and fixed complete by Messrs. Smith, Walker & Co., of 37, Old Queen Street, Westminster, who make a special feature of prompt delivery, the steelwork for this theatre having been completed two days before the expiration of contract time, and this in spite of the fact that the dates for completion were brought forward from the original contract time. No columns or stanchions whatever are in the way of the sight lines. The ceilings, too, preserve an unbroken sweep, no girders or raking joists projecting beyond the ceiling line and making obstructions to the clear view of the stage.

The general view taken on March 8th shows the front nearly finished. The crane which broke was not re-erected and therefore is not to be seen in this view. The other photograph on this date (see p. 176) was taken from the back of the stage and shows the scaffolding in the auditorium and two of the tiers. The light spots here and there are caused by the electric lamps used to illuminate the work.

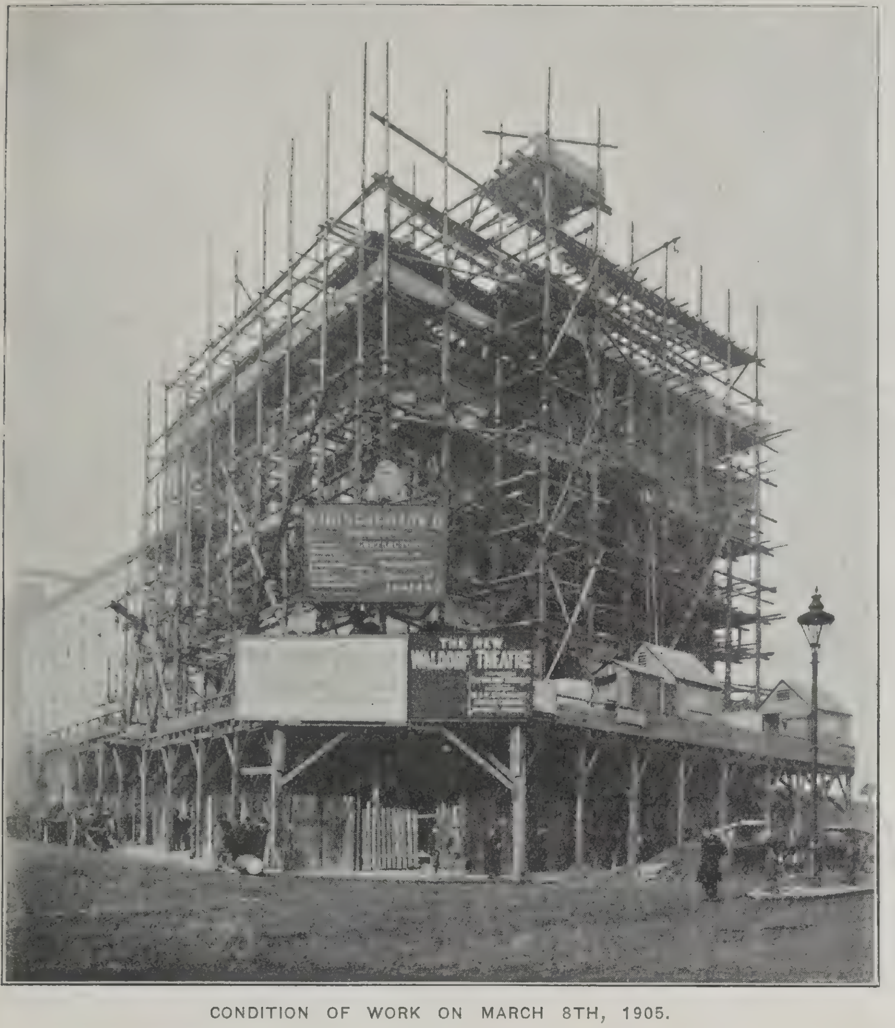
The general view on March 29th brings our record up-to-date.

In a second article we shall deal with the building further, showing it complete.

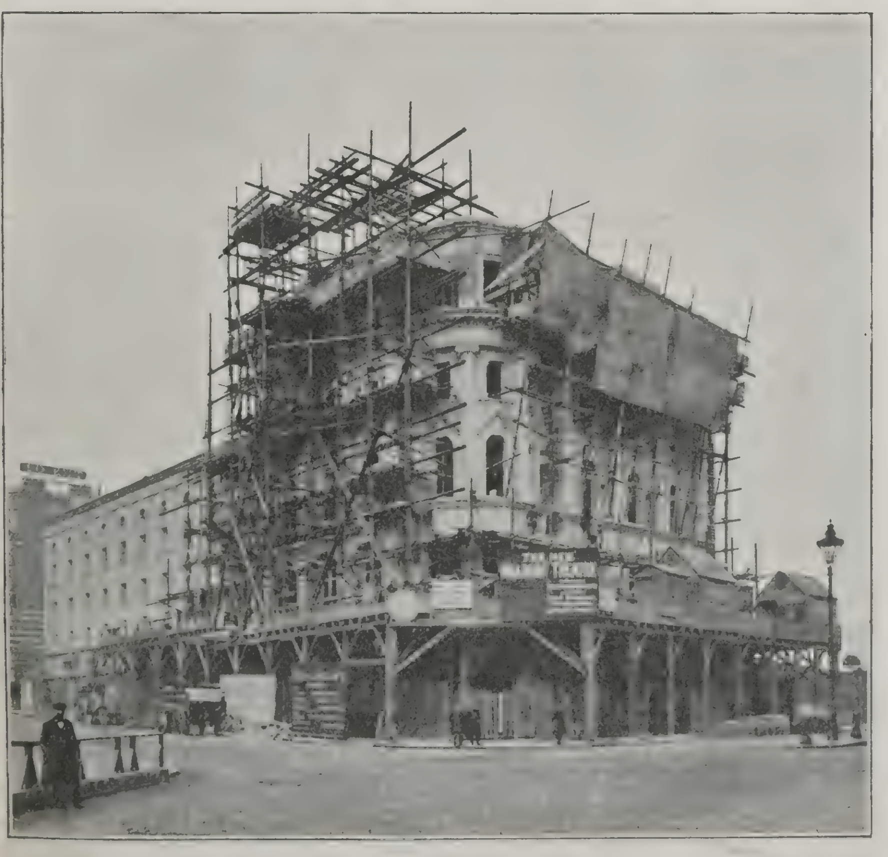


CONDITION OF WORK ON JANUARY 30TH 1905.

A Spire to St. Stephen's, East Twickenham, is to be erected in memory of the late vicar, Prebendary Johnston.



CONDITION OF WORK ON MARCH 8TH, 1905.



.CONDITION OF WORK ON MARCH 29TH 1905.

A NOTABLE WATER-SUPPLY UNDERTAKING.

AT last week's meeting of the Institution of Civil Engineers a paper on the Coolgardie water-supply was read by Mr. C. S. R. Palmer, M.I.C.E. Coolgardie is situated in the interior of Western Australia, where the country is exceedingly arid, fresh water being unobtainable naturally. Large expenditure was first incurred on small local water-supply works, but without commensurate results, and the Government decided on a comprehensive scheme of construction. After enquiry into alternatives, it was recommended that the work should consist of a storage-reservoir in the Darling ranges (capacity 4,600 million gallons, enough for two years' supply and loss), a 30in. pipe to carry thence five million gallons daily, a series of pumping-stations along the pipeline, and service reservoirs at various centres; the estimated cost of these works being £2,500,000. Parliament having approved the project and provided funds, an English commission of engineers was appointed to report on the proposals and advise on the design of the pipes, &c. Work was started soon after receipt of their report, and five years later, in January, 1903, the works were formally opened.

The English commissioners recommended that three-fourths of the pipes should be riveted and one-fourth welded, that expansion-joints should be used, and the pipes be laid above ground. Tenders were invited accordingly, but permitting of alternative offers, and in the result a new form of pipe—the locking-bar pipe—was accepted, being cheaper than welded pipe and, strength for strength, than riveted pipe. The saving on the estimate enabled thicker pipes to be used, and, the danger of undetected leakage from riveted pipes being removed, the main was laid below ground with ordinary lead joints. The protective coating consisted of 1 part of asphalt and 1 part of coal-tar.

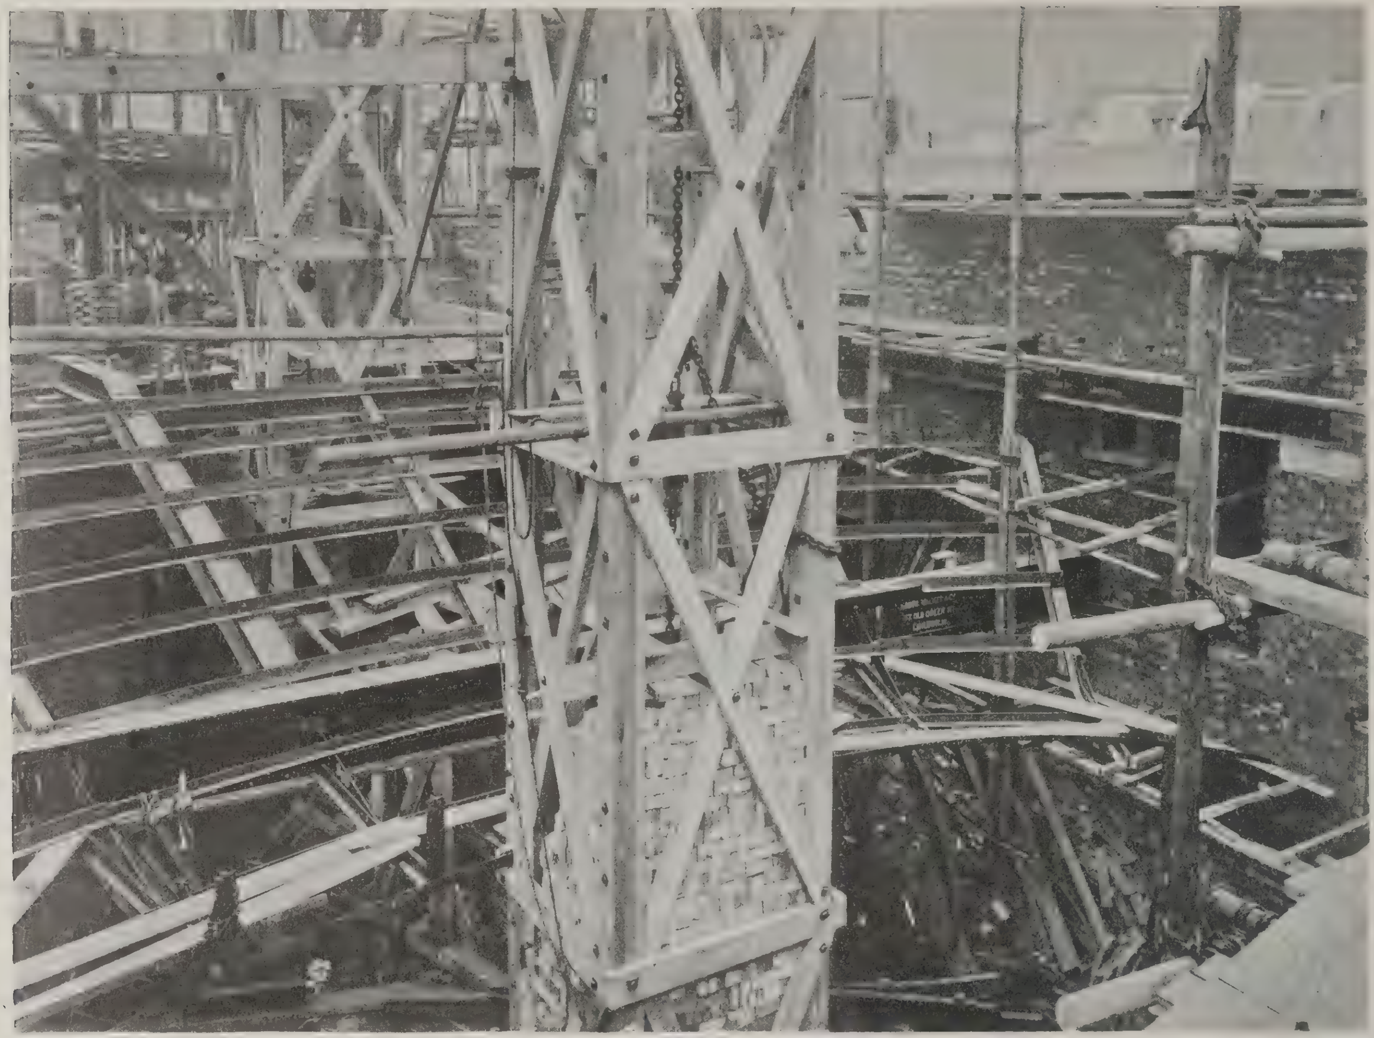
Obituary.

Mr. Joseph Ives, for many years associated with the firm of contractors Messrs. William Ives & Co., of Shipley, died recently. Among other works erected by the firm was Bradford Town Hall.

Mr. S. J. Nicholl, A.R.I.B.A., died on March 21st, aged 78. He was a Roman Catholic architect. Among many works carried out from his designs may be mentioned the Church of Our Lady of the Sacred Heart, Wellingborough, and the Church of St. John the Baptist, Brighton.

Mr. T. Denville Barry, architect, of Liverpool, died recently, in his ninetieth year. He was a native of Cork, was once city surveyor of Norwich, and afterwards practised extensively in Liverpool. He was the architect of the Unitarian Church in Hope Street, Liverpool, St. Peter's Church, Birkdale, and St. Andrew's Church, Southport.

Mr. George Henderson, of the firm of Hay & Henderson, architects, Edinburgh, died recently. In partnership with the late Mr. William Hay, he was engaged in various important building operations, including the restoration of St. Giles' Cathedral. He also acted for some years as architect to St. Mary's Cathedral, Edinburgh. He designed numerous mansions, including additions to The Hirsel, Douglas Castle, Bowland House and Colliston Castle. At Galashiels he built St. Paul's parish church and the free library. The fine parish church at Distington, in Cumberland, with the schools adjoining, was also his work. Mr. Henderson was employed for buildings of importance in Canada and other colonies. The cathedral at Bermuda, now nearly finished, was designed by him.



WALDORF THEATRE, ALDWYCH, LONDON: STEELWORK OF FIRST TIER. *(November 3rd, 1904.)*

Views and Reviews.

The Law of Easements.

The author of this book on a dull subject has aimed solely at giving a clear and accurate outline of the law, and has confined himself to easements properly so called, though in his third chapter he has been compelled to deal at some length with natural rights of property. The book is printed in big type, with bold side-heads, and has a good index. It appeals to architects as well as to law students.

"An Epitome of the Law relating to Easements," by T. J. Blyth. London: Sweet & Maxwell, Ltd., 3, Chancery Lane, W.C., price 6s.

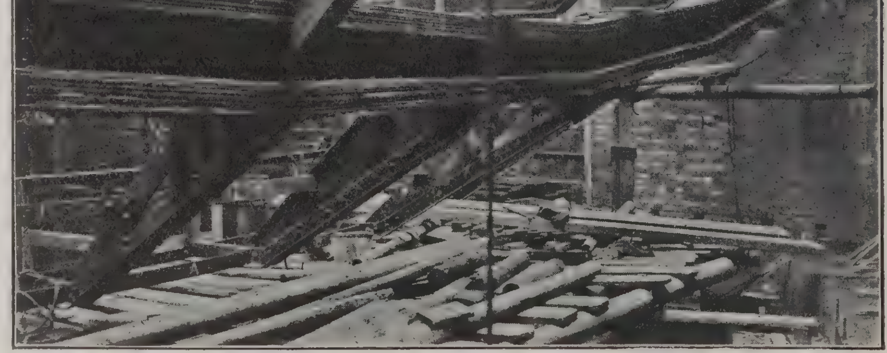
Gas Producers.

It is not long since we had the author's handbook on gas- and oil-engines before us, and this present manual may be regarded as a companion to it. The book is specially addressed to purchasers of power-producing machinery as well as to erectors and attendants. It is put together in a very practical form, and has numerous illustrations. Gas as a source of power has undoubtedly a great future, and it is useful therefore to have presented in a handy form a succinct description of the chief forms of suction plant offered by leading makers.

"Gas Producers for Power Purposes," by W. A. Tookey. London: Percival Marshall & Co., 26-29, Poppin's Court, Fleet Street, price 1s. nett.

A Fifth Edition of Fletcher's "History of Architecture."

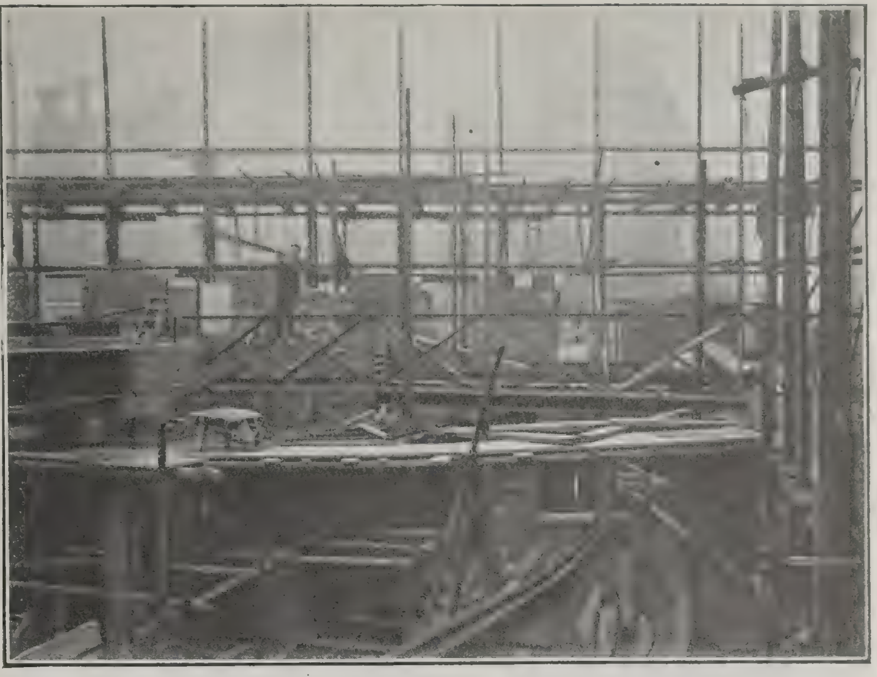
With the fifth edition Banister Fletcher's "History of Architecture" has undergone very extensive revision. Indeed, it has been largely rewritten. The illustrations have been increased by the addition of about 700, bringing the total number up to about 2,000, while many of the subjects shown in previous editions have been redrawn and corrected in the light of more recent discoveries. This present edition is a material advance on former ones. The compression of the text is an improvement, but the defects we referred to in our review of the fourth edition (in our issue for February 5th, 1902), although in part remedied, are still very apparent. We are glad to see that Mr. Fletcher has extended Part II. of the work, treating of what he calls "the non-historical styles," under which division he places Indian, Chinese or Japanese, Ancient American and Saracenic architectures. The illustrations to this part are instructive, as also the notes descriptive of them; but the author's general remarks leave the student very much at sea, and we are almost inclined to think it would have been better if this section had not been included rather than that it should create such a false impression. On the whole, we must accord praise to the publisher for the manner in which



BACK VIEW OF STEELWORK TO SECOND TIER. *(January 30th, 1905.)*

he has produced the book, and commendation of Mr. Fletcher's industry in collecting facts and illustrations, though we cannot help feeling that the book is too expensive for the students to whom it appeals the most. What is more especially needed in any book on history is a good general introduction of wide grasp discussing the principles of architecture so as to give the student a thoroughly sound bearing.

"A History of Architecture on the Comparative Method for the Student, Craftsman and Amateur," by Prof. Banister Fletcher and Banister F. Fletcher, F.R.I.B.A. London: B. T. Batsford, 94, High Holborn, W.C., price 21s. nett.



ONE OF THE FLY GIRDERS. *(November 23rd, 1904.)*

Measuring and Estimating Builders' Work.

Like others in the same series, these two sixpenny manuals are compiled from the pages of "Building World." They are full of practical information, illustrated by diagrams here and there, and will be found useful to students and workmen.

"Measuring Builders' Work," "Estimating for Builders' Work," edited by Paul N. Hasluck. London: Cassell & Co., price 6d. nett each.

The St. Louis Exhibition Buildings.

In view of the fact that the St. Louis Exhibition is now a thing of the past, and that long ago it was fully dealt with by various publications in this country, this book makes its appearance considerably belated and with much of its interest lost. Omitting those considerations, however, it may be said that the book is well put together, and doubtless will find a limited audience among those for which it is specially intended, namely, organizers, architects and others who may be engaged upon the planning and constructing of future exhibitions. At this time of day there is no occasion to make any criticism of the buildings, and we think it sufficient therefore to thus briefly announce that an English book on the subject has appeared.

"The St. Louis Exhibition, 1904," by H. Phillips Fletcher, F.R.I.B.A. London: B. T. Batsford, 94, High Holborn, W.C., price 5s. nett.

SCAFFOLDING AT STAGE END. *(November 3rd, 1904.)*

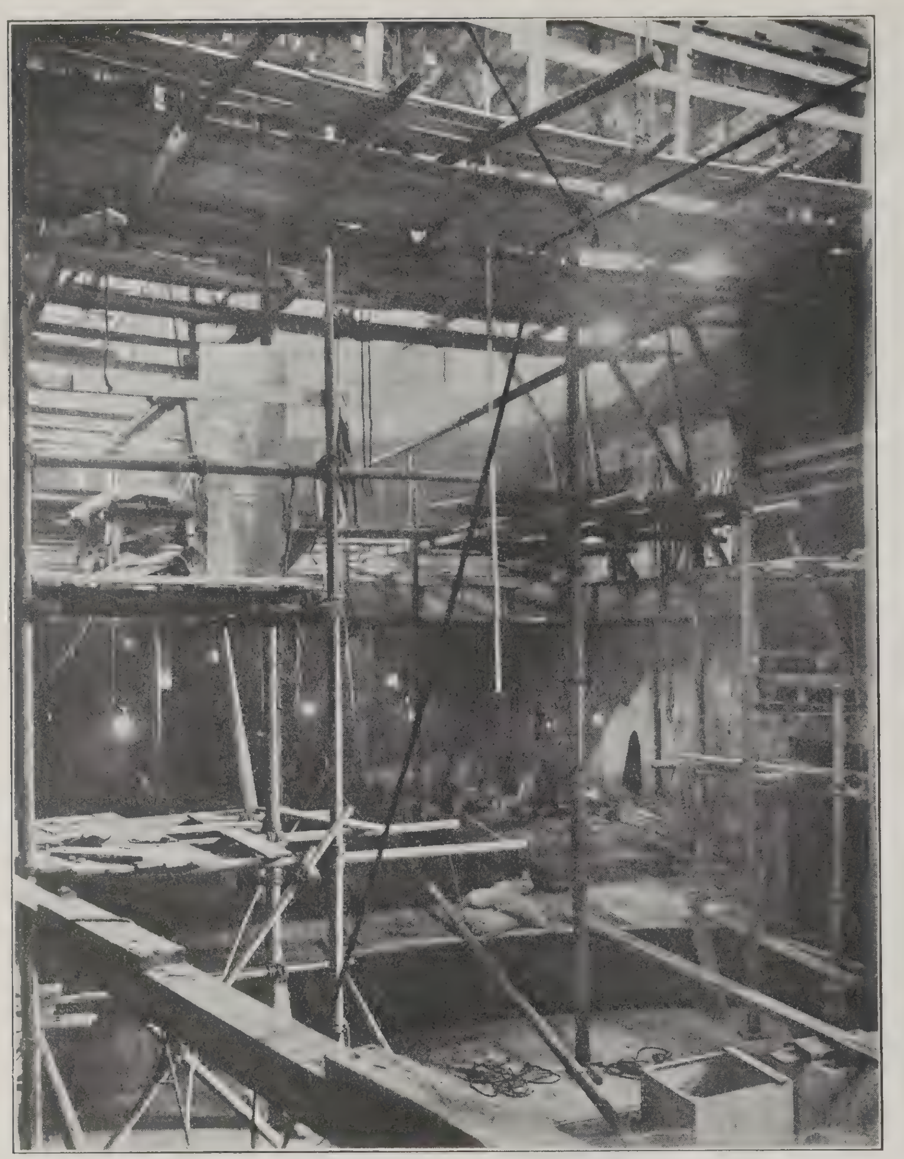
Conduct of Building-Work.

The second edition of Mr. Leaning's small book is a considerable improvement on the first. The London School Board's instructions to clerks of works, the synopsis of regulations adopted by various public bodies, and the rules for the examinations of the Incorporated Clerks of Works' Association of Great Britain have been added to the appendix. The book is very useful and is clearly written and singularly free from verbiage. In a treatise of this character it is difficult to know where to leave off, for in the conduct of building work is embraced the whole subject of construction. Considering the difficulty, Mr. Leaning has performed his task well.

"The Conduct of Building Work and the Duties of a Clerk of Works: A Guide to the Superintendence of Building Operations," by J. Leaning, F.S.I. Second edition, revised and enlarged. London: B. T. Batsford, 94, High Holborn, W.C., price 2s. 6d. nett.

Professor Lanteri is to be the recipient of a presentation by the modelling students at South Kensington, in celebration of his twenty-fifth anniversary as master of the school of sculpture.

The Manufacture of Portland Cement in Russia, while comparatively new, has nevertheless made rapid strides in the past few years. The industry was practically unknown ten years ago, at which time the annual output was not more than 300,000 barrels (equal to about 50,000 tons), and this was mainly the output of one company. Some time later other companies began operations, and the demand for cement became very much improved. In 1898 eight new companies were organized in the Black Sea district, and the demand steadily grew from 400,000 barrels in 1896 to 1,000,000 in 1899. This was further increased in 1901 to 1,500,000 barrels. Despite the ever-increasing demand, the production was greatly in excess of the consumption, however, and prices began to decline very rapidly. This state of affairs was fatal to a number of the older companies, some of which were compelled to close down their plants. In 1901 the production was almost half as much again as the demand—the production being 2,950,000 barrels and the consumption 1,550,000.



WALDORF THEATRE, ALDWYCH, LONDON: VIEW LOOKING FROM STAGE INTO AUDITORIUM.
(March, 8th 1905.)

Electrical Notes.

The Simplex Pocket List for 1905 is a neat little booklet giving particulars and illustrations of the multitudinous fittings for the system of electric wiring adopted by the Simplex Steel Conduit Co., Ltd, of Birmingham, London, Manchester, Liverpool and Glasgow.

The Brockie Pell Arc Lamp Works in Worship Street, London, were visited recently by the Junior Institution of Engineers. In the workshops a number of lamps of different types were shown in course of manufacture, and in the testing-room demonstrations were carried out to illustrate the effect on the arc of two methods of regulation, namely, differential (main coil and shunt coil working in opposition) and shunt coil only, the result being that with the shunt coil alone the current might be varied very considerably without affecting the length of the arc, whereas with the differential method the variation in length of the arc was very considerable with the same change in the current strength. The two lamps were run in series so that each had the same current passing through it.

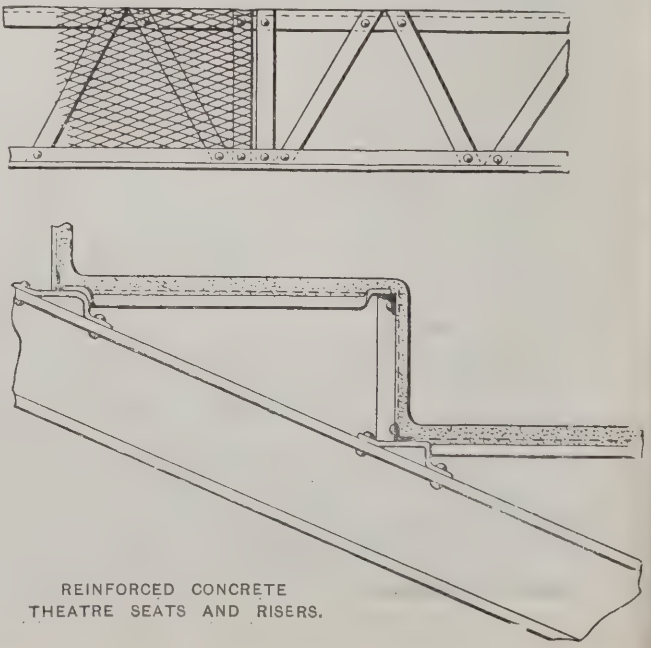
Belfast Corporation Electricity Supply.—In view of the electrification of the Belfast tramway system, now being carried out, large extensions are being made at the Corporation generating station. With a view to assisting small power users, a system of letting out motors on hire has been instituted and this has been largely availed of. The system of supply in Belfast is the three-wire low tension system at 220 and 440 volts. All the generators are arranged so that they can work as shunt machines on the lighting supply or as compound machines on a traction supply. About forty miles of streets are being equipped electrically. Mr. H. A. Cutler, city surveyor, is responsible for the track work; Mr. A. Nance, tramways manager, for the cars and car depôts; and Mr. V. A. H. M'Cowan, city electrical engineer, for the overhead electrical equipment, the feeder-cable system and the power supply. The contract has been placed with Messrs. J. G. White & Co.

Efficiency of Electric Arc Lamps.—In the course of a paper on "The Flux of Light from the Electric Arc with Varying Power Supply," which he read before the Physical Society recently, Mr. G. B. Dyke gave the results of observations made to obtain a series of curves for both continuous and alternating current arcs showing the relation between the mean spherical candle-power and the watts taken up in the arc, and to compare efficiencies. It was found from the curves obtained that for each arc length the point at which the efficiency curve cuts the axis of watts is the same whether the arc is supplied with continuous or alternating currents. For lengths greater than ⅛in. the ratio of the efficiencies of the two arcs is about 3 to 2; but if the arc remains shorter the efficiency line for the alternating-current arc is found to gradually approach the line for the continuous-current arc until for an arc length of 3/32in. they are practically coincident. Any further decrease in the arc length will result in the alternating-current efficiency line rising above the continuous-current line, and Mr. Dyke believes that this is the first case in which this greater efficiency of an alternating-current arc has been realized in practice. Within the limits of experimental error the relation between mean spherical candle-power and watts follows a straight-line law.

Firing Blasts by Electricity possesses the advantages of safety, speed and certainty. In many positions the absence of smoke from the burning fuse is no small advantage, and where blasting operations have to be conducted in crowded cities, or in close proximity to traffic, the most favourable moment for firing can be chosen, and there is not the fear that someone may approach the blast while the fuse is burning.

THEATRE SEATS.

WHILE illustrating the erection of the Waldorf Theatre it is opportune to publish the accompanying illustration of a minor but important detail in theatre design, namely, the method of forming seats and risers. This detail gives suggestions for buildings having a somewhat similar purpose, *i.e.*, housing a considerable audience, such as churches, lecture- and class-rooms, concert halls, &c. The risers are formed of lattice girders, curved on plan, fixed on stools carried by the radial cantilevers. Flat wrought-iron bearing bars spaced at 1ft. centres, half twisted at both ends so as to span the intervening space on edge, extend from the top angle of one lattice girder to the bottom angle of the next. Expanded metal lathing is wired to these bars and to the members of the lattice girders and covered with 2½ins. of concrete to form the seats or treads, and with 1½ins. of cement plaster to form the risers. The seats and risers at the Royal York Theatre of Varieties, Southampton, the Ealing Theatre, the New Olympia, London, the Alhambra, Blackpool, Paisley Theatre, &c., are all on this system.



REINFORCED CONCRETE
THEATRE SEATS AND RISERS.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

Steel-frame Buildings.

MANCHESTER.—H. G. writes: "(1) What advantage is there in adopting the American steel-frame form of building when the authority makes you put the walls of ample thickness to carry all the weights required? To my mind the only advantage in such construction is saving of space, which you do not get under the above circumstances. (2) Can you inform me of the most up-to-date and simple tables for an architect giving weights, strengths, &c., of materials?"

(1) The illogical insistence by local authorities on the same thickness of walls with a steel-skeleton construction as without such construction of course limits the advantages of a steel frame, but in many cases the saving of space and the rapidity of erection obtained by this system (and the consequent shortening of time during which capital must remain locked up without interest) warrants its employment. (2) We do not know of any combined tables giving what you ask, but you will find the information in a convenient form in "Specification No. 8," price 2s. 6d. (or 3s. 3d. post free) from our offices.

Damp Walls.

BELPER.—T. W. writes: "What do you advise for a damp stone wall with brick lining? I believe there is no damp-course. Would 'Adamant' or 'Stukalite' plaster prevent damp if substituted for existing ordinary plaster, and could the same be papered on at once?"

You cannot prevent damp penetrating a wall by plastering inside, even with Portland cement. You should first investigate whether the damp comes through the wall or rises from the ground. If the former, it can be prevented by cement-plastering, tiling, slating or tarring the outside of the wall; if the latter, a damp-course will need to be inserted, this being done piecemeal with bitumen sheets put in the wall by gradually removing bricks or by cutting through the wall with a strong two-handled saw. If this is found impossible of execution, dry areas should be created or asphalt applied vertically to the portion of the wall below ground both internally and externally.

Sketching at Haddon Hall.

BIRMINGHAM.—GOTHIC writes: "What is worth measuring in the neighbourhood of Matlock, Derbyshire? To whom must I apply for the necessary permission to measure at Haddon Hall?"

Almost everything is worth sketching at Haddon Hall. It would be very difficult to recommend a particular choice of subject without some knowledge of a student's capabilities or special interest. But mention may be made of the screen in the Great Hall, the Jacobean woodwook in the chapel, and the elaborate wainscoting in the Long Gallery. Bakewell Church was very largely rebuilt about 1842, but the west end, chancel and south porch of the old building remain. There is a Norman doorway at the west end. The Renaissance tombs in the Vernon chapel (south transept) deserve attention, and at the east end of the south aisle the Foljambe monument with the double aumbry over is worth measuring. There is some good modern work in the choir stalls and screen; some of the miserere seats are ancient. I am not well acquainted with Winfield Manor, but you should send 4d. to the "Derbyshire Times" Office, Chesterfield, for a copy of their Winfield Manor guide-book. It contains a very good plan and two full-page illustrations. Youlgreave Church, two miles from Bakewell, is worth a visit. There is some good Norman work there, and a fine fifteenth-century tower. The church was restored by Norman Shaw. The key is kept at the post-office. The Peacock Inn, Rowsley (1652), and the old hall at Bakewell (1686), are picturesque houses. There is usually no difficulty in obtaining permission to measure and sketch at Haddon. A uniform charge of 4d. is made for each visitor to the Hall. Permission to sketch inside should be asked of the custodian, Mr. J. Eades, at the cottage adjoining the hall. To prevent a possible disappointment, a letter addressed to him at Haddon Hall, Bakewell, might be of service. See an article in the BUILDERS' JOURNAL for August 14th, 1901, "In the Vicinity of Haddon." An architectural guide to Haddon is on sale at the Hall, and for a more popular description there is "A Day in the Peak," a very good local guide-book, which deals with Bakewell Church, Haddon and Chatsworth (C. E. Wardley, publisher, Buxton, price 6d.).

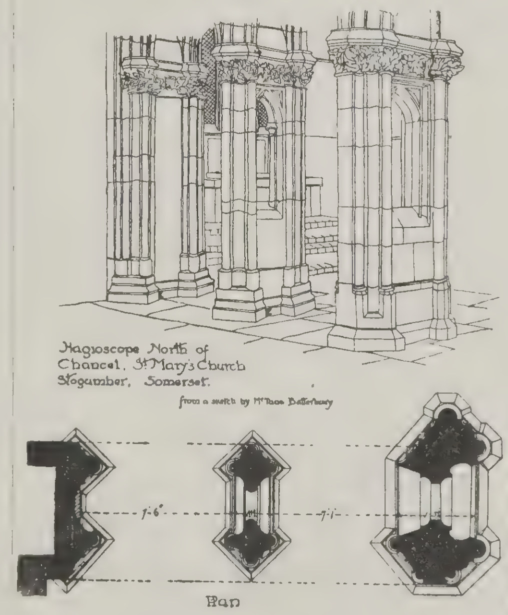
F. H. C.

Hagioscope at Stogumber Church.

DEVONPORT writes: "Having read an account of a church at Stogumber, Somerset, having the double hagioscope pierced through the spandrel of the arches (I believe the building is Norman), I shall be glad if you will explain the meaning of the above?"

The hagioscope or squinch at Stogumber occurs not only in the pier of the chancel arch but also in that which separates the two arches between the chancel and the north chancel aisle. Thus it can hardly be called a double hagioscope, but rather two hagioscopes, each contrived so that a different part of the congregation in the aisle may see the elevation of the Host and participate in the Mass. The whole, as will be seen by the accompanying sketch, is of late date—quite the end of the fifteenth, if not of the sixteenth century.

G. A. T. M.



Hagioscope North of Chancel, St Mary's Church Stogumber, Somerset.

from a sketch by Mr Thos Batterbury

Stopping-up Worm Holes and removing Discoloration.

CHESTER.—J. M. & S. write: "What preparation is most efficient for taking discolorations out of American white oak, plain and figured; also for stopping-up worm holes in same? The oak in question is to be used for internal seating, and will not be varnished."

For stopping-up worm holes you can have nothing better than a putty made with half whiting and half white lead ground up with raw linseed oil. As to removing discolorations on the oak, that is practically impossible; in fact, it is likely that any liquid agent applied would only cause greater discoloration. For the white wood you cannot do better than brush it over with peroxide of hydrogen. Success, however, cannot be promised always, for bleaching wood is very difficult.

H.

Air-holes in Base of Stanchion.

STRATFORD-ON-AVON.—PEBWORTH writes: "Is there any rule for the size and number of air-holes in the base of a stanchion?"

This query is incomprehensible. I see no reason for putting any air-holes at all in the base of a stanchion. I would regard them as detrimental rather than otherwise.

HENRY ADAMS.

St. Mary's, Redcliffe, Bristol.

LONDON.—SUBSCRIBER writes: "Please give some information about St. Mary's Church, Redcliffe, Bristol."

The middle north porch was commenced in 1292 on the site of a former foundation; in the fourteenth century the tower and grand northern porch were added; and the finishing of the nave, choir and transepts was completed in the fifteenth century. A storm in 1445 destroyed the spire and did much damage to the western end. A full history of the church was written by J. Britton, F.S.A., in his architectural essay relating to Redcliffe Church, Bristol, which will be found in any of the London architectural libraries.

M.

Perpendicular Churches.

LONDON.—F. R. S. writes: "Is there any Perpendicular work suitable to measure for the R.I.B.A. final examination which is in or near a seaside resort, preferably in the North of England? I know of several pieces of excellent Early English work, but have been unable to find any Perpendicular at a seaside resort."

Herne Church, near Herne Bay, is a excellent example of fourteenth- and fifteenth-century work. Birchington, a few miles further west along the coast, also possesses a fifteenth-century church. Other examples will be found at Prittlewell (near Southend), Southwold, Lowestoft, Cromer, and at many places on the Broads. As far as can be ascertained in London, no watering-places further north contain good examples of Perpendicular churches. Colchester, through which you have to pass on your way to Walton, Frinton and Clacton, and the surrounding district, possesses many fine examples of fifteenth-century churches suitable for your purpose, and there are several on the branch line between Colchester and the coast.

G. A. T. M.

Cultivation Tank and Bed for House Sewage.

SHEFFIELD.—X. writes: "Referring to the report on p. 139 of your issue for March 15th, I should be glad if Mr. Turnell would give particulars of a cultivation tank and bed for house sewage."

The cultivation tank should contain not less than three days' sewage from the houses, while the cultivation bed should be of about equal cubic capacity to the tank.

A. E. TURNELL.

Architects' Fees.

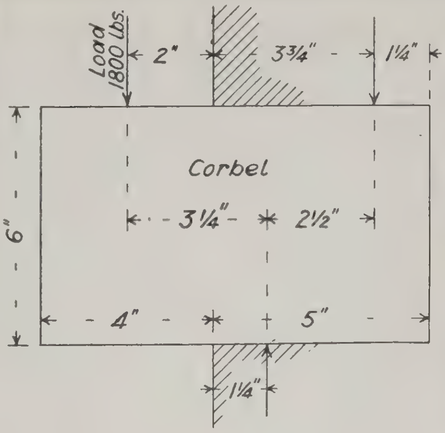
LANCASHIRE. — PERPLEXED ARCHITECT writes: "A mining surveyor's assistant was asked by a friend to prepare plans for a proposed villa to cost about £1,500, and after trying to prepare some sketch plans himself, approached me on the subject and admitted it was beyond him. It was agreed that I should submit several sketches, and eventually one was accepted by his friend, and the surveyor instructed me to prepare the necessary drawings to carry out the work, the verbal arrangement being that we should share equally at the completion of the work. I completed the draft plans and also made fair-copy cloth tracings for the district council's inspection. The plans received the council's approval in due course, the contract was made, and the work proceeded with without the client having been interviewed. During the erection the surveyor obtained the draft plans from me in order that his friend might look at them. These were not returned as promised, and I found on making an inspection of the building during its erection that my plans, which I had signed, had been cut down so as to remove my signature, and the surveyor's had been substituted. The builders who carried out the work informed me that the surveyor seldom came on the site of the works and when asked any questions respecting the construction or details simply replied that they must work to the drawings as near as possible and he would be quite satisfied. The surveyor during the erection of the house gave me a cheque for £2 2s. as a present from himself, and when I asked him some weeks after to return my draft plans I was promptly informed that he had paid for them and that they were now his property. I have copies of the drawings in my possession, also letters from the assistant surveyor instructing me to prepare the plans. Am I entitled to hang these drawings in my office as a specimen of work executed by me? Who is the architect?—for the mining assistant calls himself architect on the strength of having erected the house."

As you did not superintend the erection of the building you are only entitled to payment according to the schedule of the Royal Institute of British Architects. The letters you possess apparently only contain instructions, and do not define the terms on which you undertook the work, and, therefore, as it is a question of one man's word against another's, you must be careful of your actions. There is nothing illegal in a man posing as an architect, and if you go out of your way to damage his reputation you lay yourself open to prosecution for slander or libel. You can bring the case into court if he refuses to pay your fees, or if you have suffered damage in any way, but the latter would be difficult to prove in the circumstances, and we should not advise this course. You cannot insist on your plans being returned without you forego your fees, as in the present state of the law they belong to the client on payment. You ought to have objected before and insisted on your plans being returned, if necessary suing for an injunction to prevent the erection of the building according to your plans without your supervision, on the grounds of detriment to your reputation and affecting your responsibility. We think you would be entitled to exhibit the plans as a specimen of your designing.

Strength of Stone Corbel.

Ealing.—One in Doubt writes: "Referring to the reply on p. 132 of your issue for March 8th, I should be glad if you would explain in $\frac{1800 \times 2}{3{\cdot}75}$ how the 3·75 is obtained."

The 3·75 is the distance from the face of the wall to the centre of the back half of corbel. In the second case taken in the calculation of strength on p. 132 it would perhaps be more correct to assume the condition of the accompanying figure, taking the leverages as $3\frac{1}{4}$ins. and $2\frac{1}{2}$ins. on either side of the reaction. Then $\frac{1800 \times 3\frac{1}{4}}{2\frac{1}{2}} = 2{,}340$ lbs. upward thrust, and $1{,}800 + 2340 = 4{,}140$ lbs. downward pressure on a surface $6 \times 2\frac{1}{2} = 15$ sq. ins., and $\frac{4140 \times 144}{15 \times 2240} = 17{\cdot}5$ tons per sq. ft. The safe load on brickwork in mortar being taken at 4 tons per ft. super., the carrying power of the corbel will be reduced to $\frac{4}{17{\cdot}5} \times 1800 = 411$ lbs., or, say, not more than $7\frac{1}{2}$ cwts. on the whole girder, unless the corbels are built further into the wall.



HENRY ADAMS.

LIVE AND DEAD LOADS IN BUILDINGS.

By C. C. SCHNEIDER, M.Am.Soc.C.E.

(Concluded from p. 168, No. 529.)

In the discussion which followed the reading of Mr. Schneider's paper Mr. J. K. Freitag, Assoc.M.Am.Soc.C.E., said:—

As regards the floor loads suggested, I heartily agree with the proposed live load of 40 lbs. per sq. ft. for ordinary cases. The small live loads which have been found by such experiments as those conducted by Mr. E. C. Schankland and by Messrs. Blackall & Everett, ranging from 12 to 16 or 17 lbs. per sq. ft., have tempted in some cases the use of unit loads as low as 20 lbs. per sq. ft., but such recommendations should certainly be questioned and even heartily condemned in conservative practice.

Provision for Excess Loading.

While 20 lbs. per sq. ft. may be sufficient for average present loads in office buildings, &c., it is to be remembered that the use of an average is always dangerous, while provision should be made properly, but not extravagantly, for all possibilities of excess, either present or future. The character of a building's contents or usage is subject to extreme change. The entire building, or possibly only portions thereof, may be devoted to very different uses from those primarily assumed, so that, in spite of the provisions in building ordinances against radical change in the character or degree of floor loads, it is often difficult to balance present economy against possible maximum requirements or future possibilities. Here, as well as in the strength of materials, a sufficient factor of safety should always be applied.

Calculations for Floor Beams.

The author proposes to calculate all floor beams for a concentrated load of 5,000 lbs. at any point, this being the approximate weight of the heaviest portable safe which would commonly be used in offices, &c. A safe of this weight would be approximately 4ft. wide by 3ft. deep. The factor of safety assumed in the calculations of the floor beams as recommended in Mr. Schneider's specifications would be about 4. Professor Rankine gives a factor of safety of 4, which would be applicable to a reliable steel-frame structure, while for masonry a factor of safety of 8 is recommended under live loads. Again, on page 361 the same authority states as follows:—

"The factor of safety in structures of stone should not be less than 8, in order to provide for variations in the strength of the material, as well as for other contingencies. In some structures which have stood it is less; but there can be no doubt but these err on the side of boldness."

Floor Arches.

All present types of fireproof floor arches would come under the classification of the poorest kind of masonry, so that, if the floor beams were calculated for a concentrated load of 5,000 lbs., consistency would require an ultimate arch capacity of 40,000 lbs. applied over any bearing area of 12 sq. ft., or 3,333 lbs. per sq. ft. Many, if not most, forms of fireproof floor arches now in general use would fail to develop this strength. In the Denver tests the best end-construction arch sustained a final load of only 15,145 lbs., or 1,670 lbs. per sq. ft. over a loaded area of 9 sq. ft.; while the best side construction arch carried only 8,574 lbs., or 953 lbs. per sq. ft. over a loaded area of 9 sq. ft. These were 10in. terra-cotta arches of 5ft. span; hence they were fair samples of modern use. The tests made by Geo. Hill, M.Am.Soc.C.E., on Melan and terra-cotta arches, by means of a self-registering hydraulic machine, show only one terra-cotta arch out of eleven tests which would fulfil the necessary requirements, viz., a 10in. hard terra-cotta end-construction arch, which sustained a total load of 57,500 lbs. over a loaded area of 20 sq. ft. out of a total arch area of 22·6 sq. ft. The other ten arches ranged from 10,000 to 16,000 lbs., ultimate loads. All the Melan concrete arches showed an ultimate capacity of more than the required 40,000 lbs. Most, if not all, of the New York Building Department tests would also have failed to show this ultimate capacity, which would be necessary not only under normal conditions but under fire and water tests as well. Several of the concrete arched forms now in common use will probably exceed this required strength, but if the floor construction as a whole were to be proportioned equivalent to the concentrated load assumed for the beams, this might preclude the use of practically all flat terra-cotta arches and all slab concrete construction.

Partitions

are often classed as live loads, and in previous Chicago practice these were often assumed to be live loads distributed uniformly over the floor area at 25 lbs. per sq. ft. This was on the assumption that the position of partitions might frequently be changed to suit the subdivision of office areas as required by tenants. The present New York and Chicago building laws, however, both require partitions to be considered as dead loads.

As pointed out by the author, the live loads on

Warehouse and Factory Floors

will vary greatly, these often being far greater than might be expected and often much less. Mr. W. L. B. Jenney, the well-known Chicago architect, had occasion to estimate the loads in the wholesale warehouse of Marshall Field & Co., in Chicago, and the low average of 50 lbs. per sq. ft. was found for the total floor area, including all passageways, in spite of the very large quantities of merchandise usually stored there. The maximum load on limited areas was found to be 57 lbs.

Weights of Crowds.

Mr. L. J. Johnson, Assoc.M.Am.Soc.C.E., said he had made experiments on the weights of crowds of students, and found that 156 lbs. per sq. ft. was attainable without any attempt at selecting the men or crowding them to any painful degree of personal discomfort: and though 150 lbs. per sq. ft. could be reached only rarely, 80 or 100 lbs. per sq. ft. must be realized far more often

than was commonly supposed. A crowd of 80 lbs. per sq. ft. could easily make way so as not to afford serious obstruction to the progress of a person who wished to go through it, and a little persistence would enable a person to make his way through a willing crowd weighing 120 lbs. per sq. ft. Mr. Johnson considered that the floors of passageways, corridors, standing-room in theatres, assembly-rooms without fixed seats, ballrooms, &c., should be calculated for a weight closely approaching 150 lbs. per sq. ft., or even more in some cases. The distributed-load values given in Table 2* ought to be increased materially, at least for ground floors of office-buildings, assembly-rooms and staircases leading thereto, and in many cases for pavements.

Safes.

Mr. George H. Blakeley, M.Am.Soc.C.E., said that if it was proper to provide for supporting a 5,000 lb. safe, then only in exceptional cases could the entire weight of the safe be carried on a single joist. Such a safe would occupy an area of about 3ft. by 5ft., and it was proper to consider such a distribution of the load in designing. With joists of 15ft. span and spaced 5ft. apart it was impossible to place such a safe in any position where it would produce a loading of a single joist in excess of that caused by a centre load of 3,500 lbs. It would be proper to specify a definite area covered by the concentrated load, instead of considering it under the impossible condition of being concentrated at a mathematical point. Such a modification would produce, in general, a reduction of the sizes of floor joists, and without impairing the adequate carrying capacity.

Bookcases.

In the case of office-buildings occupied by lawyers it was possible to have bookcases filled solid with books from floor to ceiling, and on each side of the partition over a girder, producing a load of from 400 to 450 lbs. per lin. ft. of girder. Such offices were usually of fair size, and after deducting the effect of the bookcases there might be left in the girder a carrying capacity of less than 30 lbs. per sq. ft. of the floor of the offices. Such offices at times might be fairly crowded with people, as in the case of an important hearing before a referee, and might have a floor load of at least 50 lbs. per sq. ft. caused by a crowd of people at such a time.

Store Buildings.

In the case of store buildings a live load of 1,000 lbs. per lin. ft. for girders was insufficient. In such buildings the tendency was to space the columns far apart, and 20ft. from centre to centre was not unusual. For such a case, with joists spaced at 5ft. centres, according to the proposed specification, the joists would be designed for a live load equivalent to 160 lbs. per sq. ft., while the girders would be designed for a load of only 50 lbs. per sq. ft. On a limited area in such buildings it was not unusual to have a crowd of people equivalent to at least 80 lbs. per sq. ft., especially on "bargain days" and during the holiday season. It was perfectly possible that on such occasions areas affecting a girder in such a building would be loaded considerably in excess of 80 lbs. per sq. ft., as against the 50 lbs. per sq. ft. provided for by the proposed specifications.

Weights of Various Goods.

Crockery and glassware in crates, set side by side and not piled, would produce a load of 120 lbs. per sq. ft., and flannels in cases, piled 4ft. high, 100 lbs. per sq. ft.; cotton prints in cases, set side by side and not piled, 93 lbs. per sq. ft.; woollen dress goods, in cases set side by side and not piled, 84 lbs. per sq. ft.; brown-sugar barrels, set side by side, 113 lbs. per sq. ft. These and other articles handled in store buildings would at times accumulate over certain areas and fully load the girders; therefore, in the design for such buildings the possibilities of such loadings should be considered and the girders be designed accordingly.

Mr. Oscar Lowinson, Assoc.M.Am.Soc.C.E., said the author's effort to establish

A Standard Specification for Structural Work

was deserving of the highest commendation, and its success would be demonstrated by its adoption, with such modifications as would be dictated by a more detailed experience than the author possessed in parts of the field which he had covered.

Live Loads.

His live loads for dwellings, hotels and apartment-houses, however, were too small. Take a dwelling, for instance. In the life of every family there occurred periods during which the apartments were crowded. A minimum allowance for live load in dwellings should be 65 lbs. per sq. ft. In country residence work Mr. Lowinson said he designed the first floor for a live load of not less than 80 lbs. per sq. ft., and in city houses the sizes of the beams and girders were usually determined by their deflection, which should not exceed $\frac{1}{30}$in. per ft. because of the danger of cracking plastered ceilings. For pavements it had been his practice to design for a live load of 350 lbs. per sq. ft., and he suggested that the distributed load be made equal to that figure. For the pressure on wall-plates he would use 200 lbs. instead of 350 lbs.

Commenting on Mr. Schneider's paper, the "Engineering News" of New York says:—

Mr. Schneider's scale of live loads deserves approbation because it specifies, almost for the first time, that floors must be designed to stand a suitable concentrated loading as well as a distributed load. It will have done its duty if it leads to the recognition of concentrated loads in those specifications which, above all others, should prescribe carefully-chosen loadings for designing buildings—public building laws.

While agreeing with Mr. Schneider in the principle of recognizing concentrated as well as distributed loads in building calculations, we cannot agree with him in the actual loads which he specifies. His distributed

Loadings for Floors

are far below those which may occur, and are therefore too low, in our opinion, as designed loadings. This criticism applies solely to classes 1 to 8 in the table, that is, to those cases where the structure is exposed to a distributed loading due to people massing upon it, rather than to loads resulting from stored material. In the latter case, of course, the loading to be used in the design depends upon the conditions of the individual case; and for the same kind of building it may be necessary, in the building law of a given city, to specify a higher loading than is used in some other locality. But crowds of people do not vary in their characteristics from place to place, and they are much alike when they invade a dwelling or an office and when they crowd a political meeting hall. It is possible to set down a loading which will apply to all cases, making perhaps a percentage addition for cases where the crowds are apt to be very lively or to move in unison—meeting halls, armouries or ballrooms. On this account, also, it is possible to criticize Mr. Schneider's scale of distributed loads without reference to any particular case.

No argument is required to support the statement that in designing structures we should plan for

The most unfavourable Conditions of Loading

which can be foreseen. This practice is almost universal in structural designing; indeed, an evasion of it is at once stigmatized as an effort to "skin" the design, to secure business by jeopardizing the security of the structure. If this principle governs the planning of structures which must support mere dead material, structures whose failure would likely not involve injury to persons, how much more stringently should it control the design of a structure where the extreme conditions of loading are precisely those which would lead to the greatest loss of life! A certain floor, for example, may have smaller chances of experiencing the load of a maximum crowd of people than has a coal-bunker of experiencing its most unfavourable loading, but in the former case a collapse is far more disastrous, and safety therefore should engage the greater consideration.

Some careful experiments on

The Maximum Weights of Crowds

of people were reported by Prof. L. J. Johnson in "Engineering News" of April 14th, 1904. These gave weights up to 157 lbs. per sq. ft., with the suggestion that a weight of 160 lbs. might be reached in an absolutely compact stationary crowd. Similar tests made in Germany showed weights up to 145 lbs. per sq. ft., with a degree of crowding that still allowed motion within the mass. Few people have not experienced a degree of crowding where the interior of the mass was compacted to absolute standstill. And judging by the German as well as the American experiments, this may give a loading exceeding 150 lbs. per sq. ft.

Grounds for assuming 40 lbs. per sq. ft.

On what grounds, then, are we justified in using a loading of 40 lbs. per sq. ft., such as Mr. Schneider prescribes for dwellings, hotels, apartment houses, office buildings, theatres, churches, schools, stores and light manufacturing establishments? That dense crowding does occur, and by no means as an exceptional occurrence, in the case of theatres, churches and the like, is known to all. That it may occur in hotels, in apartment houses and even in private dwellings is equally evident, though it is recognized as being less frequent and for a given case less probable. We are not accustomed to designing for average or probable loads: on the contrary, we cannot in good conscience plan for anything less than the greatest loading which the conditions of the case make possible. It would be curious engineering were we to design the framework of an apartment house on the basis of average loading, or were we to neglect the higher loading that would occur only once in a year or once in five years or once in ten years. Do we build apartment houses to fall once in ten years?

The author's expressed argument for this scale of loads is brief and unsatisfactory, and need not be gone into at present; it is based on a single statement covering a few chance observations, which are mere negative testimony in the present discussion. But if we enquire what grounds may have led the author to be satisfied with his ultra-low loadings we may find

Two Explanations.

First, he assumed that the distributed load is of little importance, since ordinarily the concentrated loads would predominate in effect, or second, he relied upon the mysterious margin of the factor of safety. These reasons need no lengthy discussion here to controvert them, but may be left to stand on their merits. For our part, if, as a matter of approximating actual conditions, we are to classify loads as distributed and concentrated, we should wish to select the design load in each class as near as possible to actual maximum. And if we use a given factor of safety in a design to cover unknown and largely unknowable dangers from variations in assumed conditions, we should preferably not encroach upon that margin by a neglect of known dangers. It is to be borne in mind that the actual possible loading of 150 lbs. per sq. ft. is nearly four times as great as Mr. Schneider's specification of 40 lbs.

---

R.I.B.A.

Planning of Cities and Public Spaces.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. John Belcher, A.R.A. The decease of Mr. Frederick S. Waller, Fellow, and Mr. S. J. Nicholl, Associate, was announced.

Papers on "The Planning of Cities and Public Spaces" were then read by Mr. John W. Simpson, F.R.I.B.A., and Prof. Beresford Pite.

Mr. Simpson's Paper.

Mr. John W. Simpson, after a reference to the literature on the subject and an expression of his indebtedness to the works of Herr Stübben, of Cologne, and Herr Camillo Sitte, of Vienna, remarked that the artistic side of city planning had been almost entirely neglected in England; our authorities, he supposed, did not even realize its existence. The laying-out of new streets and roads is nowadays looked upon as purely technical engineering. It was not thus that the cities were created which are still the wonder and delight of the civilized world. The Greeks in the Acropolis, the Romans in the Forum, have given us a model for all time of the way to concentrate the forces at our disposal for the beautifying of a city. Contrast the effect of such spaces, enclosed by splendid edifices and adorned with countless masterpieces of plastic and architectural art, with the forlorn bronze figure stranded on its pedestal amid a tearing stream of traffic which represents the modern idea of a public monument. The "place" of mediæval and Renaissance times, the direct descendant of the antique Forum, has been entirely ignored in our modern city plans. Granted that modern conditions render the "place" no longer necessary as a common centre of exchange and commerce, yet we may do well to examine our fathers' work and save of the artistic heritage what may be adapted to our circumstances.

Exhibiting on the screen plans of various ancient "places" in Italian, German and Flemish cities, the author brought out that, despite their apparently aimless irregularity, they were in reality constructed upon definite principles. With a city we must husband our resources if we are to obtain an artistic whole. If we scatter indiscriminately the material which makes for beauty (and for our purpose this material is represented by the public buildings and monuments) it will be swallowed up in the general mass, and fail of its full effect. In the ancient "places" the statues, fountains and other monuments were placed not in the centre of the space but at the sides. Fountains naturally should be placed beside the beaten trackway. As Donatello's statue of Gattemala and the little column stand at the side of the entrance of the church of St. Anthony of Padua, so the obelisks and statues of the Pharaohs rose beside the doors of the temples. The ancient churches in Italy were most often engaged on one or more sides with other buildings, and the author gave several illustrations to show how this tended to produce those groups of open places which give such charm to the buildings. The enclosing of the old public "place" was an important feature and a principal element of its charm. No mere open space between streets will give it—the appearance of an unbroken frame of buildings is essential.

The author's illustrations made evident two leading principles. First, the monuments being placed at the sides, the centre of the square is left free, and the space is enclosed by a continuous frame of buildings. Next, the "place" must be proportionate in size and shape to the buildings to which it is to give value. Generally speaking, the space in front of a church or other vertical composition will be found to be deep, while that before a town hall or other building whose characteristic is length is usually wide. The irregular plan of ancient "places," though not in accordance with our modern ideas of "symmetry," do not distress us in execution—they appear natural. The builders did not trouble about theoretical symmetry, but they realized in practice what actually caught the eye. The author directed special attention to the Signoria at Florence—from an architectural point of view the most remarkable square in the world. Its form and size, the disposition of its monuments and buildings, the way in which the streets deliver into it, are all admirably studied. No effort is apparent, and the superb composition is admired without disturbing thoughts as to the causes of its beauty. Again, the plans of the Piazza di San Marco and the Piazzetta at Venice exemplify with the most refined art the principles deduced as to the placing of monuments, the freedom of the central space, the enclosed frame, the absence of geometrical regularity, and the value given to squares by their combination with others of varying form and size.

Passing on to street planning, the author referred to the theoretical systems, rectangular, radiating or triangular, as being one and all devoid of artistic interest; nor did such a consideration enter the minds of the engineers who designed them. They had failed even to solve satisfactorily the practical problem of constructing the shortest route between any two points so as to save time in transit. In ancient towns nearly all side streets entered main thoroughfares at right angles; in the modern triangulated and radiated schemes acute angles were inevitable. Again, the ancients avoided as far as they could the delivery of several arteries of traffic at the same point. This principle was now quite neglected. Considering that the chief object of modern street planning is to save time in getting from one point to another, and not merely to construct the geometrically shortest routes between them, the author turned to the streets of Bruges and the fourteenth century in search of guiding principles, illustrating his points by the aid of diagrams. In the whole of Bruges there is hardly a street which formed an acute angle with another, nor a crossing of more than one street with one other. Where a street approached another obliquely, or threatened a complicated intersection, its line would be curved so as to avoid acute angles and confusion. Again, the principle of framing the view by enclosing it and preventing distracting perspective is carried out with as delicate an art in the plans of ancient streets as in those of open "places." The more limited the impression the more complete is its effect was the sound axiom of art which, consciously or by tradition, guided the old street builders. There is no reason, either practical or artistic, why our streets should have monotonous parallel sides. The author took as an example the characteristic little "Rue de St. Armand" at Bruges. Not only is such a varying line picturesque and advantageous to the buildings, but it affords exactly those spaces for the cab-stands, telephone and fire-escape kiosks and other constantly increasing requirements which are difficult to provide for and cause obstructions in uniformly regular streets. Violent bends are not necessary; a slight curvature or displacement of the axis line will produce the happiest effects. The concave line of frontage is the most valuable in improving the appearance of a street, and it should be broken as little as need be. In conclusion, the author asked, Is it hopeless to suppose that in time our authorities may perceive that mere pulling down, aligning and widening of streets will never meet our traffic requirements, and that what is needed is artistic and considered planning? To the Institute students especially he commended this problem. Let them not be content to continue by mere tradition the measurement and study of the individual building and its details, important though these be. There lies a rich reward for those who will consider the combination, construction and grouping by which effect is gained; and the R.I.B.A. Prize Committee might perhaps judiciously stimulate synthetic as well as analytic investigations.

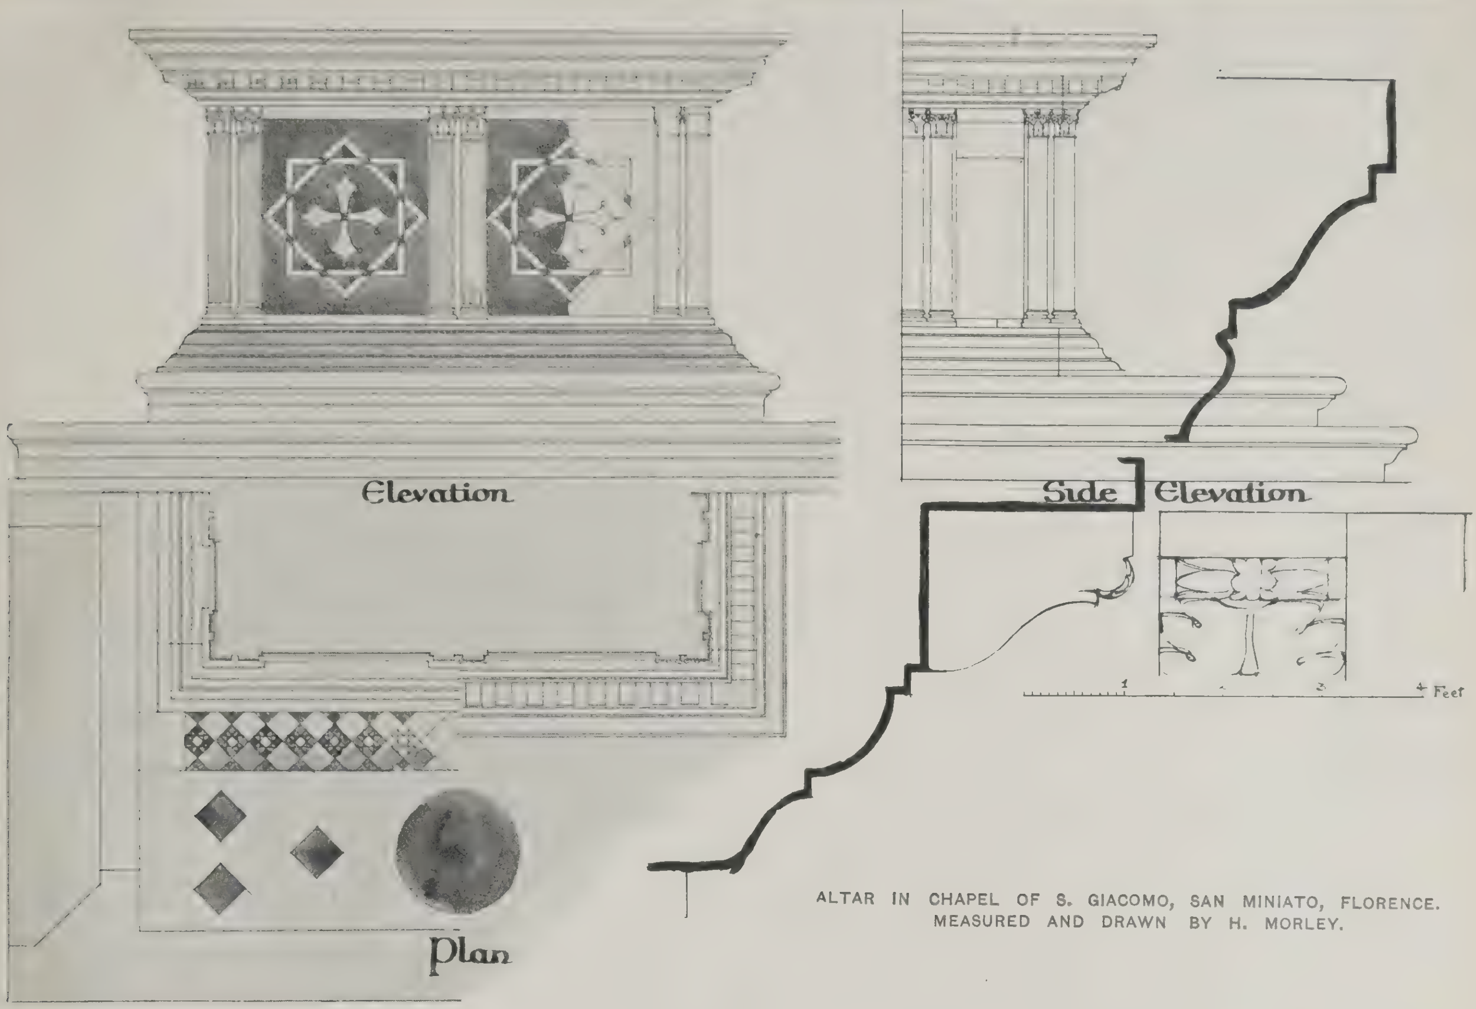
Prof. Beresford Pite then read a paper with special reference to the planning of London. A discussion followed in which Messrs. Freeman, Walter Crane, Captain Hemphill (of the London County Council Improvements Committee), H. V. Lanchester and John Belcher took part. We shall publish a report of Prof. Pite's paper and the discussion next week.

FIRES IN CHURCHES.

ATTENTION is drawn by the Fire Brigade Committee of the London County Council to the serious fire which occurred on February 26th at Christ Church, Down Street, Piccadilly, with the result that about one-third of the ground floor and the gallery were severely damaged. The Committee state that the doors of this church and of most other churches open inwards only, and they point out that disastrous consequences would follow in the event of a fire occurring during a service and a panic ensuing. Under section 80 of the London Building Act, 1894, in all churches erected since the passing of the Act all doors and barriers are required to be made to open outwards, and no outside locks or bolts may be affixed thereto. In the London Building Acts Amendment Bill a clause was inserted to make this provision apply to existing churches, and also to require that the doors should, if fastened during the time the buildings were in use, be fastened during such time by automatic bolts only, so as to open outwards by pressure from inside. This clause was in the part of the Bill withdrawn, and as the Building Act Committee are reporting with regard to this part of the Bill, they have informed the Fire Brigade Committee that they do not think that any action can be taken in the meantime.

Power Companies.—The following interesting list of electricity supply companies in Great Britain is extracted from an article which appeared in the "Times" engineering supplement for March 29th:—

—	Area in sq. miles.
I.—Companies Supplying.	
South Wales Electric Power Distribution Co.	1,034
Midland Electric Corporation for Power Distribution	70
Newcastle-upon-Tyne Electric Supply Co.	375
County of Durham Electric Power Supply Co.	250
North Metropolitan Electric Power Supply Co.	325
Yorkshire Electric Power Co.	1,800
Derbyshire and Notts Electric Power Co. (temporary plant)	1,570
II.—Companies Erecting Plant.	
Lancashire Electric Power Co.	1,100
Clyde Valley Electrical Power Co.	730
Cleveland and Durham County Electric Power Co.	820
Fife Electric Power Co.	504
Leicestershire and Warwickshire Electric Power Co.	1,340
North Wales Electric Power Co.	2,100
Scottish Central Electric Power Co.	400
III.—Other Companies.	
Kent Electric Power Co.	1,485
Gloucester Electric Power Co.	329
Cornwall Electric Power Co.	1,100
Shropshire and Worcestershire Electric Power Co.	—
Somerset and District Electric Power Co.	—
North-Western Electricity and Power Gas Co.	700
Carmarthenshire Electric Power Co.	—
Lothians Electric Power Co.	500
Loch Leven Water and Electric Power Co.	—
Belfast and North-East Ireland Electricity and Power Gas Co.	—
Shannon Water and Electric Co.	2,800



ALTAR IN CHAPEL OF S. GIACOMO, SAN MINIATO, FLORENCE.
MEASURED AND DRAWN BY H. MORLEY.

Builders' Notes.

The Building Trade in Leicester is reviving.

Messrs. Holloway Brothers (London), Ltd., of Belvedere Road, S.E., write pointing out that Mr. Thomas Holloway, of No. 19, Cedars Road, Clapham Common, who is one of their principals, is not the Mr. Thomas Holloway who is engaged in certain building operations at No. 171, Strand, W.C. They are not concerned with any other firm carrying on business under the name of Holloway.

Suing the War Office.—Mr. Kerswill, contractor, of Plymouth, has obtained, on petition to his Majesty the King, permission to sue the War Office in respect of a claim for work done at the Citadel. As the law stands, a Government department cannot be sued by writ in the ordinary way, but the permission to sue can always be obtained by the presentation to the Sovereign of a petition of right.

A Steel-Frame Warehouse is to be erected at the Alexandra Docks, Newport, by Messrs. Graham, Morton & Co., Ltd., of Leeds. The building will be 200ft. long and of 70ft. span, and the whole of the ironwork—including roof-principals, purlins, riveted compound steel girders, rolled-steel girders, gutterings, &c., and a specified number of casements constructed to open in the centre—is to be in position eight weeks from the date of the order. Best quality mild steel will be used. The principals are to be spaced 12ft. 6ins. apart, and a louvre will run the whole length of the building.

London Building Acts Amendment Bill.—At last week's meeting of the London County Council Mr. John Burns, M.P., made a vigorous attack on Dr. Napier and Mr. Shepherd, chairman and vice-chairman of the Parliamentary Committee, for their lukewarm support of the ill-fated London Building Acts Amendment Bill. Mr. Burns said that Dr. Napier had damned the Bill with faint praise and Mr. Shepherd had followed suit, and had it not been for the fact that the City dared not take the responsibility the fire clauses would have gone the way of the others.—The Council instructed the Parliamentary Committee to confer with the Building Act, Public Health and Fire Brigade Committees in regard to any future modifications of the Bill.

Brickworks for the Victorian Government.—Mr. Bent, the Premier of Victoria, has ordered machinery for State brickworks, in pursuance of his declaration that the brick combine is artificially maintaining prices and must be fought.

The Largest Reinforced Concrete Arch Bridge is the Gruenwald Bridge over the Isar, near Munich, Bavaria, which was opened for traffic towards the close of last year. It has two main spans constituting three-hinged arches, and a number of small girder spans, all of reinforced concrete. The two main spans are each 230ft. with a rise of 42ft. and a width of 26·2ft. from centre to centre of hinges. The five girder spans are each 28ft. in the clear. The roadway is 30ft. wide. The total length of the bridge is about 720ft. The structure is a highway bridge, and was designed for a live load of 82lbs. per sq. ft. uniform, and a 22-ton steam load roller. The hinges of the main arches are of steel castings with a convex-concave rolling surface. The "open spandrel" style of construction has been adopted to reduce the dead load as much as possible. The thickness of the arch ring (which at the crown is only 30ins., at the springing lines 36ins., and at the thickest portion—about the quarter points—but 48ins. deep) defines results which have barely been reached with stone.

Decay of Galvanized Iron Pipes.—Commenting on this subject the "Gesundheits-Ingenieur" says that in damp clayey soils zinc would seem to furnish a very inadequate protection against rust; indeed, it appears possible that it rather tends to facilitate galvanic action, and thus to hasten the destruction. Steel tubes have been found in these situations to last better than the common iron barrel, but the best plan, where the decay is ascertained to be rapid, is to use cast-iron pipes. Professor Steuer has suggested that the destructive action in clay soils may possibly be due to the fact that most tertiary clays contain a considerable amount of finely divided iron pyrites. This, in the presence of carbonate of lime, tends to result in the formation of calcium sulphate, setting free a certain proportion of sulphurous or sulphuric acid. Under these conditions, even though but very minute traces of the acids exist in the soil, galvanic currents may be generated which rapidly cause the destruction of the iron pipes.

The Galvanized Roofing Sheet Industry has been far from satisfactory for a long time past. Prices of spelter have advanced materially from the lowest point of last year, when G.M.B. Silesian sold at £20 12s. 6d. per ton. This year it has been as high as £25 7s. 6d., an advance of about 25 per cent., and although it has since declined about £2 from that high level the market shows again an advancing tendency. Prices of plates have also risen. There has been no corresponding advance in finished roofing sheets, as the supplies coming upon the market have more than sufficed to meet the demand, and competition has been keen for some time. Prominent members of the trade have had under consideration methods to remedy this condition, and last week about 150 manufacturers representing works in all parts of the country dined together at the Midland Grand Hotel, London, and afterwards discussed the situation. Proposals were brought forward having in view such a combination of manufacturers as would prevent over-production and regulate the market in a way more conducive to the producers' interest than the present independent action. The proceedings were necessarily of a more or less preliminary character, but at the same time material progress was made towards the ends proposed by the promoters of the meeting, the general impression being that an effective combination would speedily be effected.—As an outcome of the meeting a combination of the manufacturers of galvanized sheets has been formed. The first effect of this combination is the adoption of a minimum price of £10 5s. per ton for 24-gauge corrugated sheets in bundles f.o.b. Liverpool — an advance of from 7s. 6d. to 10s. per ton over prices accepted within the past week. There are still details to be arranged, but the present position shows that the combination practically embraces the whole of the galvanized sheet makers.

Messrs. Horace W. Cullum & Co., of 28, Budge Row, E.C., makers of the "Kulm" fireproof and soundproof partition slabs, have removed to Craven House, Kingsway, High Holborn, W.C.

Labour in the Colonies.—This month's report of the Emigrants' Information Office, 31, Broadway, Westminster, states that the labour market at Adelaide is overcrowded, and no working man is advised to go to South Australia unless he is specially skilled in his trade or has sufficient money to live on at first. In New Zealand men in the building trade are well employed. In Cape Colony there are considerable numbers of men out of work. No one is allowed to land unless he has secured employment or possesses £20 on arrival. No one may enter the Transvaal without a permit.

Dublin Building Trade Dispute: Bricklayers Imported.—Between fifty and sixty bricklayers arrived by a cross-Channel steamer at Dublin last Wednesday to replace the members of the Brick- and Stonelayers' Union who have been locked out. They took up their work under the protection of the police. At a meeting of the North Dublin Union held on the same day a resolution was passed requesting the Master-Builders' Association to appoint three members to meet a similar number of the Bricklayers' Society in conference, under the presidency of the Archbishop of Dublin, with a view to a settlement of the dispute.

Keystones.

Bitumen and Wood-fibre Paving Blocks are being tried by the Norwich Corporation.

Building Stones.—The sub-committee of the Architectural Association have received particulars of more than 200 building stones in response to the invitation issued with last month's "Notes." They will be glad if others having information on the subject will communicate with them at once, so that the record may be made as complete as possible.

The Competition for Improving Barcelona, including the beautifying of the working-class quarters and the unifying of the suburbs (for which premiums of £1,400, £400 and £200 were offered), only attracted five architects—two Spanish, one German, one Italian and one French. It was won by the last-named—a young student named Jaussely, the son of a working carpenter, who gained the Prix de Rome for architecture in 1903.

The Rapid Growth of Liverpool is illustrated by the annual report of the City building surveyor, Mr. William Goldstraw. During the nine years since the boundaries of the city were extended no fewer than 17,414 houses have been erected, of which last year alone accounted for 2,174, and although this figure was surpassed in 1903 and 1899 the number is still 269 above the average of the previous eight years.

Leeds Waterworks Engineer.—Mr. Henzell, of Newcastle-on-Tyne, is recommended for the position of waterworks engineer to the city of Leeds, at a salary of £1,000 a year. There were originally fifty-four applicants for the post, reduced later to nine.

Hyde Abbey, Winchester, to be Explored.—The site of the ancient Abbey of Hyde (a portion of which was acquired by the city of Winchester) is to be explored and the foundations of the abbey are to be uncovered.

The new Exe Bridge at Exeter (described on p. 58 of our issue for August 3rd, 1904) was opened last week. It is a one-span steel bridge, and has cost £25,000. The design was prepared by Sir John Wolfe-Barry and Mr. C. A. Brereton, and was executed by Messrs. Woodman & Sons, of Exeter.

Competition for Shire Hall, Bury St. Edmunds.—This competition has been decided as follows:—First premium (£50), Mr. Arthur Field, Ipswich; second premium (£30), Mr. Omar Mahomed and Mr. Betram H. Tarrant, Balham; third premium, Mr. Septimus Warwick and Mr. Herbert H. Hall, London, W.

Leeds Queen Victoria Memorial. — The design of Mr. Frampton, A.R.A., has been accepted for this memorial. The statue, which is to be of bronze, representing the late Queen in a sitting position, will be erected in Victoria Square. The memorial will be about 30ft. high and will have on either side figures of "Peace" and "Industry."

The new Carnegie Baths at Dunfermline were formally opened on Friday. The buildings have been designed by Mr. Hippolyte J. Blanc, R.S.A., and are expected to cost £36,000. A gymnasium 103ft. by 45ft. is included in the scheme. There are two paths around the swimming bath—one for bathers and the other for those going to and from the dressing-boxes.

Glasgow and West of Scotland Technical College.—On Wednesday last the students and staff of the architectural department met to express their feelings of goodwill towards Professor Gourlay, B.Sc., A.R.I.B.A., on the occasion of his approaching marriage. Mr. Vernon Constable occupied the chair, and was supported by Mr. John B. K. McTaggart, who presented the professor with a handsome combined bookcase and curio cabinet bearing a suitable inscription.

Restoration of York Minster. — Simultaneously with the work of restoring the west front of York Minster, now proceeding, it has been decided to restore the north and south aisles of the nave by the erection of the missing pinnacles and flying buttresses on the north side and the flying buttress on the south side. The whole of the work will be in Ketton stone. Designs have been prepared by Mr. G. F. Bodley, R.A., for a new oak pulpit in the nave to cost about £600.

The Condition of St. Mark's, Venice, now that it has been possible to examine the church closely, is found to be graver than appeared from the report of the two engineers, Signori Manfredi and Marangoni. The weakest points are the "Paradise" and "Apocalypse" vaults. Though every care will be taken to maintain these as they were originally, some parts of them will have to be demolished and rebuilt. The examination of the interior structure of the St. Alipio corner, which was excluded from the restorations made about the middle of the nineteenth century, has revealed an even graver state of things. The foundations of this corner have sunk and have become detached from the remainder of the building, so that the corner now stands independently from the rest, with only one iron bar, put there in 1780, to keep it and the main body together. The corner will have to be demolished (each piece being religiously preserved for reconstruction) in order to strengthen the foundations.

Art and Architectural Education in Russia.—The leading institution in Russia for the teaching of art and architecture is the Higher School of Fine Arts at St. Petersburg, in connection with the Imperial Academy. This is divided into two sections, one for painting and sculpture and the other for architecture. Provision is also made for the training of art teachers. Next in importance are the School of Painting, Sculpture and Architecture at Moscow; the Strogonoff School of Technical Design, also at Moscow; Baron Schtiglitz's Central School of Design at St. Petersburg, with more than 2,000 students; the Drawing School of the Imperial Society of Arts at St. Petersburg; and the Gogol School of Industrial Art at Mirgorod, which has about 700 students. Local schools of art also exist at Odessa, Wilna, Kharkoff, Kieff, Kazan and a few other towns, several of which are devoted to the benefit of local industries.

The Edinburgh Architectural Association recently visited Inveresk. Particular note was taken of the Roman remains in Inveresk House grounds, and the leader of the party (Mr. Thomas Ross, F.S.A. Scot.) declared that if the proprietors of the villa houses in the town were to unite they might at very little expense conduct some excavations on a very complete plan, and might make the Roman town of Musselburgh so that people would be enabled to form a better idea of the importance of the place in Roman times.—At last week's meeting the chairman, Mr. J. T. Baillie, referred to the loss which had been sustained by the death of Mr. George Henderson, whose work was always marked by scholarly as well as practical knowledge, and by well-trained taste.—Councillor M'Arthy delivered a lecture on "The Royal Mile—the Castle to Holyrood," in which he gave an interesting account of the numerous buildings of historical value to be found in the thoroughfare. His main object, he said, was to rouse interest in the remaining links with the past, and, if possible, to do something to secure their preservation.

The A.A. Students' Smoker, held at the Café Monico last week in aid of the New Premises Fund, was a great success. Mr. E. Guy Dawber, F.R.I.B.A., president of the Association, was in the chair, and about 400 members and friends were present. In the course of the proceedings Mr. Dawber announced that more than £20 had been contributed to the fund during the evening, and on behalf of the Association he cordially thanked the students for the effort they had made and the many artists who had so kindly given their services. The new premises had involved a debt of between £3,000 and £4,000, which it was earnestly hoped might be cleared off during the present year. Much interest was evinced in what purported to be an advance proof of the R.I.B.A. intermediate examination paper for June next. Among the questions set were the following:—

2. Is 5ft. 6ins. too high for a dining-room? If not, why not? Illustrate your answer from the works of V—ys--y.

3. What is the Purple Patch?

5. Have you ever built in Truth? If so, what did Labby say?

7. Give the author and context of the following:—

(*a*) "When we are registered,
"Why, what shall we do?"

(*b*) "Oh! this learning, what a thing it is!"
(*Taming of the Shrew.*)

(*c*) "Hullo, you funny little d-v-l, is that you or your hat?"

(*d*) "'Ere's the architect, let's 'eave a brick at 'im."

(*e*) "Everyone that was discontented gathered themselves unto the Cave Adullam."

(*f*) "Love's all right in a cottage, but wait till the chimney smokes."

(*g*) "Come join the crowd with me,
Come and be ploughed with me,
Down at the R.I.B.A."

Coming Events.

Wednesday, April 5.

ROYAL SANITARY INSTITUTE. — Inspection and Demonstration at Islington (conducted by Mr. James R. Leggatt), at 2 p.m.

INSTITUTE OF SANITARY ENGINEERS. — Election Committee at 3 p.m. Examination and Literary Committee at 5 p.m.

SOCIETY OF ARTS.—Mr. Richard N. Hall on "The Ancient Architecture of the Great Zimbabwe," at 8 p.m.

Thursday, April 6.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to the Willesden Power House of the North Metropolitan Electric Power Supply Co., Taylor's Lane, Willesden, at 7 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Mr. Philip H. Newman, F.S.A., on "Art Recollections of a Spanish Tour," at 8 p.m.

CHEMICAL SOCIETY.—Meeting at 8 p.m.

SOCIETY OF ORDAINED SURVEYORS. — Annual General Meeting at Edinburgh, at 8 p.m.

Friday, April 7.

ARCHITECTURAL ASSOCIATION. — Mr. H. Phillips Fletcher, F.R.I.B.A., on "The Buildings of the World's Fair at St. Louis, 1904," at 7.30 p.m.

ROYAL INSTITUTION. — Mr. Alfred Mosely on "American Industry," at 9 p.m.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Business meeting.

JUNIOR INSTITUTION OF ENGINEERS.—Mr. George H. Hughes, M.I.M.E., on "Practical Notes on Waterworks Construction," at 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Mr. R. G. Clark on "Cofferdams for Dock Use," and Mr. J. R. Fox on "The Bath Corporation Waterworks Extension," at 8 p.m.

Saturday, April 8.

ROYAL SANITARY INSTITUTE. — Inspection and Demonstration at the Sewage Outfall Works, Barking (conducted by Mr. John Edward Worth, M.I.C.E.), at about 3 p.m.

ARCHITECTURAL ASSOCIATION.—Sixth Spring Visit to Æolian Hall, New Bond Street, at 2 p.m., and No. 2, Hamilton Place, Park Lane, at 3.30 p.m.

ROYAL SANITARY INSTITUTE.—Provincial meeting at Bristol. Discussion on "Isolation Hospitals," at 11 a.m.

NORTHERN ARCHITECTURAL ASSOCIATION. — Visit to churches of St. Hilda and St. Barnabas, Newcastle-on-Tyne, at 3.30 p.m.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Meeting at Newcastle-on-Tyne, at 2 p.m.

Monday, April 10.

SURVEYORS' INSTITUTION.—Meeting at 4 p.m.

INSTITUTION OF CIVIL ENGINEERS. — Colonel Crompton on "Unsolved Problems in Electrical Engineering," at 8 p.m.

BRISTOL SOCIETY OF ARCHITECTS. — Annual General Meeting. "An Evening with the Lantern."

Tuesday, April 11.

SOCIETY OF ARTS (Applied Art Section).—Mr. J. Starkie Gardner on "The Monumental Treatment of Bronze," at 4.30 p.m.

CARDIFF, SOUTH WALES AND MONMOUTHSHIRE ARCHITECTS' SOCIETY. — Mr. W. Henry White, F.R.I.B.A., on "The Absence of a National Style in Modern Town House Architecture," at 8 p.m.

Wednesday, April 12.

ROYAL SANITARY INSTITUTE. — Inspection and Demonstration at the East London Soap Works, Bow, at 3 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Associates' Annual Business Meeting.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending March 31st twenty-six failures in the building and timber trades in England and Wales were gazetted.

S. SNOW, builder, West Hendon. R.O. March 23rd.

W. J. F. ANDREWS, builder, Tottenham. Adj. March 23rd.

H. ALDRIDGE, builder and contractor, Lewisham. Adj. March 21st.

F. W. MATTHEWS, house decorator, Dartmouth. R.O. March 21st.

CANWARDEN & PUDDEY, builders, Chiswick. Adj. March 22nd.

T. H. HAYES & Co., builders, East Sheen. R.O. March 25th.

C. POUTNEY, retired builder, Bewdley. Gross liabilities £2,434; creditors fully secured £2,156; estimated to rank for dividend £229; deficiency £223.

H. HUNTER, plumber, West Hartlepool. First meeting, Grand Hotel, West Hartlepool, April 6th, at 2.30. P.E., West Hartlepool C.C., April 20th, at 11.15.

A. FIDO, builder, Bristol. R.O. March 22nd. First meeting, O.R.'s, Bristol, April 5th, at 11.45. P.E., Bristol Guildhall, April 7th, at 12.

G. RAMSEY, painter and decorator, Widnes. First meeting, O.R.'s, Liverpool, April 5th, at 2. P.E., Liverpool C.C., April 6th, at 11.

F. C. J. BRETT, builder, Hythe. R.O. March 21st. P.E., Canterbury Guildhall, April 6th, at 10. First meeting, O.R.'s, Canterbury, same day, at 12.30.

D. H. JONES, decorator and plumber, Carnarvon First meeting, Crypt Chambers, Chester, April 7th, at 11.30. P.E., Magistrates' Room, Bangor, April 13th, at 12.30.

New Companies.

J. N. KESTELL AND CO., LTD., timber merchants and importers. Capital: £3,000.

PATENT METAL CEMENT, LTD. (Registered in Guernsey). Capital: £16,000.

WATSON AND HILL, LTD., wood turners, Brookfield Mills, Saynor Lane, Hunslet, Leeds. Capital: £1,000.

FREDERICK SAGE & CO. (1905), LTD., shop fitters, &c., 62, Gray's Inn Road, W.C. Capital: £300,000.

FARMER AND BRINDLEY, LTD., sculptors, modellers, &c., 63, Westminster Bridge Road, S.E. Capital: £50,000.

WRIGHT AND SONS, LTD., monumental sculptors and marble masons, 177, Otley Road, Bradford. Capital: £6,000.

CHARLES AND FRANK SMITH AND CO., LTD., dealers in architectural metal-work, locks, hinges, &c. Capital: £2,000.

AIROSTYLE SYNDICATE, LTD., manufacturers of colour spraying apparatus, &c., 35, St. Bride Street, E.C. Capital: £5,000.

KLEANITE CO., LTD., manufacturers of a preparation for cleaning paint and metal known as "Kleanite," and a preparation for preventing the steaming of windows, known as "Frottoline," 56, Ludgate Hill, E.C. Capital: £1,000.

The Restoration of the Dome Colonnade of St. Paul's Cathedral, which has employed a small army of men, is now nearing completion, and in a short time the west front will be taken in hand. Wren made a liberal use of iron bars for the purpose of strengthening his masonry, but they have proved instead a source of weakness. Rusted in some cases completely through, they have given way and thrown strains upon the stonework which it is not able to bear. The iron also seems to cause a more rapid decay of the stone in its vicinity. The sand-blast process has been tried at the cathedral, but owing to the hard surface of the stone it was found to be so slow that it was abandoned.

Joint Addresses:—

Fireclay Works: SCOTSWOOD-ON-TYNE. Engineering Works: YORK.

5 & 7, OLD QUEEN STREET, WESTMINSTER, LONDON, S.W.

Northern Architectural Association.—The report for the past session, just issued, gives the membership as 220.

Change of Address. — Messrs. George Elkington & Son, architects and surveyors, have removed to Norfolk House, 7, Laurence Pountney Hill, Cannon Street, E.C.

A Testimonial to Mr. Henry Adams, who is retiring from the professorship of engineering and surveying at the City of London College after thirty-five years' service, is proposed, and all former pupils of his are desired to communicate with Mr. J. L. Crouch, of 29, Basinghall Street, E.C.—the chairman of a committee which has been formed for the purpose.

Street Architecture of To-day.—Mr. Percy Robinson, architect, of Leeds, recently gave a lecture on this subject before the members of the Leeds Arts Club. After reference to the discussion on "Is Leeds Ugly?"—which was started by Mr. George Bernard Shaw, when he recommended them to burn it down—he touched upon the architecture of various towns. The chaotic and capricious nature of our architecture to-day was, he said, largely due to the complex factors of modern life, the varied requirements of the commercial element (which could not be sacrificed for purely artistic considerations), and the many restrictions imposed on all architects. In Leeds particularly the blackness of the buildings was due largely to smoke. He thought, however, that the worst days in that respect had been seen, now that there was an increasing tendency towards the consumption of smoke, the adoption of electricity as a motive power, and the decentralization of factories. Deploring the narrow view taken by municipal authorities in regard to streets, he said he looked upon the Cookridge Street improvement, Leeds, as anything but satisfactory.

Advertising Notes.

> *"Every wise man knows his own business better than a mere outsider, but the art of presenting business facts and reasons in an interesting and convincing manner is the essential of result-getting advertising. Often an outsider can do this better than the wise man.*
> *The best advertising is done from the reader's side of the fence."*

Contracts Open.

URBAN DISTRICT of ERITH.

ERECTION OF PUBLIC LIBRARY.
TO BUILDERS AND CONTRACTORS.

The Erith Urban District Council invite TENDERS for the ERECTION of PUBLIC LIBRARY BUILDING at Erith.

Copies of the bills of quantities and general conditions, with form of Tender, may be obtained of Mr. W. EGERTON, Architect, 12, Queen's Road, Erith, upon depositing the sum of two guineas, which sum will be returned upon receipt of a bonâ-fide Tender.

The Contractor will be required to enter into a contract and bond, with two sureties, for the due performance of the contract, and the contract will contain provisions that the Contractor shall pay all workmen not less than the standard rates of wages, and observe the conditions of labour customary in the district where the work is executed, also that he shall not assign or sub-let the whole or any part of the contract without the previous written consent of the Council.

Tenders, sealed and marked "Tender for Public Library," to be addressed to the undersigned, and delivered not later than FOUR p.m. on MONDAY, the 17th day of APRIL, 1905.

Dated this 28th day of March, 1905.

CHARLES H. FRY,
District Council Offices, Clerk of the Council
Bexley Road,
Erith.

BROMLEY and BECKENHAM JOINT HOSPITAL BOARD.

SMALL-POX HOSPITAL, ORPINGTON, KENT.

The Bromley and Beckenham Joint Hospital Board are prepared to receive TENDERS for the ERECTION of a SMALL-POX HOSPITAL, in Crotton Heath Wood, in the Parish of Orpington, Kent, in accordance with plans and specifications prepared by their Architect, Mr. JOHN LADDS, of 93, Pemberton Road, Harringay, London, N.

Application for quantities to be made in writing to the Architect not later than 25th MARCH, enclosing a Bank of England five-pound note, as deposit for a copy of the quantities, which will be returned on receipt of a bonâ-fide Tender.

Due notice to the applicants will be given where and when the plans can be seen.

Tenders, endorsed "Tenders for Small-pox Hospital," to be delivered to the undersigned at Park House, Bromley, Kent, on or before THREE o'clock on FRIDAY, the 7th APRIL next.

The lowest or any Tender will not necessarily be accepted.

(Signed) FRANK H. GEDNEY,
Office of the Board, Clerk to the said Board.
Park House, Bromley.

EAST SUSSEX COUNTY COUNCIL.

TO BUILDERS.

TENDERS are invited for the ERECTION of the proposed new OFFICES in Fisher Street, Lewes, for the Education Department.

Plans, specification, and conditions of Contract can be seen at the COUNTY SURVEYOR'S Office, County Hall, Lewes, after FRIDAY, 31st MARCH next, between the hours of TEN a.m. and FOUR p.m.; Saturdays, Ten a.m. and One p.m.

Bills of Quantities may be obtained after FRIDAY, 31st MARCH, on application to Mr. F. J. WOOD, County Surveyor, Lewes, on payment of a deposit of three guineas, which deposit will be returned upon the receipt of a bonâ-fide Tender.

The Contractor whose Tender is accepted will be required to enter into a Contract with the County Council, and, if required, enter into a bond with two approved sureties for the due currying out of the contract.

Tenders, endorsed "Tender for New Education Offices," to be addressed and delivered to F. MERRIFIELD, Esq., County Hall, Lewes, not later than TEN a.m. on MONDAY, 17th APRIL, 1905.

The County Council does not bind itself to accept the lowest or any Tenders, and will not pay any expenses in connection with the preparation thereof.

FRED J. WOOD, M.S.A.,
County Hall, Lewes. County Surveyor.
March 6th, 1905.

To Contributors.

THE EDITOR will be pleased to consider any articles illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

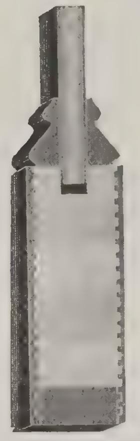
An Opera House at Ostend is to be built directly behind the King's Castle, with which it will be connected by an underground passage. It is planned on the model of the Festival House at Bayreuth, but it will have greater seating accommodation.

THE GILMOUR DOOR·Co LTD.
Factories Trenton Canada
53 BERNERS STREET LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

April 12, 1905. Vol. 21, No. 531. 6, Great New Street, Fetter Lane, E.C.

Summary.

Severe tests at a Newcastle warehouse built of Hennebique reinforced concrete were conducted last week. Two beams, respectively of 28ft. and 35ft. span, were loaded with 205 and 257 tons of steel bars and rails. Under this load the deflection in the middle of the beams did not exceed ⅜in., and as soon as the process of unloading was started the beams gradually recovered their original level. (Page 186.)

A discussion on architects' registration took place before the Edinburgh Architectural Association last week. The general opinion of the meeting was favourable to the proposal. (Page 196.)

The Tibetans have not realized the principle of the wheel or the arch, but, curiously enough, thoroughly understand the cantilever principle in bridges. (Page 192.)

The lady architect will put in plenty of cupboards in her home, because without cupboards life is not worth living (to a woman)! Her kitchen will be in just proportion to the size of the house, and not a kind of baronial hall in which even the beetles look lonely. (Page 193.)

The new Workmen's Compensation Bill, amending and extending the old Acts, was read a second time in the House of Lords last week. It is intended to abolish the restriction as to heights of buildings and the use of scaffolding. (Page 186.)

The carpenters have selected three candidates to be run for Parliament in their interests. (Page 186.)

Scarborough's new sea-wall has been so badly damaged by the gale of January 7th that Mr. Walker, the engineer, recommends that buttresses be erected in concrete at a cost of £8,000. (Page 192.)

The "Times" gives its support to the R.I.B.A. memorial against important architectural work for municipalities being put in the hands of surveyors and engineers. This system does not produce economical work, it cannot produce artistic work, and it is subversive of the interests of the individual. (Page 185.)

The Victoria and Albert Museum will be finished by February, 1907, and the new College of Science building ready for occupation next spring. An important reply as to the rebuilding of Regent Street Quadrant was given in the House of Lords last week. (Page 194.)

The St. Louis Exhibition buildings were of timber throughout, covered with "staff" on the exterior. They afforded the greatest example of carpentry ever executed. (Page 190.)

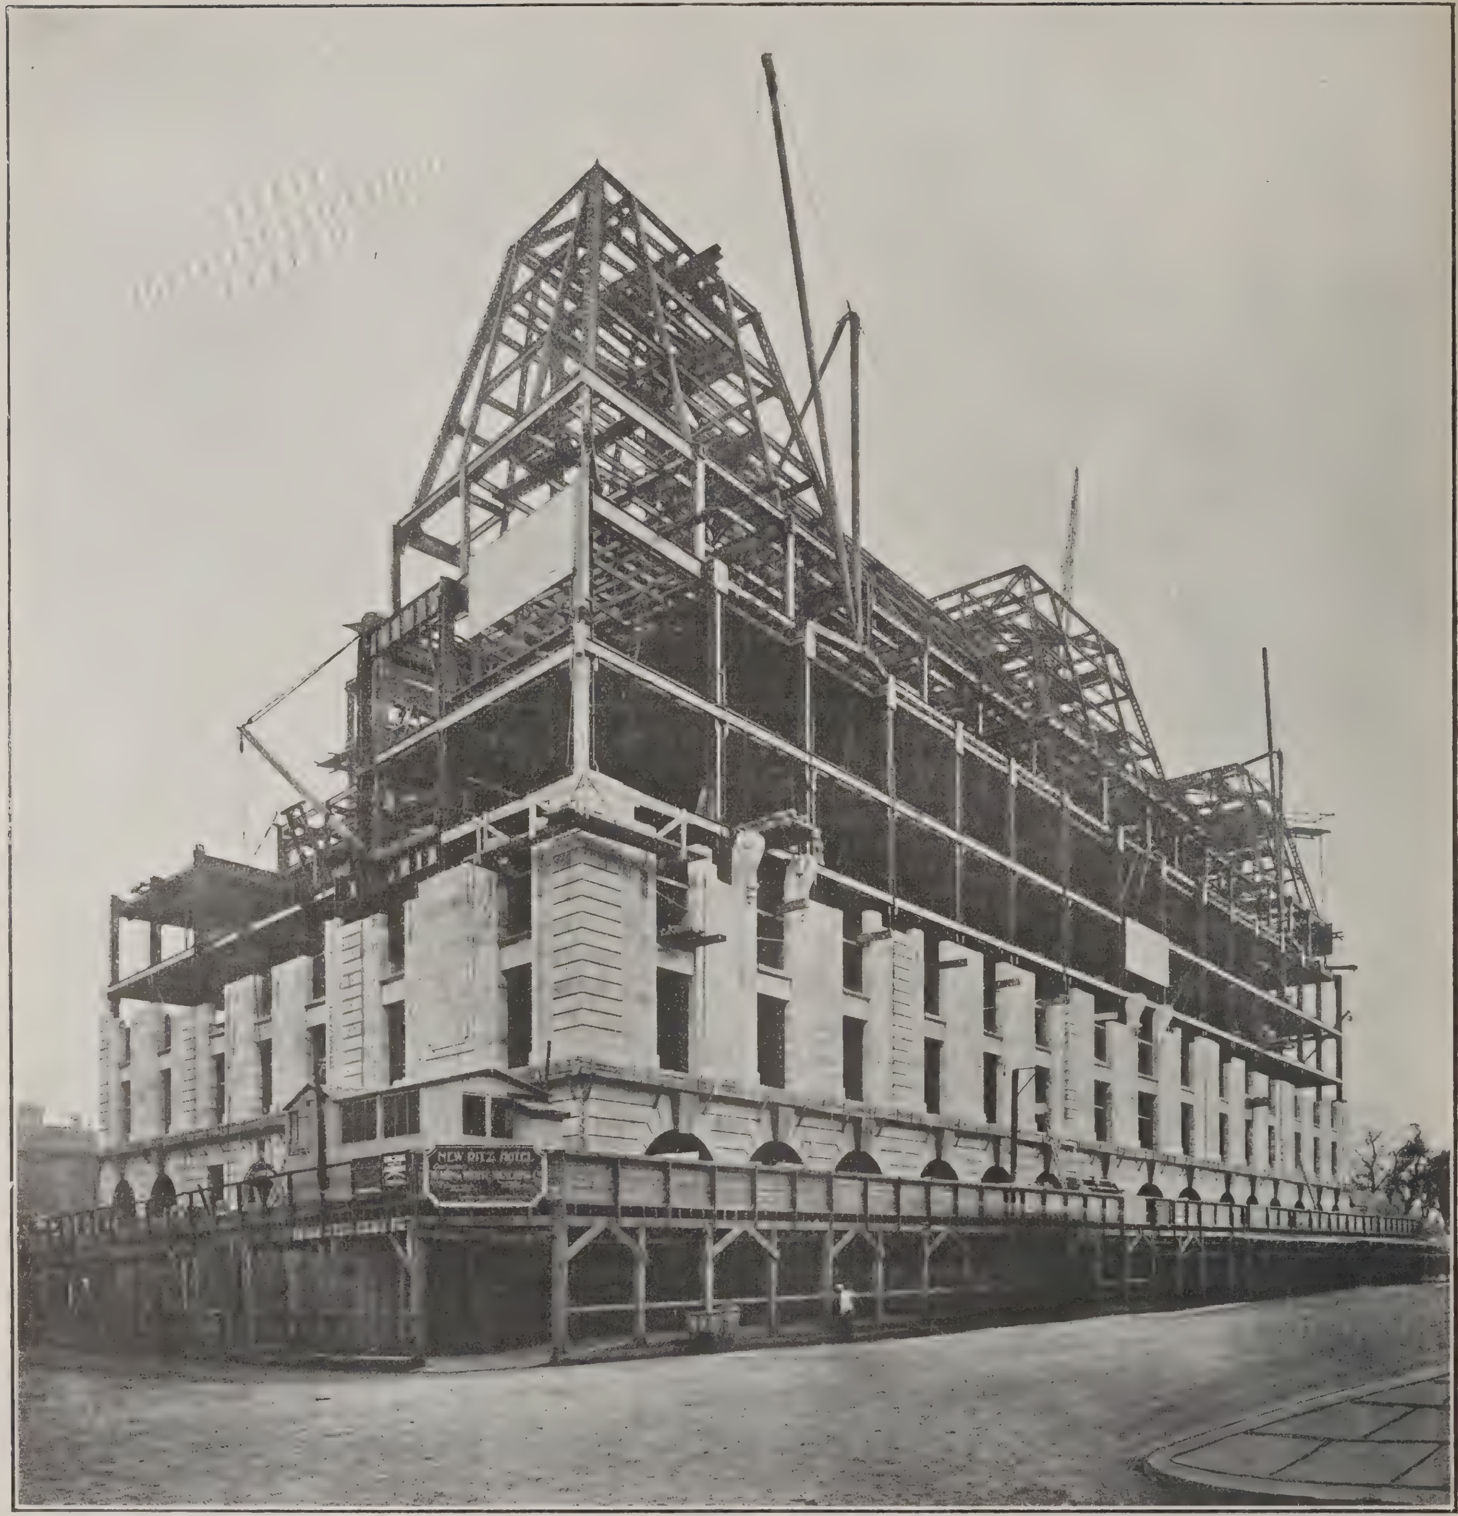
The London timber trade showed little change during March. (Page 188.)

Contractors' Deposits and Bribery. THE trial and conviction of the ex-town clerk of Holborn has drawn attention to the bribery and corruption that exists among public officials of municipal bodies, and the daily press is railing against details of the system of dealing with contractors which have been abused—such as deposits from firms tendering for contracts. Every system is open to abuse, and the only way to prevent this is to have adequate supervision. We cannot expect to have a system that will automatically safeguard against fraud. It is right, however, to insist that a system shall afford as few openings for fraud as possible, and criticism may be usefully directed to this end. Now the object of asking firms to deposit a sum which will be returned on receipt of a bona-fide tender before supplying them with bills of quantities and drawings is to save the expense of having to send copies to a large number of firms who do not tender. This precaution is a wise one, but it is only necessary where the expense of printing quantities, &c., is considerable. With most municipal contracts it is unnecessary because the contracts are only suitable for local competition, and the quantities, specifications, &c., are short and arranged in a regular form, and being printed it costs very little for a large number of copies. The modern appliances for cheaply taking copies of drawings, &c., such as the Mimeograph, Neostyle, photo-prints, &c., make the old precautions for limiting the number of copies supplied to contractors unnecessary except in a few cases. Thus the chances of contractors purposely never asking for the return of their deposits in order to get consideration from the all-powerful officials would decrease, while if the officials were made to account without delay for all deposits received it should effectually prevent any fraud. There are many malpractices in tendering familiar to contractors, and the employers' federations throughout the country ought to take steps to stop these by protesting against ill-advised clauses in conditions, &c. A corporate body can do so where a private contractor cannot without harming himself. Corruption should also be looked for among smaller officials. Where no cases of downright fraud exist many questionable transactions are carried on. It is easy to talk about the "callousness" with which many persons regard such transactions, as the judge said in this case of the ex-town clerk of Holborn, but we must make excuse for human nature, and the criminal fault lies with our municipal councils, who give a more or less educated man in a position of trust a wage no larger than a good craftsman earns—£2 10s. or £3 per week, without ever any appreciation of his honest efforts. Can it be wondered that surveyors, clerks, foremen, time-keepers and others sometimes fall under temptation? The remedy is to give them an adequate salary, with increases for good service and the study of economy, as a private firm would do. After all, there is far less corruption among the municipal officials of this country than in other countries abroad.

At Last a Site. AFTER so many years, the search for a site for London's county hall had almost become ludicrous, but last December the Council braced itself up for something decisive, and as the result of its instruction to the Establishment Committee there is now before it a definite proposal for the acquisition of a site beside Westminster Bridge, on the southern bank of the Thames. This site seems to be an excellent one, with many possibilities of fine architectural treatment, and we think the Council would do well to acquire it. The site itself is estimated to cost £600,000; the buildings, &c., £1,056,000; and the formation of an embankment (as in front of St. Thomas's Hospital), £44,000—a total of £1,700,000. The river-frontage is approximately 800ft. For the purpose of comparison we may mention that the frontage of Somerset House is about 550ft. The Committee remark that the river at this point runs nearly due north, and that the site being approximately parallel with the river, three façades would be respectively on the south, east and west aspects, thus obtaining the maximum of sunlight throughout. They suggest that the council-chamber and committee-rooms might be placed in the centre and grouped as a central feature, and in this position would be subject to a minimum of the external disturbing influences of traffic and noise. The advantage of the present scheme, compared with those previously submitted to the Council, is shown by the following table:—

Site.	Cost.	Area.
Parliament Street (1893)	£750,000 ...	About 2¼ acres.
Spring Gardens (1896) -	813,000 ...	,, 2 ,,
Adelphi (1902) - -	900,000 ...	,, 3½ ,,
Westminster Bridge (1905) - - - -	600,000 ...	,, 5½ ,,

The estimated expenditure on this suggested scheme is large; and in view of the huge undertakings the London County Council has at present on hand, it may meet with much opposition, but for our part we hope this great architectural opportunity will not be lost. Our civic spirit should surely be sufficiently stirred by such a prospect as to be willing to pay the piper. We should be able to carry out such a scheme as this; indeed there would be no doubt about doing so if the borough councils were less wasteful.



RITZ HOTEL, PICCADILLY, LONDON: GENERAL VIEW ON APRIL 1ST, 1905. MEWES AND DAVIS AND JOHN B. BISHOP, ARCHITECTS.

THE RITZ HOTEL.

WE give on this page a photograph of the Ritz Hotel taken on April 1st from the corner to Piccadilly and Arlington Street. The Arlington Street front of the building is much lower than the other, and the exterior wall is set back at third and fourth floors, rendering a relatively complicated framing necessary in order to properly support the pavilions, which are the highest parts of the building.

The method of supporting the set-back corner columns is illustrated by the photograph on the page opposite, which shows the support for the Arlington Street pavilion. On top of the column shown to the right rests a single-web plate-girder, the web being reinforced by two plates ⅜in. thick—one riveted on each side and extending part of the length of the plate-girder in order to take the shear caused by the load from strut or set-back column resting on another girder running at right angles to the Arlington Street building line, which girder is web-connected to the plate-girder.

The web reinforcing plates have milled edges to butt against girder-flange angles. The single-web plate-girder parallel to the Arlington Street building line, in addition to the vertical reinforcing plates, is strengthened by stiffener-angles 3½ins. by 3½ins. by ⅜in., riveted on each side of the web plate. These are milled at the ends so as to fit the flange of the girder. The distance between them is about 3ft., which is the depth of the girder.

The load is transferred from the web of the girder to the column (shown to the right in the photograph) upon which the greatest load is supported by means of vertical stiffener angles, riveted to the girder directly over the column, and a plate shop-riveted to the flange-side of the column in a similar way to a splice-plate, the upper end of this plate being field-riveted to side-connection angles shop-riveted to the girder. The vertical angle-iron on this same plate was riveted on in the shop so as to avoid the plate being bent during transportation. The plate-girder was made with single web in order to ensure good connections and concentric loading. The method for calculating similar girders will be dealt with in our columns later.

The compound-girder at right angles to Arlington Street, previously referred to, is composed of two 22ins. I-beams (German section: N.P. 55 cm.) and two plates ½in. thick, riveted on top and bottom flanges. This compound-girder carries the set-back walls from fifth to sixth floor, and also two set-back columns (one of which is shown to the right in the view). These set-back columns are not seated centrally on the compound-girder, and therefore have two vertical base stiffening-plates riveted on the flange side of the column in order to transfer the load equally to both beams and their webs, and also to stiffen the base-plates, which have holes for field rivets. Similar construction with girders to carry set-back walls and columns at the fifth-floor level is adopted all round the building. It is clear that the weight of steel required for the building is noticeably increased by the exterior walls being set back and so causing great concentrated loads on the cross-girders.

The sloping roof is carried on **I**-beams at the sixth-floor level. These **I**-beams also carry hip-rafters and rafters. The hip-rafters are made of two channels latticed, as may be seen from the two photographs reproduced in this issue. The beams are connected by means of top and bottom angle-iron brackets similarly to the columns.

The rafters are generally composed of two channels riveted back to back, with ⅜in. thick filler-plates between, placed some distance apart. At each floor level these filler-plates are made larger and form gussets on to which the floor beams are web-connected. This kind of connection also gives rapidity to the roof construction.

In each of the corner pavilions are placed water tanks, and the construction supporting them is, where necessary, braced by diagonal rods with turn buckles.

It may be added that all columns which carry light loads, as in the upper storeys, are made latticed similarly to the hip-rafters, the idea being to use a laterally strong section and at the same time a light section.

ARCHITECTS AND PUBLIC WORKS.

The "Times" supports the R.I.B.A. Memorial.

IN the "Times" of Thursday last a long article appeared on "Architects and Public Works," having for its subject the memorial addressed by the R.I.B.A. and its allied societies to about 1,500 county, borough and urban district councils throughout the Kingdom. The opinions set forth in this memorial are already known to our readers, having been fully dealt with in our columns, but the following remarks may be quoted from the "Times" as of interest and likely to have a good effect:—

It is a grievance that only in Bradford, Hull, Nottingham, Dublin, Aberdeen, Leith and Dundee is there a "city architect"; in many other towns duly qualified architects are not employed, the buildings being designed in the office of the surveyor or engineer. Now the surveyor and engineer, although highly-trained men in their own professions, are not trained in the knowledge of architecture. Many surveyors, no doubt, profess to combine with their legitimate business the practice of architecture, and are prepared at the same time, as has been said by Mr. Newton, to advise on light and air cases, easements, party-walls, perpetual and interim injunctions; will take out quantities, measure extras and omissions; in fact, do almost anything except architecture. For legal purposes an "architect" is a "surveyor," and he is dragged into cases to give evidence on points having no connection whatever with architecture; he may be a land surveyor, a developer of building estates, an arbitrator or expert on matters of building law, or a quantity surveyor. Such a combination is necessarily unfortunate, for the architect and the surveyor require each a different order of mind . . . .

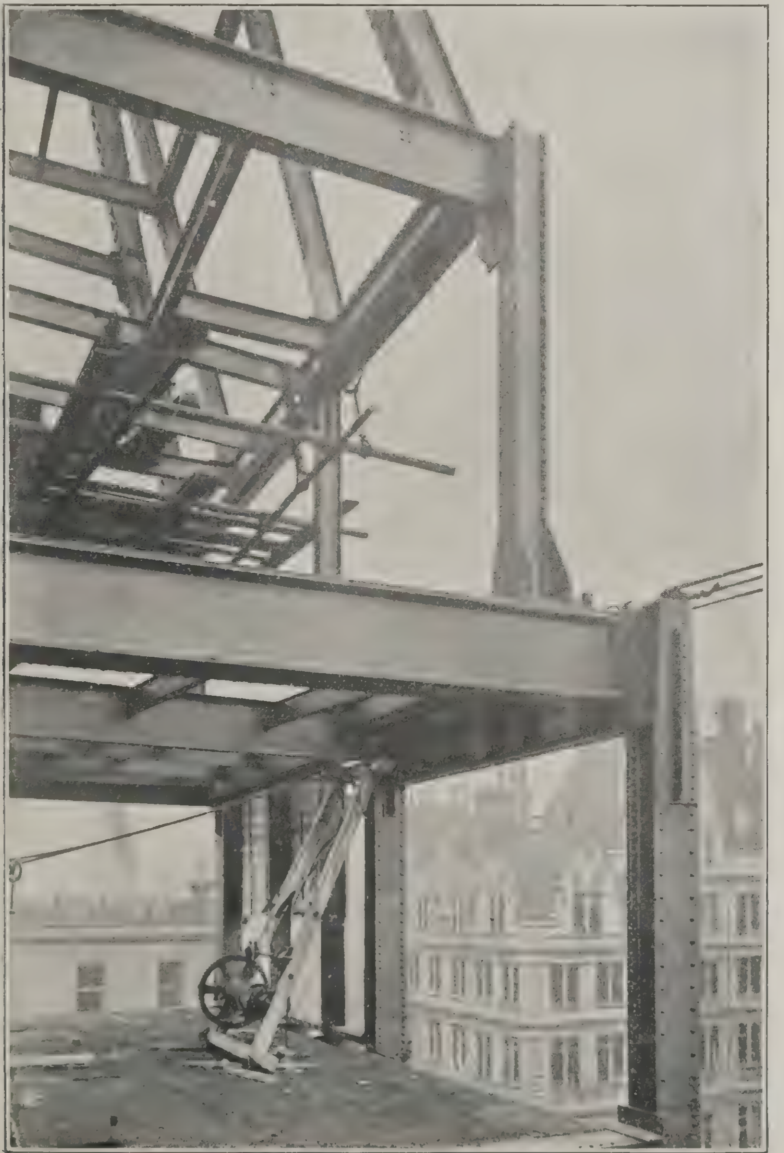
When an official architect's department is established the results are naturally better, but are by no means satisfactory, for the system encourages "stencil-plate architecture"; and there is none of that inducement to effort and originality which the spur of emulation inevitably brings forth.

What the Departmental Office should do.

There is a consensus of opinion that only unimportant utilitarian works, repairs and so forth should be carried out by the departmental office, and that all such buildings as technical schools, art galleries, public baths, municipal libraries and so forth, and certainly all buildings of a monumental character, should be placed in the hands of independent architects as the only means of obtaining variety and consistent effort; and, further, that there should be set a limit of cost beyond which work should not be carried out by an official. Some would place it as low as £500. The Birmingham City Council resolved some time ago that all work above £10,000 should be competed for—a rule which has not always been respected. In Sheffield, on the other hand, municipal architectural work is to a great extent being given to local private practising architects, with encouraging results. It should, however, be recognized as a general principle that no building is "unimportant," however small and inexpensive; and that it is desirable that even tramway buildings and gasworks offices should be in as good taste and as skilfully planned, to secure economy, as the most splendid pile in the centre of the city. In Leicester, broadly speaking, things are for the most part as they should be; the engineer builds the destructors and kindred works, and public buildings are given to independent architects; but Birmingham depends on its surveyor's department. In such towns as Wolverhampton and Brighton the evil system prevails, and it has produced lamentable results; and in Burnley within the past few months the large technical schools, involving very considerable outlay, have been handed over without hesitation to the borough surveyor . . . .

The Example of Bradford.

There is a good deal in the contention that under our system the creation of an architectural department involves, sooner or later, the creation of work for that department to do in order to keep its considerable staff working economically—that is to say, at high-pressure. Of the unpremeditated growth and encroachment of the "surveyor's department" we have a typical example at Bradford, where, before the setting up of the department, ordinary work was carried out by the city surveyor and important buildings generally by direct commission or by competition. When the department was established it was intended that it should deal with minor works only; at the present time an important extension work, involving £100,000, is being done by the city architect with the assistance of a London consulting architect. Furthermore, the School Board has its official architect, the board of guardians has its official architect, the largest industrial combination in the district has its official architect, so that there is little or



RITZ HOTEL: STEELWORK TO BASE OF PAVILION AT PICCADILLY AND ARLINGTON STREET CORNER.

nothing left to local architects to do except small and uninspiring work.

It is held, therefore, that the business of a department should be restricted to its proper functions—that is to say, to the management of Corporation property and examination of and report on building plans—so as to ensure due observance of the by-laws. It may be accepted that the prevailing system and lack of system is injuring, and will continue to injure, the architectural profession, and it will exclude the class of men most required to maintain and raise the standard of architectural achievement. It does not produce economical work, it cannot produce artistic work, and it is subversive of the interests of the individual, from whom the new thing and the original thing is invariably derived.

Builders' Notes.

Builders' Clerks' Benevolent Institution.—At the twenty-seventh annual dinner held last week at the Holborn Restaurant the secretary announced subscriptions amounting to £750, including 100 guineas from the president, Mr. James Carmichael.

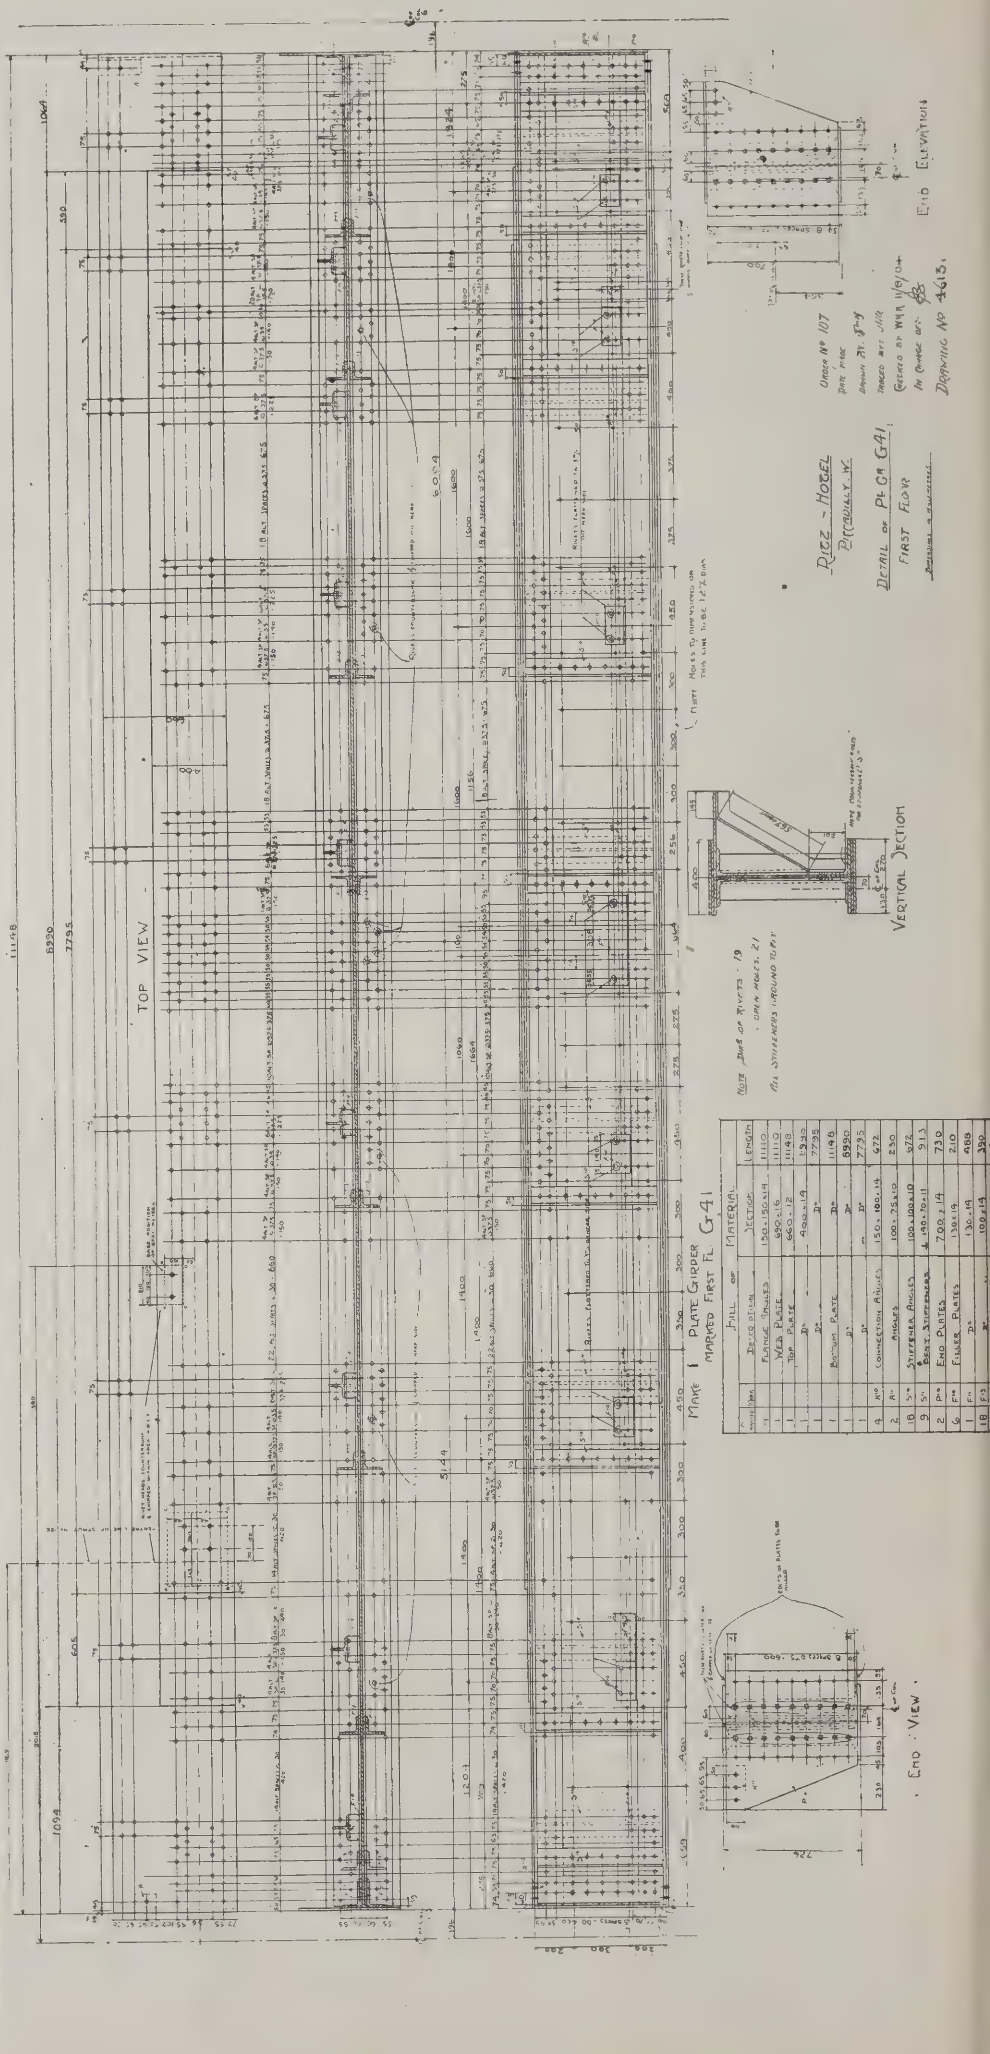
Leicester Building Trade Dispute Settled.—The difficulty with respect to walking boundaries and leaving-off time for the painters, joiners, bricklayers and builders' labourers at Leicester has been amicably settled, thanks to the conciliatory spirit of masters and men and the tactful mediation of Mr. Alderman Smith.

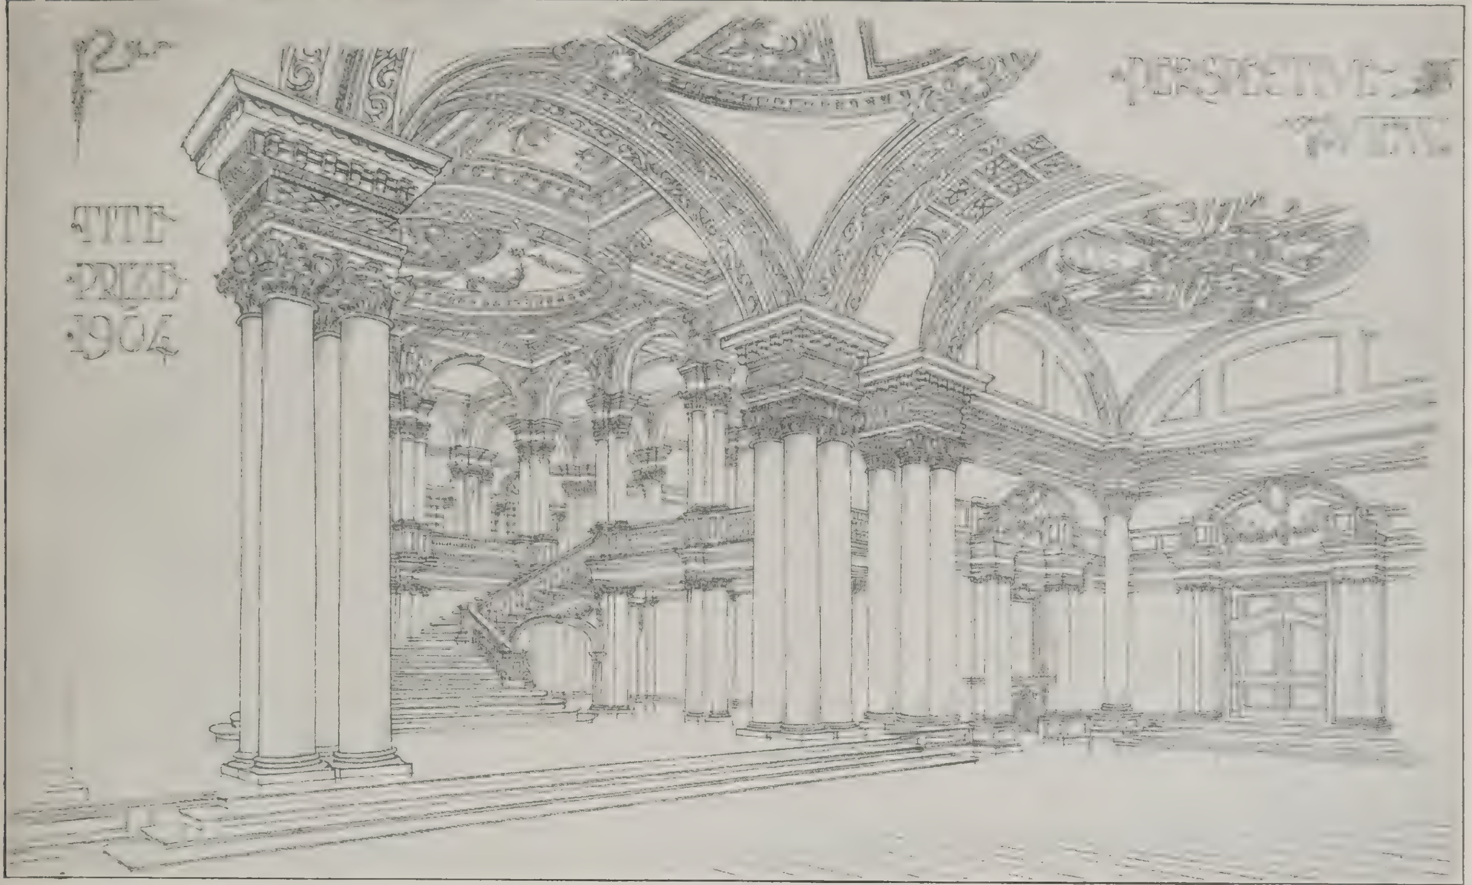
Carpenters' M.P.'s.—The final ballot of the members of the Amalgamated Carpenters and Joiners for the selection of three candidates to be run for Parliament at the general election has resulted as follows:—Councillor George Dew, L.C.C.; Mr. W. T. Wilson, Bolton; Mr. W. Walker, Belfast. Election expenses will be paid by the society, also a salary if returned to Parliament.

Notices of Reduction in Wages in the North.—The bricklayers, masons and plasterers of Sunderland have received from the masters notices of a reduction of 1d. per hour in their wages and of certain alterations in the working hours and conditions. At present the hours vary from 50 per week in summer to 41½ in winter. Similar notices have been given in the building trade on the Tyne and other districts. It is hoped, however, that the matter will be settled amicably.

The Workmen's Compensation Bill, amending and extending the Workmen's Compensation Acts of 1897 and 1900, was read a second time in the House of Lords last week. The Bill extends the Compensation Acts to all buildings irrespective of height or the use of scaffolding and machinery, laundries where steam power is used, workshops where more than five persons are employed, and to all persons employed in the care and management of horses and locomotives.

Severe Tests of a Warehouse.—Tests of abnormal severity were carried out last week at the warehouse in course of erection at New Bridge Street Station, Newcastle, for the North-Eastern Railway Co., inasmuch as no fewer than six goods trains may be at a time standing or running on the floors of this warehouse. The building is built entirely of reinforced concrete on the Hennebique system. The tests, carried out under the supervision of Mr. William Bell, F.R.I.B.A., architect to the North-Eastern Railway Co., assisted by Mr. A. Pollard, were conducted by Mr. T. J. Gueritte, C.E., who represents the patentee in the Newcastle district. Two beams, respectively of 28ft. and 35ft. span, were loaded with 205 and 257 tons of steel bars and rails. Under this load the deflection in the middle of the beams did not exceed ⅜in., and as soon as the process of





DESIGN FOR A LOUNGE TO A LARGE HOTEL, BY F. E. OSBORNE.

unloading was started the beams gradually recovered their original level. The tests were considered highly satisfactory.

Mr. James Barnes, one of the oldest and best known members of the Brighton building trade, died last Friday, aged 72. One of his chief works was the rebuilding of Aldrington Parish Church thirty years ago.

American Industry. — Speaking on this subject at the Royal Institution on Friday, Mr. Alfred Mosely, C.M.G., pointed out how close together the masters and the men were in America; the willingness of employers to listen to and pay for ideas originated by their men provided a brain-force that was ever working to improve the methods of manufacture. Moreover, piecework was the order of the day, and the men could rely on the prices not being "cut," the employer seeing that the more his men could turn out the better it was for himself.

Slag Cement.—The Dominion Iron and Steel Co., an important manufacturing corporation of Sydney, Nova Scotia, has formed a subsidiary organization under the name of the Sydney Cement Co. to manufacture cement from the slag resulting from their ordinary product. A capital of £100,000 has been subscribed, half of which is being spent on plant with a capacity of 500 barrels a day, and a coopering establishment is being added which will be capable of producing 50,000 barrels per annum. The quality of the manufactured material is said to be excellent, and the example of the Nova Scotia firm is to be followed by one of the chief Belgian companies.

Building Accidents in Glasgow. – Accidents to workmen employed in the erection of buildings in Glasgow have been so numerous that the attention of the Scottish Office has been called to the matter. Communications have been passing between the Secretary for Scotland and the Committee on the Building Regulations Act, 1900. At present the supervision and inspection of buildings in course of erection is carried out by inspectors in the Master of Works Department as part of their regular duties. For this purpose the city is divided into eight districts, and in each of these districts there is an inspector, and in some districts an assistant also. These inspectors, however, have many other duties, and it may be taken as a fair average to assume that they go into each building in course of erection in their respective districts about once per week. With this system of supervision the Master of Works considers that it would be impossible for the inspectors to deal with many of the matters submitted to them, especially where the scaffolding and gangways might possibly be shifted several times per day. A special sub-committee is enquiring into the whole matter.

DESIGN FOR AN HOTEL LOUNGE.

THE above design, submitted by Mr. F. E. Osborne for the Tite Prize this year, was planned with the idea of providing a lounge the whole length of which would not have to be crossed by guests entering the hotel and passing to the suites of rooms on the upper floors, thus destroying the seclusion of the greater part. The floor of the lounge being lower than the level of the ground floor, tends to make the grand staircase and entrances to the ball- and dining-rooms more imposing in elevation. The area of the lounge is 2,947 sq. ft.

THE TIMBER TRADE.

London Market in March.

THERE is little change to report in the London market for wood during March. The trade has been dominated by lack of demand, and this has prevented any improvement, in spite of a dock stock, which may be calculated at about 15,000 standards less than at this time last year; a low level of price which puts no obstacle in the way of consumption; an improving general trade and an obvious scarcity in many classes of supply.

Messrs. Churchill & Sim state that the reduction on the very moderate dock deliveries of last year amounts to no less than a further 3,000 standards for the month, and raises the total deficiency for the quarter to over 6,000 standards. The small additions to the overside deliveries tell us very little one way or the other. Prices for deal sizes have improved a little in the month, the stock of them in London being so small that sellers have been able to hold their own in a retail fashion. For nothing else is there much change except for prepared boards, which have fallen again sharply under pressure of a more than ample supply for a feeble demand. For wholesale business for further supplies from abroad, on the clearing of the ice, quotations are again depressed, Swedish shippers especially having eased prices whenever large business was possible, and it is long since buyers could fill any requirements on such favourable terms. Russian shippers have held steadily to previous quotations during March, and have effected a little business thereat, but have been hampered by cheap offers for resale by nervous buyers. Freights continue plentiful at a steady low level.

Messrs. Denny, Mott & Dickson, Ltd., state that there has been a slight all-round improvement in selling prices, and the attitude remains one of expectancy for broader and better business generally. Small traders have required a good deal of consideration to keep them going until the better times come; but last year's losses have been as a whole soundly regulated, and the timber trade is able and expectantly ready to take its share in the improvement in trade generally which is thought by many careful observers to have already begun.

The abstract of stock, consumption, &c., for March, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stocks.

The stock of wood in the public docks on March 31st was:—

	Pieces.
Foreign deals and ends - - -	1,167,000
Do. battens - - - -	2,024,000
Pine deals and battens - - -	1,113,000
Spruce do. do. - - -	879,000
Boards, rough - - - -	3,081,000
Do. prepared - - -	7,097,000

Totalling 15,361,000 pieces, as compared with 17,706,000 in 1904, 14,636,000 in 1903 and 16,878,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - -	195 pieces.
Do oak timber - - -	804 loads.
Do. fir timber - - -	692 do.
Do. Oregon pine, &c., spars and masts - -	4,596 do.
Colonial oak timber - - -	1,425 loads.
Do. birch timber and planks -	1,985 do.
Do. elm and ash timber -	735 do.
Do. yellow pine - - -	418 do.
Do. red pine - - -	243 do.
United States pitch-pine timber -	16,513 do.
Do. do. deals -	39,000 pieces.
East India teak - - -	7,621 loads.

The deliveries for the first quarter of the year have been—

	Pieces.
Foreign deals and ends - - -	860,000
Do battens - - - -	1,563,000
Pine deals and battens - - -	255,000
Spruce do. do. - - -	412,000
Boards, rough - - - -	1,759,000
Do. prepared - - -	3,693,000

Totalling 8,542,000 pieces, as compared with 9,434,000 in 1904, 10,552,000 in 1903 and 10,267,000 in 1902.

The deliveries for March were as follows:—

	Pieces.
Foreign deals and ends - - -	296,000
Do. battens - - - -	576,000
Pine deals and battens - - -	91,000
Spruce do do - - -	171,000
Boards, rough - - - -	659,000
Do. prepared - - -	1,327,000

Totalling 3,120,000 pieces, as compared with 3,599,000 in 1904, 3,630,000 in 1903 and 3,211,000 in 1902.

Deliveries from Ship to Craft for the first quarter of the year were:—

Deals and battens - - -	5,171 P.s.h.
Boards - - - -	2,303 do.

and for March:—

Deals and battens - - -	1,740 P.s.h.
Boards - - - -	1,011 do.

Soft Woods.

Swedish Deals.—Prices for these in London have been quite steady during March, but only piecemeal. They are now being quoted cheaply on cost, freight and insurance terms for prompt arrival, though only in quite moderate quantities. For all classes of battens there is no change to record. Prices for prepared boards shrank all round during March, consequent on a full competing arrival from the Norwegian ports.

Norwegian Boards.—The figures of the arrival of prepared boards during March are about three times those for March last year, and, although moderate enough in themselves, this has been quite enough to upset a nervous market. Prices have fallen freely, and it has been difficult to recoup cost for anything.

Russian Deals, Battens and Boards.—A large proportion of the remaining dock stock of deal sizes has been disposed of during March without much variation on previous quotations, and it has even been possible to mark a point upwards here and there for anything of satisfactory quality. For other sizes there is no change to report since February.

Finnish Battens.—There has been no change to report in the prices of Finnish battens in London during March. There is no pressure to sell them for arrival, and any that can be picked up are at very fully the equivalent cost of present values here.

Prussian Timber.—A small arrival of fir timber during March has been fairly treated, retail prices here showing a shade of improvement in sympathy with the decreasing dock stock of pitch-pine timber. The demand for oak timber was very disappointing during the month, and prices here for the moment look a good deal weaker. The political unrest in Russia, however, is reported to be affecting the usual purchases by the Prussian merchants in the interior of that country, and so far as that proves to be the case, must shut off future supplies to this and other more important markets.

Canadian Deals and Spruce.—Pine deals have been selling rather more freely in London during March, without further reduction of price. For spruce deals there is still no change to record here, though the larger outport markets are said to be responding freely to the enhanced cost quoted for the new season's supplies. For all Canadian hardwoods the London market remains inert; for yellow-pine timber some low prices have been mentioned during the month. The stock of sawn timber in London is reducing quickly, and is already lower than for some time past, while the position at the shipping ports continues to threaten a cessation of further supplies unless at altogether enhanced quotations. The London market, however, moves very slowly, and, in spite of an active demand, cannot be quoted at more than, say, a shilling a load over February rates. The importation of pitch-pine deals is much restricted, and what demand there is has had to be satisfied at a much better rate of price than was the case in February.

American Whitewood.—Logs, if large and prime, realize fair prices, but the demand is soon satisfied; planks and boards—stocks of unplaned wood are sufficient, but for planed boards there is a good demand.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., report that the landings in the docks in London during March consisted of 243 loads of logs and 231 loads of planks and scantlings, or a total of 474 loads as against 516 loads for the corresponding month of last year. The deliveries into consumption were 729 loads of logs and 411 loads of planks and scantlings—together 1,140 loads, as against 897 loads for March, 1904.

Figures give ample evidence of the abnormally short supplies of teak at the Indian shipping ports. The unprecedented high prices paid for some months past for fresh imports have failed to result in shipments of any importance; and holders on this side, while obtaining the enhanced prices without much difficulty, see their stocks dwindling—with no sound prospects of adequately replenishing them this year. Business, therefore, continues to contract, and there seems little hope of this market opening out until some estimate can be formed as to whether next autumn's outget from the Indian forests will be sufficient to give promise of a renewal at the commencement of next year of the ordinary supplies to Europe.

Mahogany.—Messrs. Denny, Mott & Dickson state that the demand has been fairly satisfactory, and the market has been generally sound during the first quarter of the year. Prices for good and sizeable logs have on the whole varied but little; but the undue proportion of small and inferior wood has been the weak spot in this market, although the position in this respect has somewhat improved. Messrs. C. Leary & Co. state that the general position of the market shows no change; the improved tone manifested at the beginning of the month has continued and the wood offered at auction met with good competition and well-maintained prices.

ABSTRACT OF STOCK, CONSUMPTION, &C., FOR MARCH.

STABILITY OF STANCHIONS.

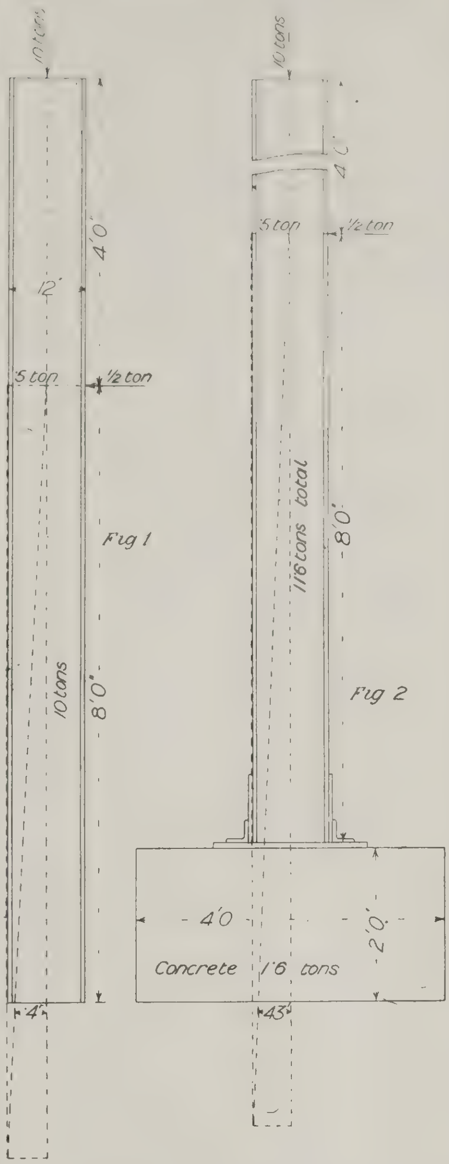
By HENRY ADAMS, M.I.C.E.

A CORRESPONDENT having enquired as to the method of calculating the stability of a stanchion when supporting a roof without being braced to it, and subject at the same time to wind-pressure from the roof and enclosure walls, the matter will be best explained by taking an example. Assume a stanchion 12ft. high, carrying a dead load of 10 tons axially and subject to a mean transverse load of ½ ton acting horizontally at a height of 8ft. This will be a case where a single rolled steel joist will probably be suitable. As there is to be no bracing, the stanchion must be considered as fixed at one end only and free at the other end, so that it will act as a cantilever, but this may be limited to one direction by building in the sides of the stanchion with brickwork. Then by Gordon's formula $p = \frac{f}{1 + \frac{a}{c} \times \frac{l^2}{d^2}}$, where p = safe load in tons per square inch on the given section; f = greatest intensity of stress in tons per square inch under working load (wrought-iron 4, mild steel 6); a = constant depending on condition of ends, both ends fixed = 1, both pivoted = 4, one fixed other pivoted = 2·5, one fixed other free as in this case = 16; c = constant depending upon shape of cross-section and nature of material, for mild steel stanchions, say, = 900; l = length in inches; d = diameter in inches in direction in which it is free to bend. Suppose the section selected for trial be Dorman, Long & Co.'s 8 × 4 × 19 lbs. r.s.j., with a sectional area of 7·3 sq. ins., and a strength-modulus of section of 18·31 sq. ins. in the direction of its depth. Then

$$p = \frac{f}{1 + \frac{a}{c} \times \frac{l^2}{d^2}} = \frac{6}{1 + \frac{16}{900}\left(\frac{120}{8}\right)^2}$$

= 1·2 tons per sq. in. The side thrust from wind will exert a bending moment of ·5 × 8 × 12 = 48 ton-inches, and the maximum stress produced by a bending moment is $p' = \frac{M}{Z}$, where M = bending moment in ton-inches and Z = strength-modulus of section in square inch-units, whence $p' = \frac{M}{Z} = \frac{48}{18{\cdot}31}$ = 2·62 tons per sq. in., which by itself exceeds the maximum stress that may be put upon the section. Try Dorman, Long & Co.'s 12 × 5 × 32 lbs. r.s.j., with a sectional area of 9·41 sq. ins. and a strength-modulus of section of 36·82 in the direction of its depth. Then $p = \frac{6}{1 + \frac{16}{900}\left(\frac{120}{12}\right)^2} = 2{\cdot}16$ tons per sq. in. total, and $p' = \frac{48}{36{\cdot}82} = 1{\cdot}3$ tons per sq. in. But the direct load on the stanchion is only 10 tons, which, with an area of 9·41 sq. ins. $= \frac{10}{9{\cdot}41} = 1{\cdot}06$ tons per sq. in., so that we have 1·3 + 1·06 = 2·36 tons per sq. in. from the combined loads, while the stanchion is capable of receiving 2·16 tons without the maximum stress exceeding 6 tons per sq. in. The difference is so slight that without going through the calculations again we may adopt the 12 × 5 × 39 lbs. section, which is the next available. Suppose, now, that the base plate is to rest upon concrete only, and that there must be a sufficient mass of concrete to resist overturning. The concrete (6 to 1 Portland cement) may be considered capable of bearing a maximum stress of 6 tons per sq. ft., so that a very small area would be necessary to carry the direct load, but the side thrust greatly increases the effect and due allowance must be made for it.

In the accompanying sketch, Fig. 1, it will be seen by the parallelogram of forces that the line of thrust passes 0·4 ft. beyond the axis. Then we have stress on concrete $S = \frac{W}{A} \pm \frac{M}{Z}$, where S = 6 tons, W = load in tons, A = area of base plate in square feet, M = bending moment 0·4 × 10 = 4 ton-feet, and Z = modulus of section = $\frac{1}{6}bd^2$, b and d being breadth and length of base plate. Then $S = \frac{10}{bd} \pm \frac{4}{\frac{1}{6}bd^2}$. Now let b the breadth of base plate = say 2ft., then $S = \frac{10}{2d} \pm \frac{4}{\frac{1}{6}2d^2}$ —or $S = \frac{5}{d} \pm \frac{12}{d^2}$. Assume d also = 2ft., then $\frac{5}{2} \pm \frac{12}{2^2} = 5\frac{1}{2}$ or $-\frac{1}{2}$; but S is fixed at 6 tons, so that 5½ tons per sq. ft. compression on the one edge leaves a slight margin, and ½ ton tension on the other edge is amply provided for by the holding-down bolts through the base plate. This fixes the base plate at 2ft. by 2ft. placed centrally at foot of stanchion, and assumed to be properly connected thereto by angles and gussets. The area of the concrete must be such that there is no tension, or tendency to lift on the inside edge, and the maximum compression at the outer edge must not exceed the supporting power of the earth. Let this be taken at ¾ ton per sq. ft., and try a block of concrete 4ft. × 4ft. × 2ft. weighing 32 cwts. = 1·6 tons. Then the resultant will pass 0·43ft. beyond the axis, and



$$S = \frac{W}{A} \pm \frac{M}{Z} = \frac{11{\cdot}6}{16} \pm \frac{{\cdot}43 \times {\cdot}5}{\frac{1}{6} \times 4 \times 4} = {\cdot}725 \pm {\cdot}002$$

= ·727 tons per sq. ft. compression on outer edge and ·723 tons per sq. ft. compression on inner edge, being just within the agreed limit of pressure. Full details of similar calculations for built-up stanchions are given in "Designing Ironwork," 2nd series, part ii. (Spon, 2s. 6d.), in which other allied cases, such as a stanchion placed at one side or one corner of foundation, are also dealt with.

Law Cases.

A Terra-cotta Contract.—At the recent Birmingham Assizes the case of *The Measham Terra-cotta Co., Ltd.*, v. *John Dallow & Sons* was heard. The plaintiffs are terra-cotta manufacturers of Measham, near Burton-on-Trent, and the defendants are builders, of Blackheath and Birmingham. The claim was for £266, balance of the price of goods supplied and work done. The case for the plaintiffs was that as sub-contractors in the building of a Congregational chapel at Nuneaton they supplied terra-cotta over and above the quantity specified in the contract, and that some of it was more elaborate in design than was indicated in the contract plan. The contract was to supply 1,780 cub. ft. of terra-cotta at 5s. 9d.; and £511 15s., less 2½ per cent. for cash, had been paid for work done under the contract. The dispute arose as to alterations in the detailed plans made by the architects, Messrs. Ingall & Sons, of Birmingham, and the inclusion of two memorial tablets, two corbels and certain figure-work as extras. It was contended by counsel for the plaintiffs that the alterations involved the making of new moulds and that the work was more elaborate than in the original plans.—The defendants denied that they ordered the extra work, and also contended that the alterations made in the plans by the architect made the work easier for the plaintiffs.—The judge decided in favour of the defendants on the ground that there was only one contract, and that was for 5s. 9d. per cubic foot.

The Design of Suburban Houses.—Judgment in the case of *Runtz & Ford* v. *Baker* was delivered by Mr. Justice Wills on March 31st in the King's Bench Division. Mr. Danckwerts, K.C., and Mr. E. M. Pollock (instructed by Messrs. Edwards & Cohen) appeared for the plaintiffs—architects, of Walbrook—and Mr. Dickens, K.C., and Mr. Francis Watt (instructed by Messrs. Webster & Webster) for the defendant, a surveyor, of 62, Coleman Street, E.C. The defendant was desirous of erecting some artistic suburban properties at East Finchley, and certain houses were pointed out to the plaintiffs as possessing internal arrangements which the defendant desired. The defendant did not want to spend more than £1,000 to £1,200 per pair, but Mr. Runtz stated that he pointed out to the defendant that the houses would cost more than this figure. Several sketches and sets of plans and drawings were prepared by the plaintiffs and submitted to the defendant, which he desired modified in certain particulars; then the quantities having been got out, tenders were invited from different builders, the lowest received being for £2,250 per pair. The result of the tenders was made known to the defendant, who objected to the amount required for building the houses, and various conferences took place between the plaintiffs, the defendant, the defendant's builder (Collins) and the quantity surveyors with a view to reducing the cost of the houses, and a list of suggestions prepared by the quantity surveyors and the builder which would reduce the cost to about £1,640 was submitted to the defendant, but apparently no decision was arrived at. The plans and drawings were afterwards returned by the defendant to the plaintiffs with an intimation that he did not require them. Some time afterwards the plaintiffs had their attention called to the fact that five houses had been erected on the land at Finchley, and it was found that the houses as erected were practically identical with those designed by the plaintiffs, and they therefore claimed a proportionate part of the agreed fees, which the defendant declined to pay. Expert evidence was called on both sides. In summing up Mr. Justice Wills said the artistic designs of the plaintiffs had been used in erecting the houses, though the modification that had been executed for the defendant deprived them of much of their beauty. The jury returned a verdict for the plaintiffs for £140, with costs, this sum to include quantity surveyors' fees.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

Prior to the ordinary meeting, a special general meeting was held for the purpose of adopting the committee's proposal to substitute "council" for "committee" wherever it occurs in the constitution or by-laws of the Association.

Mr. Reginald Blomfield, A.R.A., was elected a member of the Association—a very welcome election, which Mr. Dawber said would be a great aid to their work—and Messrs. C. B. Bone, F. A. Whitwell and P. A. Nash were reinstated.

Further donations to the Building Fund were announced as follows:—

	£	s.	d.
J. H. Squire (further donation) - -	5	5	0
Hugh Stannus do. - -	5	5	0
Stanley Hamp do. - -	3	3	0
C. Rene Harrison - - - -	1	1	0
Leslie T. Moore - - - -	1	1	0
Sundry small donations - - -	1	1	0

The president stated that £3,000 was still required, less £1,000 kindly promised by a generous donor.

It was announced that the annual dinner would be held at the Criterion Restaurant on Thursday, May 18th, at 7.30 p.m. Tickets, price 5s. members, and 7s. 6d. non-members.

The election of officers was announced. The scrutineers stated that they had examined 479 voting papers (twenty-three of which were rejected as invalid), with the following results:—

President.—E. Guy Dawber.

Vice-presidents.—John Murray (317) and Louis Ambler 303).

Committee:

R. S. Balfour (361).
A. Needham Wilson (358).
Henry T. Hare (356).
Arnold Mitchell (311).
J. S. Gibson (296).
W. A. Pite (282).
J. MacLaren Ross (277).
E. A. Rickards (266).
J. B. Fulton (264).
Maurice E. Webb (212).

A paper on "The Buildings of the World's Fair at St. Louis, 1904," was then read by Mr. H. Phillips Fletcher, F.R.I.B.A.

As these buildings have been already described and illustrated in our columns, we only propose to give Mr. Fletcher's general remarks.

After referring to the object of the exhibition—to commemorate the centenary of the purchase (at the price of £3,000,000) of the Louisiana Territory by the United States Government from Napoleon, which greatest deal in real estate more than doubled the area of the original States—Mr. Fletcher described the general plan, which somewhat resembled an open fan and was originated by a committee of some seventeen architects who were partners in nine prominent American firms.

Site Excavation: Track: Roadways.

In preparing the site for the buildings about 2,000,000 cub. yds. of earth were moved, and to facilitate the construction and the housing of the exhibits, fifteen miles of temporary track had to be laid through the grounds.

Burnt ballast, gravel, macadam, asphalt and brick were the materials used in making the fifty-five miles of roads; oak scantlings 10ins. by 3ins. thick being used in the kerbing.

For the main sewerage the exhibition authorities laid down twelve miles of 8in. vitrified pipe sewers and about 1¼ miles of brick sewers.

Wood in lieu of Steel.

In constructing the buildings a new departure was made in constructing them of timber in lieu of steel, by reason of which a great saving in cost was effected. Ample opportunities were thus afforded to the architect of studying this the greatest example of the art of carpentry ever executed, since most of the construction was visible internally, owing to lack of funds to complete the plastering.

Only forty draughtsmen were employed to prepare the drawings for the buildings, the designing and erection of the same occupying two and a half years.

The Timber used and Stresses taken.

Long-leaf yellow pine was used for all posts, roof-trusses and framing. The safe tensile strain was taken at 1,800 lbs. per sq. in., the safe compression perpendicular to the grain 809 lbs. per sq. in., the safe shearing stress parallel to the grain 150 lbs. per sq. in. In the white oak keys the safe stress parallel to the grain was taken at 400 lbs. per sq. in.

Walls.

The walls of the main buildings were 2ft. thick. Steel and wood lathing was used to carry the "staff," which was composed of 2 parts of plaster-of-Paris and 1 of Portland cement, to which Manilla or jute fibre was added, all mixed together with water till in a plastic state.

This composition was either applied direct to the laths or expanded steel sheets, or was cast into moulds, and, when thoroughly dry, nailed to the framed walls. When cast it could be sawn and planed in the same way as wood. It was alleged to withstand the weather if painted, but Mr. Fletcher said it did not.

White Oak Keys

of circular cross-section were used throughout the construction in the following cases:—

(1) To make the shear connections between the individual posts of built-up columns (subject to direct compression and bending strain).

(2) To make all tension splices of jointed timbers break joint wherever they occurred.

(3) To make all attachments to posts and trusses where a force parallel to these members had to be transmitted to them.

These keys, 2ins. in diameter, were driven into holes bored after the individual timbers had been bolted together. When the keys were all in position the bolts were tightened up. The advantage of circular keys was evident from the great saving of expense by their adoption, as but little labour was necessary; they were also speedily fixed in position, and the certainty of uniformity in their fit was certain, since the holes were bored with augers operated by compressed air. The disadvantage in practice was found to be that when the timbers shrunk these timbers could not be tightened up, and in some cases they fell out and did some damage to exhibits beneath. Life and limb being held so cheaply in the States, one must not stop to enumerate the accidents that occurred to the mere public therefrom.

Square keys used as folding wedges were undoubtedly superior, since they could be tightened up; and, moreover, the pressure of the shearing strain did not develop a component laterally, as with the round keys. Doubtless, therefore, these latter would have been adopted if the buildings had been required for any considerable length of time.

The Roof-Trusses employed

were mostly of the familiar Howe type, the span of these varying with the requirements of the different buildings. The main columns measured 14ins. by 3ft. 8ins. on plan, and were composed of two posts 10ins. by 14ins. and one post 8ins. by 14ins., with two sets of packing pieces between 8ins. by 14ins. The columns supporting some of the smaller roof-trusses were composed of two posts, 12ins. by 14ins., with one set of packing pieces of similar scantling between them. Numerous oak keys, as already described, were employed in transmitting from post to post the stresses which these columns were subject to.

The Roofs

were mostly flat, except where architectural effect necessitated them being otherwise, and composition roofing was the chief covering used. The buildings were chiefly lighted by means of skylights, clearstories and lanterns, or "monitors," as the last-named are called in the States.

The Commission of Architects fixed a uniform cornice level of 60ft. above the adopted ground level for the main buildings. This cornice level was, therefore, about equal to the height of the two orders to the banqueting house, Whitehall, and might give some idea of the scale employed.

Discussion.

A discussion followed, in which Colonel Watson (British Commissioner), Mr. Longden, Mr. Collard, Mr. Banister Fletcher and Mr. Dawber took part. Colonel Watson said the buildings were very magnificent outside, but inside the lighting left much to be desired; there was too much light in some places and not enough in others, with the exception of the Agricultural Building (by Mr. Masqueray), which was 1,700ft. long and from an exhibition point of view was the most successful internally. It was at night-time, when the innumerable electric lamps were lighted, that the effect of the buildings was best; then, indeed, the sight was wonderful. As to the oak dowels used for binding the timbers together, these became a source of real danger when they fell, and they did serious damage to some exhibits. Screw bolts would have been better.

Mr. Collard made special reference to the "staff" or fibrous plaster used. He championed this material, affirming that it was most permanent if painted and kept beyond the reach of people kicking or poking it with their umbrellas. Work which had been done with it at Earl's Court ten years ago—with a coat or two of paint every year—was to-day as good as ever. There was no decay. As to the binding material used, at Earl's Court hay had been employed by the Belgian plasterers and it proved excellent. Altogether as many as 1,000 plasterers were working there at one time, of all nationalities, and Mr. Collard said he found the Belgians to be the quickest and cheapest. Speaking of the cost of exhibition buildings, he said that the Empress Theatre at Earl's Court, including seating for 7,000 to 10,000 people, machinery, brickwork blocks for performers, &c., worked out at 2d. per ft. cube. The ordinary temporary buildings averaged from ¾d. to 3d. per ft. cube.

Mr. Banister Fletcher contrasted the St. Louis Exhibition with those of Paris, where he said the idea had been to do something novel; and it seemed a great pity that at St. Louis a similar motive had not prevailed. At Paris iron and terra-cotta were the materials used; at St. Louis all was of timber, and he thought something might have been made of that fact by an endeavour to evolve a timber architecture.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

Approval of Plans by Local Authorities.

SCARBOROUGH.—F. A. T. writes: "Your answer to my enquiry on p. 136 of your issue for March 15th does not deal with the power of a local authority to approve plans conditionally. I think it is a strong point as to whether they must reject or approve. I should like to hear your views on the subject."

Section 158 of the Public Health Act, 1875, plainly gives the sanitary authority no power of conditional acceptance of plans. They must either be approved or disapproved within one month. It may also be useful to point out that a local authority empowered to make by-laws for the regulation of buildings within its jurisdiction has no power to sanction plans in contravention of by-laws properly made. F. S. I.

Stresses in Roof-Truss.

STREATHAM.—P. F. writes: "Please give the stress diagram and show direction of lines of reaction for the truss of which tracing is sent. The point of difficulty is the effect of the free and fixed ends."

This truss has other difficulties besides those found by querist. Fig. 1 shows frame diagram of the truss with wind on one side and the foot of truss on that side free to move, the other foot of truss being fixed. Draw the load-line, Fig. 2, 1 to 10, 10 to 10*a*, and 10*a* back to 1; select a pole, draw vectors, and parallel to these draw funicular polygon in Fig. 1 to obtain point 11 in Fig. 2; then proceed with the stress diagram. All goes well until point 15 is wanted; there are then various methods that may be adopted. One of the best is to alter the trussing in the frame diagram temporarily by putting substituted members, as in Fig. 3. Then 4*a* — 14*a* fixes point *a* in stress diagram, 5*b*—*ab* fixes point *b*. The *b* will be 17, 4—16 will pass through *a* cut off by 17—16, and 14—15 will pass through *a* terminated by 18—15. The truss being fixed on one side only, the horizontal thrust will be equal to the horizontal component of all the inclined forces, and the free side being next the wind the truss will tend to close up. If, on the other hand, the truss is free on the side furthest from the wind, the truss will tend to spread more. In practice the truss may be fixed on one side only, but the wind may be one side or the other. Taking the wind on the opposite side, the frame diagram will be as Fig. 4 and the stress diagram as Fig. 5. Fig. 3 will apply equally to this case. Then, for the design a table must be drawn up as shown above, and the scantlings calculated from the maximum stresses.

HENRY ADAMS.

Ordnance Surveyors.

ORPINGTON.—ORDNANCE writes: "(1) Is it possible for a person like myself, having had a training in an architect's and surveyor's office, with an average knowledge of surveying, to obtain a position as surveyor on the Ordnance Survey? (2) What extent of surveying knowledge is required? (3) What salaries are paid?"

The major portion of the Ordnance Survey work is performed by the Royal Engineers, and the opening for civilians has never been a great one. The work of the subordinate surveyors is almost purely mechanical, and the pay but small. I much doubt whether at the present time civilians are engaged for this purpose, but you might address a letter of enquiry—on foolscap paper—to the Director General, Ordnance Survey Department, Southampton. F. S. I.

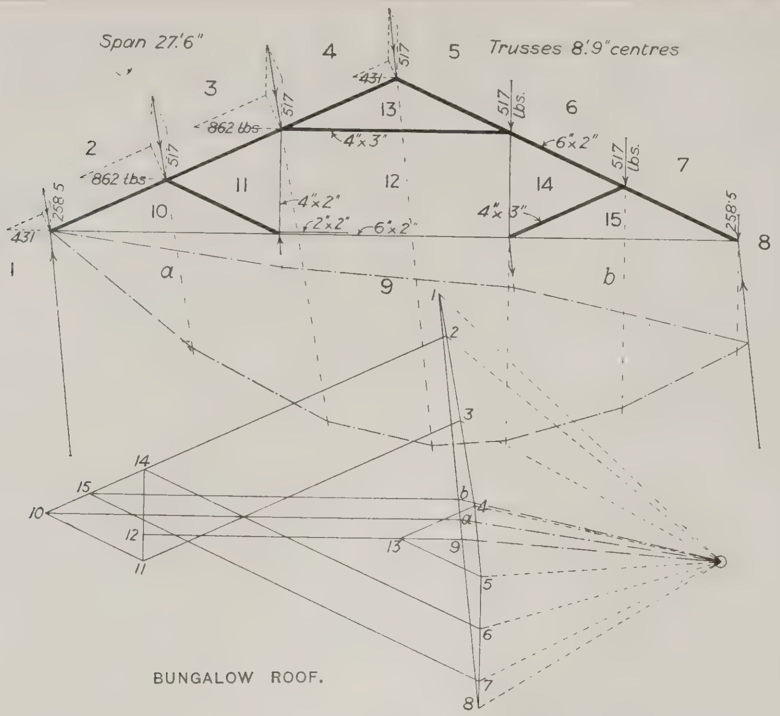
Woodsome Hall, Yorks.

OLDHAM. — SUBSCRIBER writes: "Please give particulars of Woodsome Hall, Huddersfield."

Woodsome Hall is the property of the Earl of Dartmouth. The house is built around an inner court, and the ground plan is given in the "Yorkshire Archæological Journal," vii. 509. The date is generally supposed to be the sixteenth century and additions in 1600. John Kaye probably built the oldest parts of the house before 1500, but the bulk was rebuilt or re-faced about 100 years later. M.

Valuation of Pipes.

C. B. writes: "I have been asked to value the interests of a private company in the pipes and other materials belonging to them, which are to be taken over by the local authority, and am in some doubt as to the principles which should guide me in the valuation. Of course a good deal depends on the state of the pipes when examined, but, besides that, there must be a limit to



BUNGALOW ROOF.

the life of all plant. How would it do to ascertain the value of the various pipes, &c., as new, and deduct a percentage for every year the plant has been in use, extinguishing the whole value in, say, thirty years? Is there any literature dealing with the valuation of such subjects and laying down the principles on which such work should be done? Reports of contested valuations must exist, as the question must have been often debated. Where and how can those reports be obtained?"

Local circumstances may alter the case, but, speaking generally, cast-iron pipes laid in the ground will last fifty years, and their deterioration will be fairly constant throughout that time; therefore, a deduction of 2 per cent. off the prime cost, including cost of laying, for each year they have been in use would be about a fair result. Information as to the general principles of such valuations will be found in Matheson's "Depreciation of Factories and their Valuation" (Spon, 6s.) HENRY ADAMS.

Bungalow Roof.

NOTTINGHAM.—SCANTLING writes: "Will the scantlings shown on the accompanying sketch (not reproduced) be satisfactory for a bungalow roof-truss, the roof being covered with Italian iron, 24 gauge? The ceiling joists of the 14ft. 6ins. span room are stiffened by a 6ft. by 2ins. purlin, which takes support from the tie-beam and the two walls."

The arrangement would not be satisfactory; the nearest approach to it is the truss with stress diagram, shown above. Although apparently an ordinary queen-post truss, it has some support from partitions below. This is the very lightest truss that can be recommended even for galvanized iron roofing, and the addition of an inch to the thickness of all the members would not be extravagant. HENRY ADAMS.

R.I.B.A. Examination Fees.

DORSET.—A REGULAR READER writes: "What are the fees for the examinations of the Royal Institute of British Architects?"

Preliminary, £2 2s.; Intermediate, £3 3s.; Final, £4 4s.

Book on Electric Batteries and Motors.

SOUTH BANK.—W. S. A. writes: "Please name a book dealing with electric battery making for lighting purposes, also the constructing of motors and dynamos."

"Guide to Electric Lighting," by S. R. Bottone, 1s.; "Electric Motors" (S. R. Bottone).

Keystones.

A Memorandum on the Planning of Buildings for Technical Classes has been issued by the Board of Education.

For the new Library at Wrexham more than one hundred designs have been received. Mr. Willink is the assessor.

Prof. Beresford Pite has been nominated by the assessor (Mr. John Belcher, A.R.A.) as architect for the branch library at West Islington.

Rochester Technical Institute Competition.—The Competition Reform Society is pleased to state that the conditions in this competition have been revised, and now recommends the same as satisfactory.

A new Building Department at the Leeds Institute will come into operation next session. It will be under the direction of Mr. James Neill, teacher of building construction at the Institute.

Ghizeh Pyramid struck by Lightning.—On April 1st the minor pyramid of Ghizeh was struck by lightning slightly below the apex. Several of the immense stone boulders of which the pyramid is built were dislodged, and rolled down with a terrific crash on to the sands below.

Scarborough's new Marine Drive.—The report of Mr. James Walker, engineer to the River Tyne Commissioners, states that the new sea-wall at Scarborough was very severely shaken by the gale of January 7th and is at present in the first stage of disintegration in the section—about 540ft. in length—near the north end, and unless this section is at once thoroughly strengthened a severe storm may cause an actual break in the wall. Mr. Walker suggests, therefore, the construction of buttresses in concrete at an estimated cost of £8,000.

The Ancient Temples of Great Zimbabwe.—Mr. Richard N. Hall, F.R.G.S., lectured at the Regent Street Polytechnic and the Society of Arts last week on the ancient temples of Zimbabwe (Rhodesia), the existence of which seems to have been forgotten from mediæval times until 1868, and really not treated seriously by European archæologists till Dr. Karl Mauch examined them in 1871. The walls are of granite blocks without mortar or cement, and one peculiarity is that each has a batter back on both faces. It is believed that they date from 1100 B.C., or possibly somewhat earlier.

Competition for new Council School, Accrington.—The first premium (£50) has been awarded to Messrs. Fairhurst & Holt, of Blackburn, Manchester and Liverpool; the second (£25) to Messrs. Shaw & Vowles, of Burnley; and the third (£10) to Messrs. Sproat & Clayton, of Burnley.

The Transporter Bridge at Runcorn is now complete. The car, in addition to holding 300 passengers, takes traps and vans, and will accomplish the journey across the Mersey in $2\frac{1}{2}$ minutes. Its travelling weight is about 130 tons. The bridge has occupied about four years in building and has cost £130,000.

Spoiling Carisbrooke Church.—On behalf of the Society for the Protection of Ancient Buildings Mr. John Hebb, F.R.I.B.A., protests against the revived proposition to add a new chancel to the parish church at Carisbrooke as a memorial to the late Prince Henry of Battenberg. It is urged that the addition would spoil the appearance of the church, and is not needed for Divine worship.

Glasgow Technical College Architectural Craftsmen's Society.—At the ninth annual business meeting held last week the office-bearers for the ensuing year were elected as follows:— Honorary presidents, Professor Gourlay and Mr. W. H. Baxter; president, Mr. Colin Sinclair; vice-presidents, Mr. G. Herbertson and Mr. A. Wagstaff; secretaries, Mr. A. L. Currie and Mr. J. C. Reid; treasurer, Mr. D. Skinner. A strong and representative committee of fourteen was also elected.

The University College Architectural Society, which has recently been formed, held its first meeting on Thursday last, when Mr. B. O. Fricker read a paper on glass and its application to domestic glazing. The meetings will be held fortnightly, and all the papers will deal with practical subjects. The next paper will be by Mr. E. J. Fowler on "Architectural Leadwork," to be followed by one by Mr. A. C. Hobbs on "Reinforced Concrete." The secretary of the Society is Mr. E. J. Whitley.

The Aberdeen Art Gallery, opened on Saturday by Sir George Reid, is the outcome of a desire for a thorough teaching collection of casts arranged to show the history of sculpture from the Egyptian period. Examples of Assyrian, Greek, Græco-Roman, the schools of the Italian Renaissance, and French and German sculpture have been obtained, and a special court of Celtic work and a section for lettering have been set out. The total cost of casts and fittings has been £3,500, given by 160 subscribers, mostly citizens of Aberdeen. The architects of the building are Messrs. A. Marshall Mackenzie & Son.

Tibetan Architecture.—Speaking at the Royal Institution last week on "Tibet," Mr. Percy Landon, who accompanied Col. Younghusband's recent expedition, said that in architecture and art the Tibetans had been less affected by outside influence than any other nation. Their ignorance in some ways was extraordinary. They thought that the world was shaped like a shoulder of mutton, and that their country occupied about half the world's area. They had not realized the principle of the wheel or the arch, but, curiously enough, thoroughly understood the cantilever principle in their bridges. Their style of architecture was curiously like Switzerland, and they adopted the same method of placing large stones on their huts to keep the roofs from being blown off. Some of the walls of their forts had faggots piled on them in the form of a frieze. The most lasting impression he took away with him was of the "golden" roofs of some of the principal buildings of Lhasa. They were really of copper, and the glitter from them could be seen for many miles.

Correspondence.

Hagioscope at Stogumber Church.

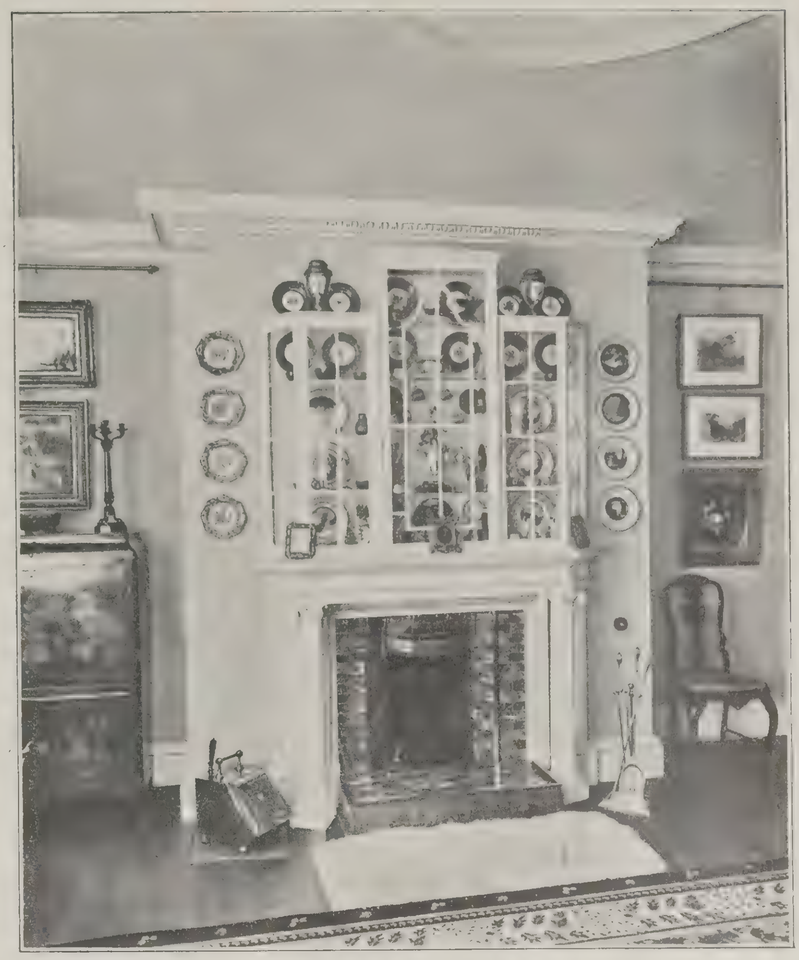
To the Editor of THE BUILDERS' JOURNAL.

SIR,—"G. A. T. M." in answering an enquiry about the above on p. 177 of your issue for last week infers that a Catholic would not participate in the Mass if he could not see the Host. This is not the case. It is only necessary to be one of the congregation to assist at Mass; just as I might truly assist at a Coronation in Westminster Abbey although, through being crowded into some corner, I were unable to see the royal personage. When it is impossible to see the altar and follow the Mass in that way, the worshippers are informed of the approach of the most solemn parts of the Mass by the ringing of a bell; nevertheless piety suggests that the altar should be seen if possible; hence the hagioscope.—Yours truly,

PORTSMOUTH. R. J. JENKINS.

THE LADY ARCHITECT.

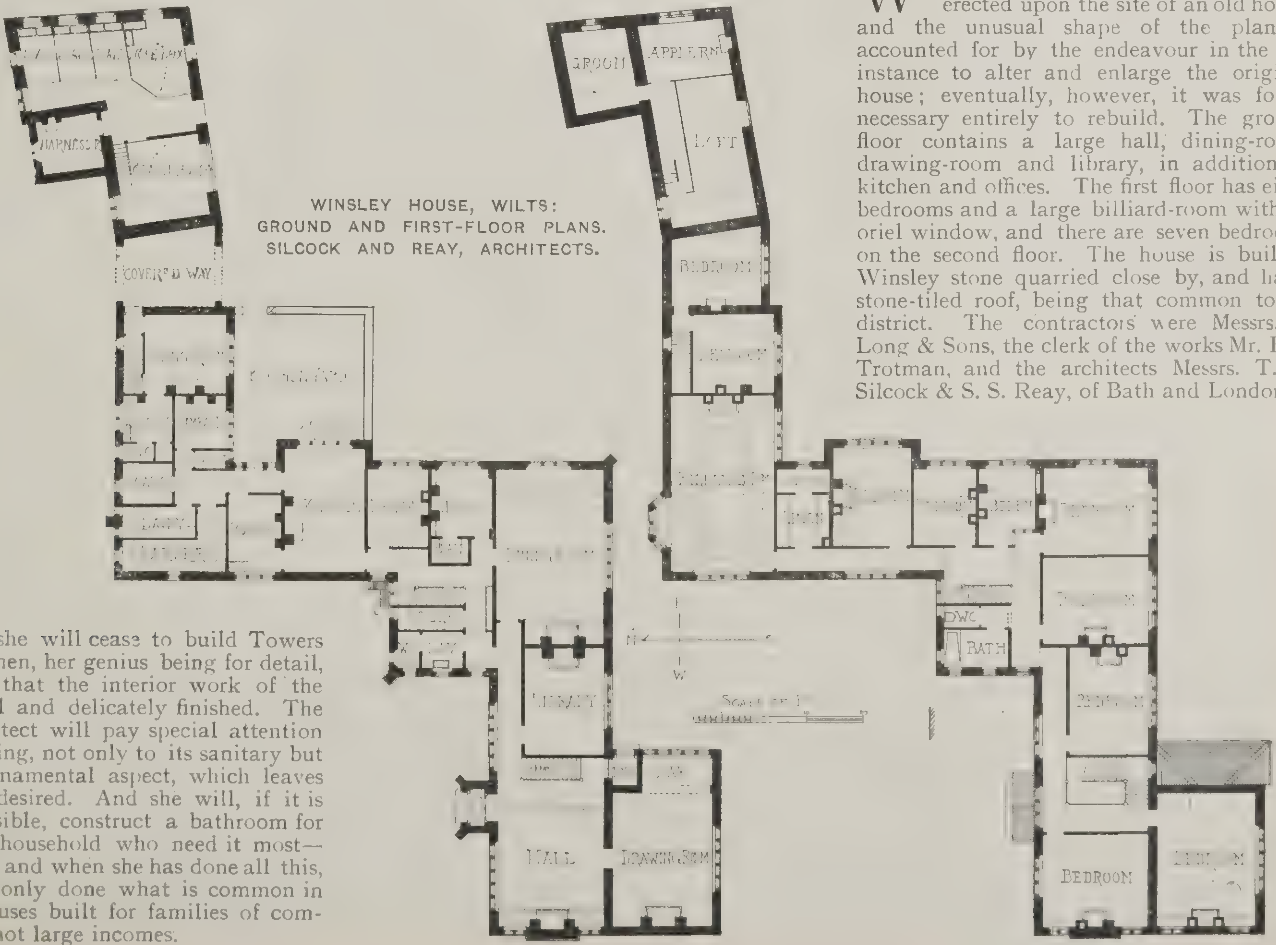
WRITING on architecture as a profession for women, Mrs. John Lane says in the "Outlook":—A woman has intuitions, and when she really does not know, it is her proud boast that she can guess, and, surely, that does quite as well. When she builds a house she will feel it, as a poet does his poem. She will put herself in the place of that other woman whose destiny it is to live there. She will create for her all the delightful things she wants herself. She will warm that house comfortably, because she herself hates to shiver. She will put in plenty of cupboards, because without cupboards life is not worth living (to a woman)! Her kitchen will be in just proportion to the size of the house, and not a kind of baronial hall in which even the beetles look lonely. Having pity on mere human legs, she will cease to build Towers of Babel. Then, her genius being for detail, she will see that the interior work of the house is well and delicately finished. The woman architect will pay special attention to the plumbing, not only to its sanitary but also to its ornamental aspect, which leaves much to be desired. And she will, if it is humanly possible, construct a bathroom for those of the household who need it most—the servants; and when she has done all this, then she has only done what is common in American houses built for families of comfortable but not large incomes.



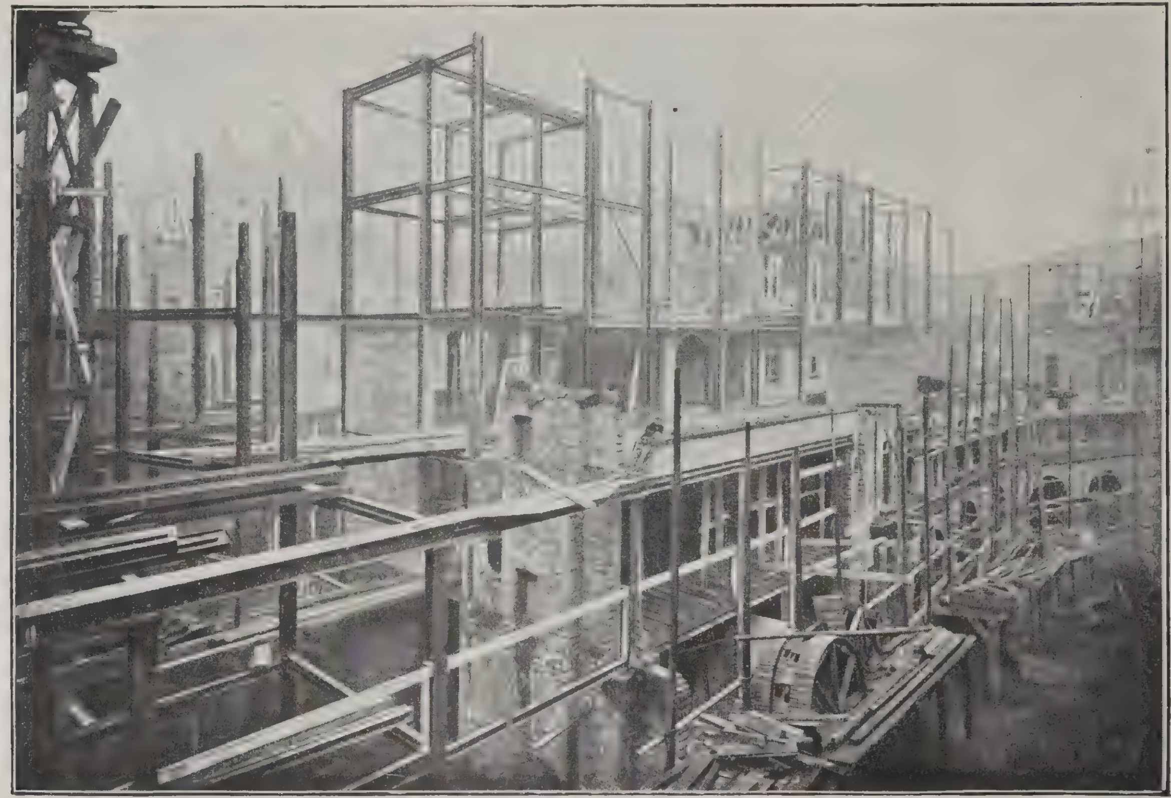
FIREPLACE IN DRAWING-ROOM, WINSLEY HOUSE. *(Photo: E. Dockree.)*

OUR PLATE.

WINSLEY HOUSE, WILTS, has been erected upon the site of an old house, and the unusual shape of the plan is accounted for by the endeavour in the first instance to alter and enlarge the original house; eventually, however, it was found necessary entirely to rebuild. The ground floor contains a large hall, dining-room, drawing-room and library, in addition to kitchen and offices. The first floor has eight bedrooms and a large billiard-room with an oriel window, and there are seven bedrooms on the second floor. The house is built of Winsley stone quarried close by, and has a stone-tiled roof, being that common to the district. The contractors were Messrs. J. Long & Sons, the clerk of the works Mr. E. J. Trotman, and the architects Messrs. T. B. Silcock & S. S. Reay, of Bath and London.



WINSLEY HOUSE, WILTS: GROUND AND FIRST-FLOOR PLANS. SILCOCK AND REAY, ARCHITECTS.

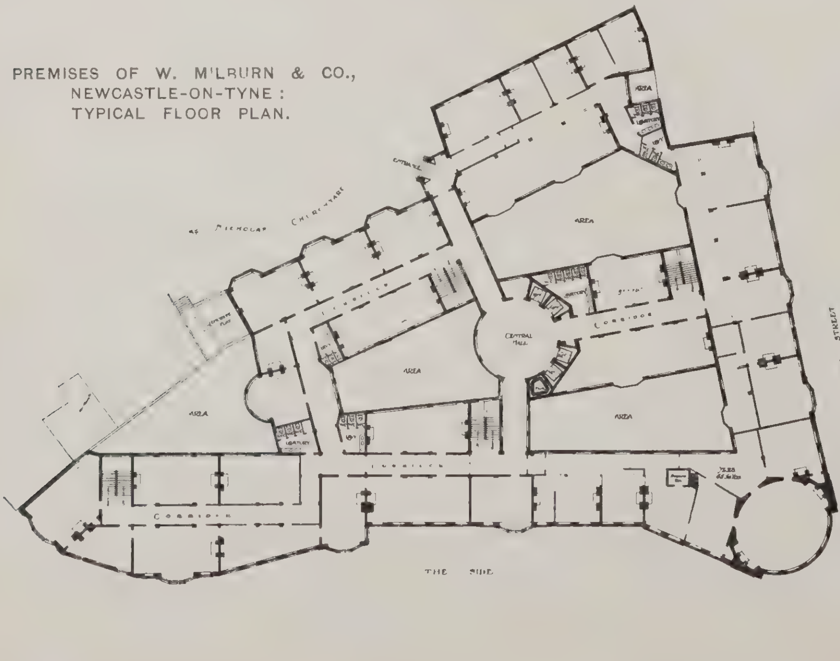


THE ERECTION OF NEW PREMISES FOR W. MILBURN & CO., NEWCASTLE-ON-TYNE. *(May, 1904.)*
OLIVER, LEESON & WOOD, ARCHITECTS.

A LARGE BLOCK OF OFFICE PREMISES.

MILBURN HOUSE, Newcastle-on-Tyne, of which a typical floor plan is here given, together with two photographs showing the building in course of erection, has frontages to three thoroughfares, namely, Dean Street, The Side and St. Nicholas's churchyard, in proximity to the quayside. As will be seen, the principle upon which this large block of office premises (covering nearly an acre of ground) has been designed consists of a central hall to which access is obtained by entrances in the centre of each front. In the hall are four lifts, and these, with three fireproof staircases placed in convenient positions, make the rooms readily accessible from all parts. The building has a steel frame with expanded metal and concrete floors, and brick and stone elevations with granite base. In all about 12,000 yds. super. of expanded steel and concrete flooring have been laid, the chief spans being 15ft. from centre to centre of bearing and the flooring 7ins. thick. The areas are faced with Opalite, and the corridors and staircases finished with tile dadoes. Where the structural steelwork is not enclosed by masonry it is encased in expanded metal and fire-resisting plaster. The entrances and central halls are panelled with oak-work. The whole has been executed by Mr. Stephen Easten, contractor, of Newcastle. The foundation-work was of a very serious nature, as may be inferred from the fact that some of it was carried to a depth of 70ft. below the level of the cathedral, which immediately adjoins the site, and quicksands had to be passed through to get to the boulder clay. The building stands upon a raft of expanded steel and concrete 3ft. thick. Messrs. Oliver, Leeson & Wood, of Newcastle-on-Tyne, were the architects.

PREMISES OF W. M'LBURN & CO.,
NEWCASTLE-ON-TYNE :
TYPICAL FLOOR PLAN.



IN PARLIAMENT.

(By Our Press Gallery Representative.)

THE following information has been recently given to members of the House of Commons by the ministers and departments concerned :—

South Kensington Museum: Date of Completion.

Mr. Coghill asked Lord Balcarres if he could say when the new buildings of the Victoria and Albert Museum in Cromwell Road were likely to be finished, and if efforts would be made to have them completed before the close of the present year; when the new wing of the Museum in the Imperial Institute Road would be opened; and how soon the temporary sheds which were now used for the purposes of the Museum between Prince's Gate and Queen's Gate could be dispensed with.

Lord Balcarres stated that the contract for the building of the Victoria and Albert Museum was to be finished in February, 1907. It was impossible to hasten the completion. Honourable members were perhaps not aware that the foundation-stone was laid by Her late Majesty's desire at a date considerably earlier than the works could be begun; hence much apparent delay. As regards the Royal College of Science in Imperial Institute Road, the building could not be ready for occupation before the spring of next year. None of the temporary sheds could be vacated until then at the earliest.

A West-End Area.

Mr. Coghill also enquired whether the Board of Works would consider the advisability of laying-out all the unoccupied portions of the area between Prince's Gate on the west, Queen's Gate on the east, and Prince Consort Road on the north as a public garden, as for a long time no other use had been made of it.

Lord Balcarres replied that the land to which Mr. Coghill appeared to refer was situated on the south side of Prince Consort Road, and was believed to be the property of the Commissioners of the Exhibition of 1851. The First Commissioner of Works did not know of any other unoccupied area in this vicinity which could be available for a garden.

Mr. Bonar Law informed Sir Thomas Esmonde that the cost of the outer or new harbour at Holyhead was £1,482,000.

Approaches to Houses of Parliament.

Mr. Akers Douglas stated, in reply to a question by Mr. Forde Ridley, that he had communicated with the Westminster City Council on the matter of road repairing at the approaches to the Houses of Parliament, and he was assured that as far as possible all repairs would be performed out of session.

Ventilation.

Lord Balcarres stated, in answer to Colonel Wyndham Murray, that it was anticipated that the works recommended by the select committee for improving the ventilation of the House of Commons would be completed by Easter, but experimental tests which were being continued might possibly necessitate further minor improvements.

THE ERECTION OF NEW PREMISES FOR W. MILBURN & CO., NEWCASTLE-ON-TYNE.
(September, 1904.)

Sir Ernest Flower asked whether it was proposed to carry out certain suggestions made by Dr. M. H. Gordon in his recent report on ventilation in the House of Commons, and whether these recommendations were in any way incompatible with or superseded by the scheme of ventilation now in use.

Lord Balcarres said the reply to the first question was in the affirmative. The recommendations were intended to improve the system now in use and were not incompatible with it.

Lifts in Hotels and Offices.

The Home Secretary, having had his attention called to the death of a young woman who lost her life through falling down a lift in a City hotel, informed Sir Thomas Dewar that the safe construction, arrangement and fencing of lifts were matters which were carefully attended to in factories, warehouses and other places coming under the Factory Act, but there were no powers, so far as he was aware, to deal with the matter in other places, such as hotels and offices. Legislation would be required for the purpose, which he was afraid he could not promise to undertake, but any proposals for giving local authorities the power of dealing with the matter would receive his careful consideration.

Rebuilding of Regent Street Quadrant.

In the House of Lords on April 7th Viscount Ridley asked His Majesty's Government whether the buildings now being demolished in the Quadrant of Regent Street had any defect which necessitated their removal; whether the sites on which they stood were under the control of His Majesty's Office of Woods and Forests; and whether in rebuilding on those sites His Majesty's Government would have due regard to the architectural continuity of Regent Street. He pointed out that in the opinion of the contemporaries of Nash that street was not well built, and there might be a reason for the demolition of those houses. But whether it was necessary to pull those houses down for architectural or other reasons, he wished to know if the Government would do their best to see that some architectural continuity, if not the exact façade as it appeared just now, was preserved in the rebuilding. He believed there was a parallel for such action in Paris, where, on the desire to build a large hotel in a certain part of the city becoming known, the French Government insisted that in the building of the hotel certain outside architectural features should be preserved. He hoped the British Government would deal with the English architect Nash as the French Government did with their architects. He did not know how far the London County Council had any authority but he was quite certain by the action of the County Council in other parts of London that they were in every way desirous of considering architectural features in the Metropolis. He hoped the Government would be able to give a satisfactory assurance that in the rebuilding on this site, where the work of demolition had gone so far that it could not be stopped, they would have due regard to one of the most important and interesting architectural features of London.

Lord Windsor, the First Commissioner of Works, replying on behalf of the Treasury, said the answer to the first question was that the buildings in the Quadrant and other parts of Regent Street were not considered suitable for modern requirements, were not for the most part well built, and did not utilize the sites which they occupied to the best advantage. It was therefore proposed to rebuild the Quadrant as the present leases expired, or earlier if suitable opportunities occurred. In reply to the second question, the ground belonged to H.M. Office of Woods and Forests. The answer to the third question was that it was intended to have regard to the continuity of architectural design. Mr. Norman Shaw had been requested to prepare a design, but this design had not yet been finally settled. It was the intention of the Commissioners to rebuild the Quadrant in one design, instead of having buildings of a patchy description. He did not think he could add any more to that information. He could only say that the Commissioners were fully aware, as it was necessary to rebuild the houses in the Quadrant, that they should be rebuilt to the designs of a well-known architect and with a view to the continuity of the buildings, and that the present curve of the Quadrant should be maintained.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS' WORKS.

A VISIT to these works at Northfleet was made on Saturday by the Northern Polytechnic Building Students' Association. The works are of the most up-to-date description, only the latest machinery being used, which, besides many other improvements, does away with the storing of slurry in backs to dry, as in the old-fashioned way at many works. As an example of the space saved by this, it may be stated that whereas before the new plant was installed the works covered 8 acres, the present works only cover about 3 acres. The party was first shown the mills in which the chalk and clay in proper proportions are mixed, entering at one end of a row of mills and, passing on, being gradually freed from stones and lumps until at the end mill the slurry is forced through a sieve of 180 meshes to the square inch, whence it is pumped into large storage tanks and there kept in a continual state of movement to prevent settlement. From these tanks it is pumped into the rotary kilns, of iron, about 9ft. diameter and 50 feet long, lined internally with firebrick, with a furnace at one end. As the slurry is pumped in at the reverse end of the kiln to that of the furnace, it is gradually dried until it reaches the furnace, when it is burnt to a clinker. Only coal-dust is used in the furnace, forced in at high pressure. This gives a much cleaner and finer cement than in the old intermittent kilns. The clinker is gradually cooled by passing down chutes into trucks before being taken to the grinding room, where it first goes through tube mills having steel balls and then into other mills of about 4ft. or 5ft. diameter containing small pebbles. This gives a more finely-ground cement than with the old method of grinding between rollers. The noise in this building is something appalling, all communications having to be made by means of signs.

In the engine-house at the works are two triple-expansion engines connected direct to dynamos for supplying power to the whole of the plant. On the wharves are immense storehouses for cement, one of which was calculated to hold about 3,500 tons.

It was interesting to note barrels of cement being packed for a Government contract at Middlesburg, also 56lb. kegs for Sierra Leone, this weight being just sufficient for natives to carry on their heads from the surf boats.

PROF. PITE ON LONDON STREET PLANNING.

IN the paper on street planning which he read before the last meeting of the Royal Institute of British Architects Prof. Beresford Pite said that London was dotted over with picturesque elements which might be crystallized into characteristic and pleasing groups and arrangements. Each district had opportunities for the conservation of the interest of public places and thoroughfares which were not far to seek for the exercise of local patriotism. London had no need of the services of a Baron Haussmann to straighten her out.

The River Site.

In a very real sense the laying-out and planning of the city depended upon the sweep of the curves with which the river passed through London from the Palace of Greenwich to that of Fulham, and thus controlled the direction of the main thoroughfares on both banks from east to west. Englishmen were scarcely yet alive to the imperial grandeur of the Thames Embankments, more worthy of admiration than any scheme of avenues or streets that the world at present held.

Public buildings and national monuments could be more splendidly placed upon the banks of a broad river than on any other class of site, and London, without the enormous expense of forming new roadways and clearing thickly occupied areas for the purpose, was in possession upon the Thames of a series of situations for grand buildings which should awaken the public conscience to the existence of the delights architecture had the power to reveal.

Speaking of the bridges of London, Professor Pite said that the two distinct aspects of a bridge design were, first, that of its width, proportion and gradient as a thoroughfare viewed from above; secondly, that of its elevation viewed from below.

The new Temple Bridge.

When the necessary new bridge at the Temple appeared, might it be as fine as Westminster from above and as beautiful as Waterloo from beneath! It would occupy a majestic site in the grand curve of the Embankment, so that its perspective would grow and radiate as it was approached; and with Somerset House between it and Waterloo Bridge, and the great embankment below, a subject would be created not unworthy of some new English Piranesi.

Railways and the Bridges.

It was to be hoped that the fashion for bringing steam railways into cities would soon be over, and that invisible tubes would supply all the needs of rapid urban locomotion, while proper masonry bridges would replace the temporary and rusted-out toys of a past century for the accommodation of the now triumphant autocar across the Thames.

It was too late to lament the presence of the Thames railway bridges; but how fine a series of the termini of the three great southern lines, such as those which lay on the north of Euston and Marylebone Roads, would have been on the opposite bank, each approached by a fine passenger bridge from the city shore.

The Inroads on Regent Street.

Referring to Regent Street, Professor Pite said that it was inevitable that the course of nearly a century should make inroads upon the completeness of any human scheme; and it was fruitless to deplore the necessary alterations which renewed the face of progressive cities periodically. Regent Street, however, had a special claim to be considered as a whole, for it was such. The whole street had been laid out and built with a regal sense of dignified discipline, and it remained the property of the Crown. It was, therefore, greatly to be regretted that latterly rebuilding had been permitted to take place, just as if the street had no harmony to be broken or special character of its own.

Architects could not forget the charm of the portico of

Hanover Chapel,

one of the rare but perfect works of Professor Cockerell, which so happily and innocently projected over the footway, supported by graceful towers at the curved approach to Regent Circus.

Nor could they but regard the reasons urged for its removal as being entirely insufficient, or find solace for their grief in the contrast to all its architectural virtues which now vauntingly occupied its site.

A Complete Design Required.

Some complete design for preserving the proportions and character of the whole of this fine thoroughfare needed to be taken in hand in order that the inevitable effects of the now shortening tenures under the original leases in rebuilding might be met without reducing the streeet to such a wreck of its former self as had been achieved at Piccadilly Circus.

The lower portion of Regent Street and Waterloo Place itself were in some danger of falling a prey to partial rebuildings without unity of treatment as to proportion.

Londoners had expended some Philistinic wit upon

The Crimea Memorial,

but no one could deny the fineness of its monumental scale and the harmonious but quiet dignity of Waterloo Place itself. Was this also to be sacrificed?

In the removal of St. Philip's Church, Regent Street had been deprived of another refined and interesting front which had been placed with full regard for the buildings opposite and the proportions of the adjoining blocks. What would follow on its site?

Piccadilly Circus,

said Professor Pite, was a painful example of how in decadent times the primeval disregard of order reasserted itself. The revelation of the latter art of the nineteenth century comprised by the Pavilion and the vista of Shaftesbury Avenue, enshrining as a jewel in a swine's snout Mr. Gilbert's fountain, and by the comedy granite dome of the Strand Board of Works' convenience, presented altogether a contrast to the Quadrant, the County Fire Office and the remains of the design of the Circus that cried aloud for remedy. This absurd accumulation of mistakes should be courageously handled and removed.

The fear of traffic and the false economy in laying-out Shaftesbury Avenue and the resulting sites had spoilt Piccadilly Circus and dismembered Regent Street, but there were capabilities in the ruins for renewing something of the completeness of scheme which had been lost, and of providing a fine public space there of which we need no longer be grievously ashamed.

Whitehall and Parliament Square

were decidedly growing in architectural interest and picturesque beauty. The placing of great formal buildings upon a wide thoroughfare having a slight general curve and some variation in width was producing in the former some charming effects; while the interest of the Abbey flank, the Houses of Parliament, and St. Margaret's Church, so valuable a foil to its neighbours, increased by contrast with the very different buildings at the northern side, and there was still a frontage waiting for some able designer to treat it worthily before the western side behind the Canning statue.

The placing of the finer Classical Buildings

that London possessed upon informal and somewhat random surroundings was worthy of remark. St. Paul's would not gain by removal from the wonderful piling-up of buildings and spires which grouped with it on its approach from Fleet Street through Ludgate Circus, and the Royal Exchange, without its pell-mell of omnibuses and the accidental appearance of the Mansion House or shy retirement of the Bank into the background, would not be in London at all.

The Success and Character of London Street Planning

would appear to depend upon the provision of a fine building upon a site and in surroundings that were not architecturally ideal, the natural tendency to picturesqueness in a crowded city making amends by artistic accidents for the lack of rule and restriction required in the surroundings.

At South Kensington

a whole modern estate of great and costly buildings had recently sprung up on roads of magnificent width, without any such totality of effect as could without much difficulty have been obtained with the gardens on the north, Cromwell Road on the south, and Queen's and Prince's Gates west and east.

The buildings included the costly and wonderful Albert Memorial, the Albert Hall, Imperial Institute, Natural History and Victoria and Albert Museums—which were of the first magnitude—while the two Colleges of Science, the City and Guilds Institute, the College of Music and others were of impressive size.

The estate, however, had been futilely subdivided by two cross-roads, practically accommodating only two buildings apiece, and the rest were left to the outskirts facing the surrounding stucco mansions. No earthly view of this fine accumulation of first-rate modern buildings was practicable. Turning

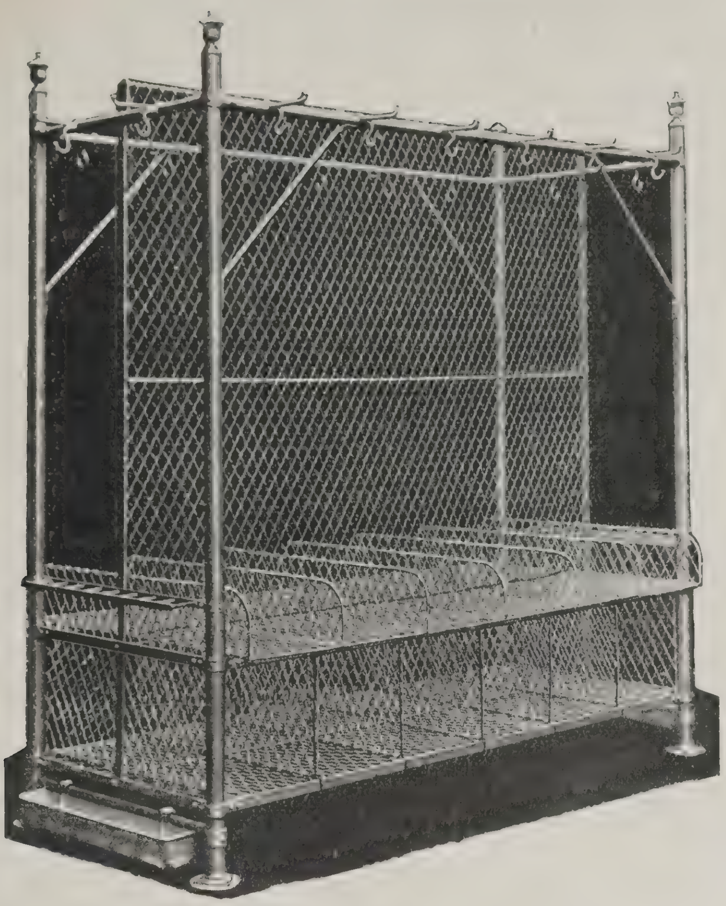
Eastwards to the Strand,

one found a great problem courageously handled and originated, but waiting for its fate at the hands of the builders. Could a street of such a width as 100ft. be fine if the sites and conditions were in character and scale with its breadth on one side of the street only? The difficulties would vanish if the providence of proportions from Regent Street were adopted here, and the scale would give value not only to the two lovely churches and to Somerset House but a healthy freedom for light and air in a central block of London atmosphere.

A Central Authority Needed.

Professor Pite concluded that the consideration of the subject before them led them naturally to look to the exercise of authority as necessary in all streets and public spaces laid out on formal and symmetrical principles, for the preservation of the character of the whole, and for the prevention of self-assertive individualism to the detriment of general amenity. Such authority could be most readily afforded by the County Council, probably acting through an architectural committee of advice, whose judgment could be allowed to decide upon the cases where the public interest demanded some regularity of treatment or otherwise.

Architects' Registration.—Last week Mr. Cross and Mr. Hubbard read their papers on architects' registration before the Edinburgh Architectural Association. Mr. G. A. T. Middleton also explained the provisions of the Bill. Mr. Henry F. Kerr said he doubted the practicableness of the proposed measure, and said that progress in raising the standard of the profession would be better made by encouraging the taking of the diploma of the Institute. Messrs. Robertson, Ross and M'Arthy commended the proposal on the ground that the profession suffered grievously from the competition of untrained and unskilled men; and although no resolution was put, this was the feeling of the meeting.—At the ninth annual meeting of the Three Towns branch of the Devon and Exeter Architectural Society (Mr. B. Priestley Shires, A.R.I.B.A., presiding) the annual report was read. This stated that registration had now assumed practical form and was being supported by the Institute and most of its societies.



A NEW FITMENT FOR CLOAK-ROOMS.

Trade and Craft.

A Fitment for Cloak-rooms.

The accompanying illustration shows a fitment for the cloak-rooms of institutions of a certain class. This, the first of its kind, was designed for the Winsley sanatorium by Messrs. Silcock & Reay, architects, of Bath, and the required number was made by Messrs. Brookes & Co., Ltd., of 4, Cateaton Street, Manchester, the makers of the "Schola" school hook, known probably to every architect in this country. As will be seen, the fitment has twelve compartments at the bottom for boots, over which are twelve trays for rugs, and over these again the hat and coat hooks, whilst at the ends are umbrella stands with drip trays. The fitments are self-contained and self-supporting, and the makers, who have registered the design, state that they were fitted together in their works and sent complete to their destination, only requiring to be carried to the cloak-rooms and placed in the desired positions. It is apparent from the photograph that the work is carried out with great neatness and attention to detail.

"Cyclone" Blowers.

We may quote Messrs. Matthews & Yates' words that it pays to instal a fan for increasing the draught where a chimney is doing the work, and it pays better still to do so in new plants before a chimney is built, because the bulk of its cost can then be saved and many other economies can be effected. For those who want full particulars of plant for this purpose we can recommend perusal of the excellent pamphlet on "Cyclone" blowers which Messrs. Matthews & Yates have just issued. These blowers are also much in use for the collection of shavings and sawdust in woodworking shops and elsewhere.

Coming Events.

Wednesday, April 12.

ROYAL SANITARY INSTITUTE. — Inspection and Demonstration at the East London Soap Works, Bow, at 3 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION. — Annual Business Meeting and President's Valedictory Address, at 8 p.m.

ARCHITECTURAL ASSOCIATION (Discussion Section). —Mr. A. Needham Wilson on "Village Churches," at 7.30 p m.

QUANTITY SURVEYORS' ASSOCIATION.—Mr. A. G. Cross, F.S.I., on "The Practice of our Profession and Suggested Reforms," Freemasons' Tavern, Great Queen Street, W.C., at 7 p.m.

Thursday, April 13.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to the Northolt and High Wycombe line of the G.W. and G.C. Railways, in course of construction.

INSTITUTION OF MECHANICAL ENGINEERS. — Anniversary Dinner at the Hotel Cecil, London.

SOCIETY OF ARCHITECTS.—Mr. A. K. G. Bamber (Managing Director, The Associated Portland Cement Manufacturers (1900), Ltd.) on "The Manufacture and Testing of Portland Cement," at 8 p.m.

Friday, April 14.

INSTITUTION OF MECHANICAL ENGINEERS.—Presidential Address. Discussion on Steam-engine Research Report.

Saturday, April 15.

ROYAL SANITARY INSTITUTE.—Provincial Sessional Meeting. Discussion at Liverpool University on "Recent Methods of Re-Housing Tenants dispossessed from Insanitary Property," at 11 a.m.

ARCHITECTURAL ASSOCIATION. — Seventh Spring Visit to Hammersmith Free Library (Mr. Henry T. Hare, architect), at 3 p.m.

Monday, April 17.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.— Mr. Mervyn Macartney on "Garden Architecture," at 8 p.m.

Wednesday, April 19.

ROYAL SANITARY INSTITUTE. — Inspection and Demonstration at Harrison & Barber's Knacker Yard, Winthrop Street, Whitechapel, E., at 3 p.m.

INSTITUTE OF SANITARY ENGINEERS. — Finance Committee at 3 p.m. Organizing Committee at 5 p.m. Sessional Meeting at 7 p.m. Paper by Mr. E. R. Palmer.

April 21 25.

ARCHITECTURAL ASSOCIATION (Camera and Cycling Club).—Easter Excursion to Hereford. Names to be sent in to Mr. G. H. Lovegrove, 18, Foxgrove Road, Beckenham, by April 13th.

Saturday, April 22.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Drum House, Gilmeston.

W. H. Ayton,* Heaton	1,706	3	0

* Accepted. [Rest of West Hartlepool.]

Wimbledon.—Accepted for the erection and completion of a residence in Parkside Avenue, for Mr. A. W. Gower. Mr. E. C. Homer, architect, 35, Bucklersbury, E.C. :—

C. Gimson	£3,700	0	0

Stables and coach-houses.

W. R. Williams	983	0	0
Larke & Sons	890	0	0
Castle & Sons	880	7	0
A. Hudson	778	9	0
C. Gimson*	680	0	0

* Recommended for acceptance.

Youghal (Ireland).—Accepted for additions and improvements to the Provincial Bank. Messrs. W. H. Hill & Son, architects, Cork :—

D. Creedon, Fermoy, co. Cork	£1,437	10	0

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending April 7th twenty-five failures in the building and timber trades in England and Wales were gazetted.

A. FIDO, builder, Bristol. Adj. March 29th.

W. HUGGINS, builder, Leyton. R.O. March 31st.

F. BARTON, plumber, glazier and gasfitter, Sheffield. R.O. March 29th.

E. HITCHCOCK, stonemason, Gipsy Hill. Adj. March 28th.

J. BROOKS, monumental mason, Smethwick and Witton, Staffs. R.O. March 30th.

F. WATKIN, timber merchant, Northampton. R.O. March 28th.

F. E. CULLIMORE, builder and contractor, Ashford. R.O. March 30th.

T. WHITNEY, builder and contractor, Manchester. R.O. March 27th.

W. MORTON, mason and contractor, Hale. R.O. March 28th. First meeting, O.R.'s, Manchester, April 12th, at 2.30. P.E., Manchester C.C., April 17th, at 10.

W. E. WILKINS, carpenter and builder, Bristol. R.O. March 29th. First meeting, O.R.'s, Bristol, April 12th, at 12. P.E., Bristol Guildhall, May 5th, at 12.

H. ALDRIDGE, builder and contractor, Catford and Lewisham. R.O. March 14th. P.E., Greenwich C.C., April 18th, at 1.

S. KENT, builder, Acocks Green. First meeting, 191, Corporation Street, Birmingham, April 14th, at 11. P.E., Birmingham C.C., May 17th, at 2.

ROBINSON & EDWARDS, builders, Seaton Sluice. R.O. March 29th. First meeting, O.R.'s, Newcastle-on-Tyne, April 12th, at 12. P.E., Newcastle C.C., April 27th, at 11.

W. BELCHER, brick merchant, Paddington. R.O. March 28th. P.E., London Bankruptcy Court, May 10th, at 11.

W. BLACKBURN, plasterer, York. R.O. March 30th. First meeting, O.R.'s, York, April 14th, at 2.30. P.E., York Courts of Justice, May 5th, at 11.

W. J. TREVENA, master plasterer, Stokesley. P.E., Stockton-on-Tees C.C., April 19th, at 11. First meeting, O.R.'s, Middlesbrough, same day, at 3.

F. J. NEWMAN, glass merchant, Croydon. R.O. March 27th. First meeting, 24, Railway Approach, London Bridge, April 13th, at 11.30. P.E., Croydon C.C., May 17th, at 11.

LONDON BUILDING ACTS AMENDMENT BILL.

Provisions in the Bill for reducing Risk of Fire in Buildings other than Part VIII.

By a Fire Risk Surveyor of Forty Years' Experience.

THE London County Council have, in consequence of powerful opposition, withdrawn the whole of their London Building Acts Amendment Bill with the exception of Part VIII., which is headed "Means of escape in case of fire and provisions for reducing risk of fire in buildings."

It would only be reasonable to infer that all provisions proposed with the objects named in the above heading are contained in this part of the Bill, but unfortunately such is not the case.

It is important, therefore, that the Parliamentary Committee to whom the remaining part of the Bill may be referred should exercise their powers (subject to such modifications and correction as they may find to be desirable) to recommend the adoption of sections included in other parts of the Bill having only similar objects in view.

"Provisions for reducing risk of fire in buildings" by which life may be endangered or lost are on the principle that prevention is better than cure, equally if not more important than the provision only of "Means of escape in case of fire."

The following are the principal sections referred to, each (with the exception of section 77) being necessary "for reducing risk of fire in buildings" to which very little, if any, opposition has been offered:—

Part VI.—Construction of Buildings.

Section 60.—Rules as to the extent of recesses and openings in walls to be applied separately to the wall of each storey and not as at present to the whole of a wall.

This is necessary to secure greater stability under the action of fire and to lessen somewhat the risk of fire spreading from a burning building to others.

Section 63.—Parapets required to the walls of all new buildings abutting immediately on a public way.

This is needed to assist in the rescue of persons who may use the escapes to roof which are to be provided.

Section 65.—Requires stoves and chimney-pieces in chimney openings to be solidly set with brickwork or concrete composed of ballast or broken brick so as to avoid all cavities in which soot can accumulate.

The ignition of accumulations of soot in cavities at the back of improperly set stoves and boxed chimney-pieces frequently communicates fire to skirtings and other woodwork near, at times with fatal consequences, as was the case at Ashmount Road, Islington, on 30th December, 1903.

Section 66 requires a more secure arrangement for flues from any new oven-furnace cockle steam boiler, or close fire used for any purpose of trade or business, or for the range or cooking apparatus of any hotel tavern or heating-house.

Improperly constructed flues, especially where used for heating appliances of the nature described, are a frequent cause of fires, at times resulting in loss of life.

Section 66 (4).—Flues not to be nearer than 2ins. to the centre line of any party-wall.

The arrangement of flues in the manner forbidden by above rule is a constant source of alarm in London houses, and is the cause of many fires. It frequently happens that the strings of wooden stairs of one house pass 4½ins. only from the inside of the flues of an adjoining house. Many fires have been traced to this defective arrangement, and many others, that destroyed all evidence of their origin, have doubtless originated from such defects, occasionally with fatal consequences.

Section 66 (7).—No iron or steel joists or ironwork to be placed in any flue except as may be required by the provision of existing Act for ensuring stability.

It is important that metal in contact with woodwork should not be liable to be raised to a high temperature at any point, because conduction of heat through the metal to the wood may set up dangerous conditions.

Section 69.—Roofs over oven or furnace-rooms to be of iron or steel and concrete.

This rule already applies to floors, and its application to roofs is obviously necessary.

Section 71 (c).—Habitable rooms over stables, with their approaches, to be separated from the stables by solid concrete floors and 4½in. brick walls.

This arrangement would provide means of escape in case of fire, as well as improved sanitary condition.

Section 77.—Floors constructed throughout to the satisfaction of the Council to be allowed as separations for the calculation of cubic contents.

Warehouses built in accordance with this section, unless the capacity of each storey is limited to, say, 60,000 cub. ft., would be very dangerous in the event of fire. A top storey having a capacity of 250,000 cub. ft., covered with a timber slated and glazed roof and filled with combustible goods as this section allows, would seriously endanger acres of surrounding buildings, and two or more such structures in proximity might cause widespread destruction should a fire gain a hold during a high wind. The fire-resisting protection for constructional ironwork or steelwork, as provided by section 87, would not be sufficient to avoid collapse in the case of fire in a storey of the extent named heavily stocked with combustible goods. Window openings would also form exposures between the storeys of such buildings. The limitation of the extent of warehouse buildings has been the salvation of London with regard to sweeping conflagrations. Any further concessions on the Act of 1894 in this direction would be sure sooner or later to be followed by alarming disasters, similar to that experienced at Baltimore in 1904.

Section 78 formulates improved rules for fire-resisting doors.

Experience shows that this is necessary, but it is doubtful if the rules proposed are sufficient. Iron frames for fire-resisting doors should be bolted together through the wall, and the door when closed secured to the frames by cleats and bolts not more than 3ft. apart. Sight holes in the doors, closed with a flap, are very useful for examination and discharge of hose streams without opening the door. Stone should not be used for the jambs and beads of openings fitted with fire-resisting doors, as now allowed.

Section 81.—Doors of churches and all places of public assembly to have automatic bolts allowing the doors to open outwards on pressure.

This is a very necessary provision to afford means of escape in case of fire or panic.

Section 83.—A building previously used as one shop not to be used as two or more shops unless separated by party structures of fire-resisting materials.

No objection can be reasonably taken to this provision.

Section 84 (1).—Openings not to be made in walls being in part external and in part party-walls (without the consent of the Council) within 10ft. of any portion of the wall used as a party-wall or of any portion of a building adjoining any part of such party-wall.

In addition it is desirable that all such openings should have fire-resisting windows or doors.

Section 84 (2).—No opening without the consent of the Council to be made in any external wall of any building within 30ft. of any opposing opening in any other building.

This is a very sweeping provision. It is concluded that such openings would be allowed if protected with fire-resisting window-frames and glazing.

Section 87 requires all constructional ironwork in any new building to be encased in concrete, brickwork, terra-cotta or metal lathing plaster or cement not less than 2ins. in thickness, with the object of protecting the same from the effect of fire.

The Council already have powers under section 164 of the London Building Act, 1894, to make by-laws for the protection of ironwork used in the construction of buildings from the action of fire. This is of great importance, as is shown by the results of fires in modern buildings.

Section 89 provides for the making of regulations with respect to buildings of iron and steel skeleton construction.

This is of growing importance, and should be extended to include structures of reinforced concrete.

Part VII.—Special and Temporary Buildings and Wooden Structures.

Section 92.—Buildings on railway company's premises not to be exempt from the provisions of the Act unless used exclusively for the purposes of the railway.

This is reasonable and necessary.

Section 93.—Regulations as to wooden structures licensed by local authorities.

To this might with great advantage be added regulations for better control over temporary timber and canvas structures for bazaars, ballrooms and similar purposes.

Section 94 provides for powers to require the removal of certain wooden structures within two years from date of notice.

Part VIII.—Means of escape in case of fire and provisions for reducing risk of fire in buildings.

This part of the Bill embraces sections 95 to 109, which remain for the consideration of Parliament. The provisions in section 106 of this part of the Bill, requiring openings in the external walls of all new buildings of the warehouse class opposing and within 30ft. of openings in the external wall of any other building to be protected with fire-resisting frames and glazing or fire-resisting doors or shutters, will not be alone sufficient to effect the object in view. To secure this it will also be necessary to protect the roofs of such buildings. The usual timber roof covered with slates or zinc offers very little resistance to the spread of fire; roofs of this character should be forbidden in districts crowded with warehouses and workrooms.

Part XVI.—Miscellaneous.

Section 150.—Regulations for the storage of wood, timber, casks or barrels.

Section 157.—Posts or bars across courts or passages to be hinged, and two keys of any locks deposited at the nearest fire station.

Section 164.—Exempted buildings on cesser of exemption to be made to conform to Act.

Section 166 (1).—Buildings destroyed for more than one-half their cubical extent to have remaining old portion made to conform to the provisions of Act.

Section 166 (2).—Any addition to an existing building to the extent of one-half the cubical extent of the existing building not allowed unless the whole of existing building made to conform to the Act.

Serious objection cannot be made to the foregoing reasonable provisions in Part XVI.

Other Amendments.

The following further amendments to the Act of 1894, with modifications and additions to the Amendment Bill, 1905, are desirable:—

Act 1894, *section* 5 (28).—Fuller definition of the term "warehouse" required. Many buildings under 150,000 cub. ft. exist, used for purposes which seriously endanger adjoining properties that are not treated as "buildings of the warehouse class."

Act 1894, *section* 64.—It is desirable to require that disused fireplaces and flues in buildings of the warehouse class be protected against the danger of sparks from neighbouring chimneys or fires falling down a flue and igniting accumulations in boarded-up fireplaces. Many fires can be traced to this cause, including the serious fire in Falcon Street on 13th August, 1902.

Act 1894, *section* 64 (22).—Wooden plugs driven as near as 6ins. and iron holdfasts as near as 2ins. to the inside of a flue, as sanctioned by this section, have been the cause of many fires. The fixing of skirtings or other woodwork on the face of brickwork only 4½ins. thick enclosing a flue, even if the brickwork is rendered as provided in the section 64 (21), 1894 Act, is dangerous and is not necessary, as any finishings in such positions can be readily formed in cement or plaster.

Act 1894, *section* 64 (15), (16), (17).—Slate should not be allowed for hearths, and the words "non-conducting" should be added after the word incombustible. Iron hearths in contact with wood floors are dangerous.

Act 1894, *section* 66 (1).—Hearths of an incombustible and non-conducting character should be required for gas stoves, especially gas cooking-stoves; the absence of this has resulted in numerous fires.

First Schedule, Bill 1905.

(i) *For General Purposes.*—(2) Granite and other stone, although solid and durable, are not fire-resisting. (4) Slate is not a fire-resisting material, and its use for coverings or corbels is dangerous when exposed to fire. (6) Coke-breeze varies so widely as to make it undesirable to sanction its use for fire-resisting concrete. Stone is also a bad material to use for this purpose.

(ii) *For Special Purposes.*—(4*b*) Wood joists used for pugged floors need to be protected with plaster, as in (2), (3) and (6) of this part of same schedule.

L.C.C.'s Own Exemption.

By section 159 (18) of the Bill, 1905, the Council seek exemption from the whole of their own regulations.

PROVINCIAL & DISTRICT FIRE STATIONS.

By **ARTHUR PORDAGE**, Firemaster of Edinburgh.

THERE has never at any previous time been so much attention devoted by our municipal authorities to the matter of fire-brigade equipment as the present. The authorities are recognizing the essential needs of fire-prevention and protection as being important factors in the well-being of both industrial and residential centres, the necessity for which has perhaps been forced home more prominently during the past few years by large gaps made in business centres by disastrous fires which have discovered many large English provincial towns without a fire department worthy of the name.

The necessity for an efficient equipment is however becoming more generally apparent, and the constant erection of fire stations in the country affords an opportunity of studying the plans reproduced in the journals and to note the diversified views of architects and others responsible for the buildings. In reviewing those plans there are many points which strike one as having either been overlooked altogether or which appear to have been carried out with a certain degree of imperfect information upon what may appear to be details of small moment, but which, though small, are details of considerable importance in working the station.

In dealing with plans of fire stations no general rule can of course be laid down, as the piece of ground allotted to the purpose is often of very unequal dimensions; but where a general rule is impossible a general principle is imperative, the main factors being the engine-room with stables and the general approaches thereto for the men, all of which should be of such a combination as to ensure rapid concentration and efficient "turn-out."

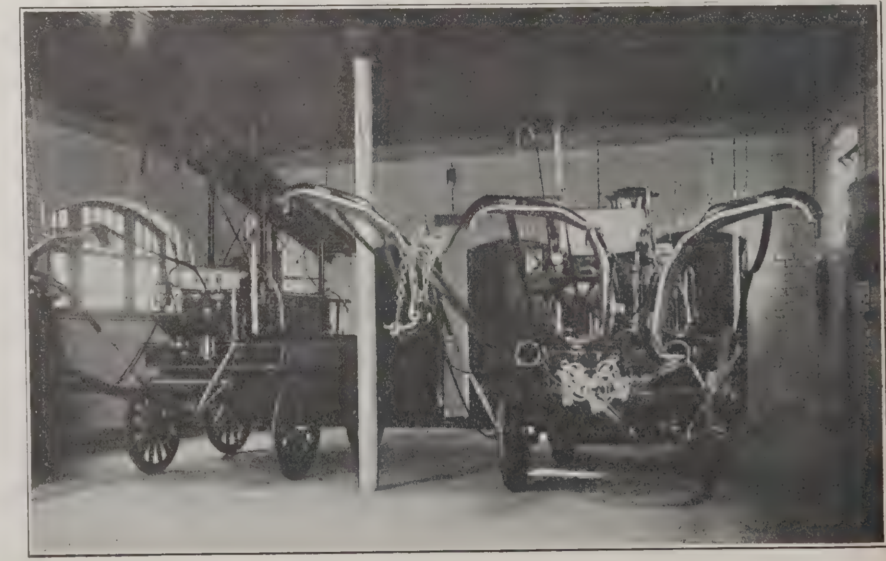
It will, I think, be admitted that an up-to-date station should have the stables in the immediate rear of the engines, with the door of each stall opening into the engine-room, in order that each horse may be trained to run up to its allotted position at the engine. One point to be considered here is that the distance between the hind part of the engine and the stall door should be as short as possible, so as to offer little inducement to the horse to go astray. The older method of placing the stables on the opposite side of a courtyard should, I think, not be taken into consideration at this period, although I am surprised to find a large station recently built in the provinces at a cost of £7,000 has such an arrangement with a space of 50ft. between the front of the stables and the rear doors of the engine-room.

The stables built immediately to the rear of the engine-room need not necessarily form part of the main structure; it is, in fact, more convenient as an attached building with flat roof, the latter affording excellent roof-drilling facilities.

A roomy stable is also a point to be aimed at. A stall 6ft. 6ins. wide by 11ft. deep, and with 8ft. passage behind, gives a good airy stable, allowing comfortable room for the horses to turn and plenty of breathing space for the coachmen to dress their horses behind the stalls in wet weather.

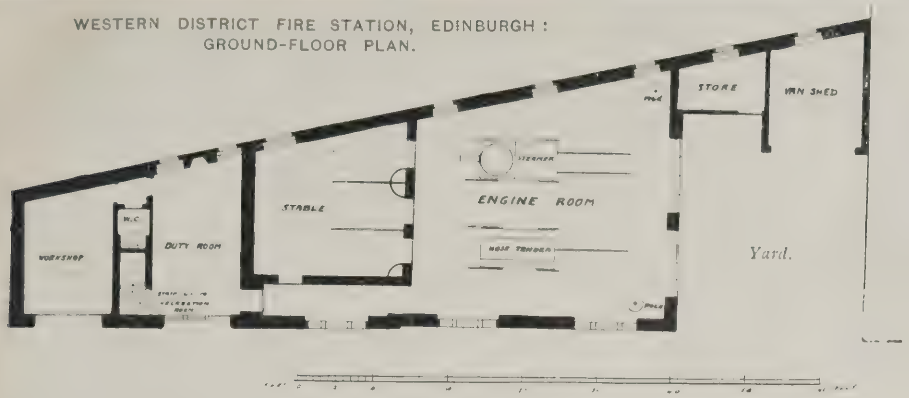
The absence of the provision of an independent or domestic entrance in most fire-stations for the families of the staff, and the consequent stream of women, children and message boys with their bundles and baskets through the engine-room, station or yard, should be avoided. The service portion of a fire station should be restricted absolutely to the service requirements; there is no justification whatever for the wives and families being either in or near the engine-room, yard or workshops portion of a fire station at any time. This is a point which is apparently seldom considered, but is one which should receive due consideration. None but the men are required in the engine-room or its approaches during a "turn-out."

The watch-room or duty-room should constitute the business entrance of the station, and have access direct from the street, and should have such a front elevation as to offer no possible doubt as to its identity as the entrance to which a complete stranger would go to give an alarm of fire. The forming of the duty-room entrance from a



WESTERN DISTRICT FIRE STATION ANGLE PARK, EDINBURGH.

WESTERN DISTRICT FIRE STATION, EDINBURGH: GROUND-FLOOR PLAN.



large opening similar to the engine-house exits for the engines is confusing to the stranger, as is also the practice of utilizing one of the engine-house gates as the general entrance. The position of the duty-room should be such that the fireman on duty has a view of the operations during a "turn-out," and the position of the switchboard be such that while attending to the telephones and fire alarms he may also operate the necessary switches, lighting or otherwise; for this purpose it is desirable that all the operating switches, &c., should be on the one board.

The men's access to the engine-room, if on the ground level should be preferably at a near corner, to allow them to follow up and not rush across in front of the horses as they run up to the harness. If poles are used by the men to reach the engine-room direct from their quarters, they should land the men in the rear of the engines clear of the run of the horses so as to avoid all possibility of baulking them.

In large stations, where provision is made for locating the "first-turn-out men" on the first floor over the engines, the poles are generally in front and the men are down in time to receive the horses, which is the most expeditious method; but as I am dealing exclusively with small provincial and district stations, where there is much less likelihood of there being sufficient men to take watch about for the first turn-out, my remarks do not apply to the latter system.

A very convenient arrangement is to provide for a hall as a general rendezvous for the men "turning out" adjoining the rear of the engine-room, to which all the approaches should lead, including the poles from the quarters. In this hall should also be hung the helmets and fire uniform.

The Paris system of stabling, where the horses stand in open stalls in the engine-room, may find favour in some quarters. I have seen most of the Paris stations, and have particularly looked for any advantage in their system during a "turn-out," but have failed to see any improvement on the closed-in stables. On the alarm given, the horses wait in the stalls until led up to the engine by the *pompiers*. It would be difficult to train the horse to run out of an open stall, because there is no change in its surroundings when the alarm is given, whereas with a closed-in stall the horse can be trained to run out when the door in front of the stall is opened. From a sanitary point of view the Paris system has nothing to commend it; the smell of the stable pervades everywhere.

An important feature in a fire station should be the heating and hot-water installation; a liberal supply of baths is essential, and each married fireman requires a bath in his private quarters, with a liberal supply of hot water. His work is often of such a dirty and disagreeable nature that a bath before he can go to his bed after attending a fire is in many instances a necessity. A commodious hot closet for drying fire uniforms is also indispensable. In connection with the boiler for providing the above the steamer may be heated and the usual gas-burner be dispensed with. An automatic connection may be attached to the steamer to receive either a continuous supply of hot water or steam, by which means the boiler of the steamer is heated from the ordinary heating arrangements of the station, obviating the expense of gas heating.

The foregoing remarks apply more particularly to fire stations in the smaller provincial towns, where the equipment of the only station should of necessity be on a most efficient footing.

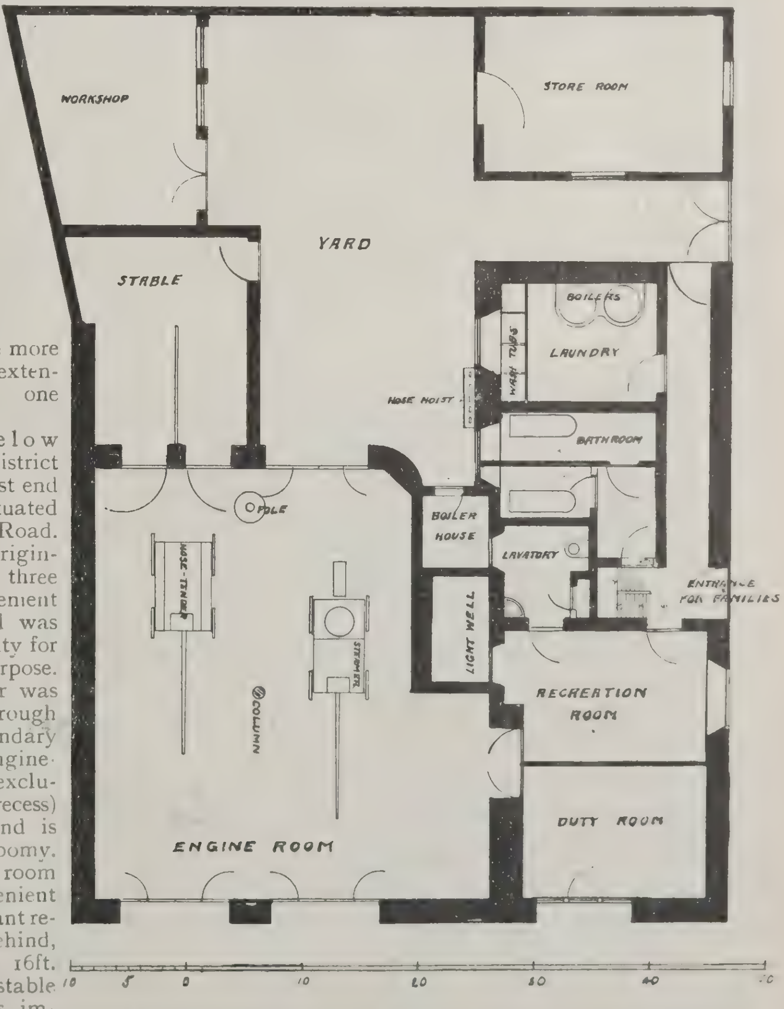
District Stations.

In dealing with district stations in large cities where there is an efficient headquarters the protection of the district is met by the efficient housing of a steamer and tender or horsed fire-escape tender, consequently the establishment of the station does not necessarily require to be on an elaborate scale. A frontage of 45ft. with a depth of 70ft. will allow for a very compact district station accommodating two machines, providing a telephone room on the street front, with stables, workshop, store-room and yard in the rear. This accommodation may appear meagre, but if it supplies the turn-out of an efficient fire apparatus it meets the requirements. It is preferable to have two such stations in different districts of a city than to have only one more elaborate and extensive station in one district only.

The plan below shows the district station in the east end of Edinburgh, situated in the London Road. This property originally consisted of three shops with tenement flats above, and was bought by the city for its present purpose. The ground floor was gutted right through to the back boundary wall. The engine-room measures (exclusive of corner recess) 28ft. by 35ft., and is ample and roomy. The telephone room is of a very convenient size, with a pleasant recreation-room behind, each measuring 16ft. by 11ft. The stable for two horses is immediately behind the hose tender; a small workshop and store are also provided off a small but convenient yard. The equipment of the station is complete and up-to-date, the harness is suspended over each machine, the steamer is connected by automatic fittings and heated by hot-water circulation from a stationary boiler. The station is manned by an officer and eight men, who live in the tenement above, and a pole lands them in the rear of the engine-room. The houses are fitted with electric turn-out lights, the stable and pole-well doors are controlled by electric switches from the telephone room, the horses run up to the tender but are led up to the steamer, and a very efficient turn-out with either tender or steamer is made in 20 and 40 seconds respectively.

The other plan on this page is another of the Edinburgh fire brigade stations, and occupies a somewhat awkwardly shaped piece of ground, with a depth of only 35ft. at its widest part, narrowing down to 16ft., the side wall running along the street front and the engine-house doorways opening on to an unenclosed yard. The telephone room is in the rear of the stables. This station, like that shown on the other plan, is thoroughly complete in its appointments, the arrangements being identical. The steamer, a large one, is horsed by three horses, and is turned out in 50 seconds. The officer and eight men who man this station are housed in a tenement adjoining, and reach the engine-house by the poles shown on plan. A photograph of the interior of this station is published on the preceding page. These illustrations tend to show that though small a station need not necessarily be inefficient.

Bradford's new Fire Station is exceedingly well planned, and equipped with the most modern of American telegraphic appliances.



EAST END DISTRICT FIRE STATION, LONDON ROAD, EDINBURGH: GROUND-FLOOR PLAN.

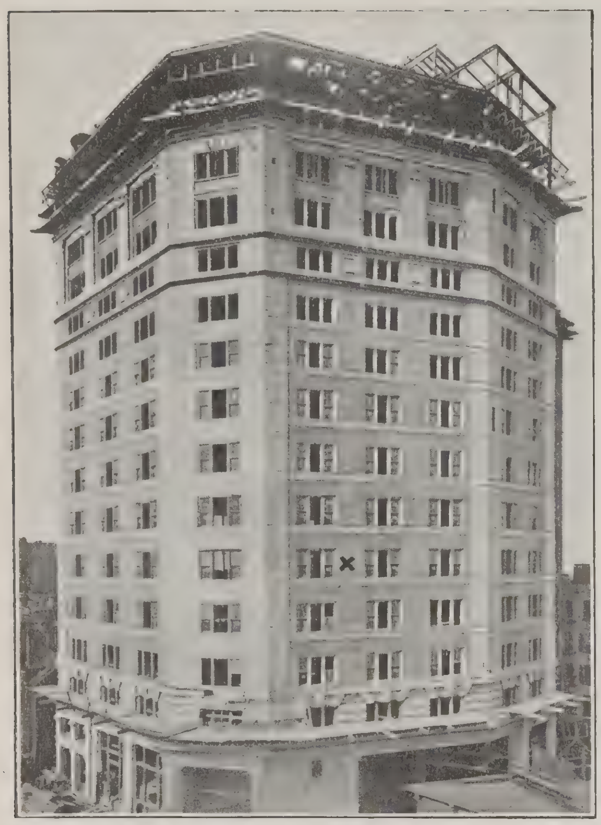


FIG. 1.—BUTTERICK BUILDING, NEW YORK: THE X SHOWS THE STOREY WHERE THE TEST WAS MADE.

FIRE TESTS IN ACTUAL BUILDINGS.

WE give below particulars of an interesting test of the fire-resisting construction employed in a building, while still in course of erection, performed by the Department of Mechanical Engineering of Columbian University at the end of last year. The method of performing this test is very instructive, for apart from the results obtained, which merely confirm facts elicited in this country from actual fires and tests, this experiment shows the possibility of investigating the value of work in course of construction. The following is taken from the report on this test at the Butterick Building, New York City, by Prof. Ira H. Woolson, of Columbia University:—

The Object of this Test was to determine the relative merits of a special cinder-concrete slab and a special cinder-concrete plaster as a fire protective covering for the bottom flange of girder **I**-beams.

In order that the two materials might be subjected to exactly the same conditions, a space 4ft. long on the bottom of a girder was plastered with the concrete mixture to be tested; adjoining this came the slab coverings, and the test chamber was arranged to include both.

The test was also designed to determine the fire-resisting properties of the cinder-concrete floor construction employed in the building. This concrete was reinforced with expanded metal. Complete data regarding the composition, age and thickness of the various concretes is given in the descriptions of the photographs and drawings following.

Location and Method of Test.

The test was conducted upon the fifth floor of the large fifteen-storey manufacturing building being erected for the Butterick Publishing Co., under the direction of Messrs. Horgan & Slattery, architects. The general view on this page shows the condition of the building at the time the test was made. The steel framework was practically all erected, the side walls were nearly finished and most of the concrete floors were laid.

A test chamber 6ft. by 8ft. internal dimensions was built in the middle of the fifth floor, the walls extending from floor to the ceiling, and so located that the girder **I**-beams to be tested ran through the middle of the portion of the ceiling enclosed by the walls. The photographic view below shows the chamber previous to the test. Three feet from the floor a suitable grate was constructed, which supported the fuel; below the grate in each wall were large draft openings. Doors for firing were also provided. In the four corners of the ceiling holes were broken through to the floor above to serve as vents, and chimney flues were constructed around these holes projecting about 4ft. to 5ft. up into the space of the sixth floor. Full details of the construction of this chamber are given in the accompanying drawings (Figs. 6, 7 and 8). Owing to a strike of the bricklayers, it was necessary to make the upper portion of the side walls of cinder concrete, but this in no way affected the results of the test.

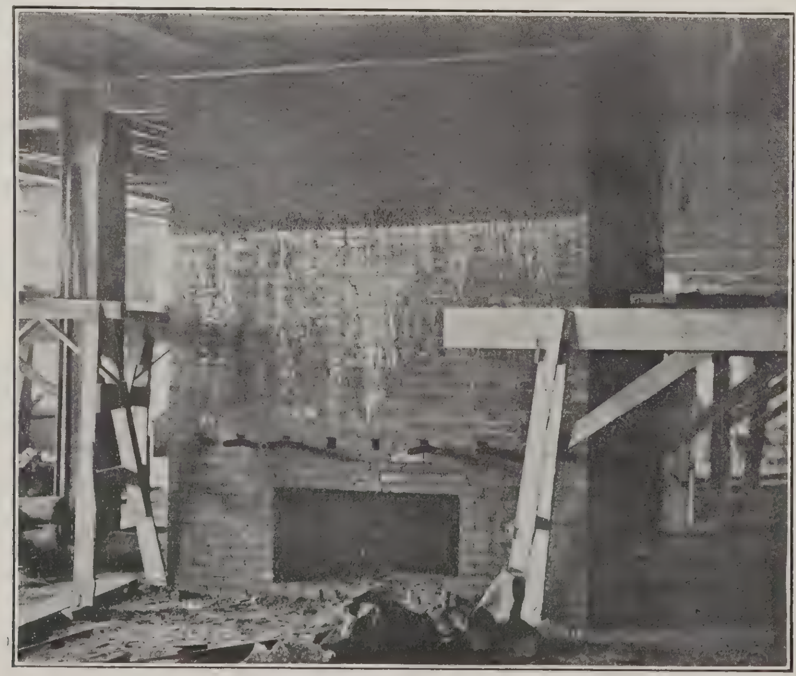

FIG. 2.—TEST CHAMBER ON THE FIFTH FLOOR.

The fuel used was cordwood and refuse wood collected about the building. Much of it was wet and unsuited for a free burning fire. The defective fuel, and a faulty arrangement of the firing floor due to the strike trouble, made it impossible to raise the heat as rapidly as desired or maintain it evenly. However, during the last twenty-five minutes of the test the heat was high and the general average sufficient to make a severe test of the beam covering.

The temperatures were determined by means of a Le Chatelier pyrometer, readings being taken every five minutes at two points located about 20ins. from the ceiling and the same distance from the side walls. Temperatures were also read between the two **I**-beams (which composed the main girder) at a point level with their bottom flanges (see Fig. 6). The attached "Table of Temperatures" gives a complete record of all readings, together with the averages.

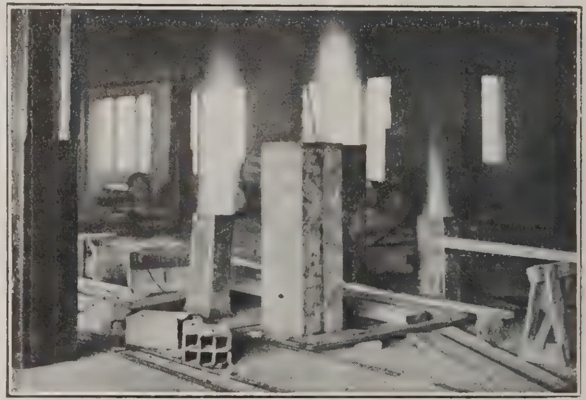

FIG. 3.—FLUES ON SIXTH FLOOR: TWO OF CONDUIT TILES USED FOR FLUES BROKEN AND REPLACED WITH METAL COLUMN BASES.

The fire was continued for 2$\frac{1}{4}$ hours, and the water was applied for five minutes to the red hot ceiling and beam covering by a detachment of firemen. The water was delivered under a pressure of 60 lbs. per sq. in. through regulation hose fitted with 1$\frac{1}{8}$in. nozzle.

Results of the Test.

During the test measurements were made to determine the amount of deflection which took place in the girder, and this was found to be less than $\frac{1}{4}$in. That the girder was not subjected to any damaging heat was evidenced by the fact that the maximum temperatures recorded on its bottom flange was only 297 degs. Fahr.

After the test, the walls of the test chamber were removed and photographs taken from different positions showing the condition of the ceiling and girder coverings, one of which we reproduce, from which it is evident that the beam protection was excellent. It is also apparent that the concrete slabs (marked A in Fig. 7) were superior to the concrete plaster (marked B in Fig. 7); but, in justice to the plaster, it must be remembered that its age was only three days, while the slabs were three weeks old when tested, and although the plaster appeared to

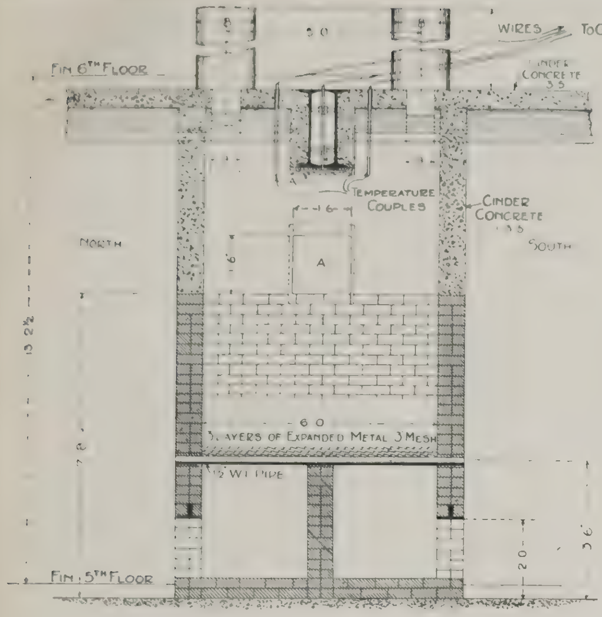

FIG. 6.—NORTH AND SOUTH VERTICAL SECTION OF TEST CHAMBER.

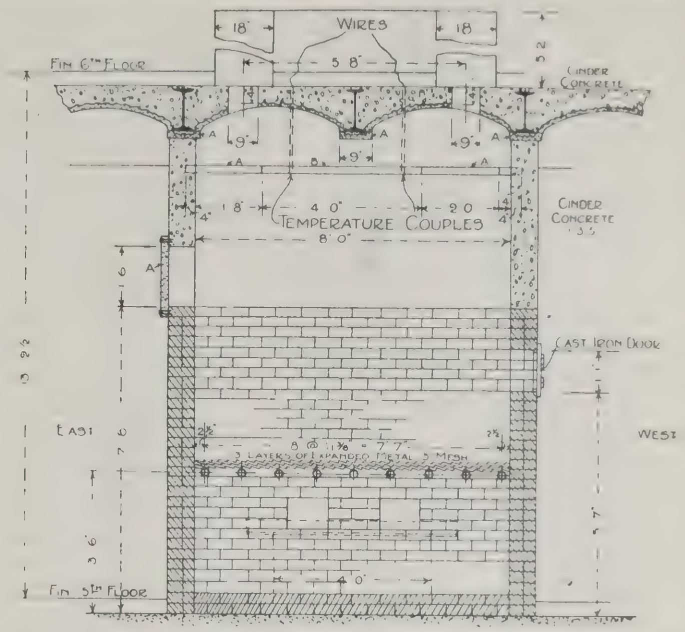

FIG. 7.—EAST AND WEST VERTICAL SECTION OF TEST CHAMBER.

be dry this disparity in age would doubtless have some effect upon its tenacity.

The force of water had washed away a portion of one slab exposing the metal lath by which it was reinforced. Part of the metal lath in the plaster was similarly exposed, but there was this distinctive difference between the two: the lath in the slab was located ½in. from the bottom, so there was practically 1½ins. of cinder-concrete protection still remaining between the lath and the beam, which the water had not disturbed, while in the case of the plaster the lath was wrapped close to the beams, so the only protection between the lath and the beam was the small amount of plaster concrete forced through the mesh in putting it on. This was washed out in places, and the beams exposed. The broken slabs (to be seen in Fig. 4) were not due to the test.

The photograph also shows that the cinder-concrete floor construction went through the test with very slight injury. In fact, that such a fire could be resisted for 2¼ hours without injuring the stability of the structure is conclusive evidence of the fire-resisting efficiency of the whole construction.

Description of Illustrations.

Fig. 1 shows the front of the building looking west from Spring Street. The cross in black shows the storey on which the test was made. The building was in this condition when the test was made.

Fig. 2 shows the south elevation of the test chamber. The lower part is of brick 8ins. thick. The bricklayers went on a strike and left the walls when they had them 7ft. high. The upper part was made of cinder concrete 8ins. thick, reinforced with expanded metal, completed twenty-four hours before the test.

Fig. 3 shows the four chimney flues on the sixth floor. Electric wire terra-cotta conduits were first used for these flues, but the intense heat cracked them, and they were replaced by iron flues. One is shown in the foreground. The flames are easily seen in this photo.

Fig. 4 shows the effect of the fire and water on the beams and girders of the ceiling of the test chamber. The cinder-concrete slabs 2ins. thick were reinforced with metal lath cast in moulds and fastened to the bottom of the beams by wire clips. The cinder concrete of these slabs was made in the proportion of 1 part of Portland cement, 2 parts of sand and 4 parts of screened cinders. These slabs were three weeks old when the test was made. The middle portion (marked B in Fig. 7) consists of a mixture of 1 part of Portland cement, 2 of sand, 2 of Acme plaster and 4 of cinders. This mixture was applied 72 hours before the test with a trowel to metal lath previously wrapped around the bottom flanges of the beams.

Fig. 5 shows plan and horizontal section of the test chamber.

Fig. 6 shows north and south vertical section showing the construction of the walls, gratings, &c., of the test chamber, also the construction of the sixth floor of the building which formed the roof of the test chamber.

Fig. 7 shows east and west vertical section showing the construction of the test chamber. Parts marked A and B are explained above.

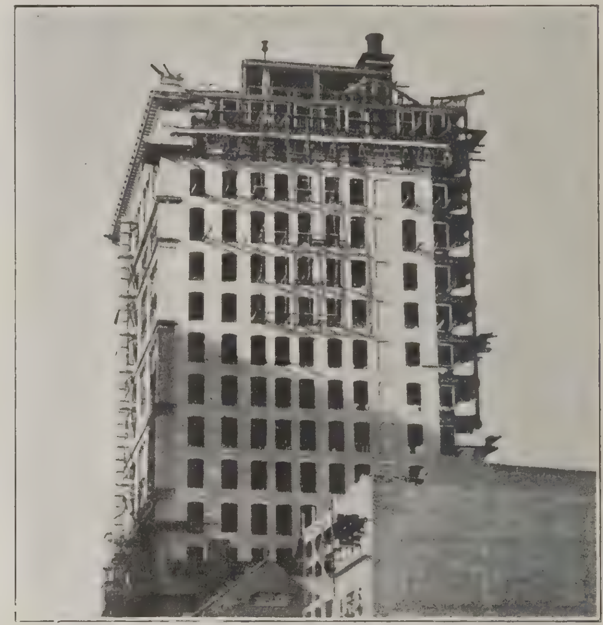

FIG. 5.—NEW SOUTH WALL. *(Photograph taken on October 16th, 1904.)*

RESTORING A FRAME BUILDING.

SO much has been written about the Baltimore fire that we are almost loath to again refer to matters appertaining to that conflagration, nevertheless so much has been said in the public press as to the manner in which the exterior walls of some of the large skyscrapers remained standing, simply requiring nothing more than decorative repair after the fire, that we should like to demonstrate what actually had to be done in the case of the most important of these buildings, namely, the Continental Trust Building. It will be observed that only one of the four front walls of this building was allowed to remain standing, whilst the other three had to be pulled down and rebuilt.

We show the work in its various stages of pulling down and reconstructing, so that there can be no error as to the facts. These illustrations should serve as an object-lesson to those who make premature announcements regarding work of this kind.

The following notes explain the illustrations:—

Fig. 1. This view was taken in May, 1904, and shows the building just as the fire left it. The street covering was erected in March.

Fig. 2. This photograph shows the Baltimore Street front and the east wall in course of removal.

Fig. 3. This view was taken on August 6th, 1904, when the wrecking of the brickwork on the Baltimore Street front had been completed. One storey of the stonework was afterwards removed.

Fig. 4. The Calvert Street front here shown was the only wall which was not ordered by the building inspector to be pulled down; but the contractors were forced to remove even a portion of this.

Fig. 5. This view shows the reconstructed south wall of the Continental Trust Building. The old front bricks from all the walls were used in erecting this wall. The wall on this side was condemned by the building inspector and was demolished down to the fifth-floor level.

Fig. 6. This is a general view of the south and east walls.

Figs. 4, 5 and 6 were taken on October 16th, 1904. When these photographs were sent us the work of reconstructing this building was expected to be finished on March 1st this year.

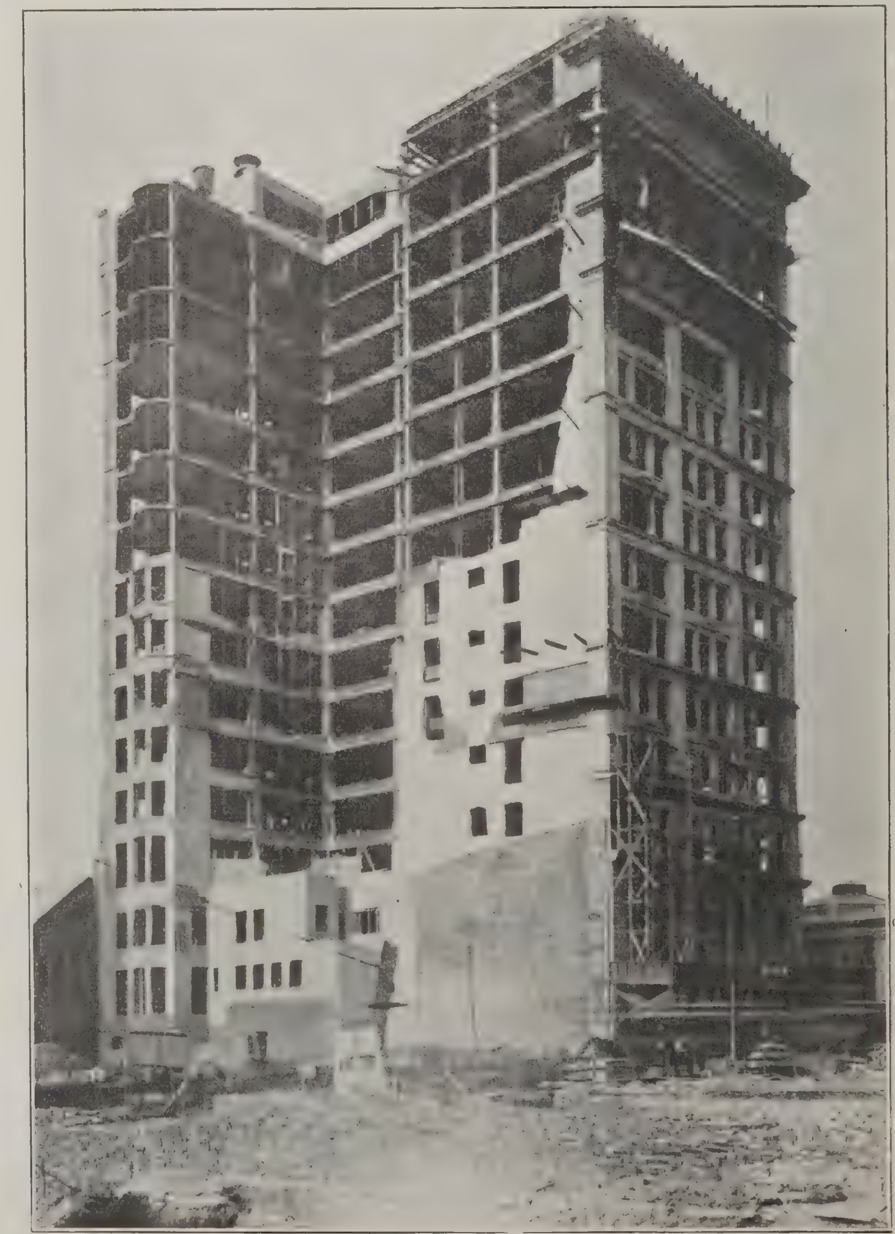

FIG. 2.—THE BALTIMORE STREET FRONT AND EAST WALL IN COURSE OF REMOVAL.

REMARKS ON THE BALTIMORE FIRE

Made at the Budapesth Fire Service Congress by Ellis Marsland, District Surveyor, Camberwell.

The Baltimore fire is one of the most interesting conflagrations of recent years, for

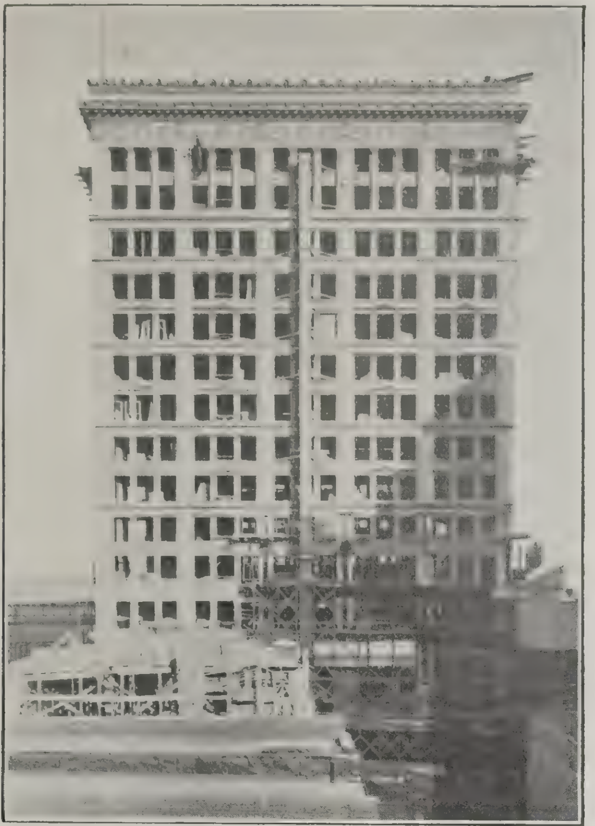

FIG. 4.—THE CALVERT STREET FRONT ON OCTOBER 16TH, 1904.

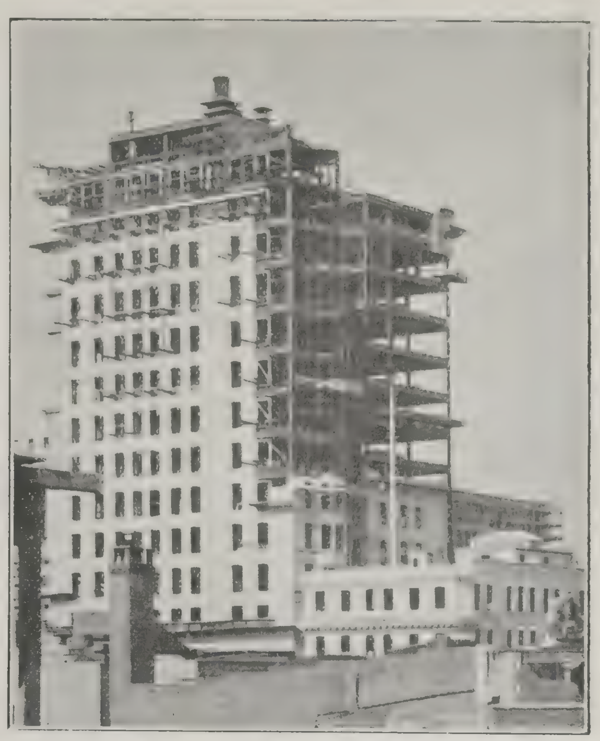

FIG. 6.—SOUTH AND EAST WALLS ON OCTOBER 16TH, 1904.

although it has redemonstrated many facts with which we are already acquainted it has furnished us for the first time with a most thorough and complete example of the behaviour of the modern steel-framed buildings under a severe fire test. It has also shown the weak points in these structures and where greater fire resistance may be effected in the future. It has redemonstrated that all forms of stone are bad fire-resistants and should be but sparingly used in the structure of town buildings. It would of course be impossible to abolish it altogether from an architectural point of view, but where used it should be well backed with brickwork, so that any renewal may be effected without danger to the structures. Indeed, this fire has clearly proved that the only reliable materials are brick and concrete. The hollow tile floor construction and encasing to ironwork of which we have heard so much in certain quarters has largely failed, and would have failed to a greater extent had the fire been less extensive in area and the fire brigade been enabled to put water upon this material, for it is to be remembered that the water test was absent, and we have only the result of intense heat without the sudden cooling.

It may be a cause of general satisfaction that at last a system of construction has been devised whereby the general fabrics may, after a serious conflagration, remain standing, but it is very little consolation to the individual occupier when he can at last return to the scene of his former labours to find that all remains of his office equipment is a building which at the outset he was assured was fireproof and a conglomerate of the remains of a typewriter and a battered iron safe.

It seems to have been overlooked by the designers of these buildings that there was just as much danger from the outside as from within, and perhaps more so, and no provision, or at any rate very inadequate provision, was made for an attack from fire from the exterior. I am quite convinced that had these tall buildings been more adequately equipped with safeguards from without they would have survived the fire, not as a mere constructional shell as we see them to-day, but with more of their internal trim and contents saved from the devouring elements.

In one case where external sprinklers were used at O'Neill & Co.'s store with marked effect, wired glass seems to have resisted the ingress of the flames in a marked degree, and has proved itself worthy of more general adoption, but it requires to be fitted into metal frames, and I think very useful experiments could with advantage be conducted with this material to ascertain the best method of fixing,

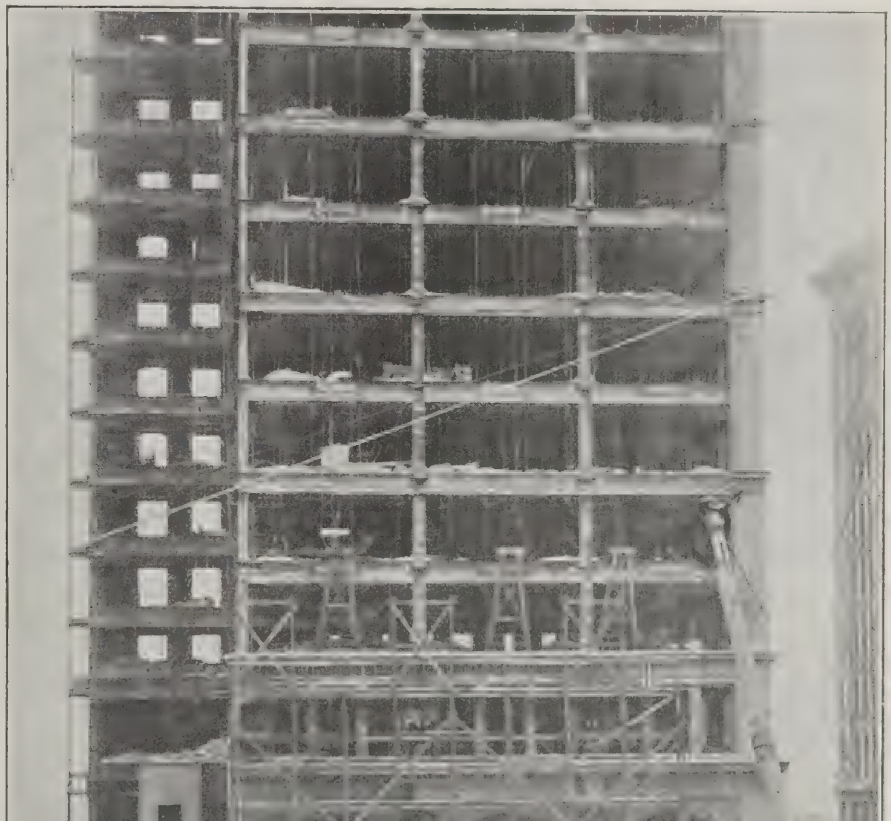

FIG. 3.—THE BALTIMORE STREET FRONT ON AUGUST 6TH, 1904.

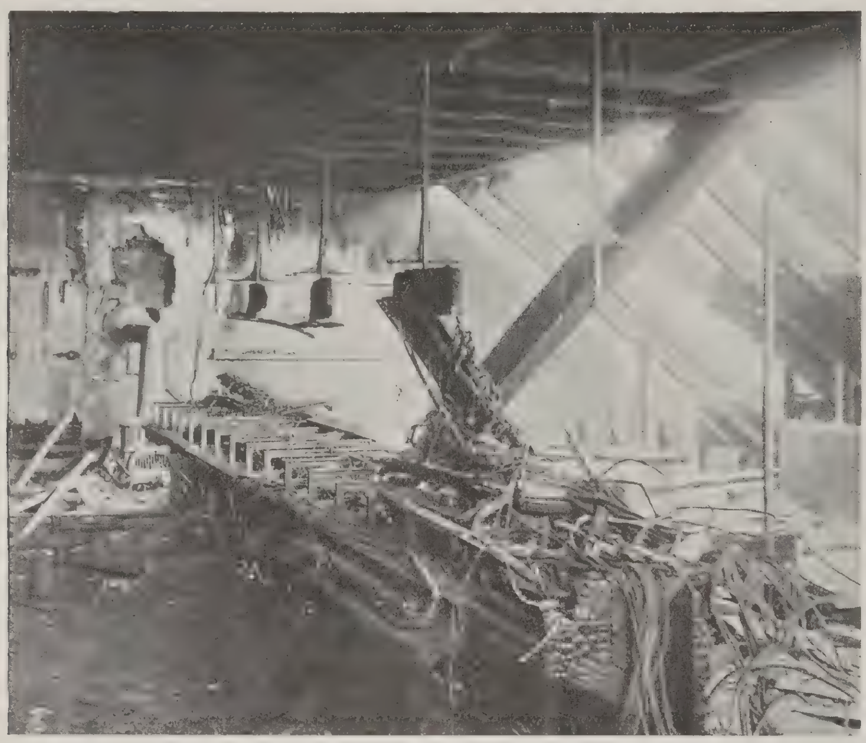

THE FIRE AT THE SOUTHERN TELEPHONE EXCHANGE, GLASGOW.

and also whether a double thickness either in the same frame or an inner frame would be more effective. In the paper read at the Fire Prevention Congress in London in 1903 on the new Entrepôt Royal in Antwerp the method of fixing adopted there was illustrated by Chief Officer A. Schepers, to which perhaps I may refer. I am not so sure that this wire-glass is the best material that will eventually be adopted for this purpose of "exposure risk," but it appears to me to be the best material now available; what we require is a transparent material with a higher melting point than ordinary glass, and it is for manufacturers who see the want to supply the need.

This fire has clearly shown that the town building owner must not be allowed to construct his building in the cheapest and flimsiest manner, trusting to the efficiency of the fire brigade to protect him from his neighbour or *vice versa.*

I have carefully examined the plan of the burnt area at Baltimore, and it appears to me that the building regulations want revision so as to limit the cubical contents of buildings. From a rough calculation I find that the cubical contents of the "Hurst" building, where the fire started, was between 700,000 and 800,000 cub. ft. (20,000 and 22,857 cub. metres), and when a building of this cubical extent becomes well alight, its extinction, without adjoining damage, is a matter of great difficulty. What is wanted is a limit to the cubical extent, and any building of the warehouse or storehouse class should be divided into compartments by vertical walls, and all communication between compartments should be properly secured by double iron doors. I cannot help thinking that we in London have been saved from these disastrous fires by this means. We have on some occasions had similar conditions, viz., a fire in a crowded district with a high wind, but although considerable damage has been done, the fire has been stopped mainly by the vertical walls dividing up the buildings. The London Building Acts limit the cubical contents of buildings of the warehouse class to 250,000 cub. ft. (7,142 cub. metres).

It would, I think, be a great advantage in buildings of this class if all roofs would be flat and of fire-resisting material. A flat roof is a great advantage to the fire-fighting force.

Reverting to the material of which fire-resisting floors and roofs are made, I have great faith in coke-breeze or cinder concrete when properly mixed and reinforced with iron, and also as a protection to ironwork generally. My faith is based on actual experiences which the Baltimore fire corroborates. We have at our testing station the roof of one of our huts constructed of this material, and although we have made a number of tests with the same, some of one, two, three and four hours' duration, at a temperature gradually increasing to 2,000 degs., this roof is practically as good as the day it was erected. Hollow tile has shown its deficiencies, but concrete has yet to be defeated.

One word as to staircases and lifts. All holes around such staircases should be encased in brick, and all doors of the same should be made to close automatically; the top should terminate in a light glass roof, easily broken in case of fire, thus a shaft would be formed for the escape of smoke and flames, which thereby would be prevented from penetrating other portions of the structure.

FIRES AT TELEPHONE EXCHANGES.

IN our last "Fire Supplement" (p. 67) we illustrated the recent fire at the telephone exchange in the City of London and drew attention to the hazard of fire occasioned by the telephone service. We are now enabled to supplement this with a photograph of another fire at a telephone exchange, namely, that which occurred in the morning of May 20th, 1902, at the National Telephone Company's Southern Exchange on the attic floor of the four-storey building situated at No. 31, Morrison Street, South Side, Glasgow. This fire is of importance, as it was the means of the National Telephone Company providing fire escapes to all their exchanges throughout the Kingdom. We present the particulars of this fire, together with an illustration, as a further example of the fire hazard attached to telephone operations.

The outbreak occurred in the switch-room and is presumed to have been caused by one of the inspectors, who was engaged making further connections to the switchboard, accidentally causing a lamp to come in contact with the wires. In consequence of the inflammable nature of the insulating material, the switchboard, which contained connections for over 500 subscribers, was immediately enveloped in flames. So quickly did the fire spread that the ordinary means of escape were cut off, and the operators, about a dozen girls, were taken out by the roof on to the top of an adjoining building, from which they had no difficulty in getting away. The outbreak was confined to the apartment in which it originated and the roof thereof, but very considerable damage was done in the flats below by water. Our illustration shows the switch-room after the fire and the roof lights through which the operators escaped.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

April 19, 1905. Vol. 21, No. 532.

6, Great New Street, Fetter Lane, E.C.

Summary.

A correspondent protests against the proposal to add flying buttresses to the nave of York Minster under Mr. Bodley's direction. These, he says, would be constructionally wrong, for the mediæval builders abandoned the idea of a stone vault over the nave and erected instead a wooden one with little thrust on the clearstory walls. He adds that "a leprosy of new stonework" is spreading from end to end of the building. (Page 209.)

Mr. Middleton, in a letter, says it is an open secret that the large committee which was formed early in 1904 to consider and report upon the principle of registration has prepared a new Registration Bill, or, as it is called, an "Enrolment" Bill, to lay before Parliament, and that this is a weak copy of the existing Registration Bill, "so badly drawn as to be unworkable in practice and containing clauses which could on no account be accepted by the House of Commons." (Page 210.)

At Nottingham the building trade is more sluggish than it has been for twenty years. (Page 206.)

Reinforced concrete has been extensively employed at the new sewage works at Chester. There are twelve precipitation tanks built on a raft of reinforced concrete 200ft. long, 180ft. wide and 21ins. thick. (Page 206.)

It would be highly advantageous to all concerned if the professional and trade associations would draw up standards for paintwork and forms of specification, to which reference could be made so as to secure fair competition. (Page 202.)

The restoration of Culross Abbey is to be proceeded with under the direction of Sir Rowand Anderson. (Page 204.)

In his valedictory address to the Devon and Exeter Architectural Society Mr. Charles Cole said it was evident that some of the leading architects did not quite appreciate the position of affairs in the provinces in regard to registration, and the longer things remained where they were the worse it would be. It seemed obvious that they must all get under one umbrella. (Page 201.)

There is a tendency now to use corrugated iron for the roofs of power stations. This lowers the initial cost, and the reduced weight cheapens the roof-trusses and walls, &c.; it also enables the work to be completed much quicker. (Page 201.)

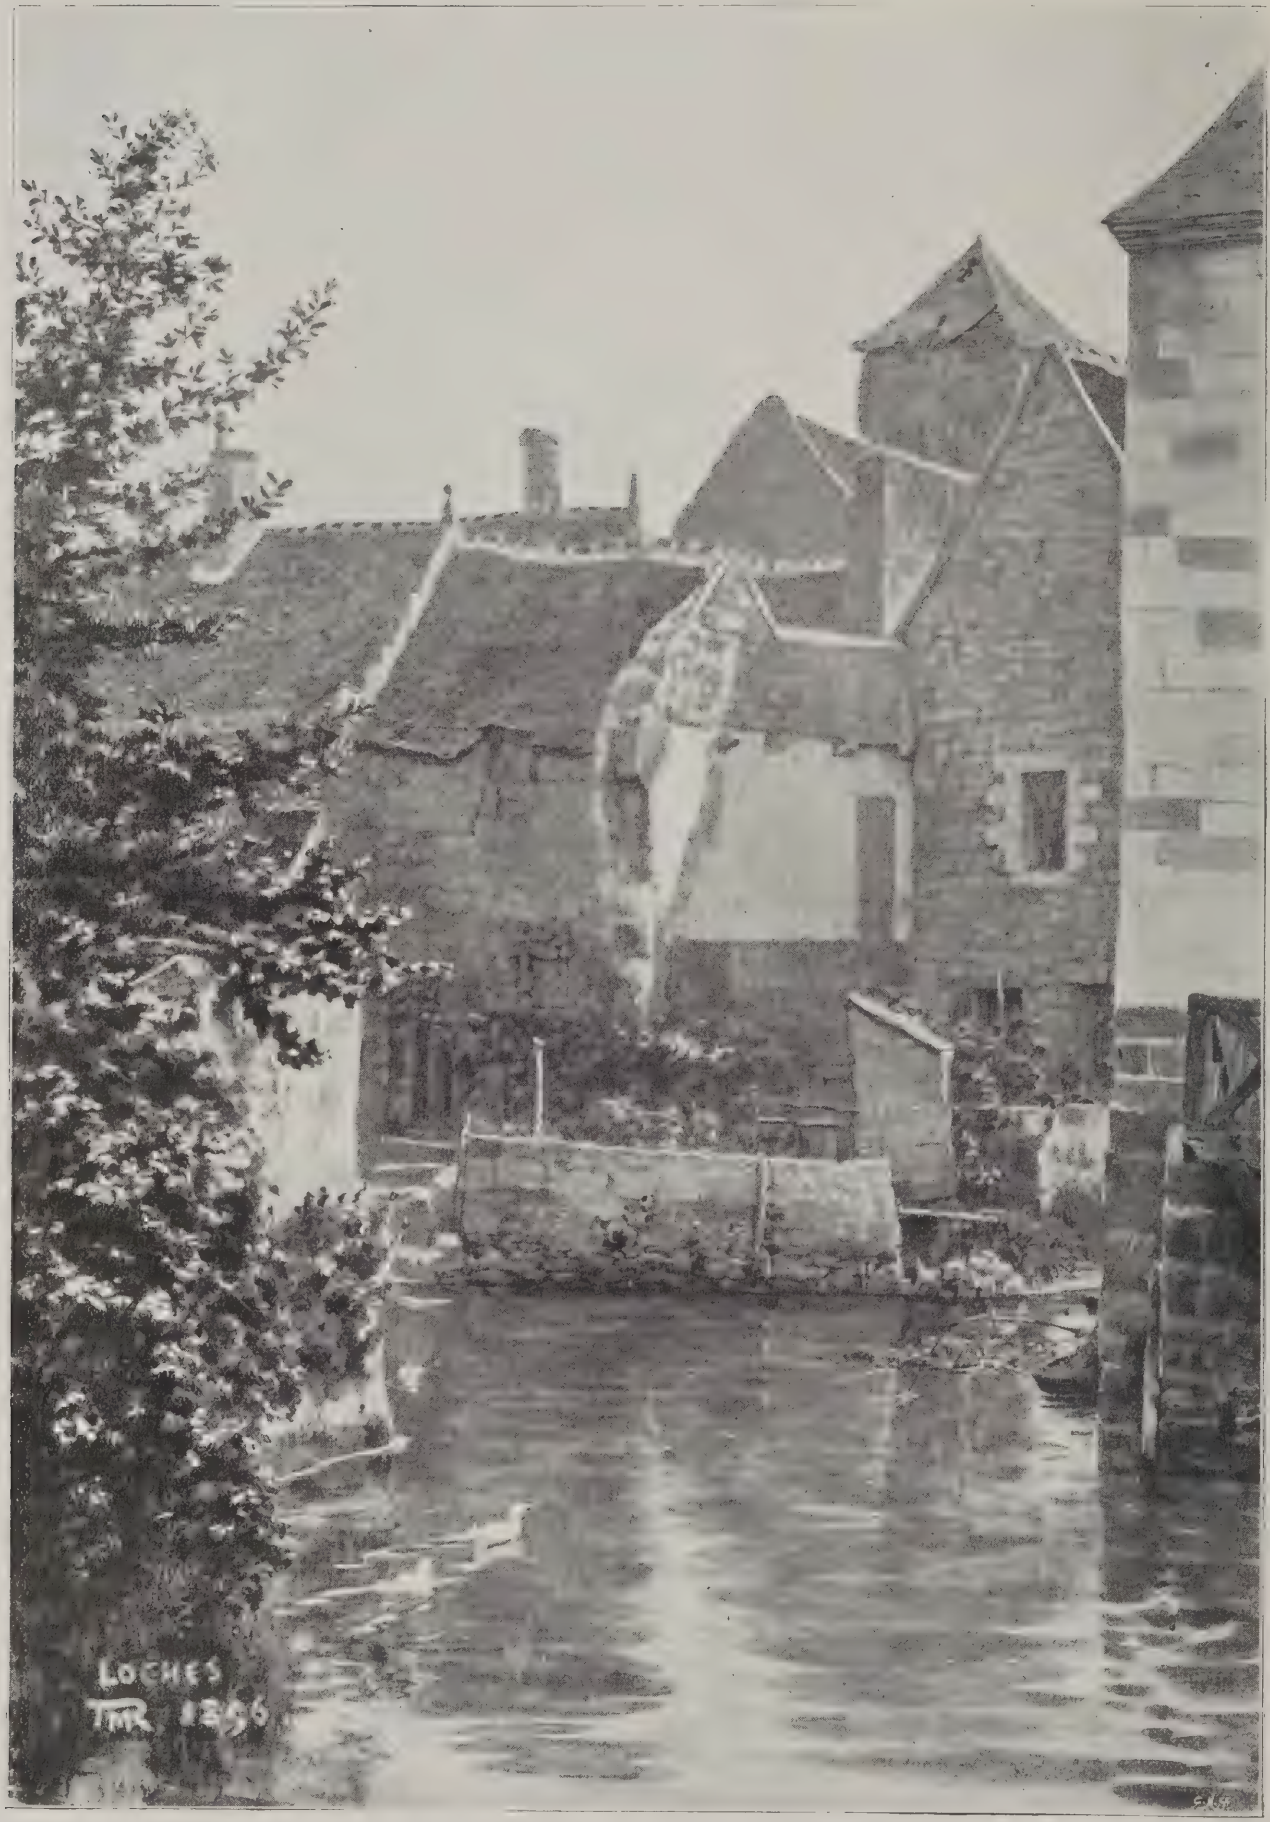
An American firm of heating engineers now advertises complete plans and elevations of the house with every plant! (This page.)

In the course of a paper on garden architecture which he read before the Institute on Monday evening Mr. Mervyn Macartney said we had nothing to learn now from foreign examples and that we had enough in this country to guide us; the best gardens are those which are not slavish copies of other lands. (Page 205.)

Architecture with a Pound of Tea. A SHORT time ago we took occasion to notice a method of supplying house designs which seems to be much in vogue in America. The designs are brought together in book form like so many wallpaper patterns, and for half a dollar you are supposed to become possessed of the most delightful, commodious and ingenious schemes conceivable—and to have all these without paying an architect. The idea has now been extended into the sphere of what we may call "architecture with a pound of tea," for we have before us the advertisement of an American firm of "engineers, architects and manufacturers" wherein is set forth the "factory to consumer" method of selling hot-water heating plants. This is no less than supplying complete blue prints of floor plans, elevations and details, together with specifications and an estimate of cost, to every purchaser of the plant in question: "and all plans are artistic." Moreover, "for 10 cents and the names of two persons who you know expect to build we will send a handsome folder showing floor plans and elevations of twenty-five residences and buildings." While, as if there were not inducement enough in all this, we note that "this advertisement is good for one dollar on the heating contract." The American always seems capable of eclipsing himself, but we hardly see how much farther he can go in this direction. This is selling architecture over the counter with a vengeance.

"Be Gentlemen." WHILE referring to the foregoing it is opportune to note some remarks in the report of a special committee of the Boston Society of Architects appointed to consider certain questions of architects' charges and methods of business. The committee asks why it is that we think an architect is not all that he might be if he competes without compensation or cuts the usual rate of charges? There is nothing immoral about either of these things, unless while doing them one pretends that he does not do them. In what way, then, does an architect differ from the grocer who undersells his neighbour until his profit is of the slightest? In what respect is he like the doctor who does not do so? Is it perhaps based on the fact that professional men sell ideas instead of goods; not drawings but design; not sermons but good counsel; not medicine but sound advice? Is it perhaps founded even more on the fact that to professional men bread-winning, while it is a necessity of life, is not after all what gives them delight in their work? To these questions the committee are unable to give any exact answers, but they are happy to know that, whatever the reason, there is a high professional spirit among architects; and they submit that the best code is that which says "Be a gentleman always and in addition as good an architect as possible." It is of course impossible to lay down any laws on the matter, and for that reason this committee of American architects believes that the only remedy for these evident evils is moral suasion. They think it cannot be too often said and repeated that a commission of 5 per cent. has been long agreed upon as a moderate bread-winning commission for work properly done; that a less charge is unremunerative; that a greater charge is perfectly proper for those whose skill makes them able to obtain it; that anybody who cuts these prices by lowering the rate is really breaking the lowest remunerative market price; that to volunteer, without pay, sketches and competition work is also practically cutting prices, as when a 5 per cent. commission was established as usual and proper for ordinary professional services it was never intended to cover expenditures for obtaining work—that if an architect does this, whether he is young or old, he will earn the name among his fellows of being unduly selfish; he will, in short, be a "hustler," and will have to take the odium that attaches to the name.

O! Presidents. "We weep for you," the walrus said, "we deeply sympathize"—a ballad which has found many an echo during a president's address: for some of the dullest reading is that contained in those quasi-Olympian orations inflicted annually on architectural bodies. The same old story is told again; the same generalities are set forth at much length; the same banners are raised to set aflame the students' eyes; and the proposers and seconders always say what a splendid address they have listened to. But the truth about the matter is very different. 'Tis generally dead stuff. There is no individuality about it. Everybody knows what has taken place throughout the year, and there is no necessity for the president to recapitulate the facts, with a sprinkling of innocuous remarks. What is wanted is a vigorous personal expression of opinion. That opinion may not be shared by many, but at least it interests and brings in some life. In this connection we draw attention to the excellent address which Mr. Charles Cole delivered to the Devon and Exeter Architectural Society last week (see p. 201). There is "go" in this address, and humour, and shrewd criticism withal. Would that other presidents might do likewise and become interesting talkers instead of dull speech-makers.



DRAWINGS OF ARCHITECTURE: T. M. ROOKE.

This drawing made at Beaulieu, by Loches, is a typical example of Mr. Rooke's draughtsmanship. As we mentioned when publishing another of Mr. Rooke's drawings in our issue of December 23rd, 1903, this artist was among Ruskin's favoured few.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

Retiring President's Lively Address.

AT the annual meeting of the Devon and Exeter Architectural Society last week Mr. Charles Cole, the retiring president, delivered an address. After some introductory remarks, he said one would fancy that the

Model By-laws

were drafted by men who had never done any practical work; and as all local authorities copied them to a great extent, they found some very curious anomalies. They must not introduce any clauses suitable to their locality or make any of them at all elastic, or the Board above would refuse to sanction them. So they got the strange state of affairs that a little one-house town in the wilds of nowhere had the same by-laws as a large city. The effect of some by-laws was that in large towns many old buildings were not pulled down and rebuilt because, in addition to light troubles and party-wall questions (which bulked largely), the unfortunate architect had still to deal with local authorities whose views were often "quaint." If there were any elasticity, many a client would rebuild entirely, instead of "tinkering" by taking out a floor, putting up a new front, and so on, often involving a great deal of trouble and anxiety and a liberal use of steel or ironwork. Even if a new building did not quite comply with all the cast-iron rules of the powers that be, it must be a great sanitary advance on old timber buildings, crusted with age and other things in its numerous cavities and worm-eaten woodwork. Perhaps one of the most irritating features of the whole thing was that where a local authority was willing and anxious to frame sensible by-laws to suit its locality, the Local Government Board would have none of them.

Registration; Competitions.

Referring to registration, Mr. Cole said it was gratifying to a great number of provincial architects to know that the Institute had at last come to the conclusion that something must be done, and had actually done something. In this matter the Society of Architects had justified its existence: it had been most loyal throughout and was ever ready to support the Institute and allow it to take the lead. "I do not want to labour the point unduly, but credit must be given where credit is due. It is evident that some of our leading architects do not quite appreciate the position of affairs in the provinces, and the longer things remain as they are the worse it will be. It seems to me to be obvious that we must all get under one umbrella. Old-fashioned notions die hard: the passing of the Medical Act showed that; and now nearly every profession has its central and examining authority, from the lawyers, doctors and accountants to the midwives; only architects remain unpractical and dilatory.

Just One Example.

"What happened to the memorials issued by the R.I.B.A. and its allied societies, and duly forwarded to nearly all local authorities? They were treated generally with silent respect, and allowed to lie on the table; no one took the trouble to read them. Where they are now goodness alone knows! When we are all united we can speak with a louder voice which will carry more weight. With a proper legal status, were we more united I do not think the courts would ride rough-shod over us as they often do now. Take the

Ownership of Drawings

question. 'It is only an architect's matter,' and the greatest injustice is done. The drawings are only the means to an end, and yet, forsooth, a cantankerous client, even if he cannot understand which is the right side up of a plan, may insist on having the drawings handed over to him. They are of little service, and nowadays not even drain plans are as necessary as they used to be, because the manhole covers and gulleys show exactly where the pipes are; and now I note that the Master of the Rolls has lately dismissed Mr. Gibbon's appeal against the decision of Mr. Justice Ridley that he must give up the plans he had prepared for certain flats. Plans of buildings erected during the course of his career, together with his brains and experience, are the architect's stock-in-trade; but unless he goes to the trouble and expense of making tracings, all his records may be swept away. I have pointed out to clients before now that if the drawings are taken away they will assuredly be lost. Time has already on more than two occasions proved the correctness of my statement, and the strayed ones have been restored to the fold. I must say that I think the R.I.B.A., with their splendid income and, if I am correctly informed, substantial reserve, should help the profession, or at least their own members, to fight with all its strength such legal injustice and unfairness.

"I feel sure that

The new Lady Architect

who is an A.R.I.B.A. would, if placed on the Council, wake up the slumberers and help the new and younger blood on the reformed body to greater efforts and a real progressive policy—not too progressive, but just progressive enough.

The Ways of the Enterprising Builder.

"The architect has to face competitors on every hand. The enterprising builder keeps the tracings of various works of which he may become possessed. Even if the architect is sharp enough and insists on their being returned before the issue of the final certificate, an office boy does the needful with pen, ink and tracing paper, and many a clever design is repeated *ad nauseam* in a row of jerry-built houses, or put in a more pretentious building in entirely the wrong position. The auctioneer and house agent has a little field day occasionally, as well as—speak very lowly and with due respect!—the solicitor's clerk.

The Engineer's Bridge.

"The engineer, too, builds a steel bridge and loads the spandrels with tons of cast-iron 'ornament' bolted on securely to prevent the structure from rising on its pin joints or hinges and shaking off its architectural adornments into the river below. Its balustrade panels are Gothic; so are the bases of its electric-light standards—all fearfully and wonderfully designed and made. There are beautiful castings further up the steel posts, but these are not Gothic, and the lamps look down bashfully and admiringly on the bases and wish that they had crochets on their shades.

Competitions.

"Generally speaking, the past year has been one of bad trade, and naturally people do not proceed with new works under such circumstances. Let us hope that matters may improve shortly and find work for a very deserving class, and that those who promote competitions may so draft the conditions that architects may feel that they will be treated fairly. The public and committees generally have only very crude ideas of the enormous amount of work involved in preparing the necessary drawings; and I think that the suggestion of the R.I.B.A. is most excellent—that promoters should pay a successful competitor 1½ per cent. on the estimated cost of a delayed or abandoned scheme. But one may call 'spirits from the vasty deep'; the question is, will they come?

"I do not propose to give the ordinary schedule of works carried out either locally or throughout the country; you can all read that for yourselves; but I really believe the public generally are taking more interest in architects and their works, and one hears less and less every year of the coarse remark or jest that 'they keep the cost of the work up because they are paid a commission on it.' When registration is *un fait accompli* this will die out altogether. We must all endeavour to see that the younger men who come in have a real love for a beautiful art and science and are determined to be a credit to it by being well informed in all its various ramifications; because, after all, even with registration—let me misquote—'the name is but the guinea stamp, the man's the gowd for a' that.'"

Mr. B. Priestley Shires was elected president of the Society for the ensuing year and Mr. Harbottle Reid vice-president.

ROOFS FOR POWER STATIONS.

By E. KILBURN SCOTT, M.I.E.E., A.M.I.C.E.

FOR the roofing of power stations in this country the practice so far has been to use slate, but there is now a tendency to employ corrugated iron. It is lower in initial cost and the reduced weight cheapens the roof-trusses and walls, &c. It is fire-resisting; there being no wood, whereas slates require wood for fastening to. Again, corrugated iron can be erected much quicker, as it is purely an engineering job—an important consideration in these days of hurry-scurry and strikes.

The usual gauge of corrugated sheet is No. 20 B.W.G., this meaning the gauge of the sheet before it is galvanized. After galvanizing with, say, 3 ozs. of zinc per square foot of surface, the galvanized sheet should measure between No. 18 and 19 B.W.G. In order that the sheet shall be of the proper thickness it is most necessary to specify exactly what the gauge is to be before galvanizing.

Specially tight joints are made by inserting between the edges of the sheets strips of canvas or loose cord which have been soaked in white lead paint. This gives a dust-proof joint, but, as a matter of fact, the ordinary overlap joint is quite good enough for the boiler-house and car-shed. The end-lap of the sheets is usually about 6ins., and the side lap two corrugations. The hook bolts which clip the sheets down on to the purlins should always be placed on the ridges of the corrugations.

Condensation of moisture on the inside of the corrugated iron sheets may cause drops of water to accumulate and fall from the edges of the purlins on to the machinery. Good ventilation will, however, go a long way towards preventing this, and the employment of the Thomas fitting will ensure that the water is not intercepted at the purlins. The Thomas fitting consists of a saddle resting on the purlin and having a convex projection immediately around the hook bolt. The washer of the hook bolt has a concave underneath surface, so that when tightened down the corrugated iron sheet becomes embossed to the shape of the convex part of the saddle, thus rendering leakages impossible. The saddle also serves another purpose in keeping the corrugated iron sheet about ¼in. clear of the purlin and so preventing the interception of condensation water by the purlin.

Painting is an important matter in the corrugated iron roof. The first coat must be oxide or iron paint, lead paint being used for further coats. It should be noted that this first coat is not required until the galvanized roof has been erected for some time and the surface has become sufficiently dulled to form a "key" for the paint.

Regarding the painting of the roof-trusses and other ironwork, this should be carefully done, the steel being thoroughly cleaned from scale and rust and a first coat applied at once, to be followed by another immediately after erection. Cast-iron, having a natural skin when it leaves the foundry, should receive its first coat before rusting has begun. The roof-trusses, &c., should be painted at regular intervals, for the proverbial pennyworth of tar is very true of metal roof structures.

A common method of ventilating an engine-room is by means of louvres running right along the ridge. In an iron roof such ventilation is arranged by leaving out sheeting at the crown of the roof and having a wider sheeting supported on standards sufficiently high to allow for the outcoming air currents. The spaces between the top row of sheeting and the roof proper is filled in with louvres, which for the car-shed and boiler-house should be fixed, but in the case of the engine-house must be arranged so that they can be opened and closed.

Occasionally this opening and closing gear may get out of order, and even when the louvres are supposed to be closed they may leak a certain amount of water during a gale. The writer is therefore inclined to the opinion that the best way to ventilate an engine-house is by means of large electrically-driven fans in the end walls, the roof being made as tight as it possibly can be.

Regarding roof lights, these should never be placed immediately over the dynamo machinery, because if a pane breaks or any water leaks through it will fall directly on to the dynamos, which are the most delicate machines in the whole station. If a roof light is employed at all it should be immediately over the engines, as the engines are usually next to the boiler-house wall. This fits in very well, for the wall on the dynamo side of the engine-house can generally be fitted with windows running from 3ft. or 4ft. above the floor to nearly up to crane level.

One important thing to take note of in connection with roof lighting is that the lights should not be next to the louvre, as, if so, any snow or ice, &c., dropping from the edge of the louvre on to the glass below may possibly break through. The writer noticed this defective design had been adopted on the large car-sheds of the London United Tramways Co. at Twickenham.

It goes almost without saying that the glazing must be without putty, for it would most certainly shake out with the vibration, and, in any case, the glass must be capable of being quickly and easily renewed. The method of glazing adopted should be such that it will allow of expansion and contraction of the roof without breaking the glass, whilst the fastenings should be so placed that they are protected from corrosion. Almost all of the several kinds of patent glazing on the market nowadays are good, for only the fittest have survived.

A steel ladder should be made a permanent fixture against the power-house wall, so that there may be no delay in repairing leaks or a pane of glass, &c.

Obituary.

Mr. Frank Caws, F.R.I.B.A., architect, of Sunderland, died recently from an attack of pneumonia. He was in his sixtieth year. He went to Sunderland about forty years ago from the Isle of Wight. While serving his articles at the latter place, he was closely connected with the building of the Eddystone Lighthouse, the predecessor of the present structure. For two years in succession recently he was president of the Northern Architectural Association. Besides being an architect of ability, he excelled in mathematics and was the inventor of an apparatus for determining the measure of a ship's resistance.

PAINTS AND PAINTWORK.—I.

THE subject of paints and painting is a very important one to the building trades generally; yet it seems to be neglected by the majority of persons. There are few things about which there is more misunderstanding than paint and paintwork. The manufacturers, it is true, have adopted scientific methods and cannot be reproached as a body, but users are woefully ignorant of the matter. Of late years somewhat more attention has been directed to the subject by reason of the advent of washable distempers or water paints and the increasing use of well-advertised enamels.

Badly-drawn Specifications.

Many architects' specifications contain clauses which are almost ludicrous, and lead only to annoyance and many malpractices. Architects seldom safeguard their clients' or their own interests, the want of any standard of work and the loose wording as to materials resulting in the wholesale adulteration and the substitution of inferior work by contractors and master-decorators who are not over scrupulous. Workmanship is specified to be of "the best," whereas the interpretation of the architect differs on every job, for he would never require the paintwork of a cottage to be equal to that of a mansion or a public building. In the same way we find two or three coats specified when one coat of good paint properly put on might be better than these three coats improperly done. Again, materials are specified to be "pure"—but, as many colours and mediums vary in composition according to their natural condition and contain in varying amount what may be regarded chemically as impurities, the stipulation is only to be regarded as fatuous. A white lead may be "pure," chemically speaking, but distinctly inferior to that made by the old stack process and more or less unequal in composition.

Decorators' Want of Knowledge.

For the ignorance of architects there is plenty of excuse, if not for their neglect of proper precautions; but decorators—both craftsmen and masters—are almost equally uninformed. They know little or nothing of the chemistry of the subject in which they specialize, and go about their work in an unscientific manner. They compound their paints from the cheapest ingredients, and, consequently, generally produce inferior results that are dear in the long run. They admix colours which deleteriously affect each other or the oil, and use dirty brushes, &c. The usual excuse is to blame the varnish, which is more to be relied upon, unless it has been bought at a price which, if it were known, would immediately disprove its genuineness. Seldom is a record kept of the proportions of the ingredients used in any paint, so as to be able to compound it again, while as to colour mixing, matching tints and harmony, it were almost as if the existence of any basis to work on had never been dreamt of.

Our Programme.

With the object of throwing some light upon this subject we have arranged for a short series of articles on paints and paintwork. These will be written so as to be understandable to anyone without a previous chemical knowledge, yet at the same time we hope to make them scientific and instructive of the underlying chemical and physical causes of the results obtained. We shall begin with a general explanation of some of the terminology and a short scientific introduction before proceeding to treat the various branches of the subject in detail. We shall deal with the manufacture of colours, oils, varnishes, &c., only so far as important to architects and other users. Future articles will treat of pigments, oils, driers, varnishes, enamels, size, distempers, stains, colour-mixing, workmanship, brushes, tools, plant, durability of paints, tests, &c.

Standards Wanted.

It would be highly advantageous to all concerned if the professional and trade associations would draw up standards for paintwork and forms of specification, to which reference could be made so as to secure fair competition. A year or two ago the Institute of British Decorators published two forms of conditions of contract for the use of decorators, and this appears to be the only organized attempt to deal with the abuses in the trade; little attention, however, has been paid to it. Such isolated effort is praiseworthy but can do very little good. Architects have a right to a say in the matter, and what is wanted is for a joint committee to be appointed by the Royal Institute of British Architects, the Surveyors' Institution, the Institution of Civil Engineers, the Institute of Builders and the painters' and decorators' associations to enquire into the matter and draw up standards for specifications, issue a series of standardized specimen examples for reference, and state tests for durability.

The Functions of Paints.

The functions of paintwork are two:—(1) preservation and (2) coloration. Under the first heading is included the durability of paints and their application with the object of giving a cleanly appearance and surface and maintaining it, and its sanitary bearing. Under the second heading we can include all decorative effects to be obtained by the use of paints. The first is the more important of the two functions of paints.

Paint in a general sense consists of a pigment and a vehicle, but the word is more particularly confined to a pigment mixed with oil. Distemper is a pigment mixed with water.

Paint dries by the oxidation of the oil, which latter hardens, so binding the pigment. It is diluted or thinned out, generally by turpentine, which evaporates away in the drying. The oil forms a protective coating and offers resistance to the pigment being washed or rubbed away.

Distemper becomes set by the drying of the water, but the necessary binding of the pigment comes from a fixing agent, such as size, glue or casein. Washable distempers have just sufficient vehicle incorporated with them to render them insoluble in water after once drying.

The oil in paints makes them dry with a gloss, whereas distemper dries with a dull surface.

Varnish is added to paint to increase its hardness of surface, to hasten its drying, and to increase its lustre (this last not always, for there are "encaustic" or "dead" varnishes, which give a lustreless surface).

Tar, some stains, and varnish and lacquer used alone and not for coating paint are other classes of materials used for the dual purpose of preservation and coloration, and belong to the same category as paints, but cannot be called so, as they contain no free pigment, and are more or less distinct chemical compounds rather than mixtures.

Definitions.

Before proceeding to the scientific study of paint substances it would be as well to define the nomenclature employed other than the foregoing:—

A thinner is a diluent substance, having the purpose of rendering paint more easy of spreading, so producing a thinner and less glossy coat. Turpentine is the usual thinner.

Clairecolle, or clearcole, is a solution the purpose of which is to render a surface non-absorbent of paint or distemper (and equally so all over).

A filler is a substance or pigment added not for its colour but to (1) increase the body or thicken a paint and so economize by saving in the quantity of the colouring pigment, or (2) to render it more durable. It is often required for both purposes.

Driers are substances which hasten the oxidation of the oil in paints.

Stains are colouring substances which change the hue of a surface without obscuring the texture or grain. This colouring may be due to the use of transparent colours in solution or thinly suspended, or to chemical action with the surface to which the stains are applied.

Polishes are varieties of varnishes which require friction to bring them to a smooth glossy surface.

Lacquers are a species of varnish used for the protection and colouring of metallic surfaces.

Enamels are paints compounded with varnish. The term originally stood for a paint consisting of a metallic oxide, ground in oil and mixed with petroleum spirit, holding some resinous matter in solution, but the term now includes any pigment ground in varnish, or in oil or spirit to which resin or gum has been added.

Knotting is any substance used for preventing the exudation of resin from knots in the wood.

Priming is the operation of applying the first coat of paint, called the priming coat, and has the object of filling up the pores of the wood to prevent absorption of the next coat.

Stopping consists of a plaster or putty for filling up cavities or inequalities in a surface to ensure an even coat of paint.

Flatting is paint that dries with a lustreless surface, and this is secured by a preponderance of diluent over oil in its composition.

Combing is the streaking of a flat tint with another, performed by putting one coat on another, and while the second is wet wiping away parts with the teeth of a comb.

Graining is the imitation of wood, and is done in a similar way to combing, except that other instruments are used in addition to combs and other colours may be put in with a brush.

Marbling is the same, only in imitation of marble instead of wood.

Stippling is the operation of applying paint without stroking or smearing it on with a brush, being performed by dabbing with brushes of special form. It has for its object the production of an even, flat, lustreless surface free from brush-marks.

Ropiness is the term used to express the state of a corded surface, which is the too apparent use of the brush. The term is also applied to paint when it is thick and sticky and holds together like treacle.

Ladders is a term used to express the missed places in the finishing coat, showing the transverse laying-off between the final brush strokes.

Cissing is the term given to the contractile action of water or paint upon a very oily surface of new paint, frequently found in varnishing oil paint.

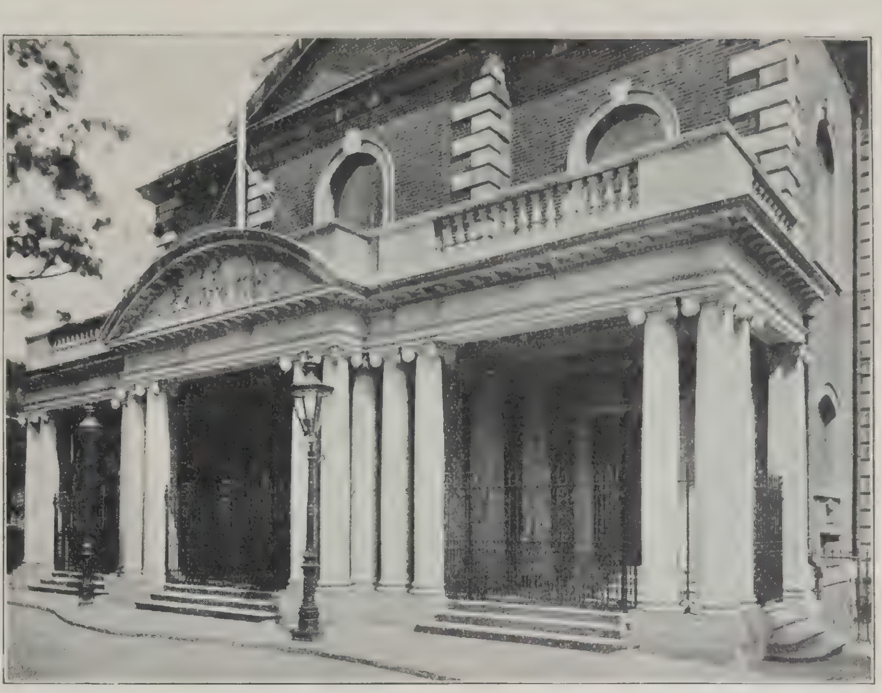
Striking or flashing is the name given to the occurrence of oily or shiny patches in flatted work.

Blooming is the term applied to the gathering of a sort of mist upon a varnished surface.

(To be continued.)

An Article on "How to be an Architect" appears in "T. P.'s Weekly" for April 14th.

The United Methodist Free Church and Schools, Seven Kings, has been erected from designs by Messrs. George Baines & Son, 5, Clement's Inn, Strand, W.C. The portion of the building completed embraces the nave and a temporary apse, with tower and spire, main schoolroom, superintendents' room, &c. The contract for this portion was £3,488. The church accommodates 400 persons in a mixed congregation.



NEW WEST PORCH TO ST. MARY'S CHURCH, ISLINGTON.
SIR ARTHUR BLOMFIELD AND SONS, ARCHITECTS.

This porch forms a portion of the extensive additions and alterations carried out last year at the church, which was built originally in 1754. Projects for improvements, and even for entire rebuilding, were entertained for some years before it was decided to carry out the work completed last year. Careful repairs to the tower and spire were first undertaken, while at the same time the building of the chancel and aisles, with the vestries and muniment room below, was decided on. Considerable alterations were made to the existing nave, including repairs to, and strengthening of the roof. The side galleries were set back, and the whole of the seating was altered and adapted to modern ideas of church accommodation. Complete redecoration was also carried out, and a general transformation effected of the hitherto dingy and depressing interior. The whole of the works were carried out by Messrs. Dove Brothers, builders, of Islington, under the superintendence of the architects, Sir Arthur Blomfield & Sons.

Keystones.

Preston School Competition.—The competition for a new council school in Roebuck Street, Preston, has been decided as follows:—First premium (£50), Mr. Herbert Howarth, Morecambe; second premium (£30), Mr. A. Brocklehurst, Manchester; third premium (£20), Mr. F. Quentery Farmer, Liverpool.

The Crossley Sanatorium for Consumptives in Delamere Forest, which will probably be opened formally by the King in July, has been erected at a cost of more than £70,000 from designs by Mr. W. Cecil Hardisty, of Manchester, who visited the German sanatoria before preparing the design. The sanatorium faces almost due south and the windows of all the patients' rooms open down to the floor. There are twenty-four patients' rooms with single beds and one with two beds, ten wards with four beds, and four wards with six beds. From the main building a covered corridor leads to the chapel and the dining hall, beyond which are the kitchens, nurses' and servants' dining halls, storerooms and pantries. The patients' dining hall is 60ft. long by 40ft. wide, and has twelve tables, each to accommodate eight persons. The chapel will provide accommodation for 150 persons. All floors, in corridors, wards and halls, including the chapel, have been covered with linoleum, of which material 18 tons have been used. It was thought that it would be warmer and quieter than terrazzo, and more comfortable than the usual waxed ward floor.

Work at the Palace of Knossos, in Crete, was resumed about three weeks ago, and there are now about a hundred workmen occupied in excavating further the additional magazines west of the building. The throne-room is now roofed in and protected by an iron gate, and the two Mycenæan columns have been restored from the existing fragments and from indications of similar columns which occur in the frescoes. The colouring of the interior has been renewed sufficiently to give some idea of the original effect. This is the most complete attempt at restoration, but elsewhere walls have been strengthened at all important points and staircases built to facilitate access from one level to another, so that the meaning of the several portions of this most complicated series of courts and chambers might be made as clear as possible. Funds, however, is still needed to continue the work.

Sheffield Society of Architects and Surveyors.—The annual meeting of this Society was held on Thursday last. The accounts showed a satisfactory increase of the balance in hand to last year. The annual report of the council stated the membership at 120, being the highest number in the Society's record. It was announced that in consequence of increasing public duties Mr. Fenton wished to be relieved from his office of secretary, which he had held for eight years; a special vote of thanks was accorded to him. The following elections for the ensuing year took place:—President, Mr. E. Holmes; vice-president, Mr. W. C. Fenton; treasurer, Mr. F. Fowler; secretary, Mr. J. R. Wigfull; Council: past presidents, Messrs. E. M. Gibbs, C. Hadfield, R. W. Fowler, Joseph Smith, P. Marshall, T. Winder; fellows, Messrs. H. Coverdale, W. J. Hale, J. B. Mitchell-Withers, H. L. Paterson, A. E. Turnell and C. B. Flockton; associates, Messrs. C. M. Hadfield, C. F. Innocent and H. I. Potter. A prize of £5 5s. for the best set of measured drawings was awarded to Mr. J. M. Jenkinson.

Architecture at the Royal Scottish Academy is represented less adequately this year than formerly, but photographic illustrations are plentiful. Mr. J. J. Burnet shows his premises for the Professional and Civil Service Supply Association; Mr. Cullen the Lanark District Offices, Hamilton; Mr. J. Macintyre Henry the Mid Lothian County Buildings; Sir Rowand Anderson the Archers' Hall and the Scottish Conservative Club; and Mr. John A. Campbell the Edinburgh Life Assurance Office now erecting in Glasgow.

Among the domestic work is Mr. Lorimer's Pitkerro, Forfarshire (the restoration and addition to an old Scottish mansion), and High Barn, Surrey.

The Proposal to build a new Chancel at Carisbrooke Church has been defeated.

Mr. Ritz, of the Ritz Hotel, is building a villa in the Bois de Boulogne, Paris, every detail of which is being designed by himself; no architect is employed.

A new Catholic Church at Willington, Durham, has been built at a cost of about £4,500 from designs by Messrs. Kelly & Dick, of London. Mr. Hopper, of Wolsingham, was the contractor.

The Exhibition of Carpentry and Joinery and Woodcarving which will be held at Carpenters' Hall, London Wall, under the joint auspices of the Worshipful Companies of Carpenters and Joiners, will be opened on June 19th by Lord Avebury.

Competition for Crookes Congregational Church, Sheffield. — Mr. E. M. Gibbs, F.R.I.B.A., has made the awards in this competition as follows:— First premium (£20), Mr. W. J. Hale; second (£10), Mr. W. T. Campsall.

No. 15, South Square, Gray's Inn.—The protest of the Society for the Preservation of Ancient Buildings against the demolition of this house—one of the oldest parts of the Inn—has had no effect, and the building is now almost completely pulled down. A new common-room is to be erected on the site.

The Bishop Walsham How Memorial at Wakefield Cathedral, consisting of an addition to the choir designed by the late Mr. Pearson, R.A., and completed under the superintendence of his son, Mr. Frank Pearson, will be consecrated on Easter Thursday. The total cost (including a recumbent effigy of the late bishop) will be £50,000.

New Town Hall, Durban.—Messrs. Scott & Hudson, architects, of Johannesburg and Durban, write stating that the drawing of the new town hall for Durban reproduced in our issue for January 25th last gives a wrong impression of the building, for, since it was made, an almost complete revision has been effected in the matter of detail. They also point out that the firm in whose favour the competition was decided was Messrs. H. E. Woollacott, Scott & Hudson, now Scott & Hudson as above.

Culross Abbey Restoration.—After a delay of more than a year, the heritors have decided to go on with the repair and restoration of Culross Abbey. Plans have been prepared by Sir Rowand Anderson. The east and south galleries will be removed, as well as all the seating and woodwork in the area of the church, the seating accommodation lost by the abolition of the galleries being provided by restoring the north chancel aisle and the aisle on the east side of the south transept. Other works to be executed comprise entirely re-roofing, laying wood-block floor, and reglazing all windows. The cost of the scheme is estimated at £4,400.

New Flats at Victoria.—The contract for the erection of a block of flats to be known as "Cathedral Mansions," Nos. 258 - 266, Vauxhall Bridge Road, Victoria, has been signed between Mr. Tod Heatley, Messrs. D'Eresby House Ltd., and Mr. C. Gra, contractor, of Kensington and Shepherd's Bush, and the work is to be commenced at once. There are many novel features in the planning, and there will be a roof garden for use of tenants. The elevation will be carried out in cherry-red bricks, gauged work and dressings of terra-cotta by Dennis of Ruabon, from full-size details for modelling by the architects, Messrs. Palgrave & Co., of Westminster. Mr. Farrell is the clerk of works.

Kingsway will be opened for vehicular traffic before the end of the year.

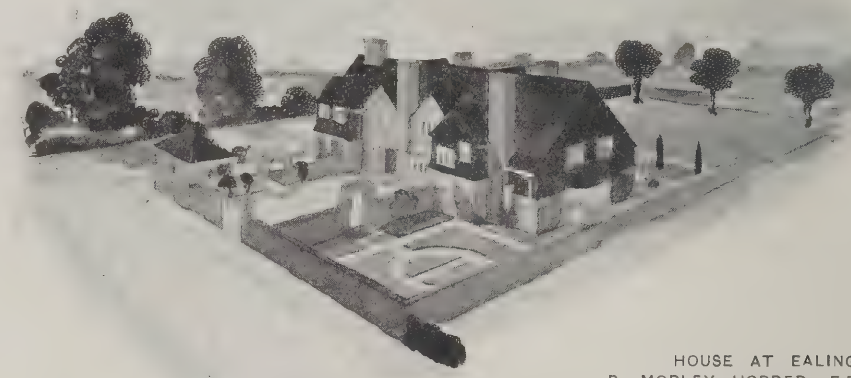
A Competition for new Baths at South Kilburn is to be held. Premiums of £100 and £50 will be offered.

A Large Roman Bath has been discovered in the Commune of Montreale, in the Department of the Ain, France. The site is believed to be that of a Roman villa.

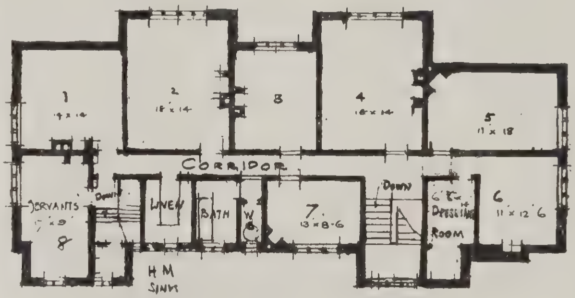
Remains of Old Bridewell Palace Found.—In excavations for a new building on land belonging to Bridewell Hospital in Water Lane, City, arches and piers have been found which, it is said, may have formed part of old Bridewell Palace. The walls rested on brick arches, with chalk and mortar abutments placed on piles and planking, the latter laid on loose soil.

The Proposal to beautify Trafalgar Square by introducing grass, shrubs and flower-beds has been rejected by the London County Council because the Square would no longer be a place of meeting for working men.

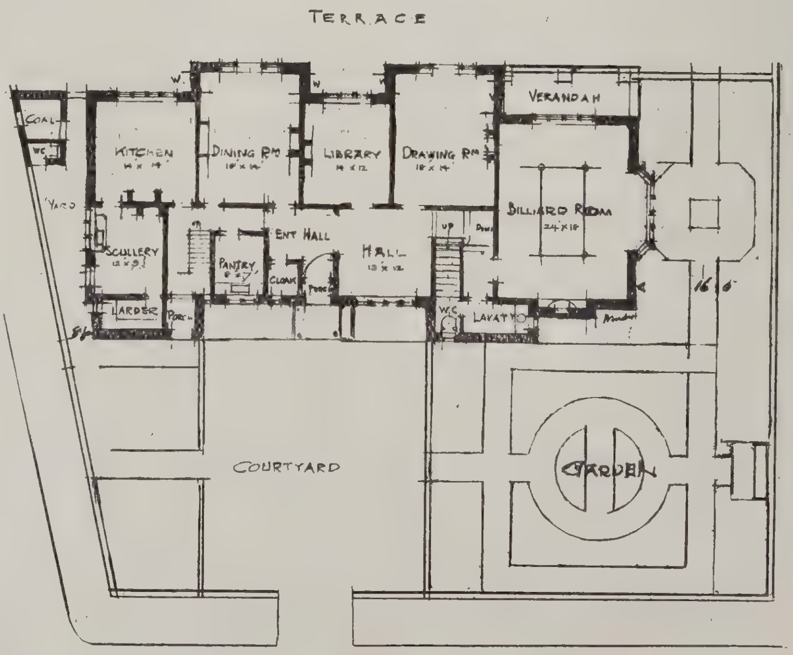
"Cathedral of the Peak" Restored.—A special service was recently held in Tideswell Church, when the Lord Bishop of Southwell dedicated the restoration work which has been carried out at the west end of the church under the direction of Mr. J. Oldrid Scott. The one great blot on the church was the gallery erected in 1826, under the tower. Some time ago a faculty was obtained for its removal, and the work was voluntarily done by members of the congregation. The new work just completed includes oak porches, screen and doors.



HOUSE AT EALING.
P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.



FIRST FLOOR PLAN



This house was designed for a client who desired a roomy house costing about £3,000, kept long and low and as little like the neighbouring villa type as possible. There is a good panelled hall inside and, generally, the house is finished in the best way. The walls are treated with rough-cast and tile-hanging, with red bricks and red tiled roof. The little building shown at one corner of the forecourt is for a motor-house.

R.I.B.A.

Mr. Macartney on Garden Architecture.

A MEETING of the Royal Institute of British Architects was held at 9, Conduit Street, W., on Monday evening, the chair being occupied by the president, Mr. John Belcher, A.R.A.

The decease of Mr. Francis Edward Caws, Fellow, was announced.

Mr. Mervyn Macartney then read a paper on "Garden Architecture."

The author thought that scarcely any subject had been so exhaustively studied of late years as that of Garden Architecture, and heated controversies had been waged over the rival advantages of formal and informal gardens. At present the former held the field, and he hoped that in this case fashion would prove constant. Citing some ancient instances of formal gardens, the author quoted at length the graphic description given by

The Younger Pliny

of his villa garden, with its spaciously well-proportioned portico, in front of which was "a sort of terrace, embellished with various figures and bounded by a box hedge, from whence you descend by an easy slope adorned with divers animals in box answering alternately to each other into a lawn overspread with the soft acanthus: this is surrounded by a walk enclosed with tonsile evergreens shaped into a variety of forms." Later, there were the formal and natural schools as represented by Lucullus and Martial, fighting the "Battle of the Styles" even thus early.

The author confessed he could not see why in the construction of a garden human thought and labour should be eschewed. The most interesting examples were those on which the greatest skill had been expended. Not that the larger the amount of wall and terrace employed the better the result. It was possible to overdo these and produce failure. In the case of

Versailles

there was a sense of enormous effort with little result. Vast terraces, lagoons of water and huge fountains produced no satisfactory result, only a sense of futility, a useless expenditure of labour and money without adequate return.

Turning to some English examples the author said: "Montacute, to my mind, is the most satisfactory: it fits the position, and yet, like so many other English and British examples, it owes little to site. It is comparatively flat, and there is no distant view. What charms it has are of its own making. So it is with Wilton and Melbourne, and herein lies

A Difference from the Italian Examples.

"They generally owe a great deal to position: perched on a hill you have vistas of distant country framed by towering cypresses into delightful pictures. Yet in the British examples you have a distinct sentiment; it is of a garden that you love—a charm that can only be gained by the employment of rare knowledge and design. There is a subtle charm about the terrace at Haddon Hall and the bowling green at Bramshill that is absolutely absent in Trentham or Versailles. There is no great striving after effect. I would rather be the designer of Montacute than Versailles—I will go farther and say of the Haddon Hall terrace rather than Versailles. Indeed, there are few of the vast garden conceptions that please me. Chatsworth bores me, so does the Crystal Palace; yet they are laid out on grand lines: they are meant for spectacular performances, and unless all the fountains are playing the effect is dismal as an empty theatre."

The Gardens placed on Hills

give the architect an opportunity of showing his skill in designing terraces, balustrades and steps. Some of these in the Italian gardens were wonderfully ingenious and beautiful. Water as part of the garden design was very largely taken into account by the Italians. Garden flowers were no part of the scheme, and scarcely came in at all. Architectural features and evergreen trees were the two principal factors in considering the effect to be produced. Antique fragments such as vases, urns, capitals, altars, &c., were largely used, some as cisterns, others as receptacles for plants, &c. These were useful to lighten up the sombre depths of the ilex groves, and were suitable in that climate; but here they look cold and unhappy.

The author exhibited lantern views of various notable examples of Italian gardens to show what masters in their art and craft their designers were. Remarking on the essential differences between English and French, Italian and Spanish gardens, the author referred to the beauty of the English lawns. Abroad they could only be obtained by great care and attention, and are a source of trouble and difficulty. Shade, too, in those countries was of vital necessity. Here it rarely was the case, and many of the pergolas that people were so enamoured of were

Nasty Damp Places

totally unfitted for the climate. A third point was the effect of strong sunlight and heat. A marble seat here was a very uncomfortable place to sit on. It was generally damp and cold, and therefore unsuited to our climate.

The author next dealt in considerable detail with home gardens, showing examples of different ways of treating some of the many factors that make up the sum of an architectural composition—such as terraces, steps, &c. As regards the width of terraces, there was more chance of failure by putting a narrow terrace than a broad one. Generally speaking, the width was largely governed by the amount of surplus earth excavated from the foundations. If the site was a very steep one the terraces were usually narrow.

Balustrades

admitted of much play of fancy. The turned baluster was very commonly used, and the author favoured the widely spaced English work. Quaint terminals on the piers, and also pavilions at intervals and at the corners, were introduced to vary the monotony of lengthy balustrades. Montacute was a case in point; the play of fancy in this design was very happy. Other architectural details referred to and illustrated were gate piers, fountains, ponds, sundials, pavements.

Summing up his own views on the subject, the author said that if he were called on to lay-out an extensive garden site in England he should avoid geometrical beds—those unhappy compositions with shapes like tadpoles, kidneys, &c. Neither should he embark on topiary work on any great scale. Hedges of yew, privet, hornbeam, &c., were charme ing adjuncts to a garden, and here and ther-trimmed shrubs were useful; but he could not admire Levens, Elvaston or Blickling.

As our country is the most beautiful

in the world, he would take advantage of every opportunity that offered of incorporating it into his scheme. Supposing he had not merely the laying-out of the site of a garden, but also the choice of its position, he should not choose a lofty hill with a panoramic view. From the result of his experience he was certain that this was a mistake: foreground and middle and distance was wanted—human interest.

Avenues of trees bordering a long stretch of water, as seen at Fontainebleau and Hampton Court, pleased him more than the terraces and beds of Versailles. One could not dissever oneself from one's climate; and though he vastly admired the superb cypress, ilex and arbutus groves of Italy, he was as fond of our deciduous trees, even in winter. He did not care very much for the appearance of evergreens in England except the yew and holly: their foliage had a hard metallic look that seemed to indicate that they were not happy in their surroundings.

To his mind the detail, invented and perfected in this country, of terrace walks, balustrades, &c., was preferable to that of any other country. Further, he would avoid marble, as looking too white and staring. A very fair surface could be got in cement (concrete) provided too much sand and water was not used and that it was not rammed down too well; otherwise the sand and cement would come to the surface and show the lines of the plank strutting. Dwarf walls of brick laid dry assumed an appearance of age very rapidly.

The author's conclusion was that we had nothing to learn now from foreign examples, that we had enough in this country to guide us, and that the best were those which were not slavish copies of other lands.

Mr. Thomas H. Mawson proposed and Lieut.-Col. Lenox Prendergast seconded a vote of thanks to Mr. Macartney. Mr. F. R. Farrow thought that the architect's work was to provide a frame in which things might grow, while Mr. Belcher emphasized the view that gardens were the architect's opportunity of linking his work to nature, to bind it beautifully to the soil and soften the hard lines.

Trade and Craft.

Mouldings.

Messrs. Elliott's Moulding and Joinery Co., Ltd., the well-known joinery manufacturers, of Newbury, have just published a catalogue of mouldings called "Architects' Series." This should be found very useful. The sections in this catalogue are characterized by their simplicity as distinct from the over-elaboration that is so distressing in mouldings used by builders and joiners. Though the variations that can be made in the shape of mouldings may be infinite, the number of mouldings that have been used is finite, and it is surprising how the forms of mouldings exactly recur in the special designs of architects; and there is no reason therefore to ban the use of stock sections, more especially as Messrs. Elliott's will generally make any required change of outline without extra charge providing the size of material is not increased. Of course the firm will make mouldings to any architect's special designs. Special attention is directed to the fact that these mouldings are struck particularly clean and sharp, saving much hand labour in cleaning up, as is usual with machine made mouldings. Goods may be primed or polished at an additional cost before leaving the works. All the drawings of sections in the catalogue are full size, and the mouldings are executed in any kind of wood. We have noticed that very few large coves are stocked by moulding manufacturers, especially in hardwoods such as oak, and this is to be regretted because of their refined impressiveness. They need not be confined to cornices. We are glad to say that Messrs. Elliott repair the deficiency to a great extent, and sections of large coves will be found in their catalogues No. 7 and No. 9, first published a few years ago. We may mention that this firm has a high reputation among architects for high-class joinery of all kinds.

Liverpool Housing.—In a paper which he read before a provincial sessional meeting of the Royal Sanitary Institute held at Liverpool on Saturday last, Mr. Fletcher T. Turton, F.S.I., deputy-surveyor to the Corporation, said that in 1864 there were 22,000 houses in Liverpool structurally insanitary, and now there were 8,600. In the Hornby Street area the Corporation was erecting 23 blocks or 445 dwellings, estimated to accommodate 2,476 persons. The total cost of the scheme would be £150,000.

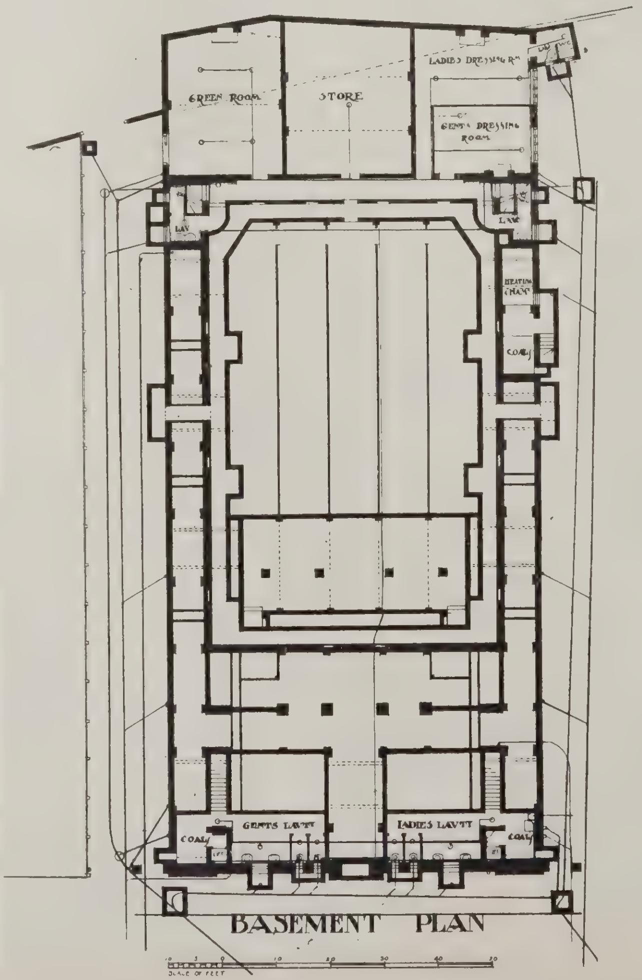
Builders' Notes.

Dublin Building Trade Dispute.—There is nothing new to record in reference to the building trade dispute at Dublin. Work on the various sites remains suspended.

Nottingham Building Trade Inactive.—It is nearly twenty years since the building trade of Nottingham and district experienced inactivity such as prevails at the present time. Usually the month of April has been one of the busiest of the year, but such is not the case this year. There are more than 500 trade-unionist bricklayers and joiners out of work in the city, in addition to labourers. Plumbers are also passing through a period of depression, and at the present time there is little prospect of any improvement of trade.

Reinforced Concrete Sewage Tanks.—At the new sewage works just completed for Chester an extensive use has been made of reinforced concrete, says the "Times" in its engineering supplement for Wednesday last. Difficulties with the foundations for the tanks and filters owing to the subsoil being unsuitable led to the adoption of this material, and Major Hector Tullock, C.B., R.E., the engineer, has constructed a very notable work. The precipitation tanks, of which there are twelve in number, are built on a reinforced concrete raft 200ft. long, 180ft. wide, 21ins. thick, and extending 6ft. beyond the walls of the tanks all round; the raft being laid directly on the sand, the soil only being removed. There are ten high-level and ten low-level filters, all 50ft. in diameter internally and arranged in four parallel rows. These also are all of reinforced concrete, supported by seventy-six brick columns to each filter. There is, of course, a tremendous weight on the foundation rafts from all this material, but up to the present no signs of settlement are visible.



BASEMENT PLAN

OUR PLATES.

HIGH Wycombe Town Hall was opened in October last and forms a part only of a larger scheme for providing new municipal offices which are to be erected on the adjoining land towards the right-hand side. The design for the whole was selected by Mr. T. E. Collcutt in open competition. The front of the building has been faced with Lawrence's Bracknell bricks, with Princes Risborough bricks for the sides. Portland stone has been used externally, and Hopton Wood internally for the staircases, columns and pavings. The front roof is covered with Mr. Goodwin's Colley Weston stone slates. Messrs. C. H. Hunt & Son, of High Wycombe, were the general contractors, and Mr. Fishburn was the clerk of works. Messrs. Haden & Son have executed the heating and ventilating, Messrs. Higgins & Griffiths the wiring for the electric light, and Mr. Fletcher, of Birmingham, the fittings. The cost of the present work has been about £12,000. Messrs. Bateman & Bateman and Alfred Hale, of Birmingham, are the joint architects. Lord Carrington has given a piece of land opposite as a public garden to improve the appearance of the building. It is worth noting that the large organ formerly in St. James's Hall, Piccadilly — which is now being demolished — was

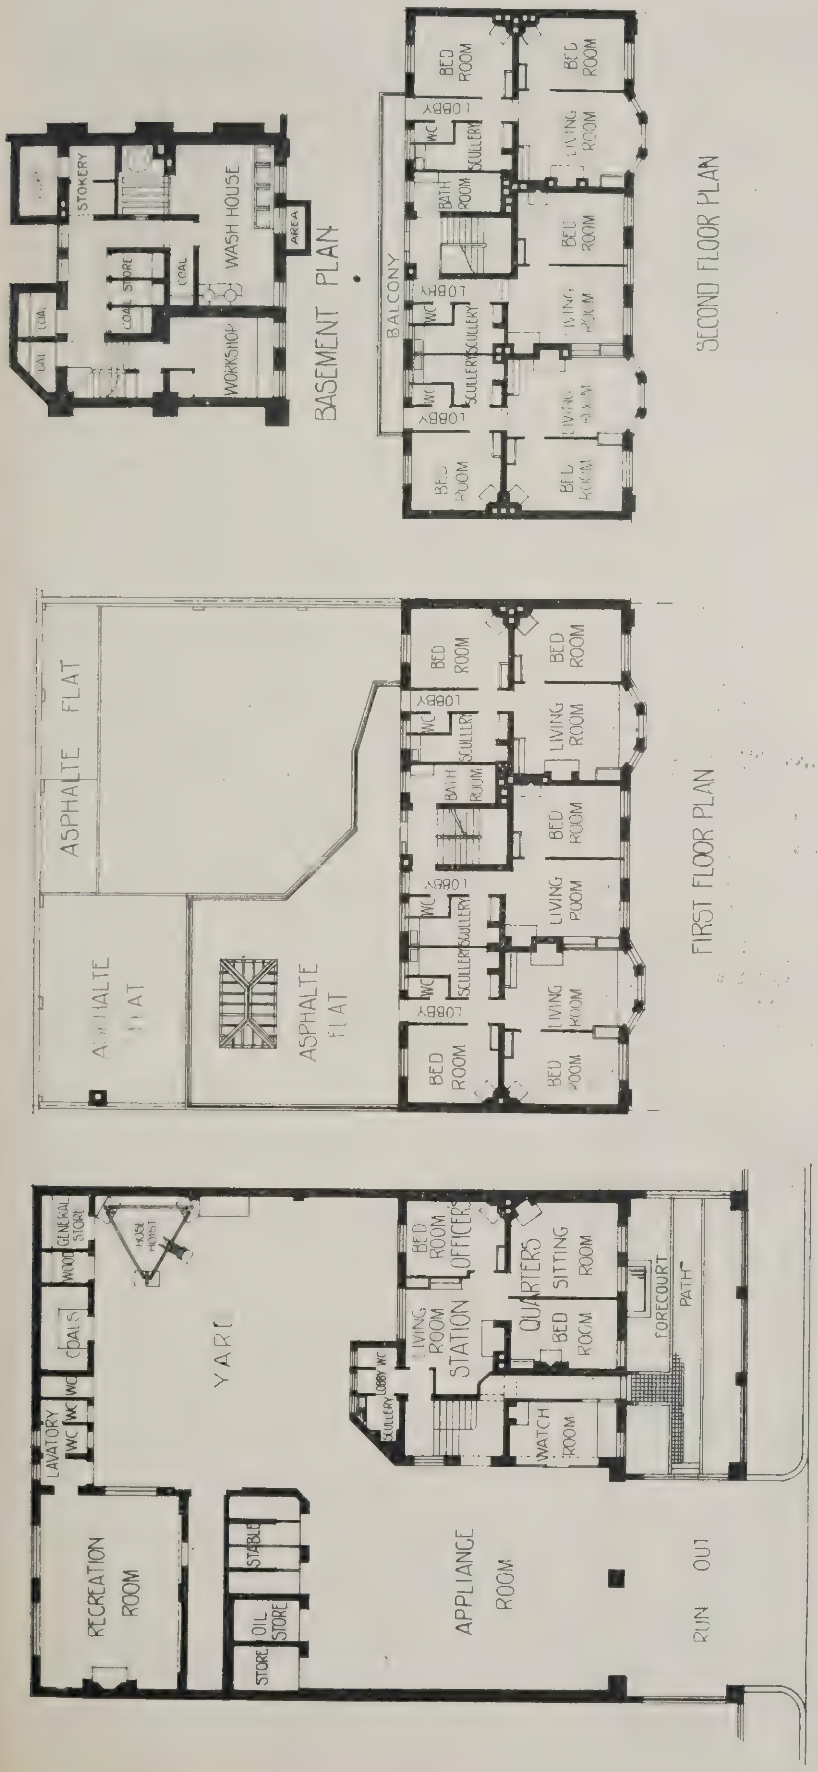
LONDON COUNTY COUNCIL FIRE-BRIGADE STATION, PICKERING PLACE, BAYSWATER. W. E. RILEY, F.R.I.B.A., SUPERINTENDING ARCHITECT.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

purchased by the mayor of High Wycombe for 190 guineas and is being reconstructed in the new town hall.—The London County Council fire-brigade station at Pickering Place, Bayswater, was completed towards the end of last year. It is what is called a "sub-station," having accommodation for seven men and their families and stabling for two horses (with provision for an extension). In the appliance room there is one horsed fire-escape, but space is provided also for a steamer. The front of the station has a Portland-stone base, with red Hedingham bricks above, and stone cornice. All woodwork is painted white, with the exception of the large folding doors, which are red. The roof is slated. The work was designed by and carried out under the direction of the architectural staff of the Fire-brigade Department of the Council, Mr. W. E. Riley being the superintending architect.



LONDON COUNTY COUNCIL FIRE-BRIGADE STATION, PICKERING PLACE, BAYSWATER. W. E. RILEY, F.R.I.B.A., SUPERINTENDING ARCHITECT.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Perpendicular Churches.

Referring to the enquiry and reply on Perpendicular work at or near a seaside resort in the north of England (see p. 177 of our issue for April 5th), Mr. Allen Foxley writes: "Querist should try Bridlington, where the west part of the priory church is a fine example; and at Flamborough, a few miles off, is a fine little roof-screen of that period with detail of a beauty and delicacy unusual in the North."

Mr. Herbert E. Illingworth, A.R.I.B.A., writes: "If your correspondent would go as far north as the lake district, I think he would find what he requires. He might advantageously stay at Grange or Arnside. The former place has little in the way of amusements and the latter absolutely nothing, but this is more than counterbalanced by the charming scenery and beautiful excursions which may be made. Cartmel Priory, about a mile from Grange, contains all styles from Transition Norman, and a large amount of Perpendicular work, including a really magnificent east window and fine choir stalls of somewhat Flemish character. Kendal, within easy cycling distance or rail of either place, and also of Windermere, has a very large double-aisled parish church entirely Perpendicular, though rather plain as a whole; it is, however, a very good example of the type and contains several good wood screens. Furness Abbey is also within easy reach, for which your correspondent can easily obtain fuller information from any guide-book. Lancaster Church also contains good work. I feel sure plenty of suitable subjects could be selected from this list."

Charges and Measurements.

MUSWELL HILL.—A. J. H. writes: "(1) Is it customary to add to the value of a party-wall architectural charges and quantities, which would be assuming they were originally paid in the total cost of the building? (2) Is a stonemason entitled to charge where he has undertaken to supply and fix for cutting in order to fit the ironwork? (3) In plastering to circular columns is it not sufficient to take the surface to be covered, and not the outside diameter when finished?"

(1) Yes. (2) No. (3) It would be customary to measure the outside diameter when finished. W. E. D.

Alterations in Contract.

X. writes: "I have been building a house. In the specifications the architect specified the brick walls to be done with three courses of stretchers and one course of headers, but as soon as the work began he altered the work to Flemish bond, namely, one header and one stretcher alternately, which I find causes more labour to keep the joints right. As the job is a very thin one, can I claim compensation? Again, on his drawing the architect showed walls of the same width from top to bottom—hollow, 4½ outside and 4½ inside, tied with iron ties, which would make 11ins. Now, however, he has a 14in. wall at the bottom up to the plinth about 3ft. from the ground, and a plinth course all round the building, which is not shown on plan or mentioned in the specifications. Also, he specified plain red tiles. These, however, did not suit him; he must have dun-coloured tiles costing 10s. more per 1,000. Can I claim compensation for these alterations?"

Yes, if the facts are as stated you are clearly entitled to extras for these alterations.

Lead Gutters.

REDHILL.—ENQUIRY writes: "How are lead gutters laid on a concrete roof where there are numerous valleys and flats, the roof itself being a steep pitch? The roof is to be covered with slates on battens nailed to the concrete."

The gutters should be shaped in concrete and covered with lead. It is inadvisable to use wood, as it would be liable to decay, in the absence of proper ventilation.

Rights of Rural District Councils.

TONDU.—PUZZLED writes: "I propose to erect a slaughter-house at the rear of some houses and on the bank of a small brook. The only approach to the building will be by means of a right of way 3ft. 6ins. wide between the ends of the rows of houses, or by going a long circuit and then crossing waste ground and going through the brook. The rural district council has disapproved the plans because of the unsuitable site, as by being on the bank of the brook it was thought that I might use it as a sewer, and also because of the narrow approach. Do you think they are acting strictly within their rights?"

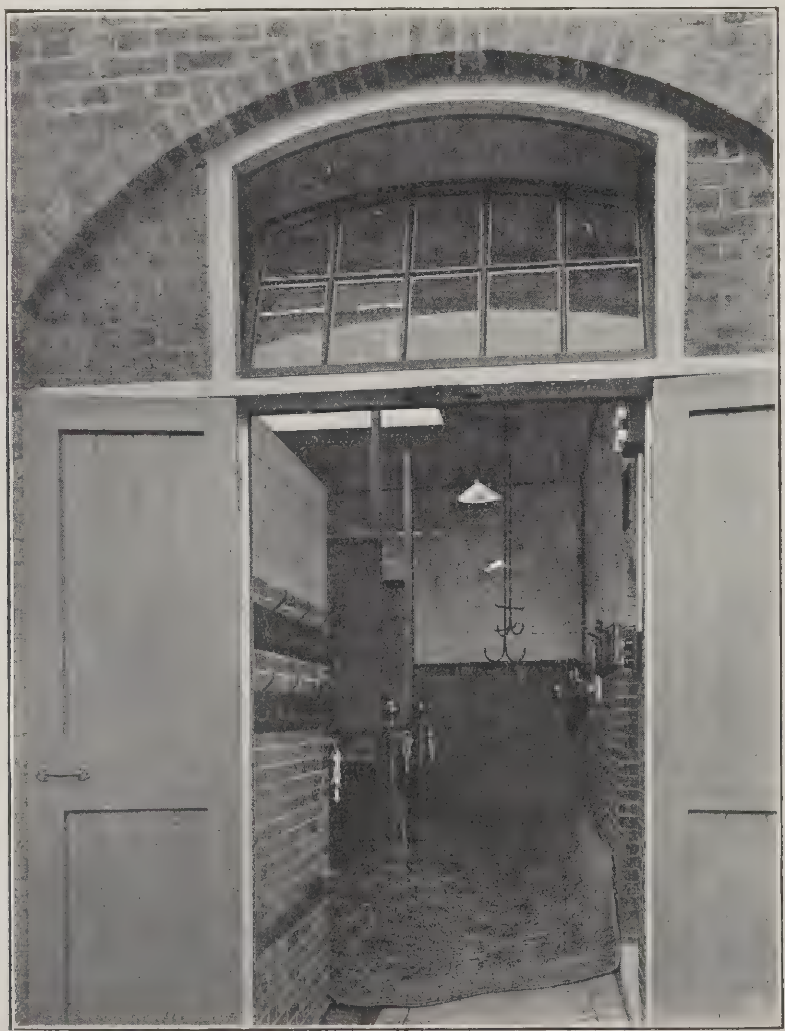
We do not think the council are acting reasonably to assume you would foul the brook. Their remedy in such a case would be to proceed against you. The precautions they should take are to see that you make adequate provision for drainage to the main sewer and that you fence off the brook. We do think the approach is too narrow, however, as shown on your sketch (not reproduced). It ought to be wide enough for a cart.

HIGH WYCOMBE TOWN HALL.

Secondary Schools.

BRIDPORT.—H. P. D. C. writes: "Please recommend a good up-to-date book on the planning, construction and design of secondary schools, containing full details."

"Modern School Buildings," by Felix Clay (price 25s. post free from our offices).



STABLES, LONDON COUNTY COUNCIL FIRE-BRIGADE STATION, PICKERING PLACE, BAYSWATER.

Acoustics.

GREAT MALVERN.—A. T. G. writes: "What book gives certain investigations on the acoustic properties of buildings (referred to by you recently), and where can a copy of the paper be obtained?"

"Specification No. 8," published annually, price 2s. 6d., or 3s. 3d. post free from our offices.

Roll-up Iron Shutters.

HAYES.—J. H. writes: "Do roll-up iron shutters make satisfactory fire-resisting doors? I have in mind one 12ft. by 8ft. Hinged plate doors would be heavy and much in the way when open."

It is inadvisable to use any doors which have not been put to very severe fire tests. The danger with roller shutters is that the metal sheets may expand under heat and bind and warp so as to let fire through. A form specially designed to overcome this is shown on p. 40 of our third "Fire Supplement," published in our issue for January 18th last. But why not use one of the sliding doors which have passed severe tests and are easy to move? It seems to us that these are the best solution of the difficulty.

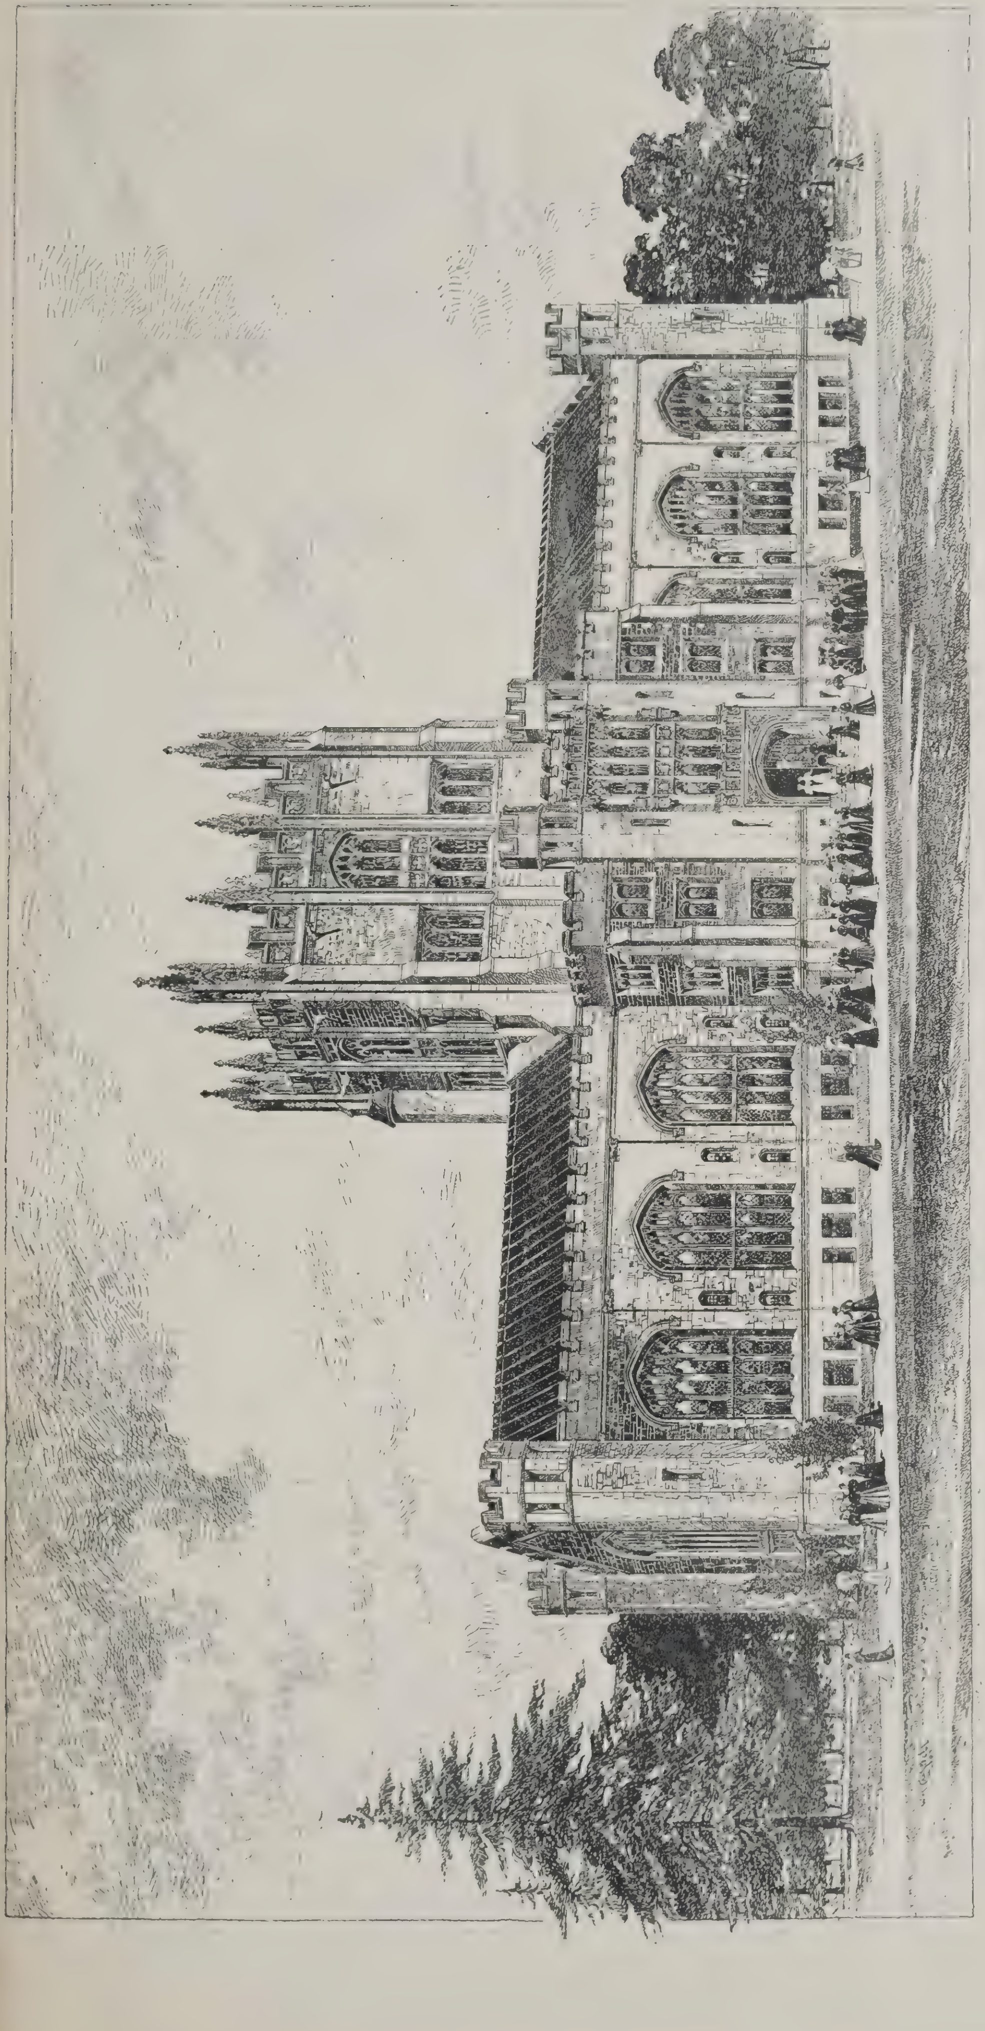
Floor Pugging.

EDINBURGH.—DEAFENED writes: "What are the advantages or disadvantages of the ordinary pugging for floors (3ins. of coarse stuff on boards and fillets) as against the best inodorous felt made for deafening purposes? If it were decided to use felt, where would be the correct place to put it—over or under the bearing timbers of floors?"

Ordinary pugging is not a very efficient deadener of sound; it is messy, especially where repairs have to be executed, and it is not sufficiently fire-resisting. The last-mentioned objection is important and forbids the use of ordinary felt. The best thing to use is slag-wool pugging. As to the place to put felt, if used, for convenience it is usually put over the heavy timbers of floors, but below would slightly improve the deadening effect.

Milburn House, Newcastle.—Messrs. Oliver, Leeson & Wood write stating that Messrs. Marshall & Tweedy, of Newcastle-on-Tyne, are joint architects with them for this building, illustrated in our issue for last week.

Building Trades' Exhibition.—In our issue for next week we shall publish an illustrated account of the chief exhibits at the Building Trades' Exhibition, which is to be held at the Royal Agricultural Hall, Islington, from April 27th to May 6th.



THOMPSON MEMORIAL LIBRARY, VASSAR COLLEGE, POUGHKEEPSIE, N.Y. FRANCIS R. ALLEN AND CHARLES COLLINS, ARCHITECTS.

Correspondence.

Mr. Bodley's Work at York Minster.

To the Editor of The Builders' Journal.

Sir,—An announcement has lately appeared of a proposal to add, under Mr. Bodley's care, flying buttresses to the nave of York Minster and to crown the buttresses on the north aisle with pinnacles similar to those existing on the south side.

The significance of this seems to have escaped the architectural press; a vigorous letter from a York freeman in one of your contemporaries is the only protest I have seen. It is not fitting that the task should be left to a layman while the profession is silent, and I trust you may see your way toward giving your valuable aid in laying the case before the profession and the public.

For many years past every succeeding visit to the Minster has been rendered more painful than the last by the sight of a leprosy of new stonework spreading from end to end of the building.

It may be reluctantly admitted that much at any rate of this process has been justified by the state of the old work, but this last proposal is of quite a different nature and belongs to a type of restoration so-called which one hoped had died an ignominious death a generation ago.

As is well known, the builders of the nave of York Minster abandoned the idea of the stone vault originally contemplated and erected instead a wooden one with little thrust on the clearstory walls; flying buttresses were thus rendered unnecessary, and though prepared for they were not built.

Huge pinnacles, very elaborate in design, had however been placed on the south aisle buttresses to provide for the thrust of the stone vault, and these were left standing; while on the north side, which was less advanced, the buttresses were finished simply at the level of the aisle parapet.

It will be seen that the present proposal involves adding to the Minster features which not only never existed but were deliberately rejected by the original builders for sound constructive reasons—reasons as cogent now as then.

I need not enlarge on the disfigurement which these immense masses of raw stonework will cause to what is now the most beautiful and satisfying portion of the exterior of the Minster.

The principle involved is of vital importance. If Mr. Bodley is to be encouraged to embellish the work of the mediæval master-builders, where is the thing to stop?

Most tempting seats exist for a pair of staring turrets on the exquisite front of the north transept; while who knows that some misguided benefactor may not provide funds for the addition of pinnacles to the central tower and so destroy its character for ever?

Has not this, too, a strong bearing on that "dignity of the profession" of which we hear so much? The barbarisms of past generations of restorers are a heavy enough weight to bear in the face of the world; and as by repentance and good works we look to win back the confidence of the public, it is a crushing blow to find the doyen of church architects working havoc on one of our grandest buildings with never a word of protest from his brethren. One is at times tempted to ask whether the popular conception of the architect is not justified more than we dare to think.

I hope I may be forgiven for writing with some heat: but, born almost within sight of York Minster, I have loved it from my youth up, and I cannot see this outrage perpetrated without raising my voice in the hope that I may move some less obscure advocate to press the matter home before irreparable damage has been wrought.—Yours truly,

London, S.W. ALLEN FOXLEY.

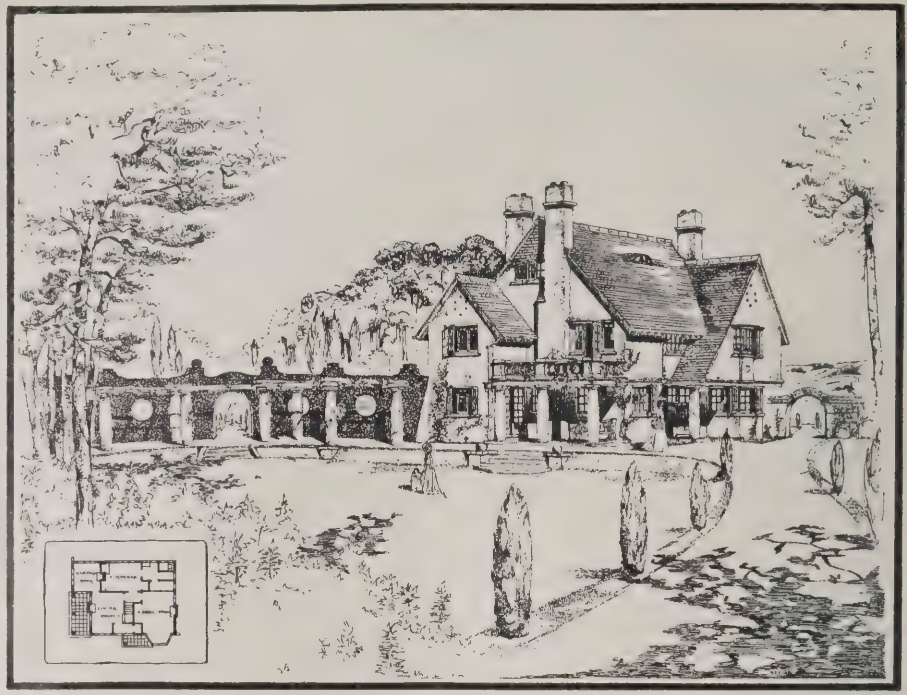
Architects and Public Works.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—In the article under this head in your issue for last week in quoting from the "Times" you mention Bradford, Hull, Nottingham, Dublin, Aberdeen, Leith and Dundee as being the only cities with the post of city architect. To take only one example, you omit to mention Edinburgh, which certainly has a city architect, and a very capable one, in the person of Mr. Morham. As regards Dundee, the post of city architect has been extinct for the last year or so since the death of the late Mr. Alexander. As your article is certainly misleading, perhaps you will be able to explain how this mistake has arisen.—Yours truly, "AULD REEKIE."

[The article was not ours, but extracted from the "Times," as stated; and we cannot be responsible for the omissions of our contemporary. Our main reason in quoting from it was to show that the "Times" supported the Institute in the matter.—ED. B. J.]



DESIGN FOR A GARDEN HOUSE BY H. C. CONSTANTINE.

This house is treated externally with buff-tinted rough-cast and the roofs covered with purple Broseley tiles. The upper floors comprise six bedrooms, bathroom, &c. Two of the six bedrooms are in the roof. The principal features are the spacious verandah and balcony over.

Registration: The R.I.B.A. Council Election and the Society of Architects.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Having received an intimation that I have been nominated upon the House List as an Associate Member of the R.I.B.A. Council for next year, it seems to me right that I should take an early opportunity of explaining the policy which I intend to promote in the event of election.

It is, I think, an open secret that the large committee which was formed early in 1904 to consider and report upon the principle of registration has prepared a new Registration Bill, or, as it is called, an "Enrolment" Bill, to lay before Parliament, and that this is a weak copy of the existing Registration Bill, so badly drawn as to be unworkable in practice and containing clauses which could on no account be accepted by the House of Commons.

For the Institute to produce so ill-considered a measure would, in my opinion, be not only grievously harmful to its great reputation, but would actually retard registration, unless, indeed, Parliament, with two Bills to select from, and seeing that the whole profession was in earnest on the matter, chose and passed the better, which is not that of the R.I.B.A.

The position is a curious and not very edifying one, but it is not beyond repair at the present moment. That a profession which is united in principle should prepare two Bills with the same object is anomalous, and seems to be due almost entirely to the separate existence of the Institute and of the Society, to both of which bodies I belong. If their amalgamation could be effected, the best points of both Bills could be welded into one perfect whole.

This amalgamation can only be brought about by the absorption of the Society into the Institute, and this is possible only until the end of 1906, after which date admission to the Institute will only be obtainable by way of the Associates' examination.

My policy, therefore, is to promote this amalgamation, in the belief that thereby the Institute will be strengthened and the cause of registration materially advanced; and I should be glad to hear personally and at once from such Fellows and Associates as are willing to assist me to bring this about.—Yours truly, G. A. T. MIDDLETON.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

During the week ending April 14th twenty-five failures in the building and timber trades in England and Wales were gazetted.

G. R. Rackham, contractor, Norwich. R.O. April 6th.

J. Woodgate, builder, Eastbourne. R.O. April 5th.

G. B. Thurley, builder, Old Fletton. R.O. April 7th.

W. Dowland, builder and contractor, Sutton. R.O April 4th.

A. Lyons, builder and contractor, Malton. R.O. April 6th.

J. Morley, plumber and electrician, Hull. R.O. April 5th.

C. Rook, builder and contractor, Cardiff. R.O. April 6th.

J. Marshall, builder, King's Heath. Liabilities £1,010; assets £75.

E. Harlow, builder and carpenter, Chatham. R.O. April 7th.

Tatton & Fitzgerald, timber merchants, Ashton-on-Mersey. R.O. April 7th.

T. Whitney, builder and contractor, Manchester. P.E., Manchester C.C., May 15th, at 10.

F. Hunt & Co., slating and tiling contractors and builders' merchant, Southend-on-Sea. R.O. April 3rd.

W. E. Wilkins, carpenter and builder, Bristol. Adj. April 6th.

T. W. Richards, joiner and builder, Tibshelf. R.O. February 27th.

Boughey & Topping, builders, New Brighton. R.O. April 3rd.

T. Chatwin, builder, Notting Hill. R.O. April 4th. P.E., London Bankruptcy Court, May 17th, at 11.30.

T. H. Hayes & Co., builders, East Sheen. Adj. April 3rd.

J. Brooks, monumental mason, Smethwick. First meeting, 191, Corporation Street, Birmingham, April 29th, at 12. P.E., West Bromwich C.C., May 5th, at 10.30.

J. F. Carrington, painter and decorator, Leeds. R.O. April 4th. First meeting, O.R.'s, Leeds, April 19th, at 11. P.E., Leeds C.C., May 15th, at 11.

H. Crookes, builder, Sheffield. First meeting, O.R.'s, Sheffield, April 19th, at 12. P.E., Sheffield C.C., April 27th, at 2.

F. W. Matthews, house decorator, Dartmouth. First meeting, O.R.'s, Plymouth, April 19th, at 11. P.E., East Stonehouse Town Hall, same day, at 12.

W. Huggins, builder, Leyton. First meeting, London Bankruptcy Court, April 27th, at 12. P.E., same, May 18th, at 11.

F. E. Cullimore, builder and contractor, Ashford. First meeting, 24, Railway Approach, London Bridge, April 19th, at 11.30. P.E., Kingston C.C., May 9th, at 2.30.

Clark & Roberts, carpenters and builders, Shrewsbury. R.O. April 5th. First meeting, O.R.'s, Shrewsbury, April 29th, at 11. P.E., Shrewsbury Shire Hall, May 9th, at 11.

Coming Events.

Wednesday, April 19.

Royal Sanitary Institute. — Inspection and Demonstration at Harrison & Barber's Knacker Yard, Winthrop Street, Whitechapel, E., at 3 p.m.

Institute of Sanitary Engineers.—Examination and Literary Committee at 3.30 p.m. Finance Committee at 5 p.m. Special Council Meeting at 6 p.m. Sessional Meeting at 7 p.m. Paper by Mr. E. R. Palmer on "The Ventilating, Flushing and Cleansing of Sewers and Drains."

Chemical Society.—Meeting at Burlington House at 5.30 p.m.

Builders' Foremen and Clerks of Works' Institution.—Meeting at 8 p.m.

April 21-25.

Architectural Association (Camera and Cycling Club).—Easter Excursion to Hereford.

Saturday, April 22.

Edinburgh Architectural Association.—Visit to Drum House, Gilmeston.

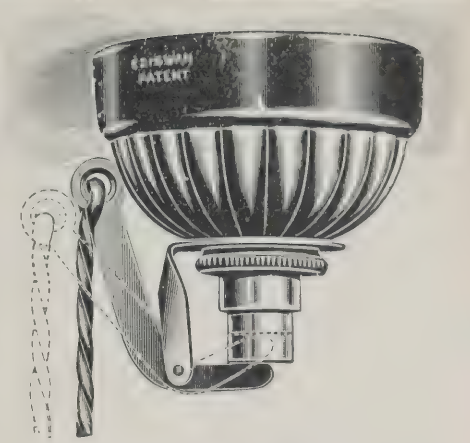
5 & 7, OLD QUEEN STREET, WESTMINSTER, LONDON, S.W.

Electrical Notes.

A Power House.—The Junior Institution of Engineers recently visited the Willesden power house of the North Metropolitan Electric Power Supply Co. at Taylor's Lane, the engineer of which is Mr. E. T. Ruthven Murray. The continuous current is generated direct at a pressure of from 490 to 540 volts, suitable for the 2 by 240 volt network surrounding the works, and this fixes the average pressure of the alternating current terminals of the same generator at 316 volts; the machines being, as it were, rotary converters driven by engines. Step-up transformers with a ratio of 1 : 9 are employed, raising the pressure to an average of about 2,850 volts, at which it is transmitted to the sub-station, there variable-rate step-down transformers and rotary converters once more reduce the pressure down to that suitable for a 2 by 240-volt three-wire continuous-current distribution. The site of the station occupies an area of 3½ acres and adjoins the Midland and South Western Junction Railway, from which access can be gained to all the great northern lines. The boilers are of the Babcock-Wilcox type, arranged in pairs, built in glazed brick settings. Draught gauges are fitted and an "Ados" registering CO_2 recorder. There are Hall steam feed pumps and a Mather & Platt electrically-driven pump, the latter having a special device for effecting its regulation. The arrangement of steam mains is novel. A jet condenser by Ashton Frost & Co. is provided for the two 300-k.w. sets, while the other sets have their own surface condensers. There is a cooling plant supplied by Korting Brothers, on which are four lines of spraying jets. The surface of the pond is 30ft. by 200ft., and it is capable of dealing with 100,000 gallons of water per hour, which is the storage capacity of the pond. All water is softened by a Brunn-Lowener apparatus in which milk of lime and soda are used. For the general arrangement and for the design of many of the special details of the low-tension continuous-current switchboard Mr. Ruthven Murray was responsible. His object was to arrange a switchboard embodying the distinctive and valuable features of the Ferranti high-pressure cellular type of switch gear for low-pressure working. The principal feature of novelty in the low-tension switchboard is that four separate 'bus bars are provided, and there are "selector switches" which enable any machine or feeder to be connected to any 'bus bar. The battery room contains 250 Tudor cells with a capacity of 840 ampére hours at a 10-hours' discharge rate.



A New Switch.

We illustrate above a new "pull" type button switch introduced by the Edison and Swan Co., of 36 and 37, Queen Street, Cheapside. The example shown is for use on a ceiling. The special feature of this switch is that it has an adaptor which presses the button when the cord is pulled, and the on and off position is actuated by one cord only. Its merit is that it saves expense in installation. The cost of the fitting is 2s. 6d., or the adaptor alone, 9d.

Contracts Open.

BRENTFORD UNION.

TO QUANTITY SURVEYORS.

The Board of Guardians of the Brentford Union are prepared to receive TENDERS from duly-qualified and experienced Surveyors who may be willing to take off QUANTITIES in connection with proposed additions to their New Workhouse and Infirmary at Isleworth, estimated to cost about £55,000.

Firms desirous of tendering must state a price per cent. for preparing bills of quantities, and the firm whose tender may be accepted will be required to enter into an agreement with the Guardians, *inter alia*, to measure up all deviations at the following rate, viz., half per cent. above the price accepted for preparing bills of quantities on additions, and half per cent. below the price accepted for preparing bills of quantities on deductions. Charges for lithographing will be paid by the Guardians.

Tenders, marked "Quantity Surveyor," with references and particulars of work done, must reach me on or before 4 p.m. on TUESDAY, the 25th instant.

The Guardians do not bind themselves to accept the lowest or any tender

By Order,
WILLIAM STEPHENS,
Clerk to the Guardians.
Union Offices, Isleworth, W.,
April 3rd, 1905.

BOROUGH OF NEW WINDSOR.

NEW POLICE AND FIRE STATION.

The Town Council of the Borough of New Windsor are prepared to receive TENDERS from competent persons for the ERECTION of a NEW POLICE AND FIRE STATION in St. Leonard's Road, Windsor, in accordance with the plans which may be seen at the office of the Borough Surveyor, Mr. E. A. STICKLAND, Alma Road, Windsor.

Bills of quantities and form of Tender may be obtained on receipt of application, accompanied by a deposit of a £5 Bank of England note, which will be refunded to Contractors submitting bonâ fide Tenders.

Tenders must be made out in accordance with the bill of quantities, and delivered to E. CECIL DURANT, Esq., Town Clerk, Windsor, not later than THURSDAY, APRIL 27th, 1905. Each Tender to be in one sum, as set forth in the Tender Form, and to be accompanied by the quantities with each item fully priced.

The Committee do not bind themselves to accept the lowest or any Tender.

By Order,
E. CECIL DURANT,
Town Clerk.
3, Park Street, Windsor,
April 10th, 1905.

CONTRACTORS.

TENDERS are invited for the Erection and Completion of a Block of Dwelling-houses, Clowney Street, Glasgow.

Plans, specifications, and particulars of the work can be obtained at my office.

The lowest or any tender not necessarily accepted.

W. J. MOORE, Architect,
Royal Chambers, 35, Royal Avenue Belfast.

To Contributors.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. THURSDAY, APRIL 20, IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS FOR NEXT WEEK'S ISSUE. OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

April 26, 1905. Vol. 21, No. 533.

6, Great New Street, Fetter Lane, E.C.

Summary.

A striking feature in the erection of the new Government Offices in Parliament Street, Westminster, is the use of wrought iron ribs and lathing to replace the usual forest of furring and lathing. The ribs are bent and fixed by smiths on the job, and the work is of great exactitude. The electric cranes are also a noticeable feature. The friction contact by which these work enables the whole weight to be taken off a block of stone without lifting it from its bed, so that the masons can put it into place with the greatest ease and exactitude. Portable tramways have been found of great convenience in handling materials. (Page 213.)

Much hardship and unfairness is caused by the present law in regard to combined drainage, and both in the Metropolitan area and in the provinces the necessity for its amendment is admitted, though there is difference of opinion as to the form the amendment shall take. Under the existing law the private owner is responsible for the maintenance of the whole system, whereas, if two or more premises are drained by a common drain without an order of the local authority, the latter is responsible for the portion which receives the drainage of both or all of the premises. (Page 214.)

The design of a wall for a swimming bath and the heating capacity required is discussed on page 236.

Whereas the common interpretation of the formulæ for the strength of rectangular beams as based upon extreme fibre stress would give a factor of $13\frac{1}{2}$ for c, in the case of a cast-iron beam it is actually 20, and therefore a beam designed for a maximum fibre stress equal to the working stress in direct tension or compression will probably be much stronger than it is supposed to be. (Page 218.)

The attention of the Factory Department of the Home Office has been directed to alleged injury to health and risks from fire in the manufacture of xylonite and celluloid, and in the use of those materials for manufacturing purposes, and it has issued a memorandum on the subject, in which it is stated that it would appear that by the general observance of recognized measures of precaution, already adopted in certain works, further security may be obtained. (Page 232.)

The restoration of one of the oldest and most interesting buildings in York—St. William's College - has been commenced. (Page 234.)

At the bridge works of Sir William Arrol & Co. at Glasgow there is a "template" floor on which the whole of the work is drawn out full size. (Page 234.)

The bricklayers at Dublin have accepted Alderman Cotton as arbitrator between themselves and the master-builders. (Page 234.)

Elementary Schools. Now that the Education Act has come into force and the education committees throughout the country are elaborating their proposals, we hear much outcry in the daily press against the increase in taxation. We do not propose to take sides in this battle of interests, which promises to wax warm, but we are directly concerned with the question of altering existing schools and erecting new ones, which seems to be one of the chief causes of increasing taxation. There is not the slightest doubt that a large number of the elementary schools throughout the country are unsuitable for their purpose. Many of them are old and do not conform to modern ideas. It should be recognized that there has been a steady growth of knowledge in school planning, and also in building construction and sanitation. We do not suggest that all these old schools should be remodelled to bring them up to one standard, but we do think that many of them are so insanitary as to be a national danger. It is easy to call attention to the fact that some of these schools hold a high record for success in examinations. Of course this largely depends upon the teachers, and these successes in no way show the physical deterioration which they may have caused, nor the deficiencies as regards supervision and easy working. Educational ideals have progressed, and will, it is to be hoped, still further advance, and unless we take the matter in hand now we shall only find an increasing drag on the wheel. It seems to be thought that drains are the beginning and end of school hygiene, but a far more important matter as regards the health of children is the ventilation and lighting, both of which are hopelessly bad in many elementary schools. At the time these were built, too, fire protection was not often considered, and one is in constant fear of some apalling catastrophe. If the alteration in the educational system of this country results in eradicating these objectionable features it will at least have substantiated the claim of increased efficiency made by its advocates.

The Design for the London County Hall. Now that the London County Council have purchased the Westminster Bridge site for their new offices, it is opportune to consider the manner in which the design for the building is to be secured. The competition system is not always an unmixed blessing, but this surely is a case when it is unquestionably the best thing to do. There is no architect available of sufficient prominence and able to command general respect to whom we could entrust the problem, and we think a preliminary open competition ought to be held, from which a few men should be selected, as with Liverpool Cathedral and the Wesleyan Hall at Westminster. We do think, however, considering the admirable work which Mr. W. E. Riley has produced as superintending architect to the London County Council, that he ought to be allowed to compete on an equal basis with unofficial architects. The London County Council estimate the total cost of the building at not more than £1,100,000. It is interesting to compare the cost of the town halls at Manchester, Glasgow, Liverpool, Birmingham and Leeds, which was as follows:—

	£
Manchester - - - -	1,050,000
Glasgow - - - -	530,000
Liverpool - - - -	270,000
Birmingham - - - -	250,000
Leeds - - - - -	250,000

Manchester Town Hall, it will be remembered, was designed by Mr. Alfred Waterhouse.

Consumption among Stonemasons. ATTENTION to the publication of an interesting and important pamphlet is called by the "Manchester Guardian." It has been written for the operative stonemasons of Newcastle-on-Tyne by Dr. Arthur T. Wear, physician to the Newcastle Hospital for Consumption and Diseases of the Chest, who quotes some remarkable vital statistics of the local lodge which have not only justified the inclusion of what is generally regarded as a healthy out-door occupation among dangerous trades, but pointedly questions the adequacy of a mere proposal to shorten the hours of employment as a remedy, though this is really the practical point of the medical plea. During the last twenty-five years there have been 191 deaths among members of the local lodge of stonemasons, and 111 of these were attributed to phthisis. Whilst for the whole of the country the average life of the stonemason is fifty years, in this district it is but forty-six years and a month. Apparently this is accounted for by the fact that banker hands, among whom phthisis appears to be specially prevalent, are here proportionately numerous, and that a high mortality is the result. It may be, too, that the sandstone which is so largely used locally for facings gives off more than the average quantity of dust, the form of phthisis from which the stonemason suffers being essentially a dust disease, directly caused by the constant inhalation of irritating particles of stone dust into the lungs. A shortening of hours would obviously reduce the danger to that extent, but it is suggested that the general use of an effective respirator during working hours would appear to be a more promising preventative.

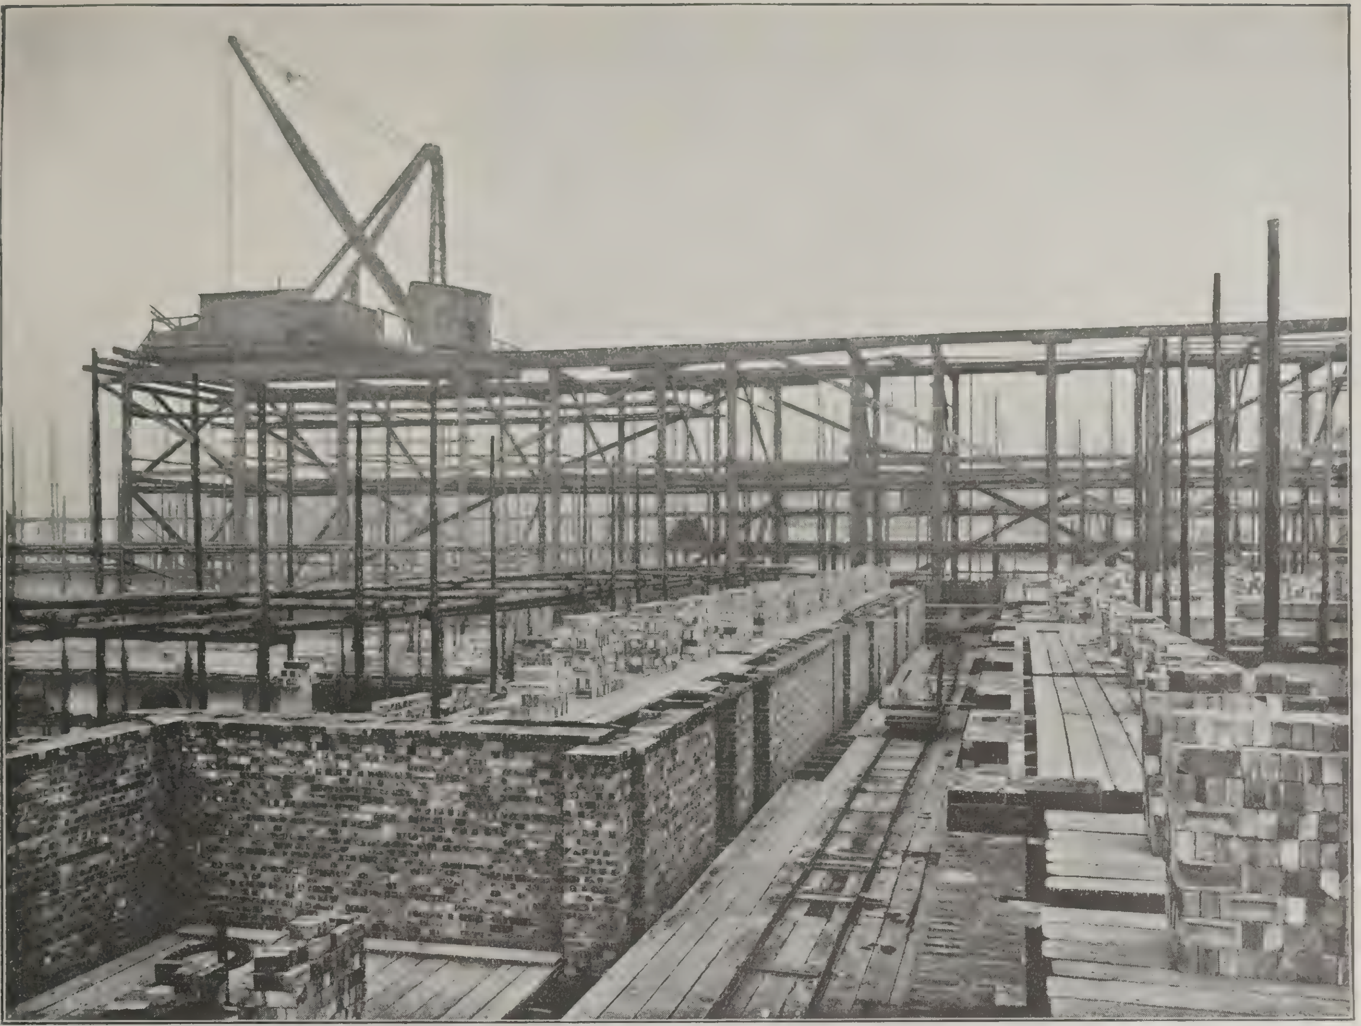
NEW GOVERNMENT OFFICES, WHITEHALL. THE LATE J. M. BRYDON, ARCHITECT.



NEW GOVERNMENT OFFICES: VIEW FROM CIRCULAR INTERIOR COURT LOOKING TOWARDS WHITEHALL.

NEW GOVERNMENT OFFICES.

IN this issue we publish several photographs of the new Government offices in course of construction at the lower end of Parliament Street, Westminster. In our issue for April 5th, 1899, we gave a perspective and plan of the late Mr. J. M. Brydon's design for the building, at the time of its first exhibition to the members of the House of Commons. Only very slight variations from that design have been made. The alterations are chiefly of a practical nature, the most important being the continuation of the original small portions of the top floor around the whole building: these, however, do not affect the elevations as designed by Mr. Brydon. Only a portion of the design is at present being erected, consisting of about three-fifths of the whole. The building, which is being erected under the supervision of Sir Henry Tanner, architect to the Office of Works, will eventually have a frontage of about 800ft. to Great George Street and more than 300ft. to Parliament Street. The longer rear frontage is to Charles Street and the shorter rear frontage to St. James's Park. It will be gathered from the general views which portion of the building is at present being proceeded with. Generally speaking, it includes the block facing Parliament Street, and half of the circular court in the centre. This central court, an important feature of the design, is 160 feet in diameter. There are also two 100ft. square courts and a number of smaller courts throughout the building. Mr. Brydon's design consists of two storeys of plain rusticated work supporting on the Parliament Street front two storeys of Corinthian order with two storeys of windows between the columns. There are sculptured pediments along this and the other frontages. The first portion of the contract was for the foundations, and was carried out by Messrs. John Mowlem & Co. These foundations may be described as a concrete dock, and are on what is generally known as the raft system. The erection of the superstructure is being carried out by Messrs. Spencer, Santo & Co., the well-known firm of contractors, who are making good progress with the job, considering the monumental nature of the building and the large extent of it. They are now up to the height of the main cornice.

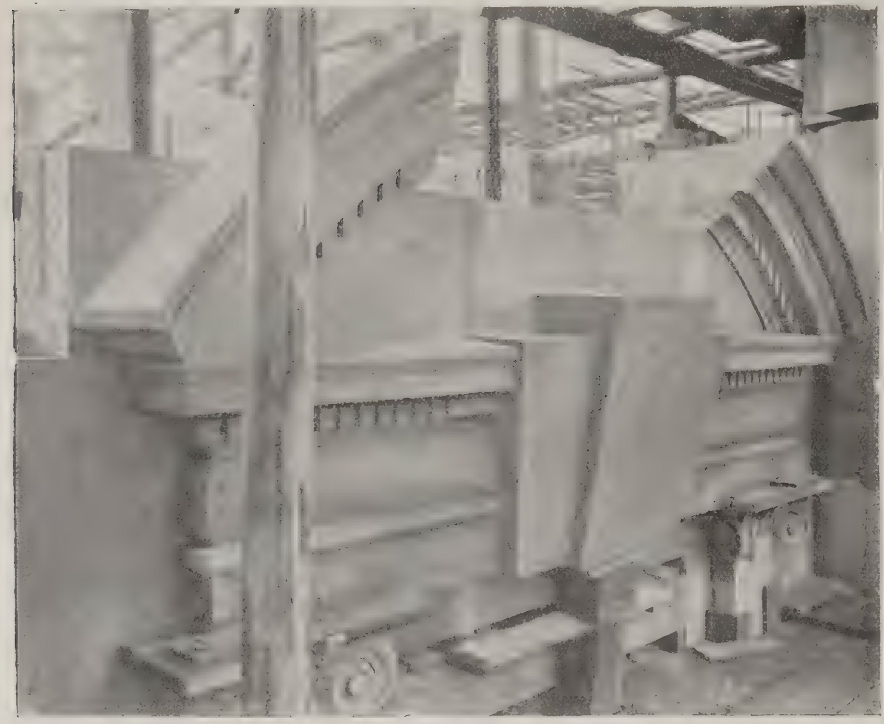
The Portland stone work is naturally very important, and great care has been taken in the selection of the stone, which is supervised at the quarries as well as on the job. Many of the stones are of very great weight, and in handling them the electric cranes, which are a striking feature on the job, have been extremely useful. With the ordinary steam crane, the piston stroke prevents the nicety of adjustment which is possible with an electric crane, for by means of the electric cranes at this building, which lift by friction contact, the whole weight can be taken off a stone without lifting it from its bed, so that the masons can put it into place with the greatest ease and exactitude. It will be seen from our view on this page that the contractors are making use of portable tramways, which have been found of great convenience in handling materials. The whole of the management of the job is carried out on the site in the contractors' offices, which are situated in the central court.

In addition to the general views, we give a number of details of particular interest. The photographs of the upper portion of the windows, in addition to the instruction they convey as to stone detailing, illustrate several points to which we desire to call attention. On the left of the curved pediment on p. 214 it will be noticed that a small portion is left rough. When the blocks are fixed this is worked smooth to a hollow, as shown in the pediment on p. 215. This is designed with the object of throwing rainwater away from the face of the wall, thus obviating the disfiguring streaks one usually finds down the sides of windows in stone-fronted buildings Another point clearly shown in these views is that the dentils are not worked right up to each joint, thus avoiding injury in fixing and permitting the spacing of the dentils to be equalized. Strips of zinc are fixed into the stonework and left hanging over any projections from the face, as shown on the top of the triangular pediment illustrated. These zinc strips serve to hold the casings for protecting the work from damage from falling bricks or refuse.

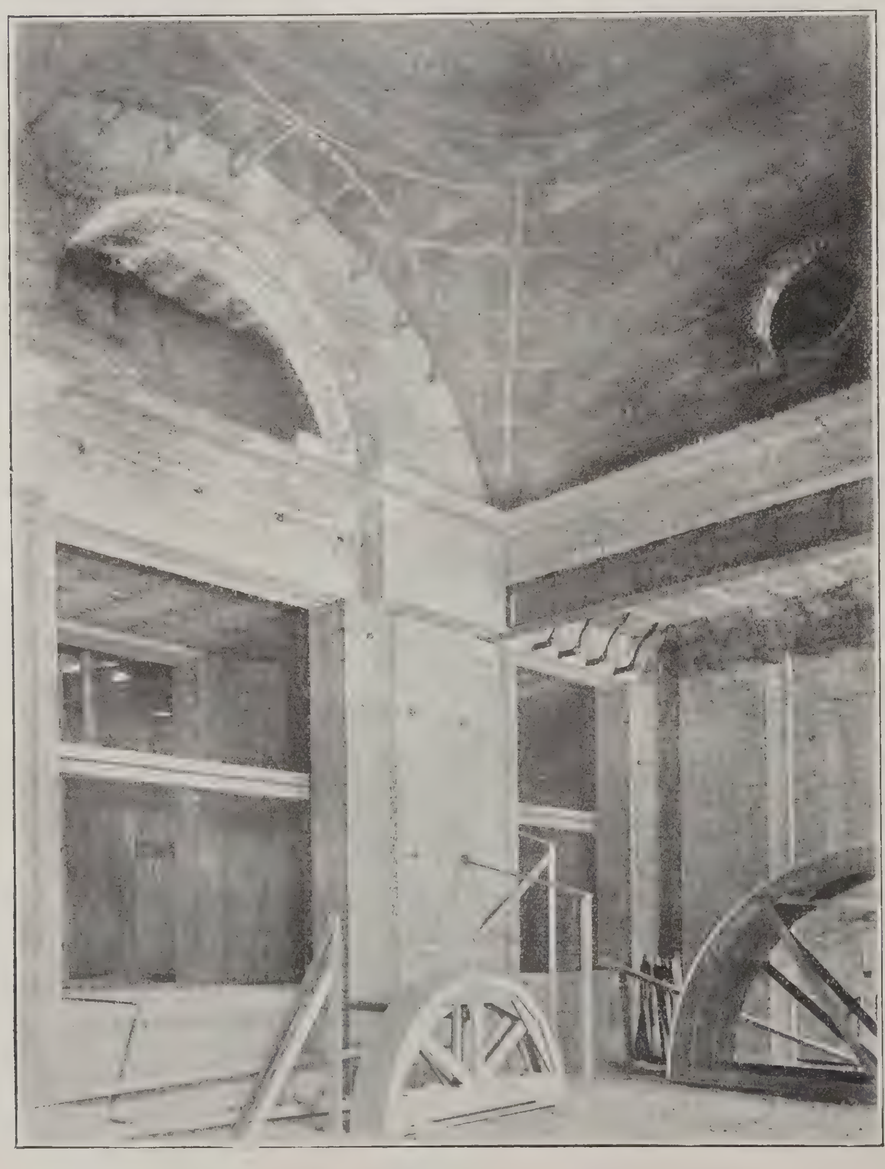
A striking feature of the job is the use of metal ribs and lathing to replace the usual forest of furring and lathing. We publish on p. 214 a view of the main entrance hall from Parliament Street with the wrought-iron ribs to receive the expanded metal lathing of the plaster dome and the cornice. We also give a detail view of the ribs of the dome and pendentives on p. 215.

Another photograph on p. 217 shows the wrought-iron ribs of the groins of the barrel-vaulted ceiling in one of the corridors round the circular court. Similar ribs are used in the other corridors. These are fixed by means of the travelling scaffold, carrying forge, &c., shown on p. 217. The ribs are bent and fixed by smiths on the job, the work being carefully set out on centres by the contractors' general foreman. This work requires great exactitude when it is recollected that the plaster would show up any inaccuracy of outline.

We shall publish further detail views illustrating the work in progress at a later date.



UPPER PART OF WINDOW SECOND STOREY.



NEW GOVERNMENT OFFICES, WHITEHALL: ENTRANCE HALL.

COMBINED DRAINAGE.

Forthcoming Revision of the Law.

By E. B. B. NEWTON, A.M.I.C.E., F.S.I.

AMONG the many matters affecting the interests of the building trades which will be brought under the notice of the public in the near future, few will be of greater interest generally than the question of an amendment of the law relating to combined drainage. There is practically unanimity of opinion as to the necessity for such amendment both in the Metropolitan area and in the provinces, but not as to the form such amendment shall take.

Dealing first with the Metropolis, Bills were drafted by the London County Council in 1897 and 1899, and in the latter case introduced into Parliament, but they had to be withdrawn, principally owing to the fact that, though not Government measures, the proposals in them, if sanctioned, would have had the effect of amending the Metropolis Management Acts, which are public enactments.

Recently the County Council have been asked to prepare a Bill again, but their reply is a suggestion that the various boroughs should agree upon a Bill and then impress its importance upon the Government with a view to the promotion of a Bill as a Government measure.

At the end of June last delegates from twenty-one of the twenty-eight borough councils waited upon the president of the Local Government Board, and his reply to them was certainly of a reassuring character. On February 4th, 1904, to a deputation of the Association of Municipal Corporations representing the provinces as well as London, and of a conference held at Glasgow, he expressed his willingness to deal with the subject if a satisfactory and practically non-controversial remedy could be found.

As a result the Metropolitan councils are moving in the matter, and there can be little doubt that in a short time proposals will be laid before Parliament to amend the existing law on the subject.

What the Present Law is.

The existing law, broadly stated, is that where premises are drained in combination under an order of the local authority or of the late Metropolitan Board of Works the private owner is responsible for the maintenance of the whole system, whereas if two or more premises are drained by a common drain without such an order the local authority is responsible for the portion which receives the drainage of both or all of the premises.

The unfairness of this clause to the general body of ratepayers is manifest, for the local authority is held responsible for drains common to two or more houses, which possibly may have been connected together surreptitiously and without the knowledge of the local authority, who perhaps may have had no opportunity of supervising the original construction of this drain. Moreover, the difficulty to the local authority of looking after such a drain is the more where, as is generally the case, the greater portion of the combined system is on private property; for while the authority doubtless have power to enter such property for the purpose of attending to the combined drain or sewer, when works have to be executed in connection with such a combined drain or sewer there is even under the best of circumstances the extra trouble of serving and obtaining compliance with notices of entry where requisite, and arranging for the convenience of the occupiers and owners, together with the additional difficulties consequent upon the execution of constructive works in confined spaces and awkward situations, while there are contingent liabilities upon the authority as to compensation to the occupiers and owners for incidental damage caused, especially where additional manholes, &c., are desirable but objected to by such owners and occupiers.

Building Over Sewers.

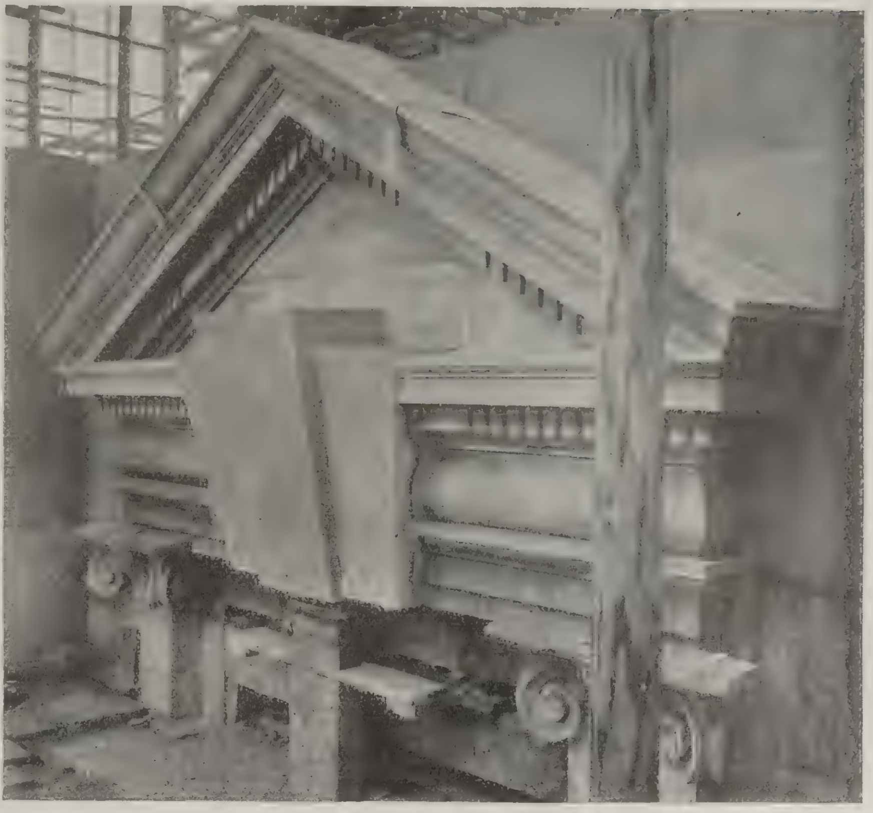
Another point that may cause hardships to property owners is that there are certain restrictions as to building over sewers; and where a common drain has been held to be a sewer, and an owner wishes to extend his premises to such an extent as to build over this sewer, obstacles may arise by reason of a refusal of the local authority to sanction such a construction over an existing sewer.

Again, in some cases there is unfairness to the owner who has originally constructed a combined drain or who has by purchase or demise taken over the liability for the maintenance of such a drain where executed in compliance with an order of the local authority, and so remaining vested in the owner. As is frequently the case in London, between two main streets houses may be constructed with the spaces at the rear of such houses abutting along their entire length. In the initial inception two alternative methods present themselves.

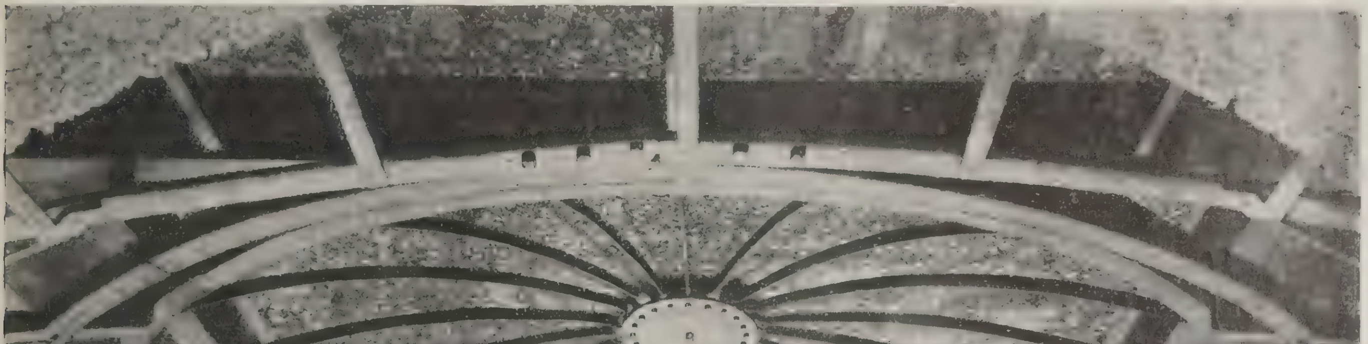
(1) A sewer may be laid along each main street sufficient to take the surface water of the street together with the drainage from all the houses, each house being connected separately to such a sewer.

In this case, if the houses are not detached each drain must pass under the buildings and rooms. After its first construction, in a manner approved by the local authority, the sewer becomes vested in the authority and each drain in the owner of the premises which it serves.

(2) Either no sewer need be laid or in each street a sewer may be laid as before



JPPER PORTION OF WINDOW SECOND STOREY.



NEW GOVERNMENT OFFICES, WHITEHALL: IRON FRAMEWORK FOR CEILING OF ENTRANCE HALL.

sufficient to take the surface water of the street and perhaps also the front positions of the houses. Then in either case a common drain may be laid at the rear of each row of houses and each house separately connected with such common drain.

By this second method drains under houses may be entirely avoided. In fact, under given circumstances this is the only possible way to avoid drains passing under houses; and the by-laws now in force require that no house shall have a drain under it unless any other method of construction is impracticable. From a sanitary point of view the second method is unquestionably the better, though it may not offer to the owner any financial advantage as compared with the first one. Nevertheless, if the work is all performed under the order of the local authority the private owners are individually and collectively liable for the maintenance of the whole drains, together with that of the common drain at the rear of the premises, and possibly of those common drains or sewers in the front, though as a rule the local authority would accept, and be liable for the maintenance as sewers of the common drains or sewers if any are needed and laid under the public streets. If, in the second case, there were constructed a public back street between the rears of the two rows of houses, the common drain at the rear of the premises would be laid along the back street, and the local authority almost certainly would take over the common drain as a sewer. The only difference between the two alternative methods in the second case would be that in one the common drain would be on a part of the private property, while in the other it would be on the public highway. Yet in the first method of the second case the private owner could be held responsible, and in the second method of the second case the public authority for practically the same conduit, save that in the latter case the public would have a right of conducting drains to the sewer, subject only to obtaining the consent of the local authority.

If narrow back streets were legalized in London the difficulty could be easily and equitably met as regards future constructions, and such a course has much to commend it for other reasons than the one particularly referred to here.*

With regard to existing drains, if legislation is to be altered and new regulations of a retrospective character introduced, it would seem desirable that the local authority should

---

* A proposition towards this end, was contained in the defunct London Building Acts Amendment Bill, 1905.

NEW GOVERNMENT OFFICES, WHITEHALL: VIEW OF THE CIRCULAR COURT.

be responsible only for such combined drainage systems as had been permitted by their order and carried out under their supervision and to their satisfaction in all respects, while all other systems should be considered to be vested in the owners of the various properties which the drain serves.

Probably the clauses suggested in the London County Bill of 1899 would be found to meet with general approval. They are of course retrospective in character, and read as follows:—

1. In the construction of the Metropolis Management Act, 1855, and the Acts amending the same the word "drain" shall be deemed to apply to and include the subject-matters specified in the interpretation of the word "drain" contained in the 250th section of the Metropolis Management Act, 1855, and in the 112th section of the Metropolis Management Act, 1862, and also any drain the construction of which as a sewer has not been sanctioned by a local authority or which has not been approved as a sewer by the Metropolitan or other Commissioners of Sewers or by the Metropolitan Board of Works or the London County Council.

Provided that the London County Council may at any time approve as a sewer any drain for draining a group or block of houses where in the opinion of the local authority of the district it is desirable that such drains should be cleansed, repaired and maintained at the expense of such local authority, and such drain shall thereupon become a sewer and be vested in such local authority.

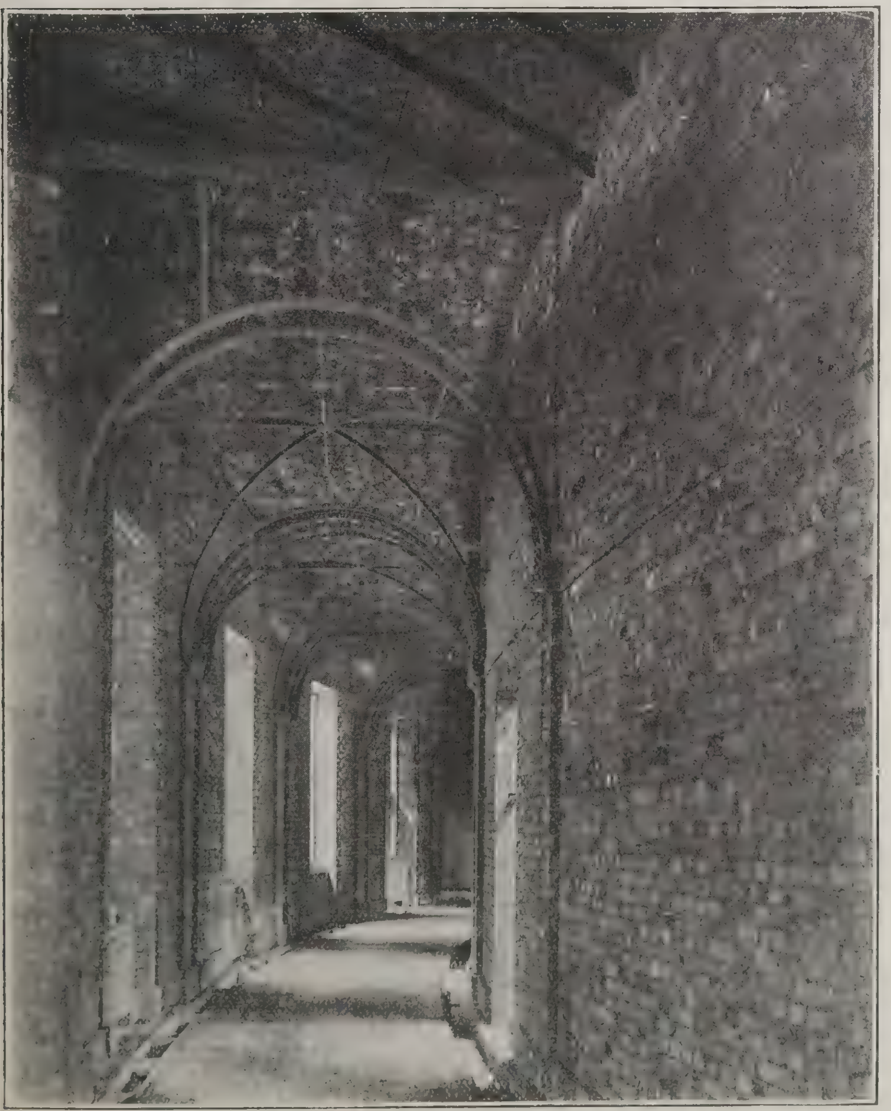
2 Any local authority may recover any expenses incurred by them after the passing of this Act in cleansing, repairing or replacing any drain for draining any group or block of houses from the owner or owners of any premises for the drainage of which such drain is or may be used in such proportions, if there be more than one such owner, as may be determined by the surveyor of the local authority, or in case of dispute by the London County Council.

Any such expenses may be recovered from the present or any future owner of the premises either by act of the High Court or before a court of summary jurisdiction.

4. This Act may be cited as the Metropolis Management Act, 1896, and shall be considered as one with the Metropolis Management Act, 1855, and the Acts amending the same.

In the provinces the law, again, broadly stated, is that where a conduit takes the drainage of more than one premises it is to be deemed a sewer and vested in the local authority. There is no question as to the passing or not of an order by the local authority.

SCAFFOLDING USED BY SMITHS IN ERECTING RIBS.



NEW GOVERNMENT OFFICES: RIBS IN CIRCULAR CORRIDOR.

Where a nuisance arises in a drain common to two or more premises, by section 19 of the Public Health Act, 1890, and under certain conditions, the private owners may be jointly and severally liable for the remedying of such nuisance, and the West Ham Corporation by a special clause (section 42) in their private Act of 1898 have obtained power to deal with common drains as drains for which the private owners are responsible, and apparently have freed themselves in this way from the general liability which rests upon other local authorities. This section reads as follows (section 41 of the Act referred to in it relates to the remedying of defects in drains after inspection by duly authorized officials):

In and for the purpose of section 41 of the Act of 1893 the word "drain" shall be deemed to include any sewer or drain, whether constructed before or after the passing of this Act, with which two or more houses or premises (whether belonging to the same or different owners) are at the date of the passing of this Act or may at any time thereafter be connected or which is used or capable of being or intended to be used for the conveyance of the drainage of such houses or buildings directly or by means of any other sewer or drain to any public sewer situate under a street repairable by the inhabitants at large, but shall not include any sewer which has been constructed to the satisfaction of the Corporation under section 152 of the Public Health Act, 1875, or any sewer which has been constructed by the Corporation for the effectual drainage of the borough.

Though this section 42 undoubtedly relieves the local authority of liability for unauthorised works, it does not appear to fully safeguard the interests of property owned in the directions indicated earlier in this article.

It would seem that a clause drawn upon the lines of that adopted for the London County Council, amended so as to meet the difference between the law in London and in the provinces, would be more equitable and more likely to commend itself to all parties, and so perhaps avoid the keen controversial discussion which the president of the

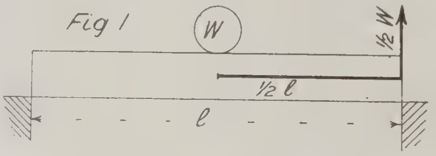
Local Government Board suggests would be inimical to its progress through Parliament.

In a brief article such as this it is impossible to touch upon more than the fringe of this complicated subject, but enough has been mentioned to show generally the main points at issue.

FIBRE STRESS IN BEAMS.

By **HENRY ADAMS, M.I.C.E., &c.**

THERE appears to be a very widely diffused misapprehension regarding one of the components of the ordinary formulæ for the strength of rectangular beams which the writer desires to make clear in the following article. Taking the well-known formula for the strength of a beam supported at the ends and loaded in the centre, viz., $W = \frac{Cbd^2}{L}$, this will be found to be made up from the fundamental equation $\frac{Wl}{4} = f\frac{bd^2}{6}$ where W = breaking weight in cwts. in centre, C = constant or numerical coefficient, b = breadth in inches, d = depth in inches, L = length of span in feet, l = length of span in inches, and f = what is generally called extreme fibre stress. It is to the last quantity that attention must be chiefly directed, but the relationship of the two equations given above must first be explained. By the "principle of the equality of moments" we have the bending moment M = the moment of resistance R. The bending moment is seen from Fig. 1 to be $\frac{1}{2}W \times \frac{1}{2}l = \frac{Wl}{4}$, but the moment of resistance will require more explanation. Let Fig. 2 be taken as a cross-section of the beam to a larger scale, with the neutral axis or layer passing through the centre of gravity of the section. Then, under the given conditions of loading, the upper half will be in compression and the lower half in tension. The stresses will, however, not be uniform throughout the depth; the fibres nearest to the top and bottom edges will be strained the most, and the effect will be less as the distance from the edge increases, until at the neutral layer the effect, so far as longitudinal stress is concerned, entirely disappears. Action and reaction are always equal, so that it comes to the same thing whether we think of the fibres as being strained by the load according to their distance from the neutral axis, or that according to their distance from the neutral axis the fibres are in a better position to resist the effect of the load. The latter view gives the better idea of resistance. Now, instead of supposing all the fibres to be in action with varying amounts of resistance according to their distance from the neutral axis, we may imagine only a certain number of the fibres acting, but all those selected fibres acting with the maximum effect to produce an equal total resistance. Thus, by drawing diagonals in Fig. 2, and shading the upper and lower triangles, we may look upon the shaded portions as representing those fibres that would be doing the whole work of resistance, the others being inoperative. These shaded portions are called the "inertia areas," acting as a "couple" in the reverse direction to the bending moment. The measure of a couple is one of the forces multiplied by the arm or distance between the forces; therefore the couple in this case, representing the moment of resistance, will be the area of one of the shaded triangles $= \frac{bd}{4}$, multiplied by the "fibre stress" $= f$, and multiplied also by the arm or distance between the centres of gravity of the shaded triangles $= \frac{2}{3}d$, that is, $f\frac{bd}{4} \times \frac{2}{3}d = f\frac{bd^2}{6}$. The fraction $\frac{bd^2}{6}$ is the measure of the resistance of the section due to its size and shape, and is known as the "modulus of section" $= Z$, also improperly called by some writers "the moment of resistance in square inches." The modulus of section is also called the "strength modulus," but this is hardly correct, because it is independent of the material and therefore of one of the chief elements of strength, and is solely a function of size and shape. The combination of the two couples producing equilibrium is shown in Fig. 3. The first equation given above is derived from the second one, thus: $l = 12L$, then $\frac{W12L}{4} = f\frac{bd^2}{6}$, or $W = f\frac{bd^2}{6} \div \frac{12L}{4} = \frac{4fbd^2}{6 \times 12L} = \frac{fbd^2}{18L}$; but $\frac{fbd^2}{18L} = \frac{Cbd^2}{L}$ $\therefore C = \frac{f}{18}$. Now, to take a practical example, cast-iron has an ultimate tensile strength of, say, 140 cwts. per sq. in. and an ultimate compressive strength of 840 cwts. per sq. in.; therefore, assuming the neutral axis to remain at the centre of gravity of the section up to the point of fracture, the fracture would take place when the extreme fibre stress reached 140 cwts. per sq. in.; then if f is the ultimate fibre stress, $f = 140$ and $\therefore C = \frac{140}{18} = 7{\cdot}7\dot{7}$; but by experiment a cast-iron bar 1in. broad and 1in. deep, 1ft. between the supports, breaks with a load of 20 cwts. (1 ton) in the centre, and as $W = \frac{Cbd^2}{L}$ $\therefore C = 20$. An explanation may be attempted by assuming that the neutral axis shifts until the inertia area on the tension side multiplied by the tensile strength is equal to the inertia area on the compression side multiplied by the compressive strength. To find this position of neutral axis $\frac{1}{2}(xbd) \times 840 \times \frac{2}{3}(xd) = \frac{1}{2}(ybd) \times 140 \times \frac{2}{3}(yd)$, or $280xbd^2 = 46\frac{2}{3}ybd^2$, or $280x = 46\frac{2}{3}y$; but $x + y = d$, $\therefore x = d - y$ and $y = d - x$, then $280x = 46\frac{2}{3}(d - x)$, whence $280x + 46\frac{2}{3}x = 46\frac{2}{3}d$, or $326\frac{2}{3}x = 46\frac{2}{3}d$; divide both side by $46\frac{2}{3}$, then $7x = d$, or $x = \frac{1}{7}d$. This may be found graphically by a very simple means. Upon a piece of the elevation (Fig. 4) set up a vertical line A B C equal in any scale to the compressive and tensile resistances as shown; join the extremity C with any point on the base as D; where this line cuts the upper edge at E draw another vertical; join B D, and where it cuts the vertical below E in point F we shall have the position of neutral layer, which will be $\frac{140}{840 + 140} = \frac{1}{7}d$ below the top. Transfer this to Fig. 5, and then we have the amount of resistance $= \frac{1}{2}(\frac{1}{7}bd) \times 840 \times \frac{2}{3}(\frac{1}{7}d) + \frac{1}{2}(\frac{6}{7}bd) \times 140 \times \frac{2}{3}(\frac{6}{7}d) = 40bd^2$. Returning to the fundamental equation $\frac{Wl}{4} = f\frac{bd^2}{6}$, then $\frac{fbd^2}{6}$ must equal $40bd^2$, or $\frac{f}{6} = 40$, whence $f = 240$. But C has been shown to be $= \frac{f}{18}$, therefore $C = \frac{240}{18} = 13\frac{1}{3}$ after allowing for the full tensile and compressive resistance on the assumption of "fibre stress," whereas experiment shows $C = 20$. Professor Rankine found the same difficulty in comparing the transverse strength of a material with its resistance to compression and tension. He says in his "Applied Mechanics," p. 316: "When the *breaking* load is in question, the coefficient f is what is called the *modulus of rupture* of the material. It does not always agree with the resistance of the same material to direct crushing or direct tearing, but has a special value, which can be found by experiments on cross-breaking only." And in a footnote on p. 634 he says: "The modulus of rupture is eighteen times the load which is required to break a bar of 1 in. sq., supported at two points 1ft. apart, and loaded in the middle between the points of supports." This would make $\frac{Wl}{4} \neq \frac{18bd^2}{6}$ for cast-iron in tons, or in cwts. $\frac{Wl}{4} = \frac{18 \times 20bd^2}{6}$, whence $W = \frac{18 \times 20 \times 4 \times bd^2}{6 \times l} = 240\frac{bd^2}{l}$, or if L be used $= \frac{240bd^2}{12L} = \frac{20bd^2}{L}$, agreeing with the experiment. Reviewing the above statements and figures, we see that whereas the common interpretation of the formulæ as based upon extreme fibre stress would give a factor of $13\frac{1}{3}$ for C, in the case of a cast-iron beam it is actually 20, and therefore a beam designed for a maximum fibre stress equal to the working stress in direct tension or compression will probably be much stronger than it is supposed to be.



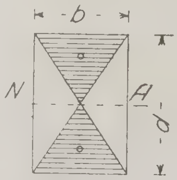


Fig 2

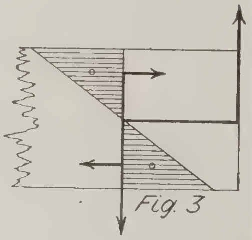
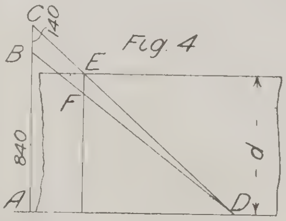
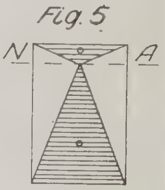






A Roman Catholic Church is to be built in the grounds of Lady Bute's Orphanage at Rothesay, at a cost of between £30,000 and £40,000. Accommodation will be provided for 1,000 persons. Mr. R. Weir Schultz, of London, is the architect.

The Organ at Hexham Abbey is to be reconstructed by Messrs. Norman & Beard at a cost of £2,000. As much as possible of the old instrument will be incorporated with the new work. The echo organ will be placed in the south transept triforium.

Wakefield Cathedral Spire.—About 10ft. of the spire of Wakefield Cathedral has to be rebuilt, one of the stones having been found to be cracked. The work is now in progress, and in connection with it an interesting "find" has been made. In the vane of the weathercock was a receptacle of hammered copper, the ends of which were sealed, containing ancient records as to the spire. From these it appears that the spire was partly rebuilt and repaired in 1715, that the tower and spire were repaired in 1803, that the upper part of the spire was rebuilt in 1823 (when it was raised to its original height, having been diminished in 1715), and that the tower and spire were again restored in 1861. These records have been supplemented by a statement with reference to the repairs that are now being made, and the box will once more be placed in its original repository. The total height is 247ft.

THE INTERNATIONAL BUILDING TRADES' EXHIBITION.

THE sixth International Building Trades' Exhibition which is to be opened to-morrow at the Royal Agricultural Hall, Islington, by Lord Windsor, First Commissioner of Works, promises to be the best which has yet been held. The exhibits are more numerous than before—there being about three hundred exhibitors—and they are thoroughly representative of all the building trades. The merits and advantages of this exhibition are now fully appreciated, and it is visited not only by builders, architects, surveyors and others in their private interests, but also by the trade and professional societies in their official capacity. To have thus brought together all the chief building materials and appliances on the market is of the greatest value, especially as regards the new systems of construction and novelties which are constantly being introduced; here they can be thoroughly inspected and compared, enabling architects and builders to keep in touch with all the most up-to-date innovations.

This year there is no special section in the Exhibition, but particular prominence is given to fire-resisting construction—so much to the front at the present time. By making forward arrangements we are able to give our readers an illustrated account of the chief exhibits, which we have gathered together, as far as possible, under sectional heads. In our next issue we shall complete our description of the Exhibition.

BRICKS, ROOFING TILES, &c.

The foremost importance of the materials in this division of building construction is apparent to everyone, and though the attention of visitors is not claimed by such startling novelties as are found in other trades it will be more soberly given by large users. Below will be found more particular reference to noteworthy exhibits, and here we may simply call attention to a few facts worthy of consideration. A new and very cheap glazed brick has been placed on the market by the Gildenburg Brick Co. The Selby Brick Co. is showing glazed faïence bricks, which add to the advantages of faïence decoration that of constructional treatment, with stability and saving in cost of rendering, floating and fixing as with tiles. The Wrotham hand-made red bricks and roofing tiles have a rich dark colour naturally obtained, and have secured a deservedly high reputation among architects. Messrs. Carter & Co., of Poole, have an attractive stand constructed of grey terra-cotta with vases, glazed dadoes, tile floor, &c., accessories, where they display their goods to advantage. Messrs. Watson Nelson, Ltd., possess at their works near Rugby a stiff-plastic clay which burns a brilliant red colour and gives their bricks, &c., distinction, while a layer of a kind of ironstone marl burns very red and makes a good roofing ile called the "Windmill" brand. The Nostell Brick and Tile Works are showing . finely-coloured dark-red machine-made oofing tile. Messrs. H. J. & C. Major's interlocking tiles are now well known, but preserve their interest to many persons. As o clayworking machinery, Mr. F. A. Smith is howing several cheap brick- and tile-making machines that are simple, compact and trong in construction—the governing factors in the life, efficiency and economical working f the plant.

Hand-made Bricks and Roofing Tiles.

Stand No. 113, Row F.

The red facing bricks and roofing tiles hown by Messrs. Thomas Pascall & Sons, whose chief office is at High Street, outh Norwood, are entirely hand-made; with the exception of the clay-grinding mills, no machinery of any kind is used in their production. They are of a very rich ark colour—especially the roofing tiles—nd it is worthy of note that this is quite atural, no staining or artificial means being resorted to. Messrs. Pascall make most of their goods from April to September, but ave artificially-heated drying sheds to nable them to meet special orders throughout the winter. The prices of the bricks range from 45s. to 50s. per thousand on rail, and the tiles from 40s. to 45s. At the works there is every facility for loading, the rm possessing a private siding on the . E. & C. Rly., and a mile of permanent railway extending in various directions in the works, enabling the railway trucks to be brought right up to the kilns, thus saving the repeated handling to which the goods would be subjected if they had to be carted to the railway. The private line also runs down into the sandpits, where a building sand of good quality is dug. Messrs. Pascall also make flower pots and chimney-pots, &c. Their works are at Wrotham in Kent and at Elmer's End, Beckenham. The phrase "Wrotham red" among sand-faced tiles is becoming as well known as "Broseley" among machine-made tiles. The works at Elmer's End are only concerned in the making of London stock bricks.

Enamelled Bricks, &c.

Special position No. 9, Row D.

Messrs. Stanley Brothers, Ltd., of Nuneaton, are chiefly exhibiting this year enamelled bricks, a speciality in coloured pots and ridges, and a sink combination consisting of sink, sink standards and sink trap fittings with sink and bath trough. This firm's glazed bricks have a deserved reputation for richness of colour and evenness of glaze, while their designs for glazed ware betray careful thought and appreciation of conditions. Their works are able to turn out large quantities of bricks, while an extensive stock is kept in hand to meet all possible requirements.

Selby Faience Bricks.

Stand No. 116, Row F.

Various examples of Selby glazed faïence bricks are shown by the Selby Brick Co., Ltd., of Peterborough. These bricks are manufactured by an entirely new method, and combine all the best features of faïence tile decoration with the advantages of constructional treatment. Walls faced with them are finished as laid, so that the cost of rendering, floating and fixing is saved. The richness of texture and wide range of colours have already received very favourable notice.

Firebricks and Stable Paving.

Stand No. 108, Row F.

Messrs. Towers & Williamson, of Little Bytham, Grantham, make a special feature of firebricks and stable paving. The clay used is of a very refractory nature and withstands high temperatures. The bed has running through it a seam of silicate rock, from which the firm supplies ganister.

A Richly-coloured Roofing Tile.

Stand No. 88A, Row E.

The Nostell Brick and Tile Works, near Wakefield, are making a special feature of roofing tiles. These are deep-red in colour (purple-brown would, perhaps, be the nearest description) and look well on a roof, as visitors may have a chance of judging at the stand of the British Compoboard Co., Ltd., in Row F, No. 5, the roof of which is covered with the Nostell tiles. Special care is taken in the manufacture to avoid lamination (the point in which many manufacturers fail), and the vitrification is thoroughly done. Finials, &c., are also exhibited, while the firm's blue and brindle bricks for paving and building purposes and ornamental and plain double-pressed bricks are deserving of notice.

Interlocking Tiles.

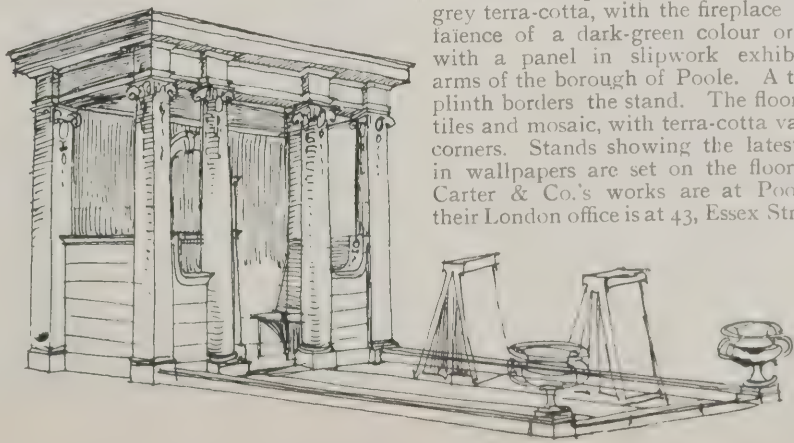
Stand No. 92, Row E.

Messrs. H. J. & C. Major, Ltd., of Bridgwater, are exhibiting their well-known tiles, namely, their patent interlocking tiles of plain, Roman and Welbeck patterns, with suitable ridge tiles, and a variety of ordinary pattern tiles with ridge tiles and finials. The interlocking tiles are designed to be proof against weather; they require no nails nor mortar or cement to fix them. In addition to the important exhibit of tiles, the firm is also showing oven, paving and malt-kiln tiles, building bricks, land drain pipes, &c.

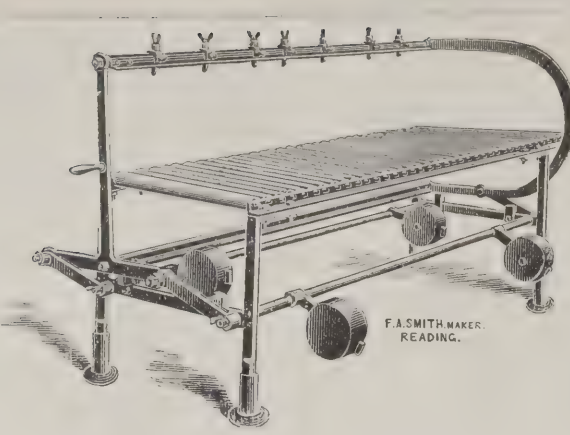
Architectural Terra-cotta.

Stand No. 96, Row E.

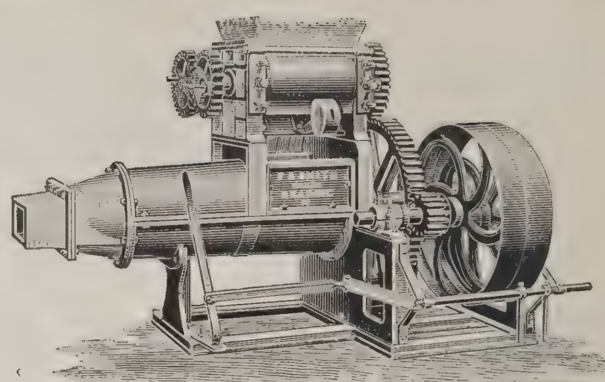
As the illustration below indicates, this is a very attractive stand, exhibiting good architectural quality. It is constructed of grey terra-cotta, with the fireplace in glazed faïence of a dark-green colour ornamented with a panel in slipwork exhibiting the arms of the borough of Poole. A terra-cotta plinth borders the stand. The floor is in red tiles and mosaic, with terra-cotta vases at the corners. Stands showing the latest patterns in wallpapers are set on the floor. Messrs. Carter & Co.'s works are at Poole, while their London office is at 43, Essex Street, W.C.



MESSRS. CARTER & CO.'S STAND.



CUTTING-OFF TABLE FOR TILES.



THREE-PROCESS AUGER BRICK MACHINE.

Clay-working Machinery.

Bay 16.

We illustrate two of the exhibits of clay-working machinery at the stand of Mr. F. A. Smith, of Kennet Iron Works, De Bohun Road, Vastern Road, Reading. The three-process brick machine is strong and serviceable in design, and is specially designed to meet the requirements of plastic clays. A 6-h.p. engine is required to drive it, and it has a capacity of from 8,000 to 10,000 bricks per day. The diameter of the rolls is 12ins. and the width 17ins., the diameter of belt pulley 2ft. 10ins., width 5ins., and it runs at a speed of 80 revolutions per minute. Its compactness is noteworthy; the amount of floor space occupied is 8ft. 3ins. by 4ft. 9ins., and the nett weight is approximately 2½ tons. Two new Auger type brick machines are shown, No. "0" and No. "4" sizes. The first or Colonial type has been designed for very small yards abroad or for making fancy ware. It is cheap, strong and occupies little floor space, namely, 7ft. by 3ft. 6ins. Its capacity is about 4,000 bricks per day, and it can be driven by a 4-h.p. engine. The No. 4 machine has been specially designed to deal with the stiffest plastic clays. Mr. Smith also exhibits an interesting tile and pipe machine fitted with die for ordinary roofing tiles which can easily be replaced with plain pipe dies. The cutting-off table for tiles here illustrated is well balanced, cuts evenly through pipes or tiles, and is strongly made of wrought-iron and steel throughout. The floor space occupied is 7ft. by 3ft. and the weight 2 cwts. A cutting-off table for bricks is also exhibited.

Adamantine Paving Quarries.

Stand No. 85, Row E.

Nothing new is exhibited by Messrs. Watson, Nelson, Ltd., of Napton-on-the-Hill, near Rugby, except their adamantine paving quarries. The rest of the exhibit consists of roofing tiles, ridges, finials and bricks. It may be noted that the ground whence the firm derive their material has a top layer of a stiff-plastic clay which burns a very brilliant red colour; then a layer of a kind of ironstone marl, which also burns very red, and is chiefly used for making the "Windmill" brand roofing tile; and then a blue shale from which good blue bricks are made.

A Granite and Cement Paving Slab.

Stand No. 84, Row E.

The chief exhibit of the Atlas Stone Co., Ltd, of Coldhams Lane, Cambridge, is the Atlas "Foothold" paving slab, made under hydraulic pressure from Leicestershire granite and the "Saxon" brand of Portland cement. A Faijas testing machine is provided to test briquettes made from this cement used for Atlas "Foothold" slabs. Another exhibit is an armoured cover for electric-light joint boxes, designed to take a distributed load of 5 tons. This has expanded steel embedded in the stone, and dispenses with the usual cast-iron frame.

Roofing Tiles.

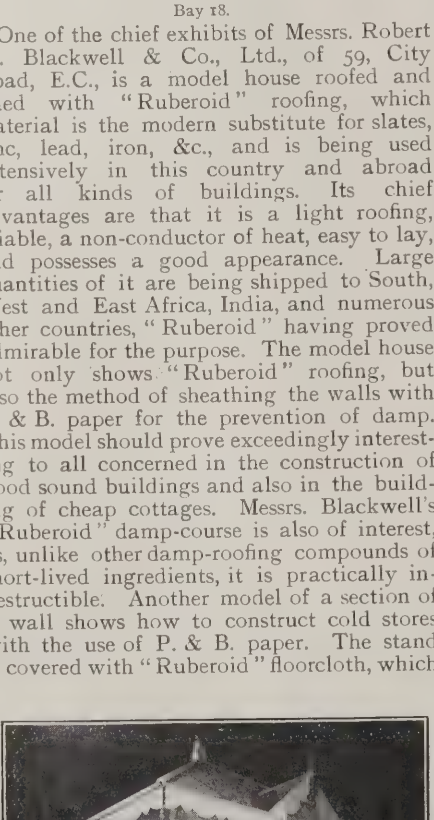
Stand No. 83, Row E.

A fine show of roofing tiles in many varieties of colour and surface, as well as finials and terra-cotta generally, is to be seen at the stand of Messrs. S. & E. Collier, Ltd., of Reading. This firm is offering a very cheap line in machine-made terra-cotta. Sand-lime bricks in various colours are also a speciality, and an artificial stone with an excellent surface is likewise worthy of attention. Coloured cement flooring tiles at very reasonable prices are another speciality of the firm. King's patent imitation gauged arches are shown. These are made of the noted Reading rubbing clay, but entail no expense in rubbing down to size.

Ruberoid Roofing.

Bay 18.

One of the chief exhibits of Messrs. Robert W. Blackwell & Co., Ltd., of 59, City Road, E.C., is a model house roofed and sided with "Ruberoid" roofing, which material is the modern substitute for slates, zinc, lead, iron, &c., and is being used extensively in this country and abroad for all kinds of buildings. Its chief advantages are that it is a light roofing, pliable, a non-conductor of heat, easy to lay, and possesses a good appearance. Large quantities of it are being shipped to South, West and East Africa, India, and numerous other countries, "Ruberoid" having proved admirable for the purpose. The model house not only shows "Ruberoid" roofing, but also the method of sheathing the walls with P. & B. paper for the prevention of damp. This model should prove exceedingly interesting to all concerned in the construction of good sound buildings and also in the building of cheap cottages. Messrs. Blackwell's "Ruberoid" damp-course is also of interest, as, unlike other damp-roofing compounds of short-lived ingredients, it is practically indestructible. Another model of a section of a wall shows how to construct cold stores with the use of P. & B. paper. The stand is covered with "Ruberoid" floorcloth, which is very durable and requires no nailing to the floor, being simply laid down. Messrs. Blackwell's City Road offices have been covered with this material for the last six years. At the Brussels International Exhibition of 1897, in the British section, the floors were covered with "Ruberoid" and millions of people walked on it; a sample piece is shown at the stand. Messrs. Blackwell also show "P. & B." paints for wood and iron (which are unaffected by lime, cement, mortar or earth gases) and numerous valves, pipes, fittings, tools, pumps, radiators, ventilators, &c. The



MESSRS. BLACKWELL AND CO.'S STAND.

Contractors' Hand-pumps

exhibited have a capacity of 3,000 gallons per hour. The "Diaphragm" pump has a 12½in. rubber diaphragm, which is used in the place of a pump bucket. These will discharge semi-liquids containing sand, gravel, &c., from sewers, excavations, trenches, &c., without choking, and are easily worked by one man. Another pump is the "Cataract" flood pump, which is capable of lifting up to 26ft. and is adapted for draining ponds, cesspools, &c. This pump is shown in operation pumping water from a tank made with 3-ply "Ruberoid" roofing; the tank has one joint at the bottom, so that while proving its waterproof qualities it shows that it will bear the weight of water without breaking joint.

Vulcanite.

Stand No. 45, Row B.

A small model house showing the application of patent Vulcanite roofing to a roof of wood construction—which roofing can also be used for roofs of concrete construction—is exhibited by Messrs. Vulcanite, Ltd., of 18, Cannon Street, E.C. Vulcanite sheet asphalts for roofing, sarking and damp-course are also shown, as well as the firm's new Vulcanite rubber paint, rubber enamel, varnishes, &c., and ready mixed paint.

Concrete, Stone and Mosaic Work; Wood-block Flooring.

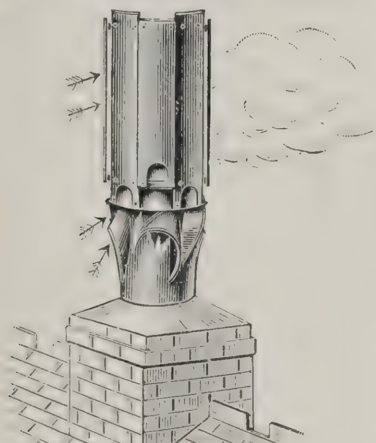
Stand No. 78, Row D.

Work in concrete and mosaic, and wood-block flooring, form the exhibit of Messrs. B. Ward & Co., Ltd., of 38 and 39, Parliament Street, S.W., and Grosvenor Works, Bedford. The granite concrete paving shown is laid *i* *situ* in thicknesses varying from 1in. to 4ins. It is jointless, sanitary and very durable and it can be rapidly laid by the firm' experienced layers with the necessary fall for draining with a grooved and channelle or plain surface; the builder providing an laying a 4in. bed of broken bricks or concret as foundation for the paving. Messrs. Ward' reinforced concrete floors and partitions ar designed to give the maximum of strengt with the minimum of steelwork, and ar executed *in situ* on the firm's own system o centering. Artificial stone staircases ma be executed *in situ* or cast at the firm works and delivered to the job ready for th builder to fix, with plain or moulded nosing and with or without Ward's patent non slipping lead treads—effecting a great savin on natural stone and securing greater durability. Mosaic staircases with terrazzo mosaic finish in colours are a speciality of the firm; these also have non-slipping leaded treads, as recently executed by Messrs. Ward at the Baltic Shipping Exchange, St. Mary Axe; Temple Bar and Thanet House, Fleet Street; the Westminster Town Hall and numerous other buildings. The leaded treads are made in the form of a lead grid embedded in the treads; they are neat in appearance, pleasant to walk upon, cannot work loose, and finishing flush with the tread have no sunk or raised portions to collect dirt. Messrs. Ward also exhibit artificial stone dressings of various designs and finished in best style; Roman marble mosaic paving laid with finest finish with the hardest and most durable marbles; terrazzo marble mosaic paving (as now being laid at the University Hospital, Gower Street; the Royal Waterloo Hospital, and the Cancer Hospital, Brompton Road); mosaic hearths, fire-kerbs and mantelpieces; and wood-block flooring. Messrs. Ward are the sole proprietors and manufacturers of Charteris & Longley's patent wood-block flooring, all blocks being dried by a special process before delivery and being laid in special mastic composition.

A New Chimney Cowl.

Stand No. 23 Gallery.

Chimney cowls and sash-fasteners are perhaps the most patented articles used in the building trade; and both of them have got into disrepute by reason of the inefficient and cranky ideas elaborated by amateurs. There can be no doubt, however, that a good chimney cowl is a great desideratum. Most cowls are based on the idea that by revolving over the mouth of the chimney they cause an updraught: that idea, however, has proved to be often fallacious, as some of these revolving cowls have actually impeded, not helped, the draught. Taking the fixed cowl, therefore, as a standard, Mr. E. G. Wright, of Guilford, has introduced his patent twentieth-century "King" chimney cowl, which has been used on numerous Government establishments and important public buildings. We give above an illustration of it, by which the general arrangement can be seen at a glance. This cowl can be swept as easily as an ordinary chimney and cannot interfere with the sweep's brush. It is made of the best galvanized steel sheet, painted with iron paint, and is so formed as to cause an updraught in any quarter of the wind. The price is 50s.



The "King" Chimney Cowl.

Cloisonne Glass.

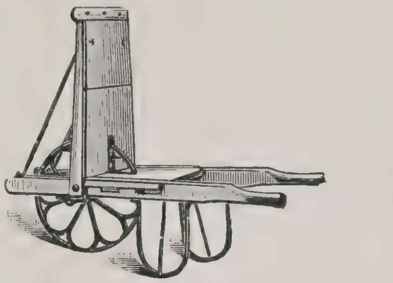
Stand No. 58, Row C.

The Cloisonne Glass Co., of 9, Berners Street, Oxford Street, W., exhibit specimens of their Cloisonne glass suitable for windows, ceiling lights, fanlights and lantern lights, partitions, and any other position where stained or leaded glass may be required. This year they are making a special feature of landscape and figure-work, and exhibit some big pieces, including one of a lady on a white palfrey under an archway: this is 7ft. 6ins. high by 4ft. wide, and is executed on a single sheet of plate glass. In addition, there are shown a number of ready articles that can be used for decoration of rooms, &c., such as electric lanterns fitted with Cloisonne glass, fire screens, threefold screens and tables. These last are not supposed to interest architects, but they all show designs that might be used for house-work, and, being framed, are safer and show to better advantage than when made up in rough sheets only.

Barrows and Tip-wagons.

Stand No. 11, Minor Hall.

Various kinds of barrows and tip-wagons are shown by Messrs. Rowland Brothers, of Fenny Stratford, Bletchley. We illustrate one of them—a crowding barrow, strong and simple in construction and very useful on building works. An entrance gate and a length or two of fencing are also shown at this stand.



Crowding Barrow by Rowland Brothers.

Glazing without Putty.

Stand No. 98, Row E.

The chief exhibit of Messrs. Sam Deards, Ltd., of 34, Old Broad Street, E.C., is their patent "Superior" glazing system, the special claims for which are its simplicity in method and the shape of the section, combined with the fact that any handy-man can fix the glazing bars; with builders this is of the utmost importance, as the smallest contracts can thus be carried out at a minimum of cost, and the builder can supply his own glass and be sure of obtaining a thoroughly water-tight roof. The bar allows for expansion and contraction, without breakage, there being no nuts, bolts, asbestos or packing of any kind, nor any hard metal caps. The bar is made in four sections to carry up to 11ft. glass. The roof can always be got at for repairs, as the web of the glazing bar will support planks and carry workmen, thus enabling repairs, painting, &c., to be carried out without danger of breaking the glass. With some systems this is quite impossible, as they have no support above the glass level. Messrs. Deards draw special attention to the fact that, after severe examination and test, they were awarded the contract for glazing the new steam factory at Portsmouth Dockyard, where the work covered 102,000ft. super.

Iron Shop Fronts; Collapsible Gates.

Stand No. 47, Row B.

Messrs. H. & F. Bonten, Ltd., of 8, Elder Street, Norton Folgate, London E., are making a special feature of wrought-iron projecting shop fronts built up with new sections specially rolled for the purpose, and a new collapsible gate with overlapping ornamentation rolled on the channels in one piece. The exhibit also includes a great variety of ornaments worked from plain and ornamental moulded bars.

Ventilating and Heating Appliances.

Wall Space 145.

Messrs. James Keith & Blackman Co., Ltd., of 27, Farringdon Avenue, E.C., have a fourfold exhibit of warming, ventilating, lighting and hydraulics. They show a chamber set apart for the purpose of practically demonstrating their method of supplying hot and cold air in proportionate quantities (or either separate) to buildings, &c. This comprises a hot-water boiler serving a battery of radiators, with Blackman fans, regulating valves, &c. The Keith patent hot-water boilers shown are both for warming buildings and domestic hot-water supply to washhouses, kitchens, &c. The radiators are of the well-known "Aiolian" and "Universal" patterns. In the ventilating section Blackman fans of various sizes are exhibited, some fitted with pulleys for belt-driving and others having electric motors wound for continuous and alternating currents. Intensified gas lighting, suitable for all classes of buildings, is shown, including Keith's gas compressors, driven by water, electric motor or other motive power. A cellar pump for the removal of water in low-lying cellars, basements, &c., invites attention, as also a ram for raising water in rural districts to any desired level.

PAINTS.

The exhibits of paint manufacturers are important. The subject of paints and painting is far too much neglected. Of late years washable distemper or water paints have come to the fore in no unmistakable way. They give a dull texture of surface and beauty of durable colour in a variety of tints. Enamels, too, are now largely used with excellent effect, while preservative paints are of primary importance in the life of a metal structure.

An Excellent Washable Distemper.

Gallery Bay No. 31.

At the stand of Messrs. W. Carson & Sons, of Grove Works, Battersea, London, S.W., there is an important display of this old-established firm's well-known specialities—their paints, colours, varnishes, enamels and water paint (Muraline). This last-named is entitled to a front place among this class of latterly so popular paints. It possesses many advantageous features, among which we may mention that (1) it is prepared in a dry powder which will not deteriorate if kept dry (thus purchasers do not pay for water, as in the paste or liquid distempers); (2) it is non-poisonous and does not contain lead, arsenic or copper; (3) it is a disinfectant and is inodorous; (4) it contains no glue and is fire-resisting; (5) it is washable when dry and can be immediately second-coated, so that a room can be finished with two or more coats in one day; (6) the colours are fast to light and unaffected by gases, and resist lime; (7) removal is unnecessary before repainting; (8) the cost is one-third that of oil paint; (9) it is superior to ordinary distemper in covering power; (10) it works and flows easily under the brush; and (11) intermediate shades can be produced by mixing various colours or by reducing with white.

Special Paints.

Among Messrs. Carson's other exhibits are "Vitrolite," a paint specially manufactured for the protection of conservatories, forcing houses and all horticultural buildings; their well-known anti-corrosion paint (which was used for painting the Forth Bridge at the time of its erection); special oil mixtures; and an enamel oil mixture for use with the final coat of any paint (an improvement on a mixture of linseed oil and turpentine); non-poisonous liquid paint; varnish woodstains, which are an improvement on the old-fashioned water stains in not requiring sizing and varnishing; "Plastine," a plastic durable glazing composition; and a solution for damp walls.

Hall's Distemper.

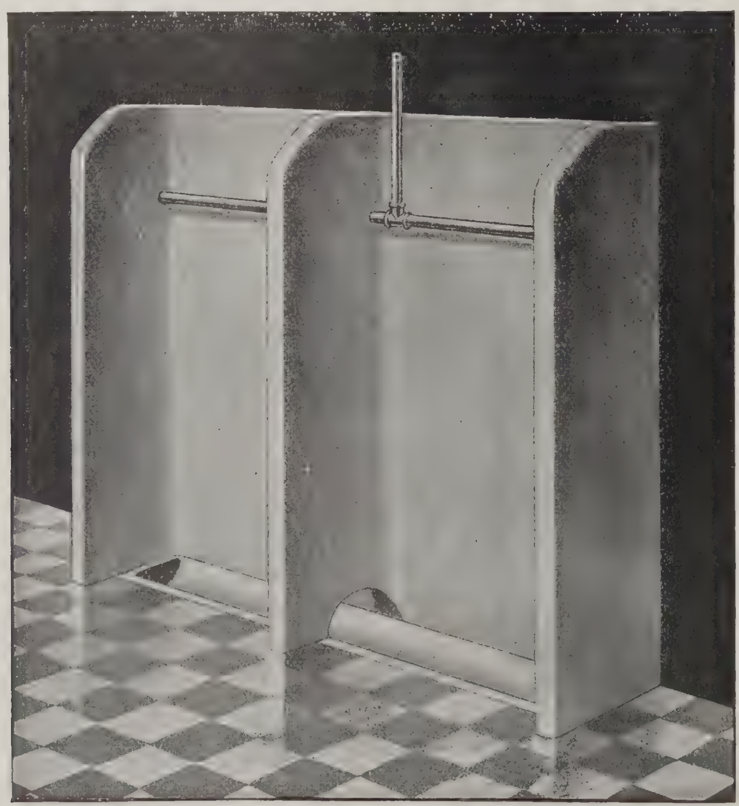
Stand No. 87, Row E.

This stand is a commodious one, 20ft. long by 10ft. wide, the object being to show a large room decorated with the chief manufactures of Messrs. Sissons Brothers & Co., namely, Hall's distemper and "Sisco" White Japan. The inside is fitted up as a modern drawing-room, treated in the simple and inexpensive manner in which Hall's distemper is so applicable. A fireplace faces the entrance to the stand, with window seats recessed to right and left. Above these seats on either side are plain leaded lights, which enable the interior of the stand to be viewed by passers-by on that side. The walls are decorated in Hall's distemper of a delicate heliotrope shade (pattern No. 61 in their shade book). A picture rail, skirting and panelling show the brilliant, hard and lustrous surface of their white enamel. The frieze is treated in stencil with a design of tree decoration incorporating several colours of distemper so as to emphasize how easily this material lends itself to the rapid and effective manipulation of even the most elaborate designs in stencil work. Extending along the whole length of the outside of the stand is a frieze treated with plaster festoons distempered white on a delicate cream background: the lower walls being also coloured with Hall's distemper of a green shade. The walls on the left side of the stand are covered with art canvas coated with Hall's distemper of a buff shade, and a rich frieze 2ft. deep extends from left to right. The subject of the frieze is a landscape, painted on canvas with distemper in varied colours. This side of the stand is an example of the work that can be done with distemper in houses where expense is not an immediate consideration. The stand has eight columns 13ft. high, each projecting 3ft. above the level of the structure. The whole of the woodwork outside is treated with "Sisco" White Japan.

Sanitary Novelties.

Bay 17.

Amongst the exhibits of Messrs. Adamsez, Ltd., of Scotswood-on-Tyne, will be found the following examples of a few of their specialities:—(1) A patent swing lavatory and closet combination, a unique arrangement by which one waste and supply suffices for both lavatory and closet, while a mimimum amount of room is taken up; this arrangement may also be applied to a bath. (2) A pneumatic closet set with the cistern actuated by a small bellows behind the push knob, one of the main features of this set being silence in action. (3) A school washing trough, which ensures clean water for each user, combined with greater economy in water consumption. (4) A "Titanite" lavatory, designed expressly for school purposes; these lavatories are supplied with horizontal or vertical waste pipes. (5) A range of T urinals, now being largely adopted for all public work; the absence of any angle joints in these urinals (the joint being in the centre) rendering them most satisfactory. (6) A range of Adams's patent "Lit and Phil" urinals. In addition there are shown glazed ware division slabs (which have obvious advantages over either marble or slate), together with a fast-action surgeons' lavatory; a hospital closet set, slop sink and drainer; and "Titanite" lavatory. The closets comprise an "Epic" set, a range of S latrines, earth-closets, &c. These, with a fireclay wall fountain, a "Montrose" firegrate and a collection of "Adamesk" art ware and pottery make a small but representative selection of the productions of the firm.



T-URINAL BY ADAMSEZ, LTD.

Ripolin.

Special Position No. 6, Row B.

This stand has been specially designed to show the application of Ripolin to decoration in the Adam, Georgian and other styles. This enamel is now well known, and it meets with favour for its gloss, easy flow, durability, uniform quality and range and beauty of tint.

Granite Silicon Plaster.

Stand No. 38, Row B.

The exhibit of the Granite Silicon Plaster Co., Ltd., of 36, King's Road, St. Pancras, N.W., is arranged to show the advantages of this plaster for general interior work. It has been very extensively adopted for hospitals, infirmaries, &c., and for many buildings under the War Office and H.M. Office of Works. The firm also make a special feature of their 2in. solid partitions consisting of granite plaster with a central core of expanded metal lathing. Several very large contracts for these partitions have been executed, and there are also several in hand.

A Material to replace Ordinary Plaster.

Stand No. 38, Row C.

"Pytho" plaster is shown by the Plaster, Brick and Stone Co., Ltd., of Wall Grange, near Leek, Staffs. This is a material intended to supersede ordinary mortar plastering at the same cost, and to produce a surface as hard as the best Keene's cement. It can be painted or papered without delay. Only two coats are required, and these can both be applied in one day. The plaster can be polished whilst being applied and has the special merit of preventing the accumulation of dirt and disease germs.

Compoboard.

Special Position No. 5, Row F.

Compoboard needs no introduction, as it is known now to all architects and builders as a most convenient and cheap material for ceilings, walls and multitudinous other parts of buildings. The company which placed it on the British market has been in existence about five years, but the material was originally invented and made in America and afterwards very much improved by a Swedish manufacturing concern, and still further perfected by the present company, who established their new factory at Willesden Junction after the destruction by fire of the Swedish Company's works. Since the introduction of Compoboard into this country five years ago nearly 10,000,000 sq. ft. of it have been sold—ample proof of its good qualities. The firm's latest speciality is a fire-resisting Compoboard, made of non-flammable wood. Often the very great cost of fire-resisting materials renders their adoption extremely onerous, if not impossible. This material is designed to meet the need. Compoboard can be had in large sizes, and the joint edges being on the end grain of the wood there is no shrinking in the joints to be provided for, as in matchboarding and canvas. The address of the British Compoboard Co., Ltd., is Hythe Road, Scrubbs Road, Willesden.

Artistic Mantelpieces and Plasterwork.

Gallery Bay No. 21.

Messrs. G. & A. Brown, Ltd., of 167, Hammersmith Road, W., exhibit modelled and enriched plaster ceilings, cornices, friezes, mouldings, overdoors, centre-pieces, &c., for public and private buildings; mantelpieces, overmantles, wall panellings, mirror frames, electric-light fittings, &c., &c., in Louis XVI., Adam and Georgian styles; and examples of Italian and modern English plasterwork. The work is very tasteful in design and well executed, and comes as a welcome relief to the poor stuff produced by some trade firms with large connections. We illustrate on the next page a mantel and a piece of ceiling decoration as showing the good quality of the work done by Messrs. Brown.

FIBROUS PLASTER DECORATION BY G. & A. BROWN, LTD.

Adamant Plaster Slabs.

Stand No. 64, Row C.

The Adamant Co., Ltd., of Commercial Street, Birmingham (London offices and showrooms: 42, Berners Street, Oxford Street, W.), exhibit "Adamant" plaster, fire-resisting partitions and floors, fibrous slabs, decorative plasterwork, pugging slabs, blackboarding, &c. The front of the stand is moulded with the special moulding material (No. 2A) manufactured by the company, and the ceiling is in special fibrous "Adamant." The sides of the stand are constructed with "Manlada" partition slabs and are finished in "Adamant" No. 1 setting. These slabs, it is stated, have withstood the severest fire-and-water test of any slabs on the market of the same thickness. The company also show their

"Brit-Opal" Wall-glazing,

both plain and ornamental. A feature of this is the fixing of same in special waterproof cement for out-door work, or for positions exposed to extremes of temperature and atmosphere. A novelty is a small floor shown of glass tiles in squares, laid to pattern. These floors can be carried out to any design. At this stand also the Asphaltic Limestone Concrete Co. show their patented granited asphalt for roads and footways, various kinds of bitumen for electrical purposes, and their new patented asphaltic troughing and lid for electric cables.

"Opalite."

Special Position No. 1, Row A.

This material again furnishes an attractive and interesting exhibit, with the same ingenious structure seen at the last Building Trades' Exhibition. We understand that "Opalite" was the pioneer of opal tiling in England, having been brought before the public about ten years ago, since which time it has obtained the confidence of all architects who have specified it. It is an opalite tile or plate having a rough granulated backing (Shelmerdine's patent) fluxed into the material during manufacture, thus ensuring a secure key for fixing to any structure. It has been very largely used in hospitals, mortuaries, bathrooms, &c.—in fact, in all places where cleanliness and light are of first importance. Its close joint and highly-polished surface preclude the secretion of any fungi or vermin. The fact that about 250,000 sq. yds. have been fixed in London alone speaks eloquently for the material. Any design can be executed in "Opalite" and any effects of light and shade obtained. Wherever there is required a wall tiling which shall be attractive in appearance, impervious to dirt, unaffected by climatic influences and extraneous agencies, and which, moreover, shall be a brilliant reflector and diffuser of light, there "Opalite" will be found of value. Besides the exhibits of this material (the London concessionaire for which is Mr. William Griffiths, of 126, Hamilton House, Bishopsgate Street Without, E.C.), some artistically arranged dadoes in porcelain tiles are shown at the stand.

Opal Tiling.

Special Position No. 9, Row B.

Messrs. Durolite, Ltd., of St. Helens, Lancashire, and 86, Leadenhall Street, E.C., are showing their opal tiling "Durolite." The difficulty which besets all makers of opal tiling—the difficuly of the "grip"—has been overcome with a backing of a non-rigid nature specially adapted to allow for the variation in expansion or contraction of the cement and the tile. This backing practically forms part of the tile itself, and its value is further increased by the fact that it will "grip" immovably in any cement of good quality, no fancy patent cements being necessary. Quite a number of tile schemes are shown *in situ*, the erection being obviously designed for that purpose. In some of the schemes marbled tiles are shown with rich effect. In plain tints and pattern designs also there is a selection, the range of tints being extensive. Messrs. Durolite, Ltd., also show samples of their work in leaded lights and stained glass, and in the reproduction of landscapes.

Mosaic and Marble Work.

Gallery Bays, Nos. 25 to 30.

The Art Pavements and Decorations, Ltd., has a large display in six gallery bays; hence it is easy for visitors to obtain a full and comprehensive view of those things in which they are particularly interested. In the Mosaic section samples are shown of Roman cube mosaic, terrazzo mosaic, ceramic mosaic, Venetian glass mosaic and terrazzo steps; also samples of the mosaic now being laid in the new War Office, Whitehall, and the Royal College of Science, South Kensington. In the Marble section are shown large slabs of numerous beautiful and richly-marked marbles, taken from the actual stock held by the firm at their new works, St. Paul's Crescent, Camden Town. To enumerate a few, we may mention striking examples of Irish green, Pavonazetto, Verde Antico, Vert de Mer, Skyros and Mexican onyx. Staircases in Sicilian marbles and marbles for fireplaces, chimney-pieces, &c., are displayed in this section. The Tile section comprises every variety of tile that may be required for walls and floors, including many new designs for embossed dadoes.

Special Tiles.

The "Medmenham" tiles, produced at Marlow under the direction of Mr. Conrad Dressler, are a special feature. These tiles have long been favourably known to architects, and we learn that the firm has just completed an arrangement for the exclusive agency for all tiles produced under the direction of Mr. Dressler. Hand-made antique tiles, glazed briquettes for hearths and cheeks, and "air-pit" fires are prominent features in the tile

MANTEL BY G. & A. BROWN, LTD.

section, and we may also call attention to the firm's "Petroglas" paving tiles, claimed to be the hardest paving material known, being perfectly impervious to water and unaffected by oils, grease, acids, weather and frost. They should prove of great value in factories, electricity power houses, &c., especially in view of the fact that in addition to their other features they possess that of being perfect insulators capable of resisting an electric current of upwards of 10,000 volts. In the Joinery section are shown numerous varieties of

Parquet Flooring

in oak, teak, walnut, mahogany and jarrah woods; also wood-block flooring in pitch-pine, maple, oak, &c. The firm claim that their system of laying blocks is the simplest, yet most efficient, of any on the market; the tongues and grooves are formed on the blocks themselves, and there are no loose parts, iron pins, dowels, &c. Hardwood panelling is also in evidence in this section, as well as some good specimens of oak chimney-pieces, with inlaid marquetry ornamentation. The new works of the Art Pavements and Decorations, Ltd., at Camden Town, cover $1\frac{3}{4}$ acres and are provided with electrically-driven machinery for working marble, with a view to the expeditious execution of orders. The offices and show-rooms of the firm are at 7, Emerald Street, Theobald's Road, W.C.

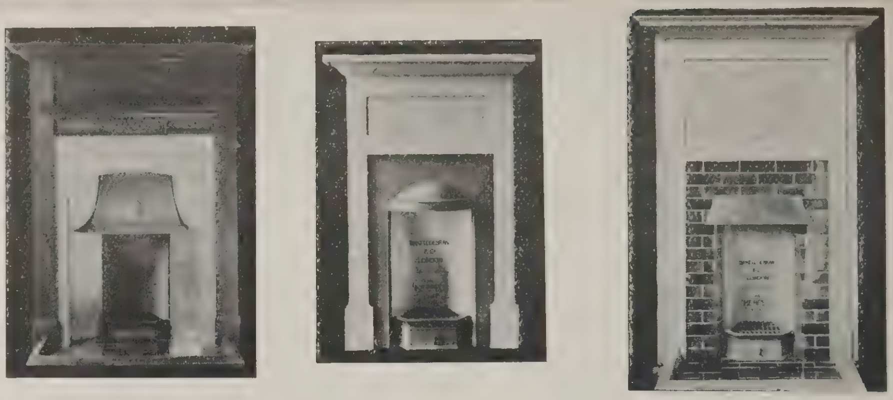
New Types of Firegrates.

Wall Space No. 134.

The exhibit of the Carron Co., of Carron, Stirlingshire, includes two new types of fire-grates which are well worthy of attention. We illustrate them below. Both are based on the same principle in design, which is to effect complete combustion with a saving of fuel. The bottom grate, concave in shape, forms with the movable front bar or trivet a well-shaped cavity, which by practical experience is found to be the most perfect form for combustion. After lighting, the fire is left with the front bar vertical for a few minutes till combustion has fairly begun, then, when the fuel begins to coalesce, the front gate is put horizontally. This allows the heat from the fire, radiating off the "Teale" firebrick, to diffuse throughout the room, without the intervention of a front bar to detract from either the appearance, brillance or heating power of the fire. These grates, therefore, are far more effective than the ordinary type.

"Esto" semi-slow combustion Grate.

Grate with "Radiant" Fire.



SOME DESIGNS FOR "HEAPED" FIRES BY BRATT, COLBRAN & CO.

The "Heaped" Fire.

Wall Space No. 128.

This patent grate is shown by Messrs. Bratt, Colbran & Co., of 10, Mortimer Street, W. The fire is not sunk below the hearth, but kept in full view, and there are no front bars to support the fuel, this being heaped against the back. The grate is said to burn very cleanly and the fire will last six or seven hours without attention. Some exceedingly good designs of mantels are obtainable with it. We illustrate three on this page, from which it will be seen that the grate has a very attractive appearance.

Builders' Ironwork.

Bay 7.

Messrs. Cakebread, Robey & Co., of 86, High Street, Stoke Newington, N., exhibit verandah castings, ranges, kitchen and portable stoves, mantelpieces, hearths and kerbs. Cast-iron baths and waste preventers, &c. are also shown, as well as painters' materials, brushes, colours and varnishes, plumbers' brasswork, locks and door furniture, leaded lights and stained glass. The "Ferrett" patent lock-fast joint for drain-cleansing and chimney-sweeping machinery is a speciality of the firm.

The Well Fire.

Wall Space No. 130.

The Well Fire Co., Ltd., of York Buildings, Adelphi, are showing their well-known type of hearth fire, the advantages of which are too well-known to need repetition. A large number of designs are exhibited which serve to illustrate the possibilities for artistic treatment which these fires afford. These designs deserve commendation when one recollects that the ordinary stock pattern fireplace is far too often of inartistic design. The Well Fire Co. also make a patent cooking-range, and hammered art-metal work is another branch of their work.

Hot-water Boilers.

Special Position No. 2, Row B.

Numerous types of wrought- and cast-iron boilers are shown at this stand by Messrs. Hartley & Sugden, Ltd., of the Atlas Boiler Works, Halifax, who are the sole makers of both these kinds of heating apparatus. The wrought-iron welded hot-water boilers shown include the conical "Stanley" boiler, the "Handy" boiler for fixing in greenhouse walls, the patent "Climax" boiler for fixing in brickwork, and the "Savile" boiler with cylinder connected for hot-water supply while the "White Rose" cast-iron sectiona boiler for hot-water supply is also show Several varieties of low-pressure steam boile are included in the exhibit, as well as cas iron radiators and cast-iron valves for ho water apparatus.

Electric Hoist for Builders.

Wall Spa No. 127.

It is becoming increasingly appreciate among builders in this country that electr hoists offer great advantages for the raisin and lowering of materials on works, an there is little doubt that in the not far dista future these hoists will be the rule rather tha the exception on jobs of any importance. visit to this stand therefore should not omitted. The "Harman" electric hoist h been specially designed to meet the requir ments of the building trade and is made in tw sizes, one with a 3-h.p. semi-enclosed mot capable of lifting 8 cwts. at the rate of 80ft. p minute, and the other having a 10-h.p. mot capable of lifting 1 ton at the rate of 100 per minute. They are both very compact design and well and strongly made, t gearing being of worm type with ball-thru bearings. Messrs. Harman & Co. (who address is 10, West Moreland Buildings, E.C are also exhibiting a very neat electricall driven friction hoist in two sizes, one havi a capacity of 2 to $7\frac{1}{2}$ cwts. and the other 10 30 cwts.

Baths for Cottages.

Stand 60B, Row C.

The Kitchen Bath Fitment Co., of 51 Queens Road, Sheffield, are showing decided novelty in the way of combinati baths for cottages, and claim by their syste that practically no extra cost is put on t erection of property by the addition of the baths. One arrangement (as illustrated) is combined bath, sink and wash boiler. T water is heated in the wash-boiler and into the bath, which, when required, turned out from one end in a circular pa under the sink. Another type is a four-fo combination, viz., range, bath, sink a wash boiler, in which arrangement the wa is heated by the ordinary kitchen fire, a the sink lifts up like a lid, exposing the ba underneath. The patentee of these device Mr. Herbert H. Hodkin, of Messrs. Hodkin Jones, Ltd., Sheffield.

JOINERY.

There are several interesting exhibits of novelties in the way of joinery. We may particularly mention the Gilmour veneered door and a window balance of Australian invention. Several varieties of reversible windows serve to emphasize the importance of this convenience and the safeguard to life and limb which it affords. There are many attempts made to improve on the ordinary methods in joinery that have existed for decades, and novelties of all kinds are constantly appearing, but very few of them last for long or come into general use, the fault being that they are intricate and soon get out of order and cost more than the ordinary methods.

A Window without Sash Cords and Weights.

Stand No. 6 in Minor Hall.

The acknowledged deficiencies of the ordinary sash window have led to many attempts to improve on it, and of recent years we have seen numerous reversible windows, wire sash cords, &c., placed on the market, but for the most part they fail to come into general favour. A new window which has just been introduced in this country by Messrs. Recorders, Ltd., 171, Queen Victoria Street, E.C., gives every promise of not falling into the same category, for the invention is so simple and so obviously a vast improvement in all directions upon the ordinary sash window with cords, pulleys and weights, while, perhaps most important of all, it adds nothing to the cost. The invention is an Australian one, having been made by an architect in the Bush, and is the outcome of necessity, as it was designed to meet a difficulty found by him in erecting a timber-framed house where there was not sufficient room in the openings for boxings for weights. It will be seen from our illustrations that the essence of the invention is a lever (marked A in Figs. 1-4) pivoted in the centre and fixed on the frame of the window, and attached at one end to the top sash and at the other to the bottom sash. These two sashes, it will be at once understood, counterbalance each other without any complication being necessary, such as weights entail. From the sections (Figs. 1-4) and photographs (Figs. 5-6) it will be seen that by pulling the bottom sash forward, the window is opened. In Fig. 2 it is pulled slightly forward, not sufficient to raise the bottom sash (which might cause a draught), but just enough to leave an opening at the top. The fresh air enters through the larger opening in the middle, and the opening at the top permits the foul air to escape. This gives efficient ventilation, and it is perfectly safe to leave windows open in this position at night without fear of burglars, because a bolt in the bottom rail will lock the window safely. This bolt (marked D on the sections) when pushed partially on one side serves as a pin running in the bottom groove in the frame, and when moved still further on one side releases the bottom sash altogether, allowing it to be pulled forward into the room for cleaning purposes, as shown in Fig. 5. The top sash also has a pin running in a groove in the frame, but by turning the thumb screw marked A a portion of the parting bead may be removed so as to allow this pin to slide out of the groove C, and the sash to reverse inside for cleaning, as shown in Fig. 6. This ability to reverse the sashes disposes of the difficulty of cleaning the window, and of all the objections which could be raised from the fact that the bottom sash will not slide right up to the top as in the ordinary type. In Fig. 3 it is shown open to its greatest extent, giving full ventilation at top, bottom and middle. Fig. 4 shows the bottom sash raised to its greatest height. Existing sash windows can be altered at a small cost. The cost of these fittings is not much, and a saving is effected over the whole window by reason of all weights, pulleys, cords and box-frames being saved. The inclined louvre position of the window is a noticeable point with regard to ventilation.

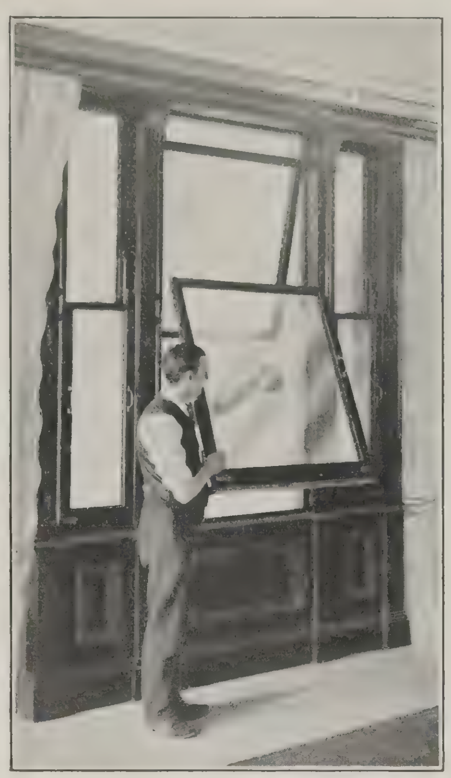

Fig. 5.—Bottom Sash in position for cleaning.

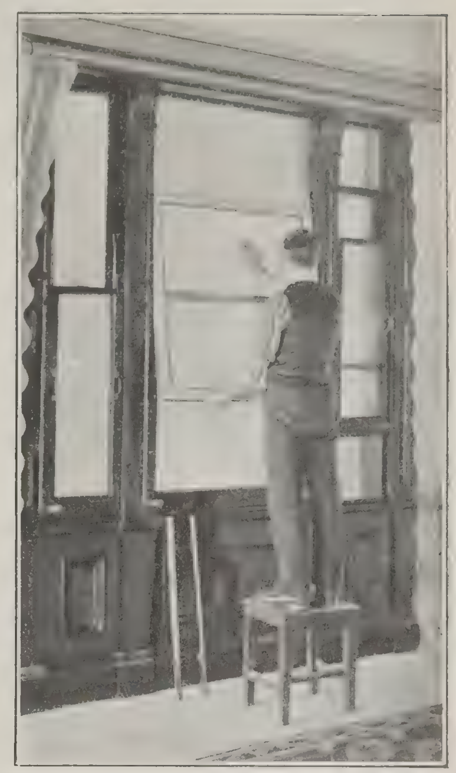

Fig. 6.—Top Sash in position for cleaning.

Sliding and Reversible Windows.

Stand No. 12, Gallery.

Messrs. W. G. & L. England, of Summer Lane, Barnsley, are exhibiting their patent sliding and reversible sash windows, the advantages of which are obvious. The simplicity of the fittings is noteworthy in Messrs. England's sashes, it being possible to instantly detach the sash from the frame by the removal of two screws. All the fittings are in view—another advantage; while another point of interest is that when a window requires new cords the sash may be removed and new cords attached without disturbing any of the beads or disfiguring the paint. Any existing windows can be adapted to this invention.

Reversible Window Sashes.

Stand No. 48, Row B.

The "Unique" reversible window sash is shown at this stand by Messrs. Martin's Patents Co., Ltd., of 11 and 12, Finsbury Square, E.C. The cost of the fitting for one pair of sashes, consisting of No. 4 patent centres and about 12ft. run of hardwood bead, which any joiner can fix to old or new windows, is 5s. 6d. in malleable iron and 7s. 6d. in gunmetal. Existing sashes are altered for 15s. per opening of two sashes, including making good paint, &c. For asylums the system is adapted so that the sashes cannot be raised or lowered more than a few inches without a key. A patent door spring is also exhibited at this stand.

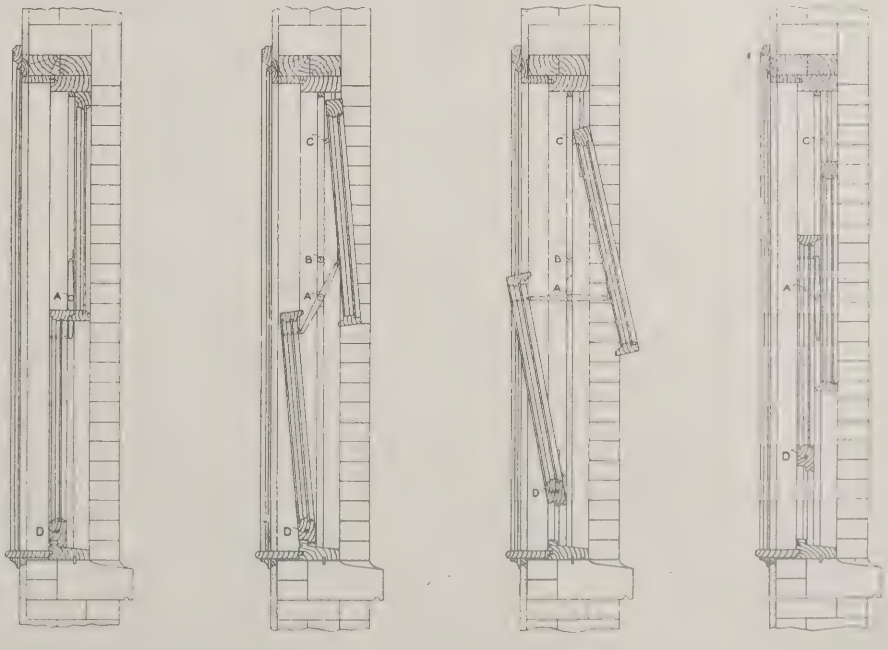

FIG. 1. FIG. 2. FIG. 3. FIG. 4.

A WINDOW WITHOUT SASH CORDS AND WEIGHTS, BY RECORDERS, LTD.

Design for Double Gilmour Doors.

Hardwood Doors.

Stand No. 62, Row C.

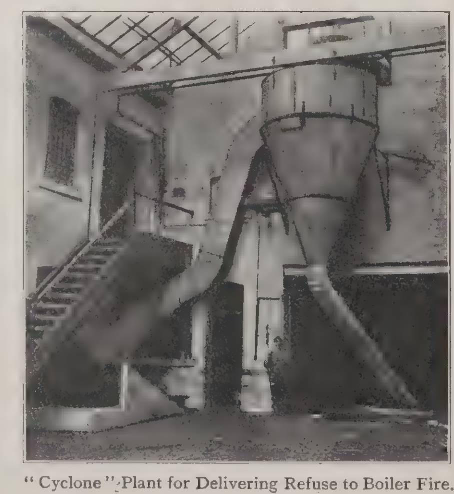
The Gilmour hardwood doors have attracted considerable notice during the past year as an innovation in joinery as regards this country. They have not previously been shown at the Exhibition, and architects and others will undoubtedly find the exhibit at this stand one of the most noteworthy in the hall. The construction of these doors is a perfectly logical use of the material. The interior core is formed of strips of selected pine, each strip having its grain reversed to that adjoining. This core is dried with 200 degs. of heat, and has the function of preventing warping, twisting, splitting or shrinking. The exterior finish is obtained by the use of a veneer, which is welded to the core under great pressure and secured from the danger of blistering or peeling by grooves and tongues and special water-proof cement. The panels are constructed of 5-ply strips of wood. The cost of these doors is considerably less than ordinary hardwood doors, while they are at the same time much more durable, and have a beauty which can never be obtained in the solid wood. The construction of these doors permits of the possibility of framing in other ways than the traditional manner, as will be seen by a glance at the number of designs exhibited, which we think will be admitted to be artistic. One special application which the construction of these doors has permitted is a door for hospitals and infirmary work with an absolutely smooth surface which is highly advantageous from the hygienic point of view, providing as it does no lodgment for dust or any other foreign matter. It has the appearance of a solid plank, and can be made with or without a glass panel for observation purposes. Although this firm makes a number of stock patterns, special doors can be constructed to architects' designs, but the stock patterns allow of considerable variation by the application of mouldings of any section. The doors are a Canadian invention and are the outcome of conditions, the climate there having proved the inefficiency of the old-time methods of construction. They have been used in that country and the United States for many years to the practical exclusion of the solid hardwood doors, and have therefore been thoroughly proved under the severest practical conditions.

Design for Gilmour Door for Hospitals.

The Removal of Sawdust and Chippings in Sawmills and Joinery Works.

Bay 21.

Messrs. Matthews & Yates, Ltd., of the Cyclone Works, Swinton, Lancs., exhibit a working model of their "Cyclone" refuse-collecting apparatus, suitable for use in sawmills and joinery works. Chippings are fed into the exhauster that creates the suction to take them as they leave the machine cutters, and are then passed through the separator, from which they fall again to the suction of the exhauster, so maintaining a circulation of the chippings. All that would be needed to complete the plant (which, although a model, is equal to dealing with three or four machines) would be to connect the suction side of the exhauster to the machines, instead of to the delivery end of the separator, the proper place for the latter of course being the boiler-house or refuse heap. There are many advantages claimed for this apparatus, the foremost being its merit as a labour-saving device. The old-fashioned method of allowing the refuse to fall into pits, to be shovelled out again into bags, is very costly, not only on account of the handling of the refuse but the loss of time during which the machines are stopped. A moulding machine often buries itself with refuse in two or three hours, and the trouble and labour entailed in keeping it clear is necessarily very considerable. Therefore this saving alone is worth consideration by all users of cutting machinery where refuse is thrown off. But, in addition, there is the reduced risk of loss by fire, because it necessarily follows that where a mill is kept clean and the sawdust and chippings are removed as fast as they are made the risk from fire is much less than in a mill where the refuse is allowed to accumulate in heaps in all directions. As a consequence, fire-insurance companies will quote a smaller premium where a "Cyclone" apparatus is installed.



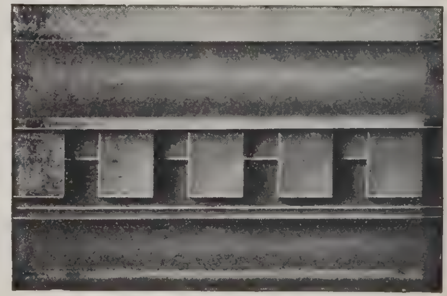
"Cyclone" Plant for Delivering Refuse to Boiler Fire.

Messrs. Matthews & Yates show several sizes of exhausters. Particular attention is paid to the blades, which are accurately balanced and powerfully made. The firm has installed many plants all over the country, one of the most recent being that for the Brush Electrical Engineering Co., Ltd., at Loughborough. At these works the machine shop, which is fitted to prepare the timber framing for the large number of cars turned out annually, is 200ft. long by 120ft. wide, and contains about sixty woodworking machines. A No. 8 exhauster has been installed, working in conjunction with a No. 9 "Cyclone." The delivery pipe between the machine-shop and the boiler-house (where the refuse is burned) is about 320ft. long, and extends over the works like a great snake. At the sawmills of Messrs. Baird & Co. at West Hartlepool the sawdust is drawn into a large bin and thence delivered down a chute into trucks. A typical "Cyclone" plant delivering to the front of a boiler is that erected at the cabinet works of the Wholesale Co-operative Society, Manchester, shown by the accompanying photograph. In addition to such fans as those described above, Messrs. Matthews & Yates exhibit "Cyclone" electric fans for ventilating purposes. These are used for ventilating the committee-rooms of the House of Commons, and are therefore of special interest just now.

Woods; Machine-carved Mouldings.

Wall Space 124.

Stocks of American hardwoods, American whitewood, pine, mahogany, round and square turned newels and balusters, turnery of every description, handrail, and oak and maple flooring, &c., are shown by Messrs. Cobbetts, of Virginia Road, Bethnal Green; but the special exhibits at this stand are the "Marbut" machine-carved mouldings, here illustrated. These have a large market for cheap and sound work.



French Mouldings.

Stand No. 26, Gallery.

Gilt mouldings of French industry for frames and tapestries are exhibited by Mons. X. Ramspacher, of St. Dié (Vosges) France, for which mouldings the general agent in England is Mr. E. Thiroux, of 3, Tudor Street, Ludgate Circus, E.C. The firm export annually about 20,000 kilometres of mouldings of all sorts. A large panel of inlaid flooring by Messrs. Ausseur et Hipp, of Paris (for whom also M. Thiroux is the general agent in this country), is also exhibited, as well as litho marquetry of all kinds.

American Whitewood.

Wall Space 141.

A speciality of American whitewood is made by Messrs. C. & R. Light, Ltd., of Curtain Road, E.C. This useful wood is obtainable in all thicknesses from ¼in. to 10ins. and of any width up to 36ins.; it can be had in 8ft. to 16ft. lengths, and also in fascia boards 1in. thick, 18ins. and more wide, and from 11ft. to 20ft. long. Messrs. Light are also bringing into more prominence "3-ply" in various woods, such as walnut, oak and birch, in sizes up to 72ins. by 24ins. This is a very useful article for panels, &c. Being highly finished and ready for use, it effects a great saving in labour, and it is of greater strength than twice its thickness in 1-ply.

Gilt and Enamel Letters.

Wall Space 137.

The Brilliant Sign Co., Ltd., of 38, Gray's Inn Road, W.C., show brilliant concave metal letter richly gilded, in many styles, shapes and sizes, for affixing to the inside of windows; also for fascias, stallplates, &c. Large gilt wood letters, enamel letters, prismatic gold glass letters, day-and-night signs, and many other novelties made by the firm, are also exhibited. This year the firm has decided to sell their brilliant letter, unfixed, to the trade proper at very big discounts from standard rates, with guaranteed fixing instructions. This enables the trade to make a good profit out of the specialities, and to keep the whole of the work in their own hands.

FIREPROOF RESISTING CONSTRUCTION.

Nowadays the importance of fire-resisting construction in building practice makes this section of the exhibition one of the chief features. A number of established firms are exhibiting their various systems. Partitions are much in evidence, while the stands of those firms specializing in flooring are always striking, and fully show the various applications of their systems. We may mention that this year the well-known fire-resisting material "Uralite" has been used for constructing a number of the stands in the hall.

Damp-courses, Felts, Fireproofing, &c.

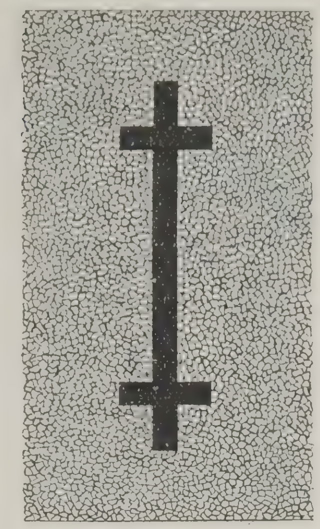
Stand No. 55, Row C.

Messrs. McNeill & Co., of Bunhill Row, E.C., and Kirkintilloch, near Glasgow, exhibit a number of specialities which are of general application in building operations. They show several sheet damp-courses, namely, patent metal asphalt, bitumen, pliable mastic and fibrous asphalt damp-courses, all of which do not crack and are made to suit different widths of walls. In the matter of sound-deadening materials, Messrs. McNeill show dry hair felt, bituminous hair felt and slag wool or silicate cotton. Both the last two are vermin-proof and the slag wool is generally esteemed an invaluable commodity. This firm also make slag-wool slabs for fireproofing. Their inodorous felts and bituminous hair felts for the lining of roofs are efficient non-conductors and are damp- and vermin-proof. Fibrous plaster slabs are also exhibited, and are admitted by most who have used them to be an improvement on the old-fashioned method of plastering.

Columbian Fireproofing.

Stand No. 54, Row C.

The Columbian Fireproofing Co., of 37, King William Street, E.C., have done so much admirable work in England that their system is becoming one of the stock things in building construction. Their stand is a striking one, and here the various applications of their system are well shown. The essential features of this system are the cruciform-ribbed bars, which by their special shape are economical of reinforcing metal and utilize to the full the strength of the concrete. Three forms of Columbian fire-resisting floors are used—1, panel; 2, double construction; 3, ribbed-bar floor between main girders. The ribbed bars are suspended in stirrups. We illustrate the bar above. It will be recollected that this firm underwent a very severe official fire test, and came out with flying colours. One special application of the system is remarkable, namely, its adaptability for roofs, the fire-resistance of which is not enough studied in view of the great danger from the spread of fire by that means.



COLUMBIAN BAR.

"Mack" Partitions.

Stand No. 57, Row C.

It will be recollected that the "Mack" partition slabs and hollow blocks successfully underwent a severe official fire test. They have since been increasingly used, and very many important buildings now contain them. The "Mack" patent slabs are made from specially-prepared gypsum, &c., and have embedded in them strong hollow reeds of the nature of bamboo. These reeds form air-chambers, and with the plaster make a light non-conducting material of great strength. The air cells formed by the reeds have as one of their objects the breaking up of sound vibrations so as to prevent sound passing through the partitions. No iron rods or metal keys are required in their erection and partitions constructed with these slabs possess considerable rigidity. Woodwork can be fixed direct to the partitions without plugging. The slabs are made in four thicknesses—2ins., 2½ins., 2¾ins. and 4ins.—the blocks being each 6ft. long and 12ins. high, the top and bottom edges having grooved and tongued joints, the vertical ends being concave. The method of fixing these slabs is to build them up with a break-joint bedded in plaster, and to grout up with plaster the vertical hollow joints formed by the concave ends, and also the joints between slabs and door frames and slabs and brick walls. Where the slabs are cut in half, concaves may be easily made in the ends by sawing out a **V**-piece. External angles are bonded over each alternate course as in brickwork. Door frames should be fixed in position before commencing to fix slabs, ½in. square fillets being fixed to the frame to receive the concave ends of the slabs. The address of Messrs. J. A. King & Co., the manufacturers, is Bridge House, 181, Queen Victoria Street, E.C.

Plate-wall Partitions.

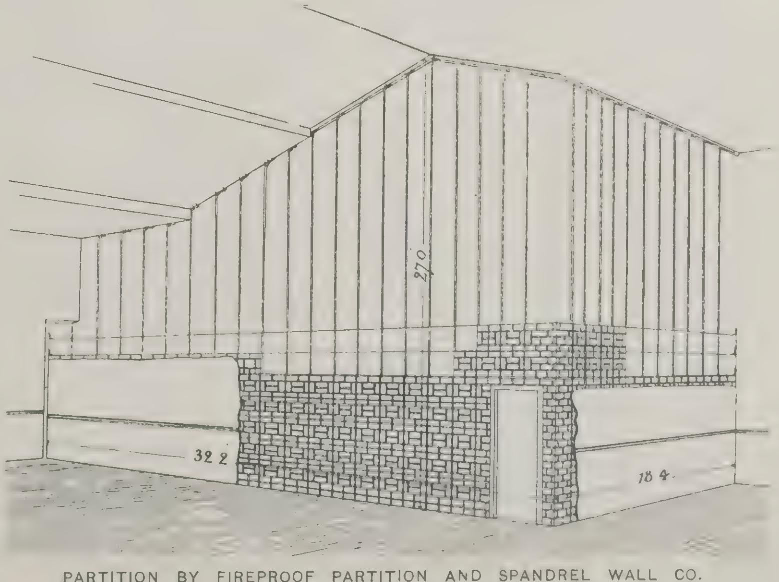
Stand No. 63, Row C.

The London Fireproof Plate-wall Co., Ltd., of 60, Watling Street, E.C., are exhibiting Bruckner's patent partitions, in regard to which it should be noted that use is made of internal rods to increase the strength and rigidity. By these means walls of any size can be safely erected, and the system also allows the whole structure to be suspended from overhead beams in positions where the floors are not capable of carrying a weight. The plates are made in three thicknesses, namely, 2ins., 2½ins. and 4ins. The firm also has systems of protecting constructional ironwork, as well as a cheap partition which goes under the name of "Lancastrian Plates," and patent ceiling plates for protecting wood joists from fire.

Strong 4½in. Brick Walls.

Stand No. 107, Row F.

The Fireproof Partition and Spandrel Wall Co. are exhibiting a simple partition showing their system of construction, but space does not permit of demonstrating its advantages on a large scale. The special feature about this system of constructing walls and partitions is that they can be erected without supporting beams or girders or foundations to carry them throughout their length, the weight being transmitted to stanchions, wooden uprights or other vertical supports by hoop-iron bonded between the bricks both vertically and horizontally. The hoop-iron is embedded in cement and so protected from decay and fire. By this system 4½in. walls can be safely built to any height and almost any width of span, so being very economical, while it is claimed that a 4½in. wall can be constructed for small houses, garden walls, &c., cheaper than a 9in. one and, built in cement, is more efficient in all respects.

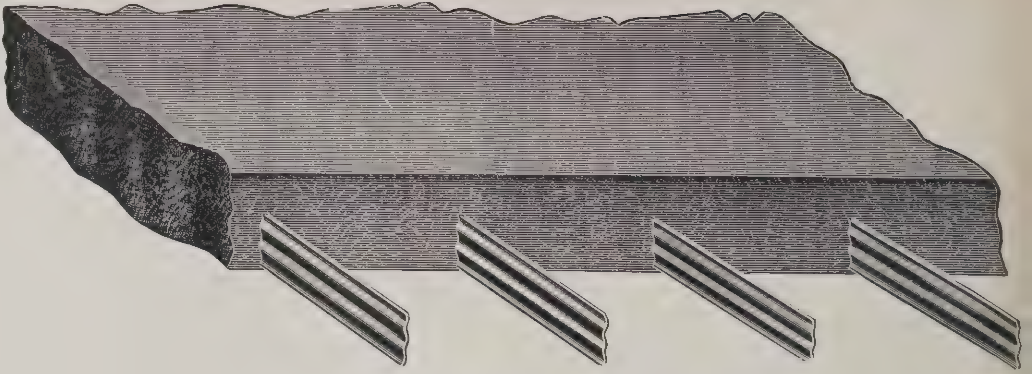


PARTITION BY FIREPROOF PARTITION AND SPANDREL WALL CO.

A Corrugated-bar Floor.

Stand No. 60, Row C.

Messrs. Hodkin & Jones, Ltd., of Sheffield and London, exhibit their corrugated-bar system of fire-resisting floors, which they claim to be cheaper and stronger than other existing forms. Two pieces of flooring are shown, one being 8ins. thick, having 6in. corrugated bars embedded, and the other being 6ins. thick, with corrugated bars 4ins. deep. The object of this form of bar is to eliminate all flanges, which are the chief cause of longitudinal cracks, common to fireproof floors.



HODKIN & JONES'S CORRUGATED-BAR FIRE-RESISTING FLOCR.

Expanded Metal.

Stand No. 82, Row D.

The new Expanded Metal Co., Ltd., have erected a light steel frame building measuring about 16ft. by 16ft., on which is built a suspended expanded steel and concrete floor 3ft. off the ground, and show a suspended ceiling 9ft. above the floor with roofing above that. For the floor they are showing two spans of 8ft. by 16ft. long, one span being completed flooring, and the other flooring in progress, showing the method of construction. For the ceiling different applications of their lathing are shown; and with regard to the roof, on one side is erected some roofing *in situ* and on the other side some expanded metal and concrete slabs on rolled-steel-joist purlins about 4ft. apart. In addition, there are some partitions and walling upon the framework, both hollow and solid, to show their different systems, and some of the steelwork is encased for the same purpose. Some expanded steel and concrete steps are erected up to the floor, and a wood-framed door and sash are put into the walling and as many systems and details as possible worked in, so as to make the exhibit instructive to the trade. In the forecourt of the space are shown various goods made up with iron bar and expanded metal, such as fencing, tree-guards, lockers, baskets, builders' screens, riddles, &c. We publish below an illustration showing the machine for cutting expanded metal up to 16ft. long in the direction of the longway of the mesh.

Fire-resisting Partitions.

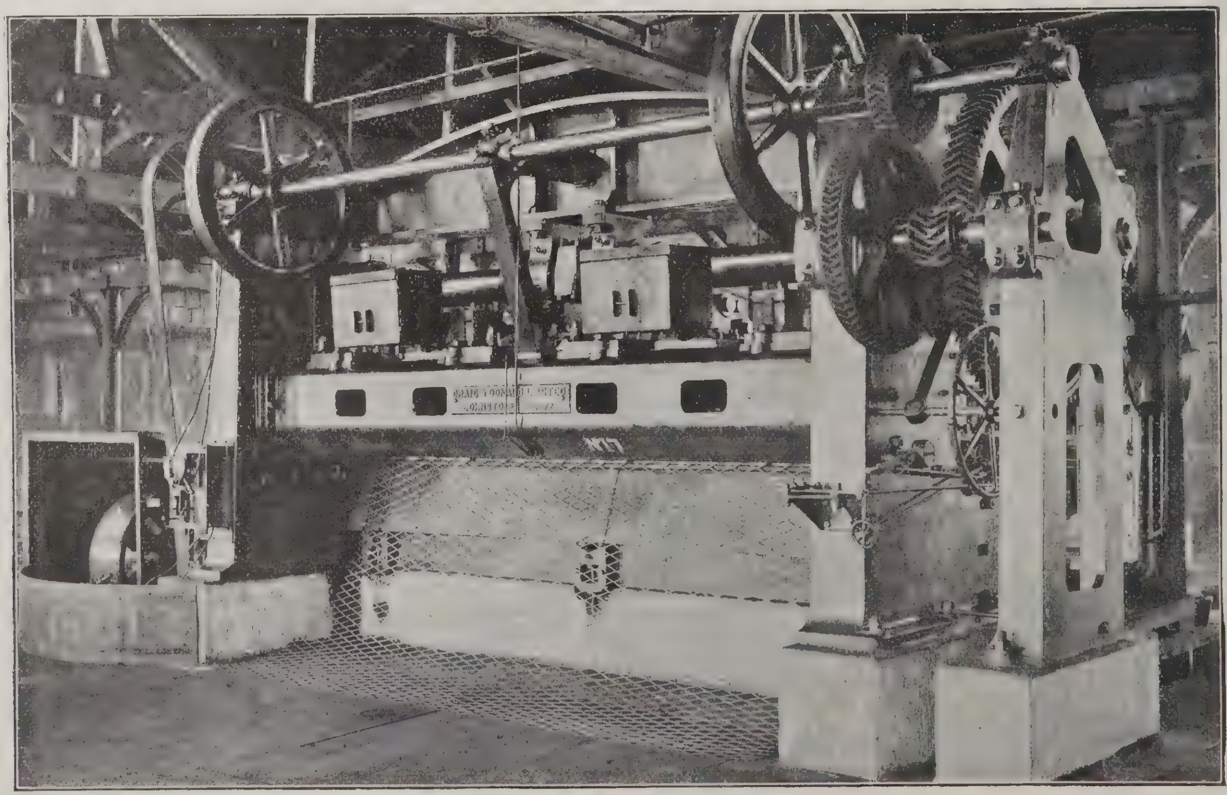
Special Position No. 8, Row E.

The exhibit of Messrs. Frederick Jones & Co., of Kentish Town, London, N.W., Manchester and Middlesbrough, is built of their fire-resisting partition specialities. They show three partitions, *i.e.*, the "Hercules," the "composite," and one built with concrete building blocks. In the interior of their stand are neatly-arranged patterns of their fibrous and fireproof plaster slabs—popular means of rapid and fire-resisting plastering. A variety of samples of their "Pioneer" brand of slag-wool ("silicate cotton") in all its different forms is also shown, suitable for fireproofing, soundproofing and heatproofing purposes. The price of this material appears to have been reduced lately, and it now stands safely outside the category of luxuries. We would advise all those interested in fire-resisting and non-conducting materials to pay a special visit to this stand.

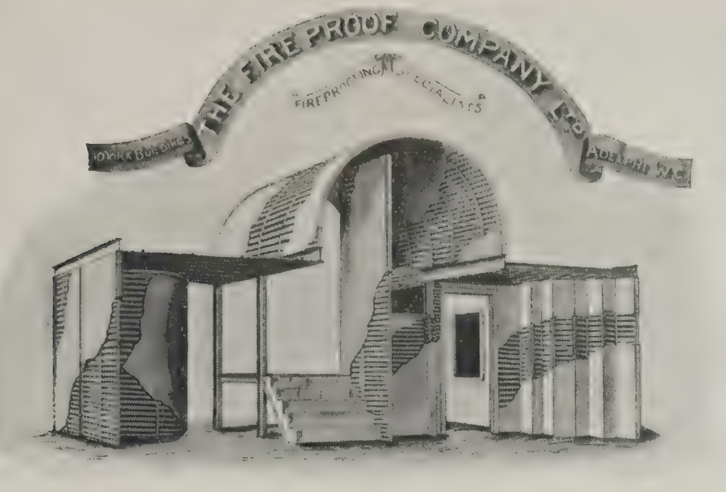
Dovetail Corrugated Sheeting for Partitions, &c.

Bay No. 2.

The Fireproof Co., Ltd., 10, York Buildings, W.C., are showing a well appointed exhibit of the various kinds of work to which their speciality of dovetail corrugated sheeting, &c., may be applied. This dovetail corrugated sheeting is used in conjunction with **H**, **T** and channel irons and plastic material to form fire-resisting partitions, floors, ceilings, &c. The advantages secured are very great strength, a perfect double key for whatever kind of plastic material may be used as a covering, and a great saving in space (inasmuch as a partition may be finished at not more than 2ins. thick); the result being a very strong and fire-resisting partition, for if, under the combined effects of heat and water, the thin setting coat of plaster should become dislodged, the dovetails would effectively retain their portion of the plaster, which, owing to the dovetail form, it is impossible to remove under ordinary circumstances. Among the work which this exhibit is intended to illustrate may be mentioned L.C.C. staircase enclosures and lift enclosures (both of which can be finished 3ins. thick) and suspended ceilings of shallow-section dovetail corrugated sheeting. This latter is used as a permanent centering to concrete floors, thereby avoiding all use of wood centering, an important feature, as all work in the building can be carried on without interruption while the concreting is being proceeded with. The exhibit also shows the utility of the sheeting for forming straight partitions, ordinary divisions to rooms finishing 2ins. thick and being fire, sound, damp and vermin proof. For irregular work with sharp returns, panelling and so forth the sheeting is admirably adapted, and for curved work, girder and stanchion casings, &c., it is especially suitable. The illustration on the next page shows the exhibit which has been designed to give a practical illustration of fire-proofing requirements in the construction of modern buildings. The dovetail corrugated sheeting



MACHINE FOR CUTTING EXPANDED METAL.

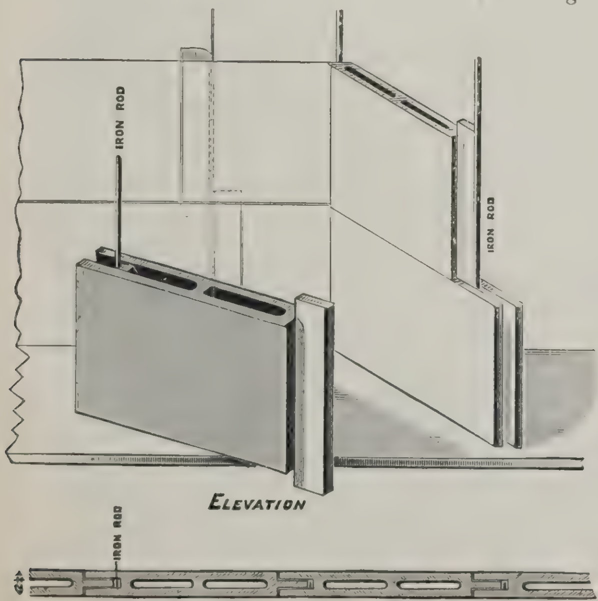


is suitably employed to reinforce concrete under all conditions, whether as floors or ceilings. Complete buildings with or without steel framework have from time to time been erected upon this system, the interior and exterior walls being plastered to a total thickness, in most cases, not exceeding 2ins. and 3ins., sand and cement being used as the outside covering to the sheeting and being finished as desired—rough-cast, pebble-dashed, hand-floated or lined to represent masonry. Roofs to these complete buildings are also constructed with shallow-section dovetail corrugated sheeting carried by **H**-section bars used as purlins, and the same plastered outside and inside to a total thickness of 2ins., or the roof plastered and tiled, or slated. Such buildings have the special merit of comparative light weight, with the consequent saving in cost of foundations.

Havelock Patent Plaster Partition.

Stand No. 60A, Row C.

The Havelock Patent Plaster Partition Co., of 63, Finsbury Pavement, E.C., have a unique demonstration of the rigidity and lightness of their patent partitions. A large piece of partition about 14ft. by 8ft. is shown carrying itself by lateral support on the two sides, being unsupported both at top and bottom. This result is achieved by reason of the blocks being so constructed as to tenon into one another. "Havelock" partitions have been used at St. James's Palace and other important buildings.



THE "HAVELOCK" PATENT PLASTER PARTITION.

Bucket Fire-extinguishers.

Stand 109, Row F.

The patent bucket fire-extinguisher made by Messrs. Messer & Thorpe of 8, Quality Court, Chancery Lane, W.C., is the acme of simplicity, and furnishes a most valuable means of keeping ready in a small space a large number of buckets filled with water. The buckets fit into one another in a neat tank, and being kept in place by guides, can be withdrawn without any risk of jamming. In every case after each nest of buckets has been withdrawn there is sufficient water remaining to refill five of the buckets—thus, with a 10-bucket tank, providing 15 buckets of water in constant readiness.

Trucks.

Bay 3.

Slingsby's patent trucks, and trucks of all kinds, are shown at this stand. A selection of about 60 from 1,000 varieties is kept permanently on view at Mr. Slingsby's offices, Old Street House, E.C. The business comprises twelve lines, including, in addition to Slingsby's patent trucks, sack trucks (Slingsby's patent collron), hand carts, tipping wagons and portable railway, wheelbarrows, &c. All kinds of wheels and tyres are supplied also.

Boilers, Stokers and Water Softeners.

No. 6, Arcade.

Messrs. Babcock & Wilcox, Ltd., of Oriel House, 30, Farringdon Street, E.C., exhibit models of their patent water-tube boiler for land purposes, their chain grate stoker for burning low-grade fuels smokelessly, and their water softener and heater, as well as specimens of their tube cleaner and their wrought-steel steam piping. The combined water softener and heater is Oscar Guttmann's patent and has been designed for the purpose of removing (by chemical means) the scale-forming matter from water, thus preventing incrustation in boilers. The apparatus works automatically, a float regulating the admission of the hard water and the soda solution in proportion to the quantity of soft water drawn off. Either exhaust or live steam can be employed, and thus the apparatus is a water softener and feed-water heater combined.

Shannon Files.

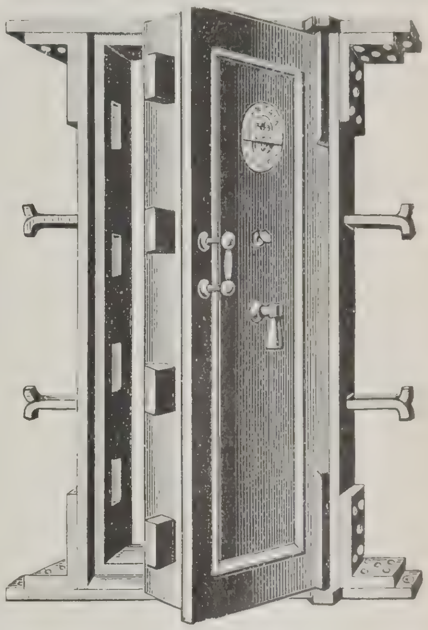
Bay 8.

The exhibit of the Shannon, Ltd., of Ropemaker Street, E.C., comprises the Shannon system of filing and classifying records and correspondence and business papers of all kinds for rapid reference and security; office labour-saving specialities and furniture.

Party-wall and Strong-room Doors.

Wall Space 123.

The specialities shown by Mr. John Tann, lock and safe engineer, of 11, Newgate Street, E.C., are party-wall doors (at greatly reduced prices) in conformity with the insurance companies' requirements; and a new pattern strong-room door at prices greatly below those charged hitherto. This latter door is shown by the illustration below.



Strong-Room Door by John Tann.

The remainder of the exhibit comprises "Anchor Reliance" safes for all purposes, built with fire- and burglar-proof steel, bent without joints at the corners and having immovable flanged backs.

Filing Cabinets.

Stand No. 105, Row F.

Filing cabinets and modern office specialities are shown by the Lyle Co., Ltd., of Gray's Inn Road, W.C.

Account Books and Files.

Gallery Bay, No. 22.

Perpetual systems for account-keeping are shown by the Trading and Manufacturing Co., Ltd. (offices: Temple Bar House, Fleet Street, E.C.), consisting of the "Dade" ledgers, order blanks, invoice duplicate systems, loose leaf binders and devices. There are also shown the "T. and M." card-index costing systems, vertical files for correspondence, &c., and the "T. and M." individual file and renewable leaf or section catalogue cover.

Gas and Oil Engines.

Wall Space 121.

Crossley's gas and oil engines (of which more than 52,000 had been sold up to January 1st last) are exhibited at this stand. The engines shown are four in number, namely, an "OE" type engine and dynamo combined, capable of developing 14·5-b.h.p. as a regular working load with town's gas and 11·2-b.h.p. as a regular working load with suction gas; an "H" type gas-engine capable of giving 1-b.h.p. as a regular working load; an "N" type gas-engine capable of developing 10-b.h.p. as a regular load; and an "LLE" type high-speed electric-lighting oil-engine combined with dynamo, this engine being capable of developing $3\frac{3}{4}$-b.h.p. as a regular load. A No. 2 suction gas plant is also exhibited.

FORMING PARTITION WITH "PHŒNIX" SLABS.

Fire-resisting Slabs.

Stand No. 16, Row A.

The Excelsior and Phœnix Fire-resisting Partition and Ceiling Co., Ltd., of 163, Palmerston House, E.C., exhibit their fire-resisting slabs for partitions and ceilings. These are made in the usual sizes, 3ft. by 12ins., and in thicknesses ranging from ⅝in., ¾in. and 1in. for ceiling slabs to 1½ins., 2ins., 2½ins., 2¾ins., 3½ins. and 4ins. for partitions. They are not plaster slabs and they are not hollow, nor do they contain reeds. The company make the so-called "Phœnix" slabs for ceilings and partitions, which are chiefly composed of crushed pumice stone and lime, and the "Portland Phœnix" slabs, which are made of Portland cement and crushed pumice stone. The company's slabs have been tested by the British Fire Prevention Committee up to 2,000 degs. Fahr. The slabs can be plastered dry, and are sound-proof as well as vermin-proof. They are easy to erect, can be sawed and nailed, and become exceedingly hard with age, so that it is claimed they can be used for outside work.

Fire-resisting Wood.

Stand No. 69, Row C.

The importance of fire-resisting wood in present-day building construction needs no emphasis. The Fire-resisting Corporation, who supply non-flammable wood and impregnated scenery, ropes, &c., for theatres, &c., have an interesting stand where they exhibit mantels, window frames, doors, cabinet files and joinery of every description made in fire-resisting wood. The firm now undertake the working of wood in their shops at Fulham, and supply joinery of every description. The chemicals used by the company are phosphate of ammonia, sulphate of ammonia, and boracic acid in definite proportions. The treatment is throughout the fibres of the wood, and not merely superficial, as can be easily tested by applying a splinter about the size of a lead pencil from the prepared wood and holding it in the flame of a gas burner. If it lights and spreads the flame to the end of the splinter, either the strength of the solution was too weak or the wood has not been thoroughly impregnated. Some woods, of course, take the treatment better than others. The impregnation is performed in a large steel cylinder, under pressure, which forces the solution through all the pores of the wood, crystals of the chemicals being left throughout the substance of the wood when it is dried out. The address of the Fire-resisting Corporation, Ltd., is, Townmead Road, Fulham, S.W.

Concrete Partitions.

Stand No. 40, Row B.

The fire-resistance of concrete has been so often proved up to the hilt that every architect now relies upon it, one would almost say, as his final line of defence. The Acton fire-resisting partitions are of concrete and are constructed in slabs of a form which gives lateral and vertical stability. The slabs are solid and usually 2ins. thick; they afford a good key for plastering, tiling, marbling, &c., and contain nothing to discolour the plaster, while nails can be driven with ease. Only a setting coat of plaster is required for a finished surface, which can be papered or distempered within a week of erection. The slabs have been used in a number of important buildings in London and the provinces. The address of the Acton Concrete Partition Co. is 63, Cornhill, E.C.

Automatic Electric Lifts.

Special Position No. 11, Row E.

The exhibit of Messrs. R. Waygood & Co., Ltd., of Falmouth Road, Great Dover Street, S.E., comprises direct-coupled electric-lift gear, an automatic electric dinner-lift, a hand-power lift, and car switches, push-boxes, &c. The direct-coupled electric passenger-lift is fitted with a mechanical automatic cut-off gear to prevent it travelling beyond either extremity, and also has a patent controller, enabling the lift to be operated by automatic push-buttons in the cage, so that on the pressing of a button the lift automatically starts and stops at the desired floor. The lift is also fitted with automatic buttons on the various floors for calling the lift to these floors as desired. This automatic controlling device is connected with automatic electrical and mechanical locking gear on the doors, designed to prevent the lift working so long as any door is open. This is the type of lift which is being largely adopted in private residences and is similar to one recently erected by Messrs. Waygood for the Prince of Wales at Marlborough House. The automatic electric dinner-lift is worked in a similar manner. This lift is so fitted that in the event of the shutter being open while the lift is in motion the lift will stop and so be prevented from descending on anyone who might have his head or hand in the well-hole.

Stanchions, Joists, &c.

Stand No. 111, Row F.

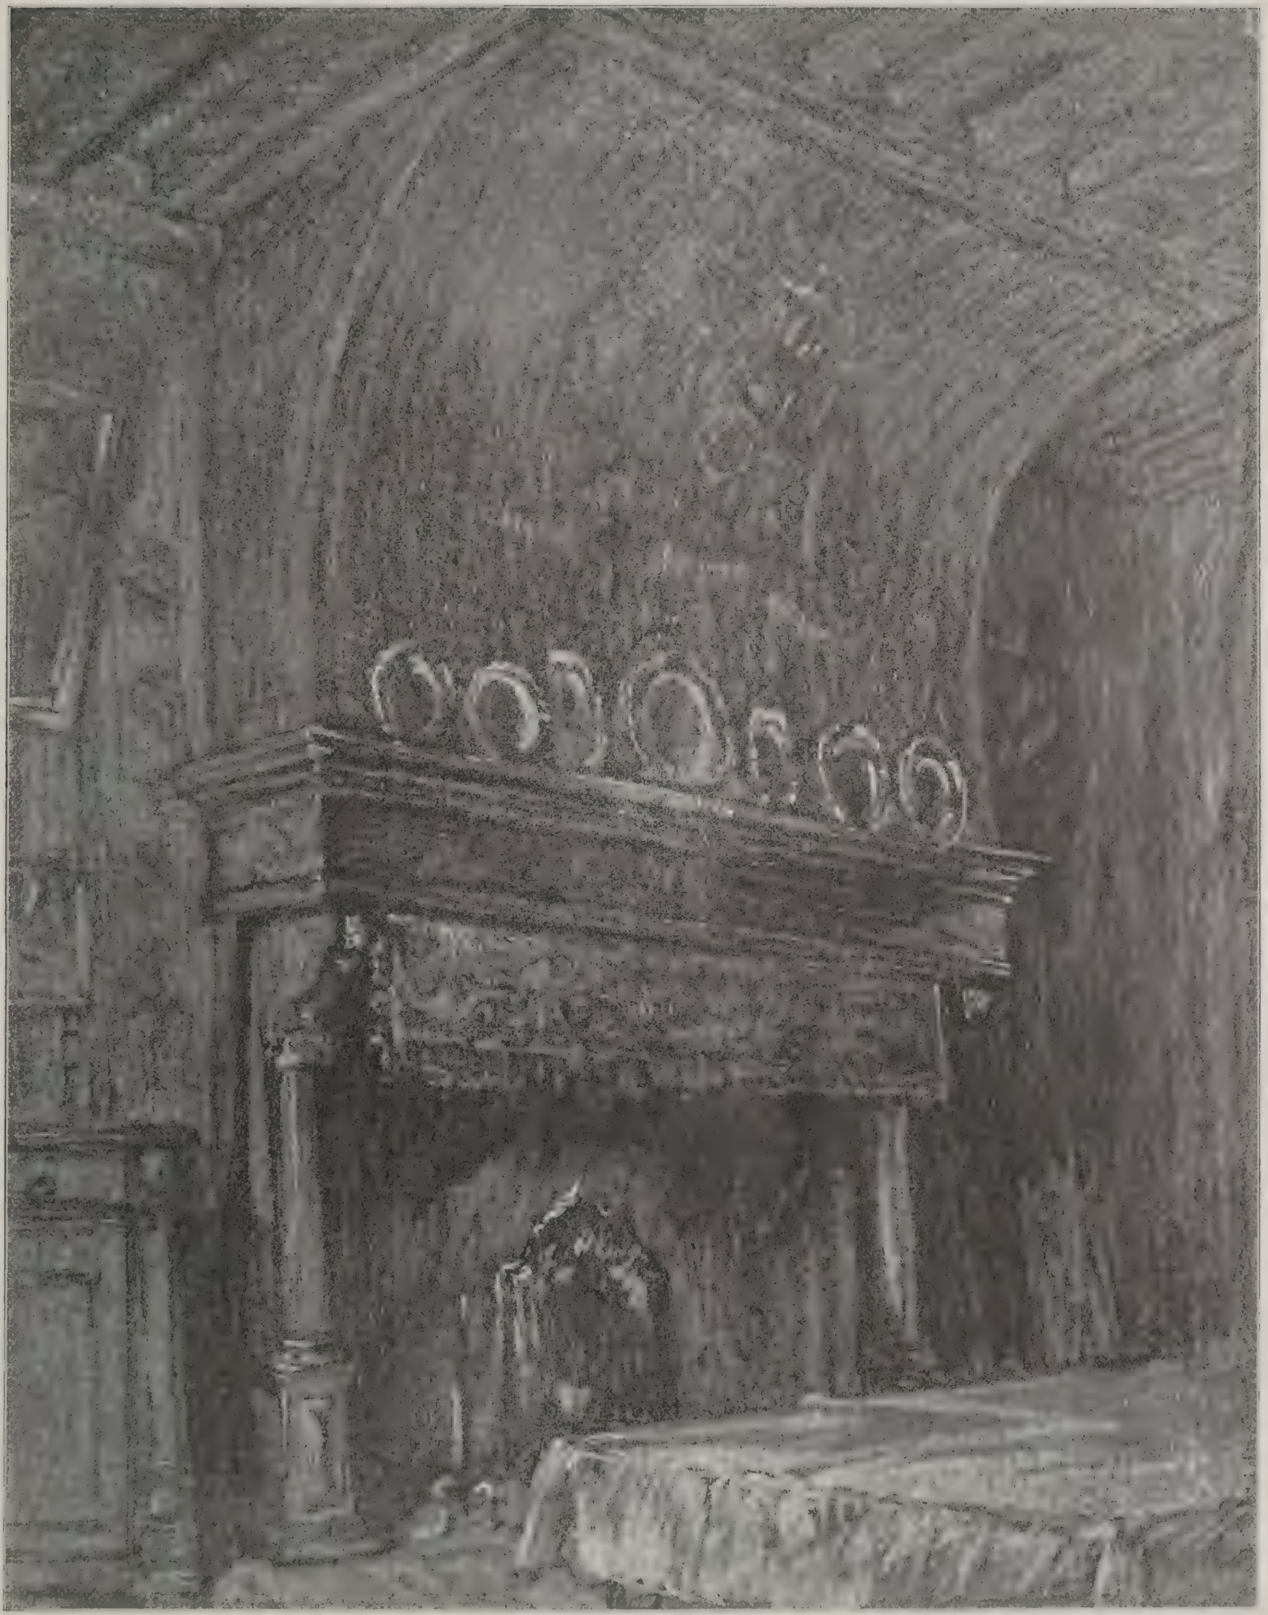
Messrs. Power's & Deane, Ransome's, Ltd., of Plymouth Wharf, Cubitt Town, E., exhibit cast-iron and solid steel stanchions of various sections and designs, roof principals, lattice girders, compound girders, and various forms of cleated connections of rolled steel joists, handrailing, anchor and lewis bolts, &c. Special attention is directed to sections of compound girders, two of which are built up of the largest- and smallest-section steel joists ever rolled.

Books on Architecture and Building.

Stand No. 43, Row B.

Mr. B. T. Batsford, the well-known publisher, of 94, High Holborn, W.C., has his publications on view, including such works as Mitchell's "Building Construction," Rea's "How to Estimate," Ellis's "Modern Practical Joinery," a new edition of Millar's "Plastering," Middleton's "Building Materials" and "House Drainage," Leaning's "Building Specification," Fletcher's "History of Architecture" and "Quantities," J. Wright Clarke's "Tables for Plumbers, &c.," Hellyer's "Plumber and Sanitary Houses," Moore's "Sanitary Engineering," Day's "Alphabets, Old and New," Adams's "Modern Cottage Architecture," Briggs's "Homes for the Country," Tanner's "English Interior Woodwork," and other important books on practical and historical architecture. Architects and builders who are not often in the neighbourhood of Mr. Batsford's premises will doubtless be interested in this exhibit.

FORMING CEILING WITH "PHOENIX" SLABS.



DRAWINGS OF ARCHITECTURE: FIREPLACE IN THE "LION DE FLANDRES," FURNES, BELGIUM, BY H. WILSON.

CELLULOID FACTORIES.

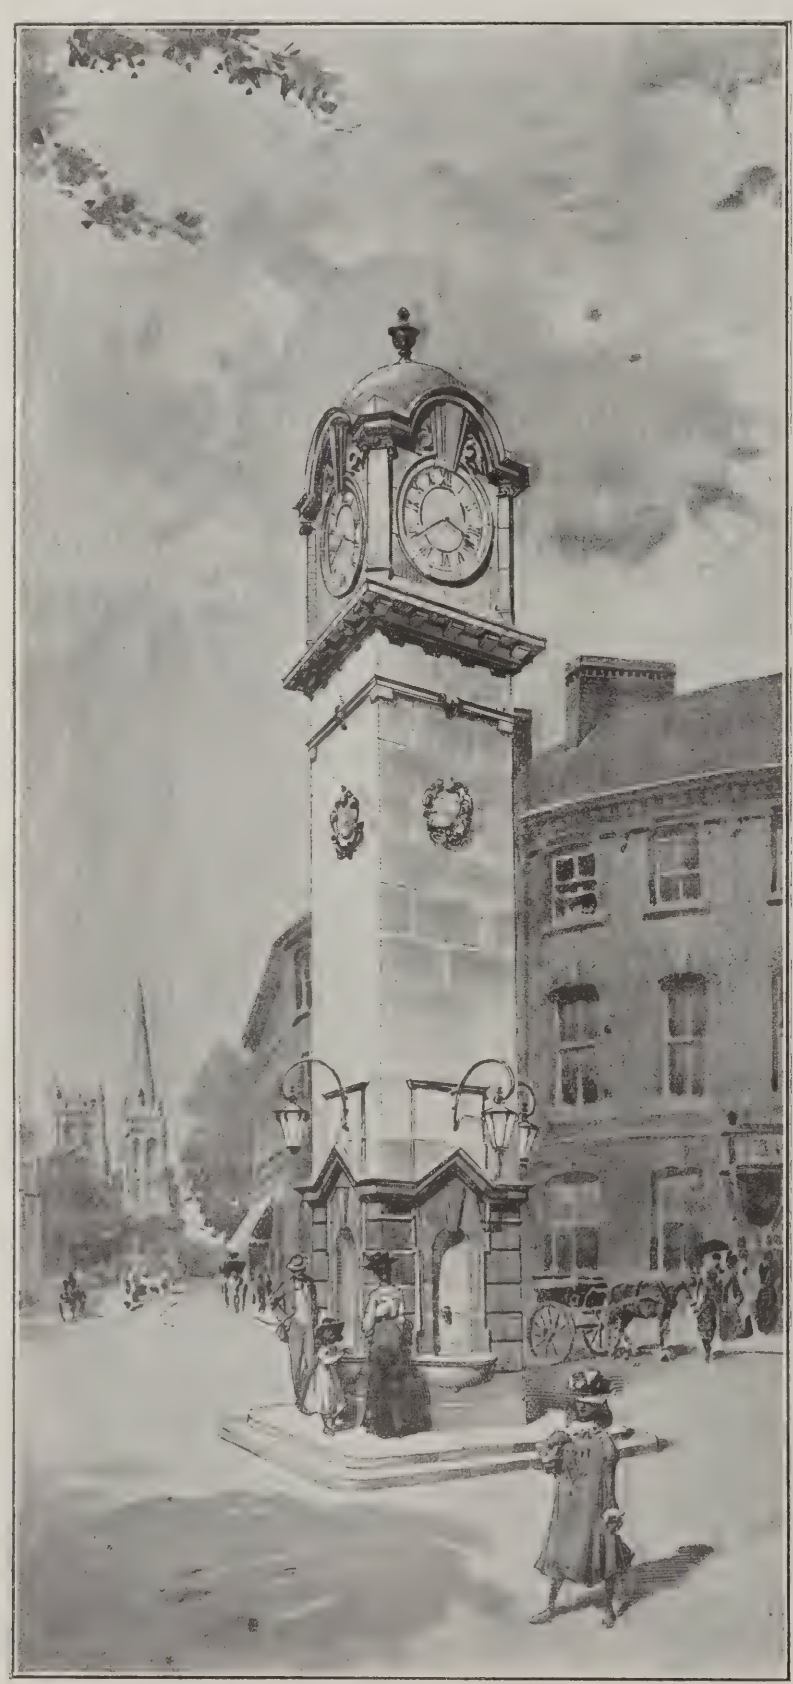
THE attention of the Factory Department of the Home Office has been directed to alleged injury to health and risks from fire in the manufacture of xylonite and celluloid, and in the use of those materials for manufacturing purposes, and it has issued a memorandum on the subject in which it is stated that it would appear that by the general observance of recognized measures of precaution, already adopted in certain works, further security may be obtained. The following observations are offered by the Home Office after an exhaustive enquiry by Commander Hamilton Smith, one of H.M. Superintending Inspectors of Factories, who has conferred with experts in the matter.

In the manufacture of the raw material, and in its subsequent manipulation, it does not appear that there is any exceptional risk so far as the health of the workers is concerned, excepting in rooms where nitric and sulphuric acids are used and necessarily give off fumes. These should be drawn away mechanically at or as near as possible to the point of generation by suitable exhaust ventilation pipes.

The risk of fire is obvious, having regard to the highly inflammable nature of the substance used. Probably only a proportion of the more serious fires, leading to casualties and loss of property, are brought to the knowledge of the department, but these have caused many fatalities. Between 1894 and 1904 the records for England alone show fifty-nine fires connected with xylonite or celluloid—fifty in the manufacture of those materials (forty-six in cutlery works at Sheffield) and nine in places in which it was stored or used.

The following precautions are recommended:—

(1) Where large quantities of xylonite or celluloid are stored fireproof rooms should be provided.
(2) Where xylonite or celluloid is used or temporarily stored the material not in actual use should be kept in metal or other fireproof receptacles.
(3) Xylonite or celluloid shavings or dust should not be allowed to accumulate on the floors, but should be swept up daily and placed in receptacles of non-inflammable material, not in the sacks or wooden boxes now commonly employed for the purpose.
(4) The use of naked lights should be avoided as far as possible; if used at all they should be at least 3ft. from any boring or glazing machine.
(5) Where cutting or sawing of xylonite is done the saw or other cutting instrument should run in water, or by other means be kept thoroughly cool.
(6) The shanks of tools used for boring the scales for table knives and forks should be of such form as to avoid friction caused by contact with the material bored.
(7) In addition to a supply of water, buckets filled with damp sand should be kept in constant readiness in every shop in which xylonite or celluloid is being worked, in order that any accidental fire may be immediately smothered before it attains serious proportions.



KING EDWARD VII. CORONATION MEMORIAL, CAMBRIDGE.
MACALISTER AND TENCH, ARCHITECTS.

Bankrupicies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

J. Fachney, plasterer, Sheringham. R.O. April 12th.

E. Rowles, builder, Pill. R.O. April 14th.

J. Bridgeman, builder, Weymouth. R.O. April 15th.

H. Crookes, builder, Sheffield. Adj. April 12th.

A. Lyons, builder and contractor, Malton. P.E., Scarborough C.C., May 2nd, at 12.

J. Picknett, bricklayer and plasterer, Redcar. R.O. April 14th.

C. J. Edwards, builder, Appex, Warlingham and Thornton Heath. R.O. April 11th.

W. H. Belcher, brick merchant, Paddington. Adj. April 12th.

H. Harris, painter and decorator, Abertillery. R.O. April 15th.

Robinson & Edwards, builders, Seaton Sluice. Adj. April 12th.

J. Brooks, monumental mason, Smethwick and Witton. Adj. April 14th.

J. E. Scott, joiner and builder, Bradford. R.O. April 11th. First meeting, O.R.'s, Bradford, April 27th, at 3. P.E., Bradford C.C., May 10th, at 10.

C. Rook, builder and contractor, Cardiff. First meeting, 117, St. Mary Street, Cardiff, April 27th, at 11. P.E., Cardiff Town Hall, May 2nd, at 11.

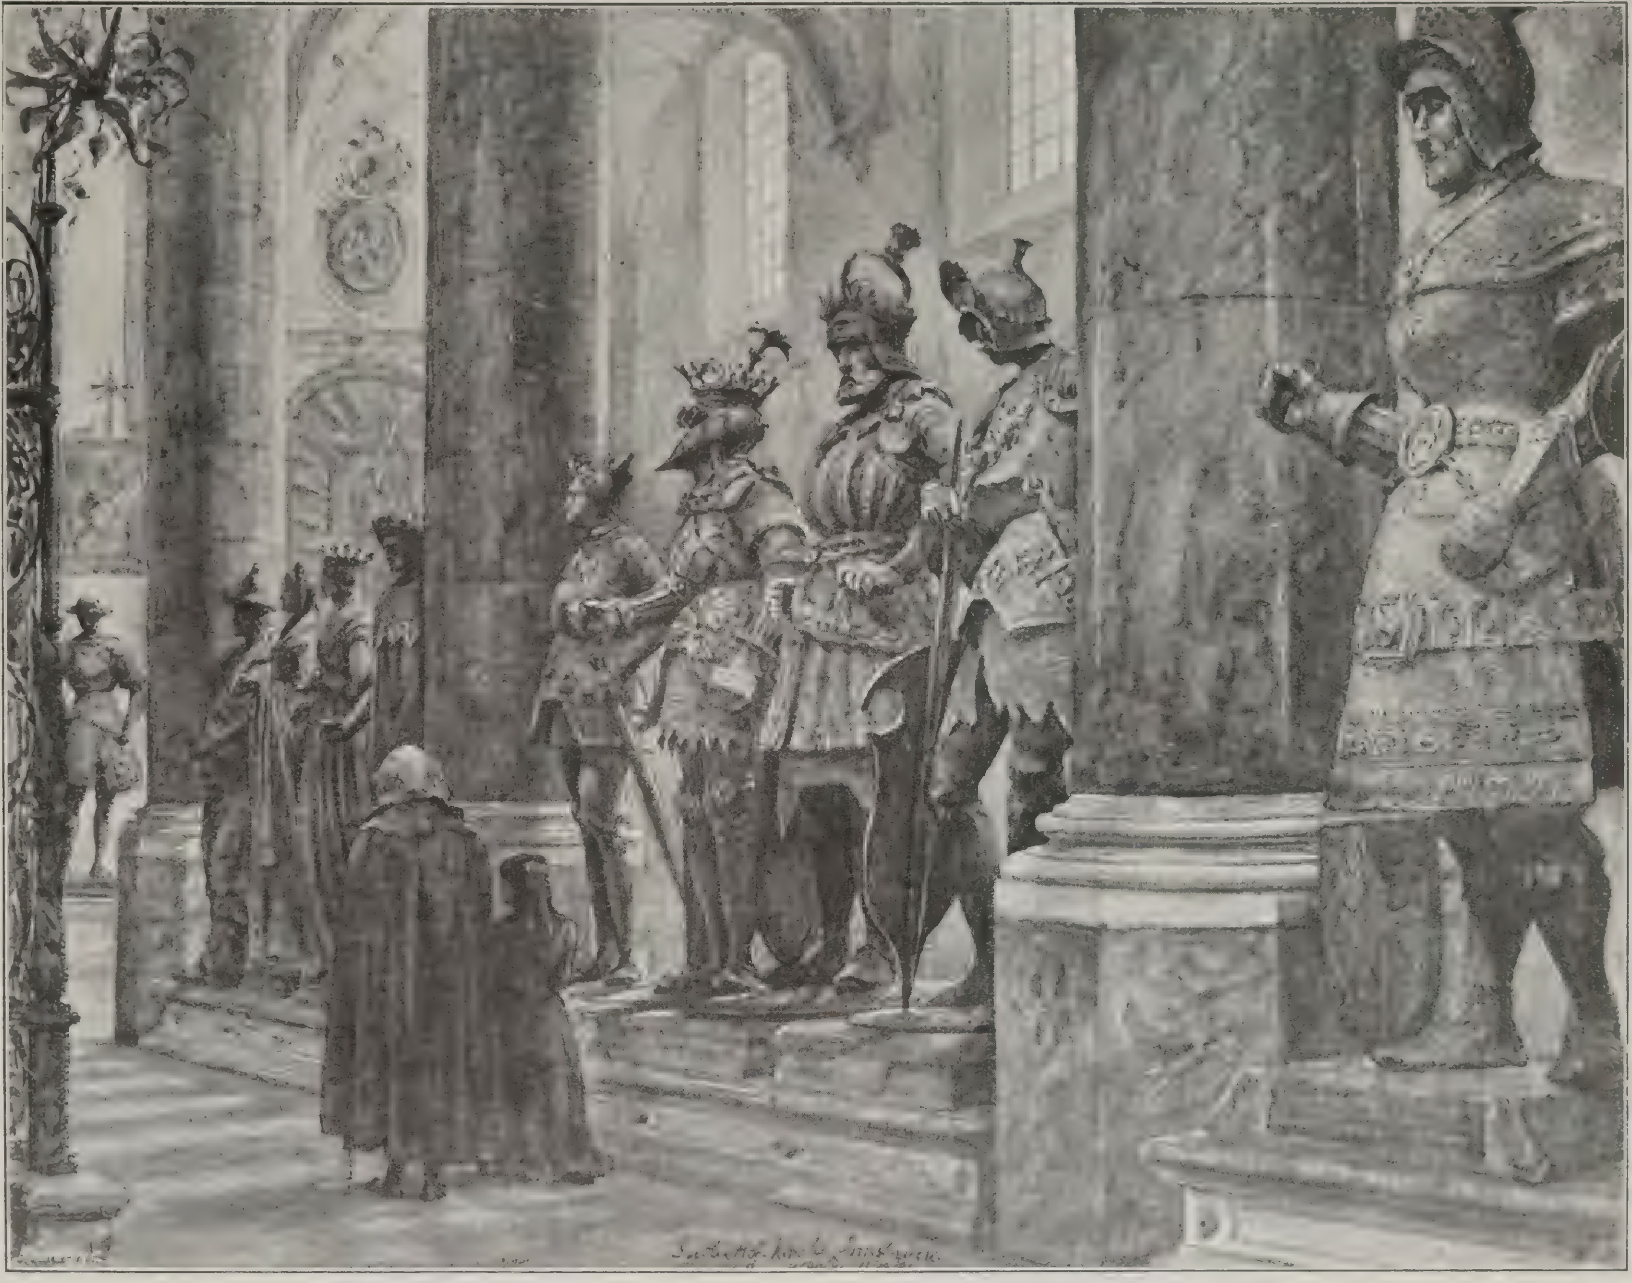
W. Dowland, builder and contractor, Sutton. First meeting, 24, Railway Approach, London Bridge, April 27th, at 11.30. P.E., Croydon C.C., May 17th, at 11.

Tatton & Fitzgerald, timber merchants, Manchester. First meeting, O.R.'s, Manchester, April 27th, at 2.30. P.E., Manchester C.C., May 15th, at 10.

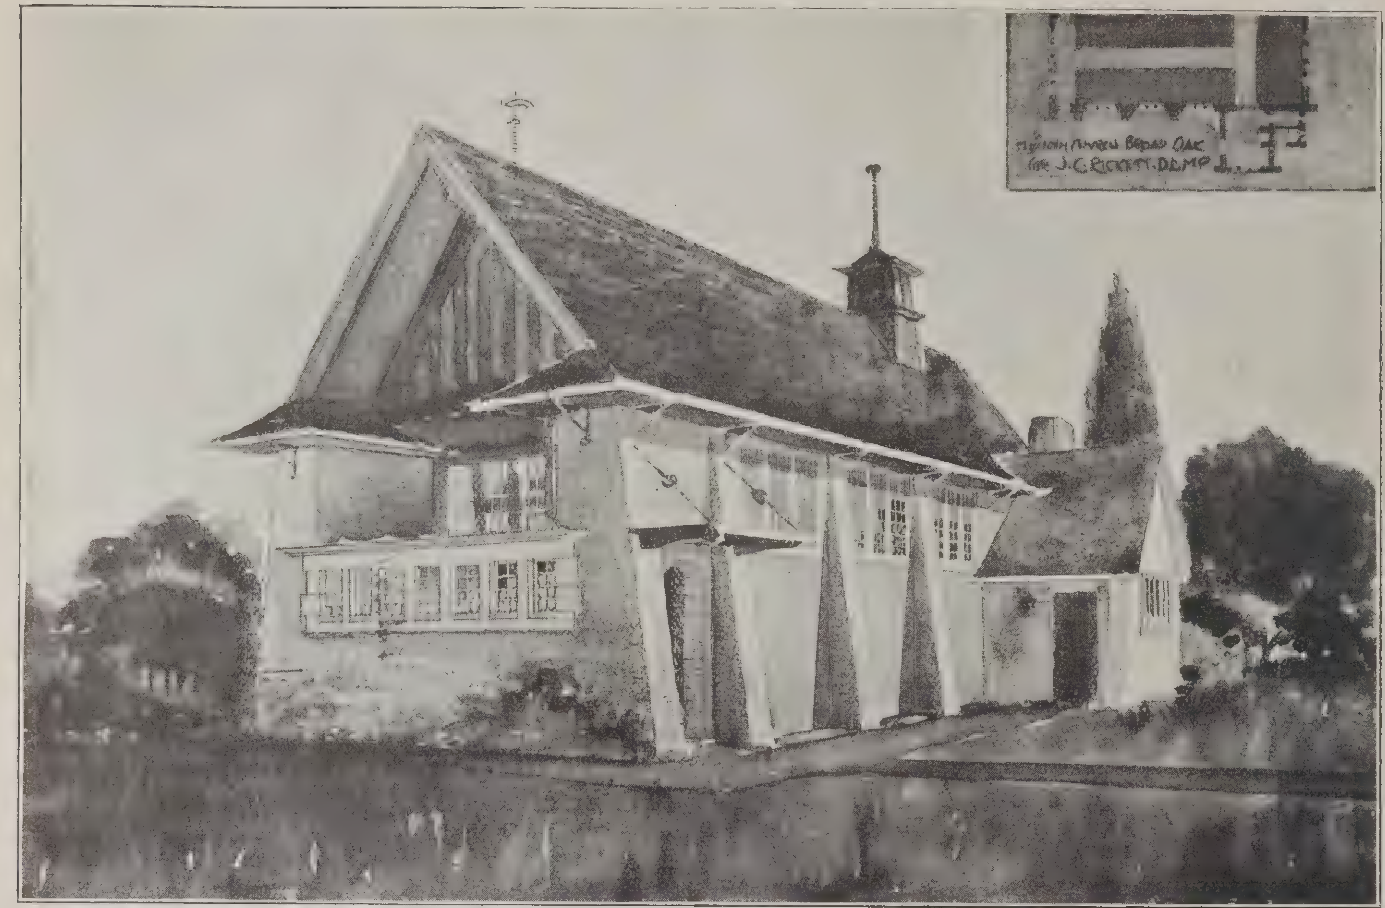
E. Harlow, builder and carpenter, Chatham. First meeting, O.R.'s, Canterbury, April 29th, at 11. P.E., Canterbury Guildhall, May 4th, at 10.

T. W. Richards, joiner and builder, Tibshelf. First meeting, O.R.'s, Derby, April 27th, at 3. P.E., Derby C.C., May 9th, at 11.

King Edward VII. Coronation Memorial, Cambridge.—This design was placed first by the assessor (Mr. J. A. Gotch, of Kettering) in a limited competition held by the Corporation of Cambridge. The memorial is proposed to be erected at the junction of the Station Road and Hills Road, where it will be visible from three principal streets of the town. The area at the disposal of the competitors was only about 7ft. square, and the cost, including clock and lights, was not to exceed £750. Messrs. Macalister & Tench, of Cambridge and London, are the architects.



DRAWINGS OF ARCHITECTURE: TOMB OF THE EMPEROR MAXIMILIAN, INNSBRUCK. BY WALTER MILLARD.



MISSION CHURCH NEAR HAILSHAM, SUSSEX. T. EDWIN COOPER, F.R.I.B.A., ARCHITECT.

Keystones.

Garden Cities in Theory and Practice.—An exhaustive treatise on this subject, by Mr. A. R. Sennett, A.M.I.C.E., M.I.M.E., M.I.E.E., is about to be issued by Messrs. Bemrose & Sons, Ltd., in two volumes of about 600 pages each, with 400 full-page half-tone plates, plans and diagrams. The price (to subscribers only) will be one guinea nett.

The Competition Reform Society disapproves of the conditions in the competitions for an isolation hospital at Windsor and secondary schools at Chepping Wycombe, the former because there is no professional assessor and the award of the board is to be final, and the latter because the remuneration is insufficient.

Agricultural Cottages Competition.—The council of the Yorkshire Agricultural Society have decided to offer prizes to the value of £120 at the Yorkshire Agricultural Show for cheap cottages erected on exhibition which afford the most space and accommodation at the most economical cost, having regard to durability. The cottages may be one or two storeys in height and any materials may be used.

The Restoration of St. William's College, York, one of the most ancient and most interesting buildings in the city, has now been commenced, but such is its extremely dilapidated condition that three years may elapse before it will be fully available for the purpose for which it is being restored, namely, the holding of the meetings of the Houses of the Convocation of York. As far as possible the place will be restored to its ancient appearance. Every part of the old oak panelling which it is requisite shall be removed from the walls is numbered and indexed on the plans, so that when the work in the rooms has advanced to the proper stage the panels may be replaced each in its original situation. That principle of replacement of ancient material is to be observed throughout, even to replacing the little panes of the windows, and where half a beam is good that half will be retained.

A WORLD-FAMOUS BRIDGE WORKS.

A VISIT to Sir William Arrol & Co.'s Bridge Works, Glasgow, was recently paid by the Aberdeen Association of Civil Engineers. Attention was first drawn to the "template" floor, where the whole of the bridge work is drawn out on the floor full size from the drawings and the templates of timber made for distribution to the bridge yard. This avoids all mistakes when the work comes finally to be put together. In this way the great bridges built by the firm were drawn out before construction, including such structures as the Tay, Forth and Tower bridges, and the visitors were fortunate enough to see one of the large girders for the bridge over the Nile at Cairo lying in template on the floor ready to go to the bridge shops.

The large smithy shops and engine shops were next carefully examined, and much interest was exhibited in the special hydraulic machinery in the smithy for bending the steel bars and plates into shape in a single operation.

Amongst other work in the bridge yards were to be seen the steel foundations of the large new railway bridge over the Wear at Sunderland, bridges for the Egyptian railways, and the steelwork of the large new road bridge over the Nile at Cairo, which alone is estimated to cost nearly £250,000. These works were in different stages of manufacture, and gave a clear insight into the manner in which such work is prepared.

A visit to the spacious drawing offices proved not the least interesting part of the round, as numerous drawings of the work in hand had been carefully selected and laid out for inspection.

Builders' Notes.

The Builders' Exchange and Exposition, Birmingham, which is to be opened on May 17th, is to be a permanent exhibition where all classes of machinery and materials for the building trades will be shown. The building is in High Street, facing New Street. Thursday is the Exchange Day.

Manchester Builders Busy.—The number of houses in course of erection in and around Manchester is almost without parallel in the history of the city. In one suburb—Gorton—plans have recently been passed providing accommodation for 10,000 persons, while in Cheetham 800 houses are being built upon one estate.

Dublin Building Trade Dispute.—The men have accepted Alderman Cotton as arbitrator between themselves and the master-builders in respect of the addendum to one of the rules, which is the cause of the lock-out. This addendum is as follows:—The master-builders are to get every advantage given by the members of the Society to others not members of the Master-Builders' Association, and where work is done by measurement or agreement by such persons the master-builders to have the right to claim a similar advantage.

OUR PLATE.

THE stables at Gallops Homestead, Plumpton, Lewes, were built some time ago. The accommodation at ground level is shown by the plan. On the first floor are living-rooms and a loft. The walls are faced externally with a local red brick, parts being tile-hung, and the roofs are covered with wheat-straw thatch. The architect was Mr. C. H. B. Quennell, of London, and the builder was Mr. W. Oram.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Architects and Surveyors' Societies.

BRIGHTON. — NIMAJNEB writes: "Please name the principal architects' and surveyors' societies, with information as to where particulars and conditions of membership can be obtained."

The Royal Institute of British Architects (9, Conduit Street, London, W.), the Architectural Association (18, Tufton Street Westminster), the Society of Architects (Staple Inn Buildings, Holborn W.C.), the Royal Institute of the Architects of Ireland (63, Dawson Street, Dublin); the Surveyors' Institution (Great George Street, Westminster). For particulars apply to the secretaries at the addresses stated.

Scantling for Steel Rafter.

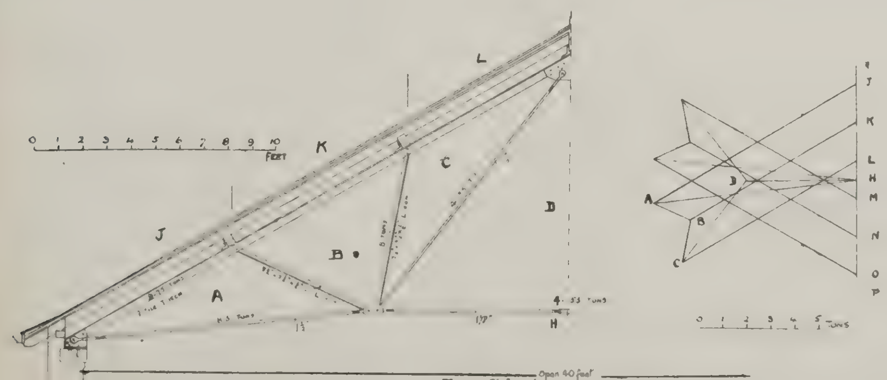
WATFORD.—T-IRON writes: "Please state size of principal rafter of wrought-iron truss. As shown by tracing (reproduced below), the roof is to be slated, battened and boarded. Distributed load taken at 56lbs. per ft. super., sloping surface, including 30 lbs. vertical wind load; trusses 8ft. apart. By Gordon's formula a $5\frac{3}{4} \times 3\frac{3}{4} \times \frac{5}{8}$ T-iron seems insufficient —taking $\frac{a}{2}$ for one end only fixed—but as a strut, when $\frac{\text{length}}{\text{least width}} = 25$, this size is far beyond requirements."

There must be something wrong about your calculations, as Gordon's formula applied to the principal rafter of a roof or to a strut is the same. The coefficient a applies to a member fixed at both ends and $\frac{1}{2}$ a to a member fixed at one end and rounded or pivoted at the other. The principal rafter of a roof is generally taken to be of the latter class, and a strut may be either, or may even be pivoted both ends, but the latter is unusual. Hurst's "Architectural Surveyors' Handbook" gives $4\frac{3}{4} \times 3\frac{1}{2} \times \frac{5}{8}$ tee as the size for a roof of 50ft. span, when the rafter is divided into three bays. Taking this size, the strength by Gordon's formula will be

$$w = \frac{fs}{1 + \frac{l^2}{\frac{1}{2}ad^2}} = \frac{30 \times 4\cdot75}{1 + \frac{1}{750}\left(\frac{84}{3\cdot5}\right)^2} = \frac{142\cdot5}{1\cdot768} =$$

80·6 tons. As the maximum stress is 9·75 tons the factor of safety will be $\frac{80\cdot6}{9\cdot75} = 8\cdot26$.

HENRY ADAMS.



SCANTLING FOR STEEL RAFTER.

Sewage-disposal System for Country House.

D. S. writes: "About three years ago a country house was provided with a sewage-disposal system as shown in the accompanying sketch (not reproduced). The scullery and pantry sinks discharge into large grease intercepting gulleys of the usual and somewhat out-of-date type, and are cleaned out once a week. The drainage is from house and stables. The cesspool (in existence for six years) has never been cleaned out, but there is no sludge in it, the contents being completely liquified. The filter beds are worked alternately in pairs, with rests of about a week. The large beds have been covered in with hinged close-boarded covers to exclude leaves, &c. The filter has never worked well, and for months past has been completely choked up with a black slime which looks like grease. The sewage now passes through the overflow pipes without any change in its character. I shall be glad to know (*a*) why the system does not work in a satisfactory manner; (*b*) what is the best way to improve the existing system, regardless of cost; (*c*) what is the best way to improve the existing system if the cost has to be considered; and (*d*) what is the most automatic system for country houses, giving a good effluent."

(*a*) The contact bed is wrongly constructed, due to some misapprehension as to the bacteriological method of purification. In the present case you have a cesspool acting as a septic tank and breaking up the solids. But if the septic or anaërobic process is adopted—and in small installations it is imperative—it must be followed by the aërobic process, or treatment by the bacteria that require plenty of air. Your filter bed in this instance has a close-boarded cover; it is practically air-tight, and so far from being an aërobic contact bed is now, more probably, a second septic tank. It is not surprising to hear that it is choked up. The septic tank also may not be large enough to contain the day's flow of sewage. It must be borne in mind that the sewage should be held up a day in the septic tank before being passed on to the contact beds. (*b*) The contact bed must be cleaned out and the cover done away with. The bed material would be better of coke alone, of the size of a walnut or a little larger, and without any dust. It should be set on a flooring of expanded metal fixed 2ins. above the floor or on patent filter tiles, so that there is a clear space under for the water to drain away. The flooring should be easily removable for cleaning purposes. We presume that the sewage can be held up in the septic tank until there is sufficient to fill the contact bed. Contact beds should always be filled quickly, so that as much air may be imprisoned in the porous material as possible. After a charge the filter must be allowed to aërate for some hours. (*c*) Same as last. The system must follow the rules. (*d*) This depends on the size of the installation. Several firms (such as Messrs. Adamsez, &c.) have an automatic apparatus for small installations.

Bending Moment on Beam.

GLASGOW.—SCOTSMAN writes: "Please explain how to find the bending moments for the following:—A beam is supported at both ends and has a distributed load, also a fixed load 10ft. from one end. Length of beam 25ft. I can find the moments by graphics, but want to prove it by mathematics."

Let A B (Fig. 1) be the beam in question, w the load per foot-run in cwts., l the span in feet, x and y the segments into which the concentrated load W divides the span. Then the maximum bending moment from distributed load, or ordinate to centre of parabola (Fig. 2) $= \frac{wl^2}{8}$, and the ordinate of parabola at y distance from B $= \frac{wy}{2}(l - y)$. The maximum bending moment from the concentrated load, or ordinate to apex of triangle $= \frac{Wxy}{l}$. The maximum combined bending moment will therefore be $\frac{wy}{2}(l-y) + \frac{Wxy}{l}$. Should a tangent to the parabola make an angle with the horizontal more than B A D, then the ordinate of maximum bending moment must be taken a little nearer to A.

HENRY ADAMS.

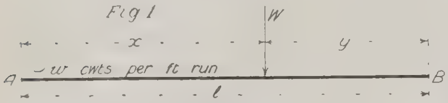


Fig 1

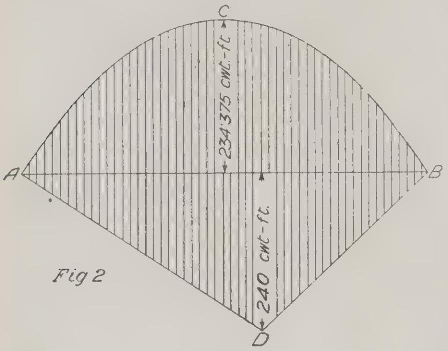

Fig 2

Strength of Reinforced Concrete Beam.

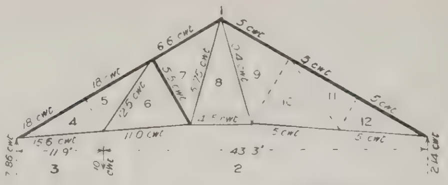
COLCHESTER.—E. A. G. writes: "In your issue for February 8th, in answer to an enquiry by 'Studio,' it was stated that 500lbs. per sq. in. compressive working stress is about four times too high for concrete, for safety. In the case worked out in your columns the load of $9\frac{1}{4}$ tons appears to me to give a maximum unit stress of 9 cwts. instead of about 125 lbs. My working is as follows: Assume that sufficient steel is inserted to make up for want of tensile strength of concrete, and that the reinforced beam can be calculated as if composed of materia of the same tensile as compressive strength; or moment of resistance $= \frac{sbd^2}{6}$ where s = unit compressive strain, $\frac{sbd^2}{6} = \frac{WL}{8}$, or s =

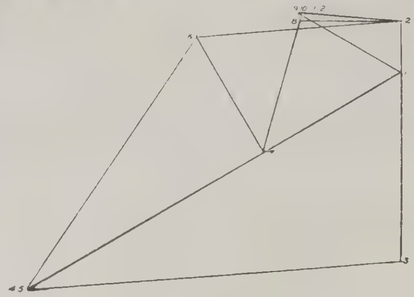
$$\frac{WL \times 6}{8 \times 6 \times d^2} = \frac{\overset{\text{tons}}{9\cdot25} \times \overset{\text{length}}{9\cdot25} \times 12 \times 6}{8 \times 12 \times 12 \times 12} = \frac{85\cdot56}{1\cdot92} =$$

·45 tons approximately 9 cwts. As the subject is one of interest to most of your readers perhaps you would be good enough to reply to the above."

The suggested mode of working out the strength is vitiated by two errors. First the lintel is calculated as if it had no reinforcement, and second, the coefficient s is not "unit compressive strain," but the "modulus of rupture," or "coefficient of transverse strength." The subject may perhaps be better understood after perusal of the article on p. 218.

HENRY ADAMS.





Hanging Additional Load to Roof-truss.

GLASGOW.—ANNUAL SUBSCRIBER writes: "I send a drawing of a portion of steel roof-truss, and on it are marked the stresses as found by diagram for wind-pressure and weight of roof, with the scantlings proposed. It is now intended to hang a moving load of $\frac{1}{2}$ ton where shown. What will be the additional stress caused to the members and how can it be found?"

The accompanying frame and stress diagrams show the additional stresses on truss caused by the live load of $\frac{1}{2}$ ton acting at joint of first bay as required. The nature of the stress is shown by the lines—thick for compression, thin for tension, and dotted for no stress.

Concrete Swimming-baths.

FILEY.—R. W. S. writes: "Please give your opinion on the stability of a wall around a proposed swimming-bath. Do you think the method of heating the water shown by the accompanying sketch (re-drawn) is an economical and practicable one? Careful provision has been made that no strains due to the expansion of the furnace or flue come upon the concrete."

The section of proposed wall is shown in Fig. 1, where the resultant stress is given at each set-off, assuming the bath to be empty. This indicates that the wall requires reinforcement, which may be done by iron or steel rods inserted as shown, cleaned and painted with cement-wash before being put in, and the concrete well mixed and rammed. The furnace may be flush with face of wall in stoke-hole or projecting 3ins., as shown in Fig. 2, with ordinary cast-iron front. The size of furnace, &c., may be determined as follows:—Temperature of water to be raised, say, 20 degs. = 20 units of heat per lb. of water, $20 \times 62\frac{1}{2} = 1{,}250$ units of heat per cub. ft. of water, while 1lb. coal contains 13,000 heat units, of which, say, 10,000 can be utilized. Swimming-bath contains 5,415 cub. ft.; therefore $1250 \times 5415 = 6{,}768{,}750$ units of heat required. Then $\frac{6768750}{10{,}000}$, say 680 lbs. coal to heat water. Furnace 3ft. × 5ft. 6ins. = 16·5ft. area, say 5 lbs. coal burnt per sq. ft. firegrate per hour; then $16\cdot5 \times 5 = 82\cdot5$ lbs. per hour total quantity of coal burnt, and $\frac{680}{82\cdot5}$ = say 8 hours to heat bath from cold water. The area of a flue should be $\frac{1}{5}$ the firegrate area, but the chimney may be as little as $\frac{1}{10}$ the firegrate area, $\frac{16\cdot5}{5} = 3\cdot3$ sq. ft. area of the flue for this furnace; but a 10in. pipe only is shown; this is altogether inadequate; nothing less than one of 18ins. diameter would be suitable, $18^2 \times \cdot7854 = 1\cdot77$ sq. ft. area, and $\frac{16\cdot5}{1\cdot77} = \frac{1}{10}$ nearly. The weight of this would be about $\frac{1}{2}$ cwt. per ft. run, while the water displaced would be about 1 cwt. per ft. run, so that not only must provision be made for carrying the weight when the bath is empty but also to resist the floating tendency when the bath is filled. The joint at wall next to chimney-shaft may be arranged similarly to that shown for the furnace shell at the other end. The chimney shaft should not be less than 50ft. high, unless a Sturtevant induced draft fan is applied at the base. It is not clear why you want 4ins. of broken stone below the concrete; it may be to give a gathering ground for your land drains, but the work would be more solid without it, and as the subsoil is stated to be dry hard clay, it is not clear why any drainage is required. Before the work is put in hand it should be well considered and an estimate of cost obtained. An alternative scheme would be to have boiler and chimney at the deep end with the water passing into the boiler through a pipe from the bottom of the bath and out of the boiler, after heating, through a pipe near the top of the bath. This would probably be very much cheaper and more efficient.

HALL'S Sanitary Washable DISTEMPER
Made in 70 Colours

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

Sample and Shadecard on application to Sissons Brothers & Co., Ltd., Hull. London Office –199B Boro' High Street, S.E.

CAUTION – See the name Hall's Distemper on all tins; refuse imitations, which are inferior.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

May 3, 1905. Vol. 21, No. 534. 6, Great New Street, Fetter Lane, E.C.

Summary.

Among the best church work shown in the architectural room at the Academy this year is that of Mr. Ashbee, Mr. Bodley, Mr. Horsley, Prof. Beresford Pite and Messrs. Nicholson & Corlette, while the chief public buildings represented include Sir Aston Webb's fine design for the triumphal archway and buildings at the east end of the Mall, Sir William Emerson's huge Queen Victoria Memorial Hall for Calcutta, a scheme for new buildings at Liverpool University by Mr. Charles H. Reilly, the council-chambers of Cardiff and Deptford town halls by Messrs. Lanchester & Rickards, and a bold design for the grand staircase at Walsall municipal buildings by Mr. J. S. Gibson. The libraries include Mr. H. Percy Adams's notable design for the new central library at Bristol, and among the schools is Mr. Leonard Stokes's Grammar School at Lincoln. The domestic work shown is very good, Mr. Stokes, Mr. Dawber, Mr. Bodley, Mr. Reginald Blomfield and Sir Aston Webb being well represented. (Page 238.)

A joint committee representing the Glasgow Archæological Society, the Glasgow Institute of Architects and the Glasgow Art Club have had drawings prepared to show how the cathedral will be dwarfed by the proposed reconstruction of the Glasgow Royal Infirmary. (Page 251.)

Nothing in the way of restoration, as the word is commonly understood, is to be attempted at the Parthenon or any other of the ancient temples of Greece. (Page 252.)

In his presidential address to the Edinburgh Architectural Association last week Mr. H. O. Tarbolton suggested that a competition committee drawn from members of the Institute and its allied societies should be appointed to make awards. (Page 242.)

The report on brickwork tests by the Science Standing Committee of the Institute is in type and will be published shortly. (Page 253.)

The Bill for the enrolment of qualified architects is to be submitted for the adoption of the Institute at an early general meeting. (Page 252.)

The competition for the Palace of Peace at the Hague is to be thrown open to all architects. (Page 252.)

Are Lightning Conductors Dangerous? FOUR years ago the Lightning Research Committee was organized by the councils of the Institute and the Surveyors' Institution with the object of obtaining trustworthy information on the subject of disasters to buildings by lightning. Some hundreds of cases have been carefully recorded, and the committee is now about to issue its report, to which Sir Oliver Lodge will contribute a preface. The subject, by the very nature of it, is of course one of extreme complexity, and the only possible means of forming an opinion on special cases is to carefully examine the course which the lightning has followed and the condition in which it has left all conductors in its path. Perhaps the most difficult aspect of the matter is that affecting side-flash, and in regard to this especially the report of the committee is awaited with much interest. Our contemporary the "Electrical Review," we notice, raises the interesting question as to whether lightning conductors are a source of danger. A building "protected" by a lightning conductor, says our contemporary, is probably more often struck by lightning than it would be without it; and unless the conductor offers a sufficiently clear run direct to earth, there is the danger of side-flash, when a portion of the discharge will pass through the masonry or metal-work of the building to earth. "Experience appears to teach that the safest way to protect a building from lightning is to keep the conductor quite clear of the building, that is to say, sufficiently far from it absolutely to prevent side-flash. If this be so, the best way to treat an isolated building, such, for example, as a country house, would be to erect a conductor in the form of a tall steel mast, or a wood mast fitted with an efficiently earthed copper conductor, at a safe distance." There can be no doubt that side-flash is the great danger to protect against, because the damage done, say, by the stroke passing from a conductor on the outside of a building through the wall to a safe inside is likely to be most disastrous—far more so than the knocking off of a few chimney pots. The suggestion, therefore, to erect a high mast absolutely clear of the building seems to be a good one, as in that event there could not possibly be any side-flash.

Lord Grimthorpe and the Architects. THE late Lord Grimthorpe had a way of getting at architects which did not leave him a friendly memory among them—quite apart from the obliteration of St. Albans Cathedral, which was carried out at his expense and under his direction. The fact is, he was too much for most of them. He hit hard, and being a layman in matters architectural, this was all the more resented. As the "Times" observes, he would not be led away by the mediæval enthusiasm of Mr. Pugin or the fine language of Mr. Ruskin, though he recognized the merits of both, and owned as to the latter, when much less honoured than he now is, that "Mr. Ruskin might, if he liked, write the best and most popular work on architecture in the world." His guiding text was ever that architecture was the art of erecting new buildings for use and beauty—an admirable text, no doubt, if it were possible to define "use and beauty" in a manner acceptable to all: but that definition was and is an impossible one—hence there arose a mutual antipathy between Lord Grimthorpe and "the purists who preferred a deserted ruin to a church made serviceable for centuries by judicious repair." The purists count a lot of fools among them, but even they are to be preferred to those clean-sweepers who think that old architecture is not presentable till it is tidied up. However, apart from agreement with the views expressed in them, Lord Grimthorpe's books on architecture form interesting reading. Nowadays we have not the same prejudices as the Gothicists of fifty years ago, when "Grounds of Dissatisfaction with Modern Gothic Architecture" appeared, and we can read unconcernedly criticisms which stung the mid-Victorian architects to the quick, but "A Book on Building, Civil and Ecclesiastical, including Church Restoration, &c.," preserves its sting, though we may laugh at the author's egotism. He was, of course, an acknowledged authority on clocks and bells as well as somewhat of an expert in mechanics, and he leaves a great design in Big Ben, which fully carries out his tenet that "a public clock should not vary more than five seconds in any week," Big Ben, as a matter of fact, varying little more than a second during that time. For that at least we are indebted to Lord Grimthorpe.

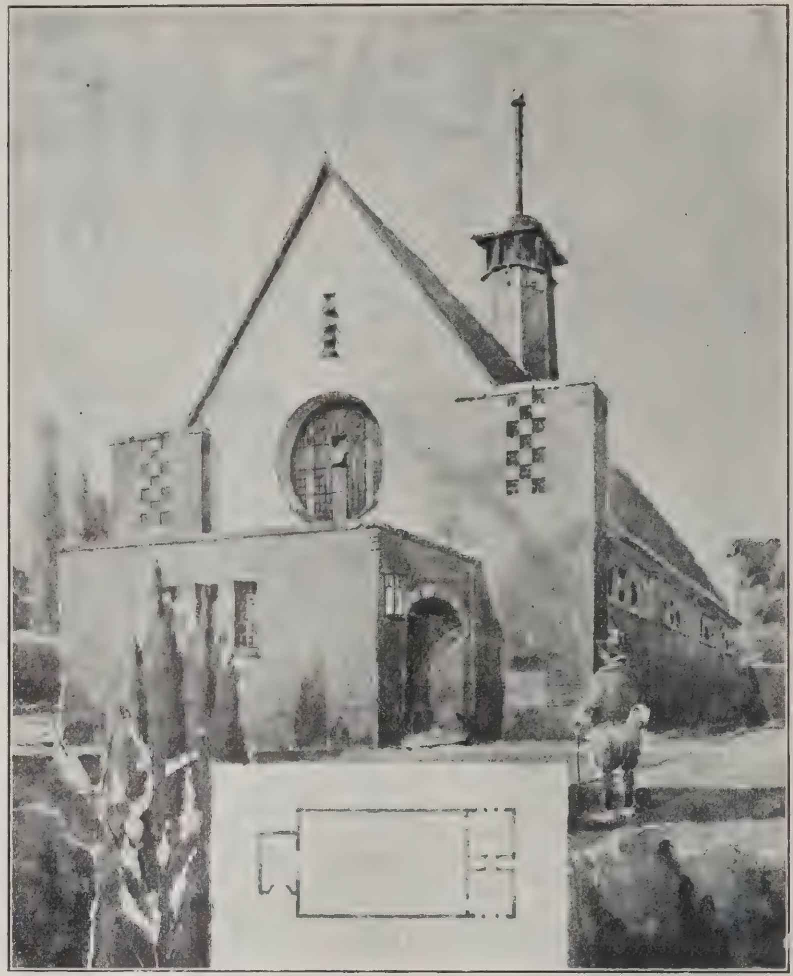
ARCHITECTURE AT THE ACADEMY.

IN connection with every exhibition of the Royal Academy it is usual to say that there is nothing of special interest to be seen, that the collection is extensive but not distinguished for merit, and that one is astonished how some of the pictures could have been hung. For such comment there is an extenuating circumstance—that of boredom; because it is a veritable task to wander through room after room straining and searching, with intervals of collapse, and by the time the critic has come at last to the end of the business he is thoroughly tired out. That is an affair of fifteen or sixteen rooms. To take only one of them—containing about 200 architectural drawings—is an easy matter in comparison: yet, after a careful study of even this small handful, it requires an effort to collect one's disjointed thoughts and form some comprehensive idea of the exhibits.

It will be generally admitted that about a dozen architects—such as Mr. Leonard Stokes, Sir Aston Webb, Mr. Ernest Newton, Prof. Beresford Pite, Mr. Bodley, Mr. H. Percy Adams, Mr. Dawber, Mr. J. S. Gibson, Mr. Horsley and Messrs. Nicholson & Corlette—exhibit work of very high quality, while of the rest it may be said that, in general, it is good, especially the church and domestic work. We may take first the

Church Work.

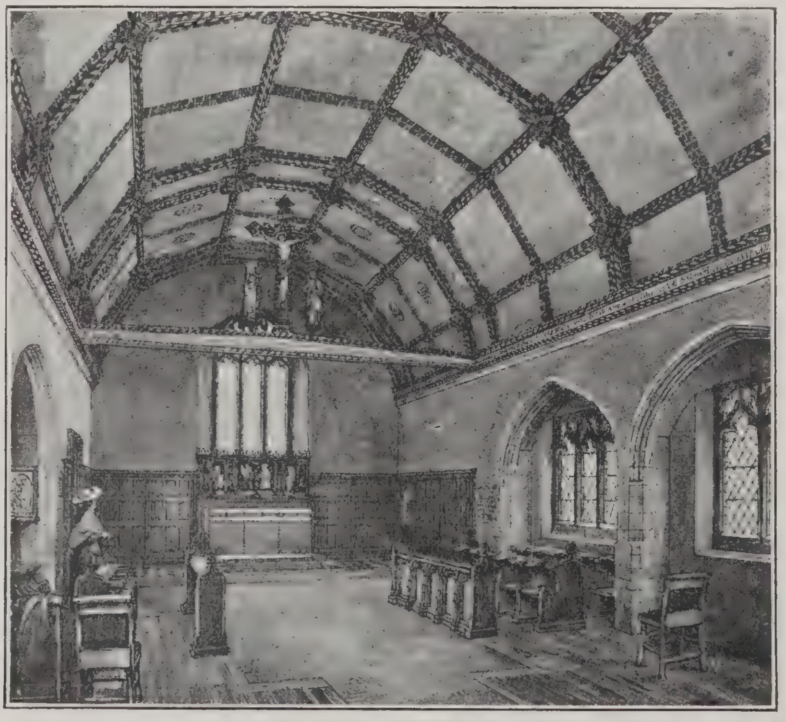
Mr. Ashbee shows a fine design for a church at Wolverhampton, excellent in proportion and detail. It is a strange-looking building, with the nave and tower separated by a covered passage and an arch over, carrying another passageway from half-way up the tower into (presumably) a gallery or stairs in the church, though it is difficult to follow the arrangement without a plan.



(Royal Academy Exhibition, 1905.)

MEETING-HOUSE OF THE BAPTIST CHURCH, CHORLEY WOOD. H. G. IBBERSON, F.R.I.B.A., ARCHITECT.

This building, which will, when the whole scheme is complete, become a schoolroom, is being erected in a rapidly growing district at present without any place of worship. The building committee readily agreed to allow the chapel to be very simple in character, and desired to make no attempt with the thousand pounds at their disposal to imitate the glories of a parish church. The walls are of yellow stocks with rough-cast in the gables, and the roof is of grey-green slates. Mr. A. J. Bates, of Chorley Wood, is carrying out the work under the superintendence of Mr. H. G. Ibberson, F.R.I.B.A., of 28, Martin's Lane, E.C., Cambridge and Hunstanton.



(Royal Academy Exhibition, 1905.)

CHAPEL OF THE ASCENSION, HEATHFIELD, ASCOT. C. H. M. MILEHAM, ARCHITECT.

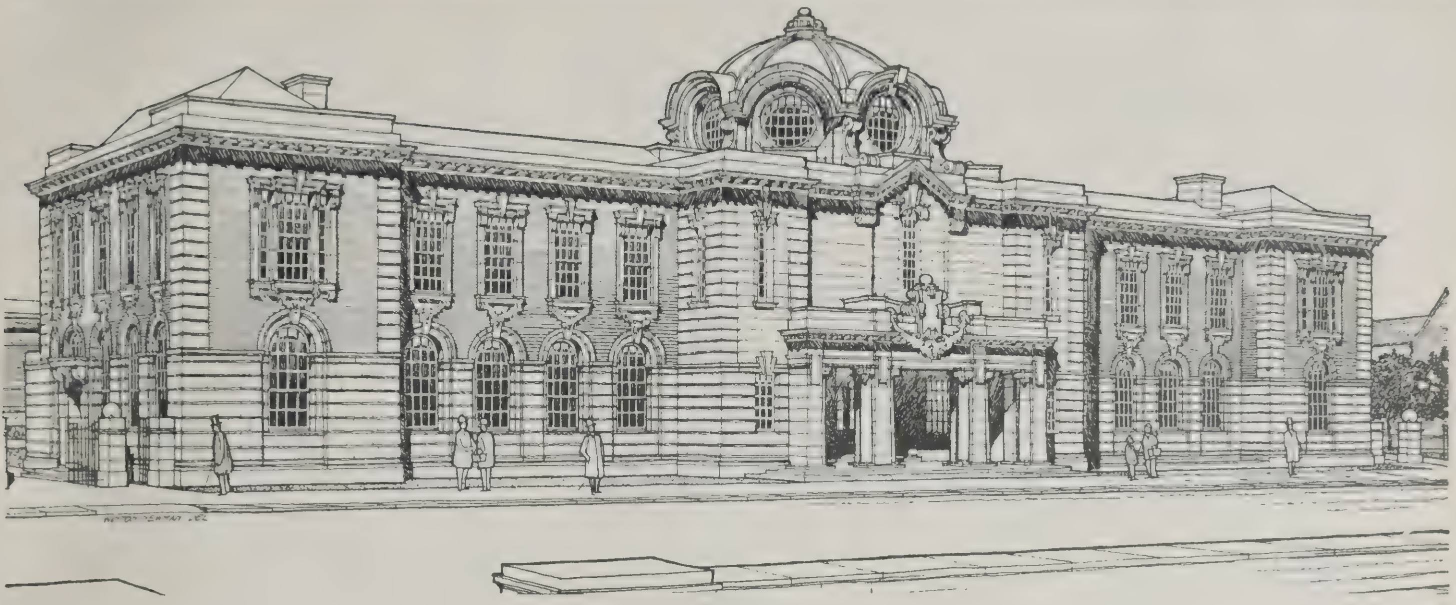
This is the chapel of a well-appointed ladies' school, and was erected in 1903-04 by Messrs. Spear & King, contractors, of Crowthorne. It consists of a nave and sanctuary under a single roof, with an organ gallery and timber bell-turret at the west end, and a small sacristy. The walls are of brickwork, rough-cast outside and stuccoed inside. The roof is of timber covered with plain tiling, and forms a wagon-headed ceiling which is plastered. The chapel is approached from the school buildings by a long enclosed cloister or corridor, of timber and plaster, with a tiled roof. It is expected that the interior will shortly be completed by the decorations and fittings shown in the drawing.

Mr. Bodley has two church drawings, both good examples of draughtsmanship, the one of the interior of a chapel at St. Chad's Church, Burton-on-Trent (signed Charles Gascoyne), being especially well done. The design of this chapel is thoroughly refined in every detail, as also Mr. Bodley's other drawing of the reredos at St. Edward's Church, Holbeck, Leeds.

Some well-executed elevations and sections are shown by Prof. Beresford Pite of Christ Church, Brixton. It is interesting to study these, as the architect has introduced many fresh features, and the detail is everywhere vigorous; but the executed building is not so successful as these drawings of it, the front with its tower being rather a muddle both in treatment and materials. Prof. Pite also shows drawings of his scheme of decoration for the new chancel of Clapham Parish Church.

Of work which is not justly represented by the drawings is Mr. Gerald C. Horsley's delightful church at Longsdon (the drawing of which, by the architect himself, is in the stodgy lifeless style of twenty years ago) and Mr. Mileham's quiet little chapel at Heathfield, reproduced on this page. Messrs. Nicholson & Corlette's additions to All Souls' Church, Hampstead, call for special mention as excellent work. Mr. Flockhart shows a clever design for new Presbyterian church, hall and classrooms at Marylebone, Mr. Edgar Wood an interesting scrap of a drawing of a chapel at Birch, and Mr. W. J. Tapper a very interesting design for the interior of St. Erkenwald's Church, Southend, where a beautiful grille divides off the choir. Of Liverpool Cathedral we still have a relic, in the shape of Mr. Nicholson's design for his exterior (reproduced in our issue for Ocober 19th, 1904).

Mr. Geoffry Lucas is well represented by a plain little country church at Grantham, Mr. Ibberson by the design here reproduced,



(Royal Academy Exhibition, 1905.)

SECOND PREMIATED DESIGN FOR BROMLEY MUNICIPAL BUILDINGS. H. V. ASHLEY AND WINTON NEWMAN, ARCHITECTS.

Mr. Arthur Grove by the new chancel, chapel and vestries just completed at St. John's, Richmond (shown on p. 240 of this issue), Mr. Charles J. Blomfield by a good line drawing of a rood screen for Swaffham Church, Mr. F. K. Oliphant by a rather poor drawing of the rood and screen at St. Mary's Church, Houghton, Mr. Fellowes Prynne by St. Martin's Church, Worcester (which, if carried out in the bluish stone indicated on the drawing, would present a most unfortunate effect), Mr. Temple Moore by a hurried pencil drawing of St. Wilfrid's, Harrogate (a piled-up design which is the worst we have seen by this architect, whose work is usually so good), Mr. Sidney K. Greenslade by a very pleasing design for an altar cross, and Mr. H. H. Statham by a clever pencil sketch of a cathedral conception with a glimpse of the organ.

Messrs. Douglas & Minshull show a coloured drawing of the memorial baptistery at Buckley Church—in which stencil is used extensively, though somewhat harshly; and Mr. Edmund Sedding shows a large drawing of the new church of St. Mary Highweek, Newton Abbot, with a huge tower, correct but rather dull.

A beautiful design in colour for a painted rood screen is exhibited by Mr. J. Harold Gibbons, a pleasing design for Wesleyan church buildings at Bolton by Messrs. Bradshaw & Gass, a wretched design for a domed church by Mr. Lionel W. Grace which somehow managed to win the Academy travelling studentship, a cast-iron drawing of a richly-embellished but not over-interesting church at Elvedon by Mr. Caröe, and a little Catholic church at Egremont by Mr. F. A. Walters which is pleasant in appearance, though not equal to the architect's usual work.

The chapel now being erected at the King's Sanatorium is shown by Mr. H. Percy Adams. The drawings were reproduced in our issue for December 7th last. This chapel is quite unique and at once proclaims itself as the work of a very able architect.

Mr. H. Dare Bryan shows the Western Theological College, Bristol — a careful though not by any means a brilliant design. The rest of the church work embraces some ordinary examples of Gothic design and odds-and-ends of varying interest.

Turning next to the

Domestic Work,

one is confronted with a far greater collection, in attempting to deal with which it becomes necessary to pick out only what is most interesting.

Attention may first be directed to the work of Mr. Leonard Stokes, who shows a most delightful drawing of the hall at Minterne, Dorset, with semi-circular plaster ceiling and dark woodwork—admirable in proportion and detail. Next we may mention Mr. Ernest Newton's three drawings, respectively of a house at Triscombe in Somerset, a proposed house at Reigate, and the front of a house at Bickley (the garden front of which was shown at last year's Academy). At this time of day there is no need to make extended comment on Mr. Newton's work: it preserves the same qualities as hitherto, is always fresh and delightful, and may be counted among

(*Royal Academy Exhibition*, 1905.)

the very best domestic work done in England to-day. Mr. Dawber is another notable architect of country houses and, as usual, he is well represented at the Academy this year. He shows three drawings: one of a house at Denbigh, another of Solom's Court, Surrey, and the third of the "Dog and Doublet Inn" and new cottages at Sandon, Staffs—the last forming part of a scheme of remodelling and rebuilding which is now being carried out.

Mr. Walter H. Brierley shows the drawing of a house at Scarborough reproduced as a centre plate in this issue, and Messrs. Ernest George & Yeates are represented by two drawings, one of the new loggia and central bay at Welbeck Abbey and the other of the new carriage porch and central tower at West Dean, Sussex—both academic in treatment.

Mr. Bodley shows two fine coloured drawings of alterations to the dining- and drawing-rooms of Powis Castle, though there is nothing to indicate which is old and which is new work. The general effect of these rooms is very rich and baronial, but, personally, we do not care for the Elizabethan style in which the design is executed.

Mr. Reginald Blomfield exhibits a line drawing of a big square house at Rye, in Sussex (which would doubtless look far better in reality than as the drawing represents it), and a large block of new buildings at Lady Margaret Hall, Oxford, carried out in red brick: both these designs being in English Renaissance style, skilfully treated.

Sir Aston Webb exhibits a drawing of the remodelling of the Manor House, Stoke d'Abernon, and another of the headmaster's house at the new naval college at Dartmouth. Each is excellent, the former especially. These drawings go to indicate that the architect excels more in domestic work than in monumental design, though his scheme for the proposed triumphal archway and buildings at the east end of the Mall will be admitted to be noble in effect.

Mr. Caröe shows a very large house near Dublin, well treated, and planned on a liberal scale; Mr. Schultz, Pickenham Hall, Swaffham, in Georgian style; Mr. E. J. May a house near Haslemere, essentially English in feeling; Mr. Gerald Horsley the entrance front to "Framewood," Stoke Poges—quiet and dignified; Mr. Halsey Ricardo a rather remarkable house in Addison Road, Kensington, where bricks of various colours are introduced—grey for the base, green above between the pilasters, and blue in the chimneys; Mr. Prentice a house at Newmarket, the drawing of which is a brilliant specimen of pen-and-ink work; Mr. Flockhart a somewhat theatrical piece of architecture in a house at Henley-on-Thames; Mr. Mountford some rather ordinary flats in course of erection at Sloane Square; Mr. P. Morley Horder a house at Warwick and a cottage at Bledlow (both of which have been reproduced in our columns); Mr. Geoffry Lucas workmen's cottages at Letchworth (reproduced in our issue for March 1st last); Mr. E. P. Warren elevations of the large block of flats called Hanover House, St. John's Wood (reproduced in our issue for September 28th, 1904); Professor Pite some large elevations of a house in Mortimer Street, well worth studying; Messrs. Hart & Waterhouse a house at Enfield and another at Tullylagar—both good examples of English domestic work; Mr. Leonard Wyburd two alarming designs for the dining-room and hall of a country house—after the manner of Mr. Baillie Scott *in extremo;* Mr. Norman Evill a well-designed house at Tidenham, in Gloucestershire; an Arab hall at Assuan by Mr. Henri Favarger; Mr. George L. Alexander a well-designed stable at Wonersh; Messrs. Silcock & Reay a new entrance to Bailbrook House, Bath, which looks far better as executed; and Messrs. Forsyth & Maule delightful additions to "The Stocks," Wittersham, Kent; while several well-designed new fronts to houses in the west of London are shown by Mr. W. Henry White, Mr. Ambrose Poynter, Mr. Edwin W. Felkins and Messrs. Niven & Wigglesworth.

Public Buildings.

In this country we do not excel in monumental design—possibly owing to our method of architectural training—but we have some most inspired examples in the English Renaissance to which we can turn with admiration, and it is generally admitted that a development on those lines is the best we can adopt.

In the Academy this year there are drawings of half a dozen very large and important public buildings. First in merit, though not in size, is Sir Aston Webb's design for the archway and buildings at the east end of the Mall leading into Charing Cross. Much curiosity has been evinced in regard to what was proposed for this termination of the great new processional road from Buckingham Palace, in connection with the National Memorial to Queen Victoria. Now that the design is before us, we think it will meet with general approval. It is really a fine design, big in feeling, well proportioned and dignified. On plan it is segmental, with the three archways in the centre and buildings on either side, the façade to Charing Cross having columns and sculpture and the whole surmounted by a quadriga. The chief weakness of the design is in the detail of the capitals, which are insignificant.

The memorial to Queen Victoria in Calcutta has taken quite a different form, being a huge hall in marble with a great dome in the centre. Sir William Emerson shows a large coloured drawing and a model of the building, which will be known to our readers by the photograph which we published in our issue for February 22nd. There is undoubtedly a good feeling about the general mass, but we do not consider the design to be really notable. Like Milan Cathedral, it commands attention by its very size, but the conception is not great.

Mr. Charles H. Reilly, who is now professor of architecture at Liverpool University, shows a very fine scheme for new buildings for the faculties of arts and fine arts at the university. This is exceptionally well thought out and treated.

Several important

Municipal Buildings

are included. There are the town halls at Cardiff and Deptford, the council-chambers in both of which are shown by Messrs. Lanchester & Rickards; the huge block of the new town hall and law courts at Hull, by Messrs. Russell & Cooper—a fine design bold in treatment; the grand staircase at Walsall municipal buildings by Mr. James S. Gibson—a splendid piece of design rendered by a very clever pencil drawing; the proposed extension to Chelsea Town Hall, a scholarly treatment, by Mr. Leonard Stokes; municipal buildings at Ilkley by Mr. W. Bakewell (reproduced in our issue for December 28th last), and similar buildings at South Shields by Mr. E. E. Fetch, this latter including a high tower not well proportioned.

Messrs. Woodhouse, Willoughby & Langham show the new fire and police station at Manchester (illustrated in our issue for June 10th, 1903)—which masses well together.

Libraries and Schools.

Under this head we may first refer to Mr. H. Percy Adams's two drawings of the new central library at Bristol. This is a notable building, thoroughly fresh in treatment and worthy to be included amongst the architect's best work.

Mr. Hare shows a corner of the public library at Harrogate, Mr. T. Gibbon a clever drawing of one of the Glasgow public libraries, and Mr. Maurice B. Adams two new libraries at Bromley and Eltham—about all of which there is no special comment to make.

Among the schools shown is a fine design for the grammar School at Lincoln, by Mr. Leonard Stokes; a pleasing design for a new choir school-house at New College, Oxford, by Messrs. Nicholson & Corlette; and a characteristic design by Mr. C. F. A. Voysey for the Lincoln Grammar School; while Mr. Arnold Mitchell exhibits an outline drawing of the new University College School, Hampstead; Prof. F. M. Simpson his design for the same building, submitted in competition; Mr. John Bilson an excellent design for an extension to the boarding-house at Grantham Grammar School; Mr. Walter Cave his competition design for memorial buildings at Eton College; and Mr. Paul Waterhouse a hard drawing of the new medical school and nurses' home for University College Hospital.

Business Premises.

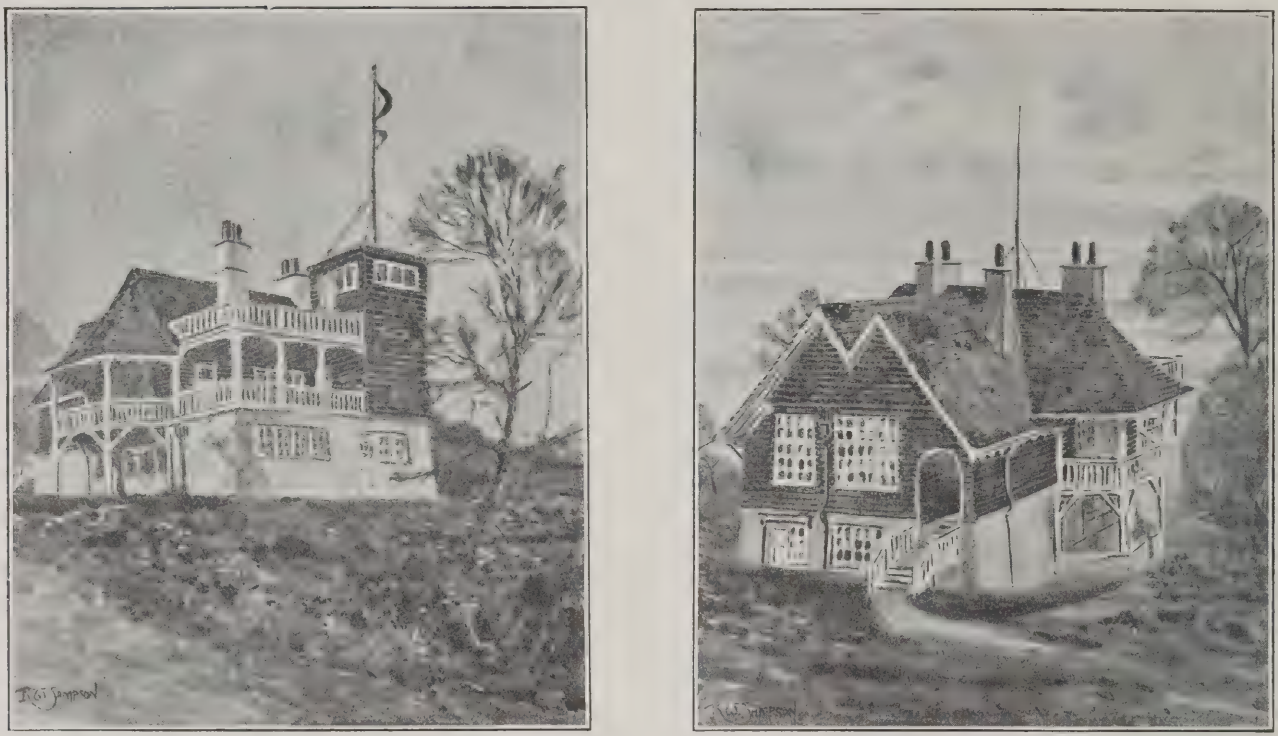
There are several noteworthy designs for business premises exhibited. Mr. Edwin J. Stubbs shows an exterior and interior of the new exhibition hall and offices for the Royal Horticultural Society (reproduced in our issue for December 28th last)—a fine design with a good exposed iron roof over the hall; Messrs. Matear & Simon the Liverpool Cotton Exchange and Messrs. Bradshaw & Gass the Manchester Stock Exchange—also reproduced in our issue for December 28th, and both worthy of the closest attention; Messrs. Niven & Wigglesworth an excellent design for the "Dundee Courier's" new premises; Mr. T. Middleton Shallcross an excellent design for proposed shops in a provincial town; Messrs. Skipper new assurance offices at Norwich, on safe classical lines; Messrs. Silcock & Reay a fine design for the Crown Brewery at Bath; Mr. Arthur Blomfield a bank at Chelmsford; and Mr. Henry Tanner, jr., the new shipping offices in Cockspur Street, London—a building of varying merit.

Of other designs not classed under the foregoing headings we may mention Mr. Frank T. Verity's new Scala Theatre in Fitzroy Square, London, Mr. J. B. Fulton's design for a picture and sculpture gallery, and Mr. Marshall Mackenzie's drawing of the arcade in the new art gallery at Dundee.

THE USHER HALL, EDINBURGH.

Report by Sir Aston Webb.

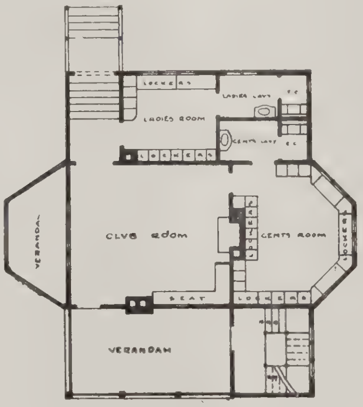
It will be recalled that the Edinburgh Town Council remitted to Sir Aston Webb the question of the acoustics and general arrangement of the Usher Hall, as planned by the city architect, Mr. Morham. In his report Sir Aston Webb says that he considers the removal of the dome and the formation of a straight ceiling essential. Further, he thinks that the lunette windows in the circular cove of the ceiling should be removed and placed below the main cornice. His general idea is that the hall is inclined to be too long for its width. He suggests that it should be made wider, so as to get a more harmonic proportion between length, width and height. He agrees that the whole of the orchestra end should be lined with wood in order that it may act as a sounding board.



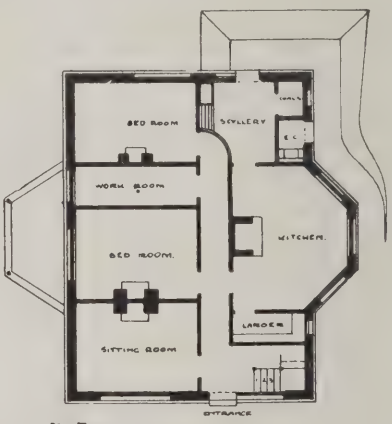
(Royal Academy Exhibition, 1905.)

GOLF CLUB PAVILION, SIDMOUTH. R. W. SAMPSON, ARCHITECT.

This building is rather more than a pavilion and rather less than a club house, the links being so close to the town that the latter was unnecessary, though at the same time it was considered desirable to make the pavilion as comfortable as possible, so that the accommodation includes caretaker's rooms below (occupied by the ground man) and club rooms above, with wide verandahs for afternoon tea and for viewing the play. The lower part of the building is built of brick, finished with rough-cast, and the upper portion is of timber framing plastered inside and weather-boarded outside, the latter being treated with Carbolinium, and the wrought woodwork painted white; the roof is covered with local tiles. The building has been erected at the expense of Major J. E. H. Balfour, D.S.O., of the Manor, Sidmouth, the contractors being Messrs. R. W. & J. Skinner, of Sidmouth.



Ground-floor Plan.



Basement Plan.

EDINBURGH ARCHITECTURAL ASSOCIATION.

President's Valedictory Address.

AT the annual general meeting of the Edinburgh Architectural Association held last week Mr. Harold O. Tarbolton, F.R.I.B.A., president, delivered his valedictory address. Speaking of the position of municipal bodies with regard to public works, he said that as that kind of work involved grave interests of an artistic, practical and financial nature, it was essential that the services of only properly trained and experienced architects should be retained. Architectural work should not be placed in the hands of engineers and surveyors, and the work of the official architect should be restricted to structures of secondary importance, all buildings of a monumental character being entrusted to independent architects, selected in such a way as might seem best to the local authority concerned.

With regard to

Assessors in Public Competitions

Mr. Tarbolton said that the difficulty lay in the haziness which surrounded the position of an assessor. His duties were certainly ascribed, but there was no recognized rule as to the terms of his employment. He had no stated fees, and the large accounts which were frequently sent in by assessors had naturally frightened many who would willingly seek their assistance. Some clear definition of the obligations of assessorship was wanted. He thought the difficulties might be obviated if the Institute were to appoint a Competition Committee drawn from its own body and the various allied societies throughout the country. The duty of such a committee would be to examine competitive designs and to give awards upon the same. This would encourage promoters of competitions to make these bodies their referees. He recommended the appointment of either three or five assessors instead of one, in which case the award would not only be more final, but would remove the tendency to play up to the idiosyncrasies of a single assessor, whose predilections for certain types of architecture might be well known.

Referring to the question of

Monumental Sculpture

he said that in countries where sculpture thrived more happily than in our own, statues were seldom placed in the open. They were placed upon the sides of places of moderate size, and when so disposed as to get value from background, whether of stone or of vegetation, they gained vastly in effect. The statues in Edinburgh were invariably placed in an unfortunate position, as if merely dividing the lines of tramcar or other traffic.

Alluding next to the

Ownership of Architects' Drawings

Mr. Tarbolton said that that was a matter of great importance. He took it that all architects were agreed that, unless a special arrangement had been arrived at, the client paid for a concrete result, and that the drawings prepared were only the customary means employed by architects for illustrating their ideas for the benefit of the workmen. As such, the client had no more right to them than he had to the architect's office materials. He could hardly find anything quite analogous in other professions. The question recurred again and again in the Courts, and it still awaited some final settlement. He did not hesitate to admit the right of a client to the possession of any plans of a pictorial or sketchy nature prepared primarily for the client's benefit, but he did strongly dispute his right to demand the mechanical apparatus set in motion to give certain tangible results.

The Association recently visited Drum House, Gilmerton, which is supposed to have been the work of the elder Adam. It was built about 1724, and is an early example of fully developed Palladian style in Scotland. The grandeur of the front, compared with the meanness of the other elevations, is characteristic of the time. Attention was drawn to the fine stone detail of the front elevation, the leadwork—which was rare in Scotland—and the interior plasterwork by Italians.

THE INTERNATIONAL BUILDING TRADES' EXHIBITION.

THIS week we conclude our notice of the Building Trades' Exhibition at the Royal Agricultural Hall, Islington, which closes on Saturday next, May 6th. It has been generally approved as an excellent show, eminently instructive and useful to all connected with the building trades, and has been visited by a very large number of people. To-day the Society of Architects are paying a visit and on Saturday the Architectural Association. Many well-known firms are not represented, but taken as a whole the exhibition is a comprehensive one, and all who have not yet visited it should make a point of doing so.

LORD WINDSOR in his opening speech said that if any proof were wanted of the undoubted success and usefulness of the Building Trades' Exhibition it could not be better found than in the increasing number of exhibitors. He mentioned that in 1895 there were only ninety-two exhibitors, but that during the last five exhibitions, held biennially, the number had steadily mounted up to 317 this year. He felt certain that the public would recognize the usefulness and importance of such an exhibition. The increase in the number of exhibitors showed that the designers and manufacturers in those industries connected with the building trade found it worth while to place their inventions before the public, and the more complete the exhibition became the more it was worth the while of the visitor that came there and the better was he able to carry away useful hints if he were interested in building. Lord Windsor said he wished to make special reference to smoke abatement. He urged the importance of this question. London was not the only transgressor, for one had only to visit the large commercial industrial towns to find the surrounding vegetation killed; but certainly London was hardly bearable when there was a fog. We saw the trees in the parks dying because of it, and our buildings suffered just as disastrously. How much of the stonework of buildings in London was destroyed by smoke? Fortunately, however, the Portland stone available, with its white lights and grey shadows, seemed suitable and most beautiful for the Metropolis; yet we had to go to our professors in chemistry and ask them how we could preserve it, and although cure was a good thing prevention was better, and he hoped the exhibition would keep before the public all the best means of prevention in regard to this matter. The question of dealing with fireproof buildings was another most important one, and it was satisfactory to know how many of the exhibits dealt with it. We were constantly confronted with new materials and new methods of utilizing them. We saw in London streets skeletons of buildings being reared up on a framework of steel, which might be more or less concealed by brick or stone, and we saw sometimes the distressing fact of what appeared to be a massive stone wall resting apparently upon a plate-glass window. It was steel, no doubt, which did this, and he ventured to think we were hardly right in using our inventive powers to conceal a material and make it appear something other than it was, giving almost invariably a sense of insecurity and bad construction; rather we should give a full recognition to these necessary materials, and turn our minds as far as possible to dealing with them in the most natural and therefore in the most artistic manner. In conclusion, he urged the importance of cheap houses to the public, and said it was to those present to whom they had to look for the solution of this knotty problem.

Mr. Fitzroy Doll, F.R.I.B.A., Mayor of Holborn, proposed a vote of thanks to Lord Windsor, which was seconded by Mr. H. Greville Montgomery, who said that for the first time in the history of the Building Trades' Exhibition the Agricultural Hall was full of exhibits. When he became connected with the exhibition he determined to eliminate what were called "side-shows." It had taken a long time to perfect the exhibition, but no one could say there was an exhibit this year which did not in some way or other appertain to the building industries.

Asbestic Bricks.

Stand No. 61, Row C.

At Lodge Place, St. John's Wood, N.W., on land adjoining the Regent's Park Canal, plant has been erected by the Asbestic Brick and Tile Co. for the manufacture of asbestic bricks according to a French process, and specimens of the bricks are to be seen at this stand. The works have only recently been completed. The process is briefly as follows:—The materials, sand, asbestos and lime are elevated to the first floor, mixed in a steam-jacketed machine, conveyed firstly to hoppers where the lime slakes, and then to the brick-making machine house, where the materials fall into edge-runner pans to receive the final grinding, mixing and incorporating before being pressed into brick form. From the presses (one of which we illustrate on this page) the bricks are stacked in blades on platform wagons and hardened in autoclaves or large steam boilers, of which there are three, each 38ft. long and 6ft. 6ins. in diameter. These lime-sand bricks are free from the usual defects of shortness in the grain by reason of the incorporation of asbestos fibre, and their high resistance to fire was testified by a recent official test, while their exactness of form and evenness of tint are superior to ordinary clay bricks. Many shades of colour are produced, and are noticeable for their softness of tone. Tests prove the strength and low porosity of these bricks.

Terra-cotta Partitions.

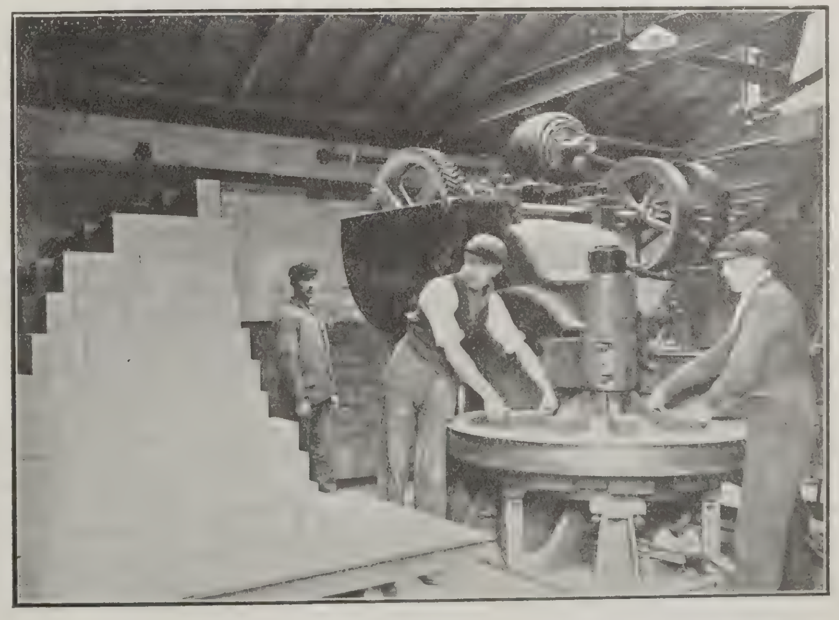
Bay No. 14.

The London and Brighton Brick, Tile and Terra-cotta Co., Ltd., of Crowhurst, show some admirable terra-cotta partition blocks, tubes for fire-resisting floors, and bricks. The Williams partition blocks have numerous holes into which the cement mortar penetrates, forming dowels, and so binding the partition together that most of the weight is transmitted to the walls and little comes upon the floor. Grooves on the face give an excellent key for plaster. These blocks are light, and are very suitable for half timber houses, greatly lessening the cost, as they only require rough casting on the face and plastering inside. Several sections of various sizes are made for fire-resisting floors. They are easily adaptable for application to wood joists and are most useful for adapting existing floors. The facing bricks, 2ins. thick, are rich and even in colour, and of good shape, and made with sand or smooth terra-cotta face. Wire-cut backing bricks are made to bond with the facing bricks at ordinary common brick prices, and obviate the troublesome justification and bonding entailed in the use of ordinary-sized bricks for this purpose.

Reinforced Concrete Tubes.

Stands Nos. 14 and 15, Rows B and C, Gallery.

Messrs. John Ellis & Sons, Ltd., of Leicester, exhibit a variety of large tubes constructed in reinforced silicated concrete. The materials used in the concrete are Mount Sorrel granite crushed to pass through a $\frac{1}{4}$in. mesh and Portland cement in the proportion of 3 to 1. The steel ribs are $\frac{1}{4}$in. round steel wire rings, placed 9ins. apart. Manholes made of the same materials are also shown at this stand, as well as patent granite concrete invert and sewer blocks, made applicable to any shaped sewer, paving slabs, kerbs, &c.



MOULDING PRESS FOR ASBESTIC BRICKS.

Glazed Bricks.

Stand No. 19, Row D.

The exhibit of Messrs. Ingham's Firebrick Co., of Raven's Lodge Brick and Pipe Works, Dewsbury, deserves notice by every architect and builder. Special attention may be called to their glazed bricks. The manufacture of reliable glazed bricks is very difficult. So many points have to be taken into account, and so much care has to be exercised over every part of the process, that it is not surprising few bricks are put on the market that are uniformly of first quality. In our opinion no brick that is not made complete in one operation will be satisfactory. To biscuit the clay first, and then fire again for the glaze, prevents that adhesion of the two which is absolutely essential for the glaze to stand. Messrs. Ingham's Firebrick Co., although they have only recently taken up the manufacture of glazed bricks, have succeeded in overcoming the difficulties of producing a brick in one firing. Those who are unfamiliar with the science of brickmaking can have little appreciation of the difficulties to be met. One of the chief of these is the even regulation of the temperature in the kiln. Then, again, there is the necessity of preventing ashes entering the kiln, as they would speck the glaze. Further, there is the question of the composition of the glaze as to resistance, temperature and colour, and also the working and moulding of the brick into shape, and the retaining of that shape under fire, and the keeping of the size exact. The bricks of this firm are all made with leadless glazes—a requirement which is rightly being increasingly insisted upon by architects. Another special point about these bricks is that they taper very slightly from the face to the back. This seemingly small matter is nevertheless important, as it allows the perpends of a wall to be kept correct during erection without the necessity of chipping one course of bricks, so as to slope the wall back again to a true line. At this stand is also shown a distributing manhole in glazed ware. It is circular in shape and has two or three outlets for distributing sewage in two or three directions. Grooved slots are placed in front of each outlet for cutting off the supply, and in these wooden or iron standbacks are placed, these being built up according as the sewage is required to be distributed in one direction or another. By placing a 24in. diameter pipe on top of the manhole, with an outlet, the sewage may be distributed at a slightly higher level if desired. The purposes for which this manhole is suitable are numerous, and will occur to those interested. Its advantage as regards setting in loose or made ground is distinct as against an ordinary brick-built manhole, while the saving in cost is considerable.

JOINERY.

Mouldings, Doors, &c.

Stand No. 95, Row E.

Messrs. Samuel Elliott & Sons, Ltd., of Caversham, Reading, have some fine examples of their joinery work on view at this stand. Mr. Samuel Elliott, late of Newbury, has been engaged in the trade for fifty-five years, so that his experience is as comprehensive as could be desired by any architect, while his reputation is a guarantee of good work. A noticeable feature at this stand is a door made for H.M. the King's box at the new Waldorf Theatre now being erected in Aldwych. The examples of mouldings show the perfection of the firm's machinery for turning them out clean and its ability to deal with intricate work, while the timber is of special selection. We might mention that Messrs. Elliott are executing woodwork for the new Westminster Cathedral, Bentley's masterpiece, and have already completed work in the Bishop's Palace and the great doors to the cathedral, which weigh two tons each and are 6ins. thick out of solid timber.

Joinery and Stone.

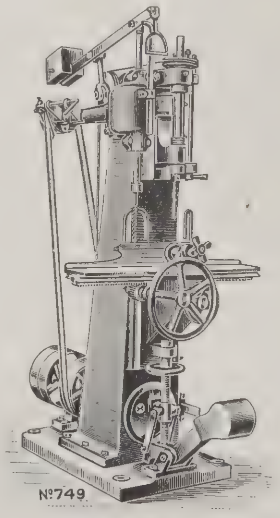
Stand No. 67, Row C.

Messrs. Strange & Sons, of 34, London Road, Tunbridge Wells, are showing examples of work executed at the Holly Bank Joinery Works and of stone from the Tunbridge Wells Stone Quarries. The joinery shops have been designed and erected for a large output and the machinery is of most modern type, while the stock of woods is a large and good one. The work is turned out with the best finish, as may be judged from exhibits at this stand. Contracts have been executed for many architects of eminence. The Tunbridge Wells stone is a warm buff-coloured sandstone of fine texture and grain and beautifully marked. It retains a fine arris, and weathers well. Among the buildings executed in this stone may be mentioned Hever Castle, Tonbridge Science Buildings and Tonbridge School and Chapel.

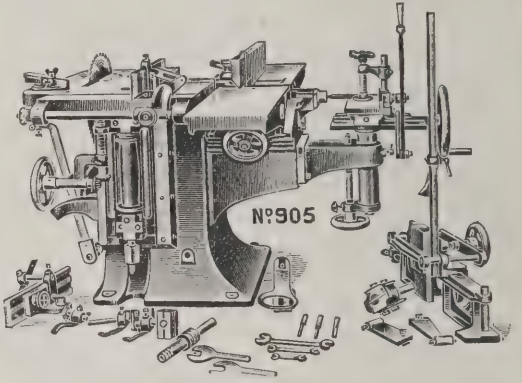
Woodworking Machines.

Wall Space 129.

A number of woodworking machines of interest to contractors and others are exhibited by Messrs. Sagar & Co., of Canal Works, Halifax. These include the following:—(1) An improved circular saw bench; (2) a band sawing machine; (3) the "Premier" hand and roller-feed surface planing, thicknessing, moulding, &c., machine; (4) an improved planing-out-of-twist and jointing machine; (5) a panel planing, thicknessing, tonguing, grooving, moulding, &c., machine; (6) a vertical spindle moulding and shaping machine; (7) an improved tenoning machine; (8) a patent automatic dovetailing machine; (9) a patent tenoning apparatus; (10) a mortising and boring machine; and (11) a general joiner or variety woodworker. We illustrate the last three named. The patent tenoning apparatus is intended for use in connection with vertical spindle moulding machines. It will make a complete accurate tenon. It consists of an oscillating bracket carrying the cramp for holding the timber in a vertical position, and when the piece to be worked is fixed, this cramp is made to slide past the cutter block, and one side of the tenon is made. The bracket is then brought over to the left by a simple movement and the cramp slide pulled forward. The tenon is then completed. Suitable adjustable stops are provided on the table to regulate the thickness of tenon and depth of shoulders, and a very simple arrangement is fitted so that the length between the shoulders of tenons may be accurately gauged so as to avoid the trouble of measuring or marking off, and all pieces are finished exactly alike. The mortising and boring machine is intended for the general run of mortising in joinery, sash and door work, &c. It is easy of operation, runs at a high speed, and will get through a great deal of work in a little time. Where a combination machine is required the general joiner is a happy arrangement. There is no doubt that separate machines for separate operations are much to be preferred, but where for considerations of limited space at disposal, quantity of work to be done, &c., a combined machine is advisable, we can recommend this one with confidence. It will do many kinds of planing and sawing works, sawing up to 6ins. deep, will work any kind of moulding on straight, circular or irregular-shaped pieces, &c., and will tenon and mortise. All these operations are done from three separate spindles by means of suitable saws and cutters, any of which can be easily put on or changed for others.

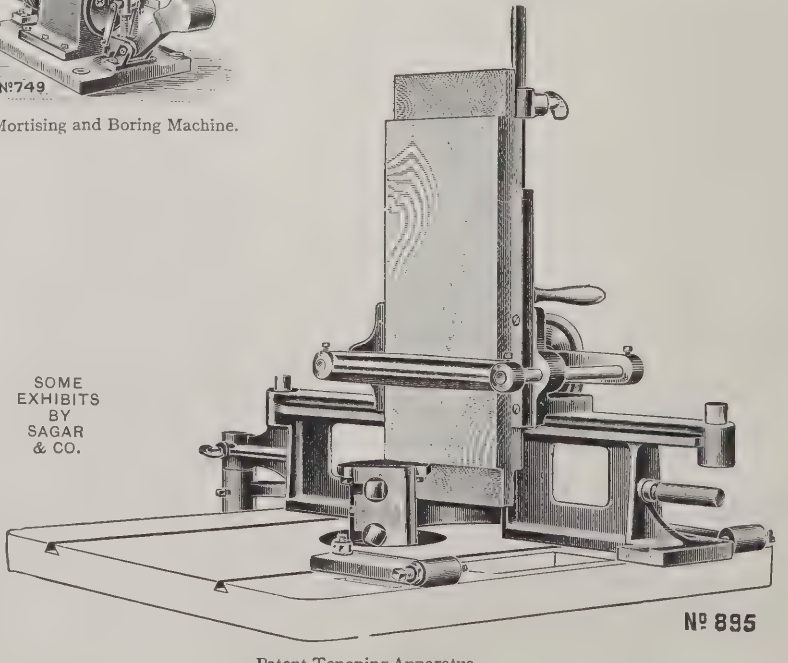


Mortising and Boring Machine.



General Joiner.

SOME
EXHIBITS
BY
SAGAR
& CO.



Patent Tenoning Apparatus.

Woodworking Machinery.

Wall Space No. 135.

A large and interesting collection of woodworking machinery is to be seen at Messrs. F. W. Reynolds & Co.'s stand, all driven by an electric motor of 10-b.h.p. The machines shown are as follows:—Three hand mortising machines, a steam power reciprocating mortising machine, a chain mortiser, a trying-up and jointing machine, a thicknessing machine, a vertical spindle, a band saw, and a machine- and a hand-power combined saw-bench and band saw. The special feature of the exhibit is the chain mortiser, but equally striking is the vertical spindle, which works anything up to 4½ins. in depth to any mould and either straight or circular. The hand-power central lever mortising machine should be carefully studied; it gives extra play at the end of the stroke and will take work up to 11ins. by 7½ins. Messrs. Reynolds's address is Acorn Works, Edward Street, Blackfriars Road, S.E.

Cheap Doors.

Stand No. 99, Row E.

Messrs. Stavers & Stavers, whose address is 158, Leadenhall Street, E.C., are showing a considerable quantity of doors that are remarkably cheap considering their finish and quality. These are Swedish made to the firm's special designs. There are 30 or 40 new designs shown, ranging in price from a five-panel door at 12s. 6d. to one at 18s. 6d.; and other very cheap plain doors. Many of these designs are distinctly happy, and are far superior to the usual class of thing. The cleverness of the Swedes in making the joints hardly visible is particularly noteworthy. A somewhat new departure as regards stock doors is to decorate the panels with embossed designs in relief coverings, which can be painted over and picked out as desired. A patent graining process is shown that is a most remarkable imitation of natural wood, and adds only about 3s. 6d. on to the cost of a door. A number of mouldings of good section, cleanly worked, exceedingly free from knots, and cheap, are also in evidence. While this exhibit appeals more particularly to speculative builders, architects may well take note of it, for in cheap work stock doors are often a necessity, and any means of obtaining a little richness without additional cost is welcome.

Wood-block Flooring.

Stand No. 112, Row F.

This stand of the Acme Flooring and Paving Co. (1904), Ltd., of Gainsborough Road, Victoria Park, N.E., which is floored in 1½in. pitch-pine on Mr. Duffy's patent "Immovable-Acme" system of dowelled wood blocks, is an index to the firm's main exhibit in the gallery (bays 9 and 10), where examples of this paving in various woods are shown, as well as jarrah and karri planks, red gum planks, &c.

"Solignum"—a Wood-preserving Stain.

Stand No. 29, Gallery.

Messrs. Major & Co., Ltd., of Hull, again supply a picturesque addition to the Exhibition, demonstrating the advantages of their wood-preserving stain "Solignum." This year their stand takes the form of a summer-house with a small verandah in front. The woodwork is treated with "Solignum" in brown and green shades. If the wood-preserving properties of "Solignum" are as satisfactory as its appearance—and a glance at the numerous testimonials to be seen at the stand assure us of this—it must be a valuable preparation. "Solignum" is easily applied, it has a large covering capacity, and is moderate in price. It is now being extensively used, and is a cheap and effective covering for fences, gates and wooden outbuildings. It has antiseptic properties, prevents the accumulation of vermin, and it can be advantageously used for both the inside and outside of wooden buildings occupied by animals. "Solignum" is easily applied and can be put on cold, though it is best applied hot. It has a considerable covering power: a gallon will cover 250 to 350 sq. ft., according to the quality and condition of the timber. Wood treated with "Solignum" does not become more inflammable. Four shades are made: three of brown (the lightest shade maturing to a reddish brown, the medium to a Vandyke brown, and the darkest shade to a black brown) and one of green (a very pleasing tint).

A Paint Remover.

Stand No. 27, Row A.

Messrs. H. E. Kershaw, Ltd., of 120-131, Curtain Road, Shoreditch, have a special exhibit giving prominence to their paint-remover "Kompr." This is an article of very great interest to the building trade. It will remove paint in a minute, is entirely free from acids, alkali or any other chemicals, and will not hurt the most delicate fabric, or the flesh. "Kompr" is 9s. a gallon. Messrs. Kershaw also exhibit French polish and spirit varnishes, glue and brushes, and builders' ironmongery.

"Chez-Lui" Enamels and Stains.

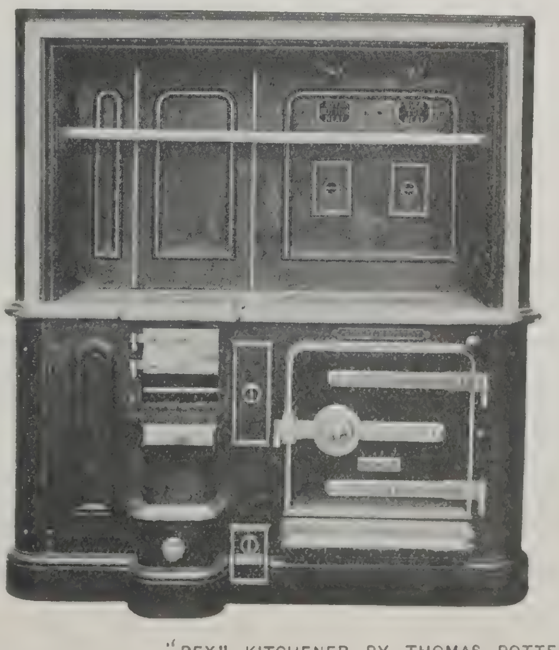
Stand No. 41, Row B.

Messrs. James Price & Son, of 10-20, Fitzroy Place, Euston Road, N.W., exhibit numerous enamels, paints and stains—more particularly the several varieties of enamels and stains for sanitary and decorative work known under the registered name of "Chez-Lui."

Ranges.

Stand No. 44, Row B.

Mr. Thomas Potterton is showing his "Rex" and "Regina" kitcheners and high-pressure bath boilers, the patent "Zig-zag" range boilers, and patent gas-heated hot-water system for domestic services, "Victor" gas boilers, and acetylene gas generator. We illustrate on this page the "Rex" kitchener with single oven, and the single-handed boiler. The special feature about these kitcheners is that they are different to the usual arched flue bath boiler, with the fire passing under it and direct up the chimney, as in the ordinary type of kitchener, which is distinctly uneconomical of fuel if hot water is required. In these ranges the boiler is constructed so that the flue is formed between the boiler and the oven, where it descends and passes under the oven and up at the rear. By this means a very long flue travel is obtained, with little heat wasted, while it enables hot water to be obtained at the same time as the ovens are heated. By the use of dampers, top or bottom heat may be obtained, as desired, for cooking. An arrangement is supplied in which there is a separate flue for the boiler to heat water alone, this being entirely closed while cooking. A very useful little hob register, fitted with a patent high-pressure boiler, is shown at this stand. It would be very advantageous in many buildings, such as flats, as it allows hot water to be obtained for domestic or heating purposes when the kitchener is not in use, or where cookers are arranged instead of coal ranges. This stove has wide hobs, which can be used in cooking. The special "Victor" gas boiler and hot-water circulating apparatus is very useful for domestic services with or without gas-cooking ranges. The boiler is made of copper, and consists of one or more tubes in an outer shell enclosed in a cast-iron frame. They can be fitted to any make of cooker by cutting away part of the side.



"REX" KITCHENER BY THOMAS POTTERTON.

High-class Mosaic.

Stand No. 42, Row B.

The exhibit of the Mosaic Manufacturing Co., 18 and 20, King's Road, St. Pancras, N.W., consists of mosaics of every description in marble, glass and ceramic; parquetry, leaded lights and hammered copper. Original designing combined with good workmanship place this firm in the front rank of modern mosaic workers; and the exhibits at this stand will be appreciated by all who have an interest in first-class work.

A Wonderful Imitation of Marble.

Special Position No. 9.

At this stand of Messrs. Durolite, of 86, Leadenhall Street, E.C., to whose exhibit of opal tiling we referred on p. 223 of our issue for last week, some remarkable examples of imitation marble are shown. These appear to be produced by a photographic process, the image being transferred on to the tile and there fired, the result being wonderfully true to the original—in fact, even on a close inspection it is difficult to detect that this is not real marble.

Stable Fittings.

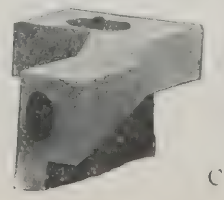
Wall Space No. 134.

In addition to the grates exhibited at this stand by the Carron Co., of Carron, Stirlingshire, and 15, Upper Thames Street, E.C., which we noticed on p. 224 of our issue for last week, stalls for a racehorse and a carriage-horse, and loose-box, are shown, carefully finished in every detail, and special attention is directed to a manger which has a turned-over top that prevents the horse injuring himself whilst feeding, and also prevents him throwing the food over the edge on to the floor.

Lift Gates.

Stand No 81, Row D.

Messrs. Joseph Richmond & Co., Ltd., of 30, Kirby Street, Hatton Garden, E.C., who have a model of their automatic electric passenger and hand-power and electric dinner lifts on show, have one feature of particular interest, namely, a gate for use with their automatic lifts. This removes the objection with such lifts of the doors swinging out and blocking narrow passages (a folding gate being impossible of adoption for obvious reasons). The gate is made in two halves, and thus only swings out a small way. It is only unlocked by the lift moving a cam-arm. If accidentally pushed open when the lift is passing, the lift immediately stops, so obviating accidents.



Weldon Stone.

Stand No. 11c, Row F.

Samples of this well-known stone, and also a beautiful old date stone 1690, showing its extraordinary weather-resisting properties, are to be seen at this stand. Weldon stone is a typical oolite composed of oolite spherules and shell fragments of the more durable form of carbonate of lime bound together by sub-crystalline calcite. Its chemical analysis, as made by Professor Attfield, Ph.D., F.R.S., &c., is as follows :—

Carbonate of lime	94·35
" magnesia	3·55
Iron (as peroxide)	·61
Alumina	·28
Silica	·08
Moisture, with traces of organic matter, manganese, &c.	1·13
	100·00

Its specific gravity is from 2·42—2·45. It saws readily without water, and is therefore a cheap and easy stone to work, whilst at the same time it hardens rapidly by exposure to the weather. The stone is delivered on Midland rails at Weldon and Corby for 1s. 4d. per ft. cube. Blocks are quarried up to 80ft. cube, though the general average is 16ft. Weldon stone has been used in many important buildings in this country—for example, in the new tower to Rochester Cathedral, completed last year—and architects concerned with church-work especially should take occasion to examine it. Samples will be forwarded on application, and the quarries can be viewed by appointment with the manager, Mr. John Rooke, Weldon Grange, Corby, Kettering.

A Superb French Stone.

Stand No. 80, Row D.

Though used for some of the most important buildings and monuments on the Continent, more especially in Paris, the fine marble stone called "Echaillon," exhibited at this stand, has only quite recently been introduced in this country, and as yet has only been used in a few buildings here, among which we may mention that staircases and paving at the new Ritz Hotel in Piccadilly will be of this stone. The quarries where it is obtained are about twelve miles from Grenoble, in the south of France, and are very old, though the working of them has been spasmodic owing to political and financial difficulties. Now, however, the most up-to-date plant has been installed, and the proprietors are able to cope with all requirements. Echaillon is a coralline limestone, almost pure, in some cases showing traces of magnesium, but in no way argillaceous. It is quarried in three colours, white, yellow and pink, and by reason of its great density, close grain and exceptional strength and hardness is specially suitable for the finest class of sculpture, as well as work of utility such as staircases, paving, sinks, &c. White echaillon is particularly effective when finished with a matt polish, whilst yellow and red can be highly polished. The sole agents for Great Britain and the Colonies are Messrs. Dawson & Co., Ltd., of Mendip Wharf, Battersea.

The Baryta Treatment of Stonework.

Stand No. 91, Row E.

The exhibits of Messrs. Julius Hülsen & Co., of Collingwood Street, Newcastle-on-Tyne, are baryta-water for the treatment of stonework, and precipitated carbonate of barytes for the prevention of scum and discoloration on facing bricks, terra-cotta, tiles, ridges, quarries, &c. (samples showing the difference between the same seams of clay when burnt with and without an admixture of this chemical). Professor Church's report on the baryta treatment of decayed stonework was given in our columns when it was published last year. From the experiments made on the chapter-house of Westminster Abbey and elsewhere it is clear that this is the best known treatment for decayed stone, and every architect should make himself familiar with it. The baryta-water is applied, preferably, with a diffuser, and the chemical changes brought about by its use are mainly these :—The soluble sulphate of lime, that is, gypsum, in the decayed stone is converted, in part or wholly, into soluble sulphate of baryta, with the simultaneous production of hydrate of lime. The latter will be changed gradually into carbonate and will then have re-assumed its original state. It is to this change that the hardening and consolidation of the decayed stone are mainly due, but it may be weeks or in some cases months before the process is complete. The experience of four years indicates that the baryta-treatment involves no risk of bad consequences, though it is possible that, after the lapse of a decade or two, further treatment with baryta may prove desirable.

A Destructor for Hospital Refuse.

Stands Nos. 5 and 6, Rows B and C.

Just as cremation will ultimately supersede the old method of burial, so in the future the disposal of town and trade refuse by being burned in suitable furnaces will be exclusively adopted in place of shovelling into pits and leaving the slow processes of Nature to reduce all to earth. Destructors are now commonly employed by private as well as municipal bodies, and in this connection we may draw attention to the patent hospital type exhibited at this stand by Messrs. Meldrum Brothers, Ltd., of Timperley, near Manchester. For infectious-diseases hospitals especially it is essential that the refuse shall be dealt with absolutely without risk of contagion, either by inefficient transfer, incomplete combustion or the dissemination of noxious gases. To this end Messrs. Meldrum's destructor is designed, and all architects interested in the subject will do well to inspect it.

Electric-light Gas-engines.

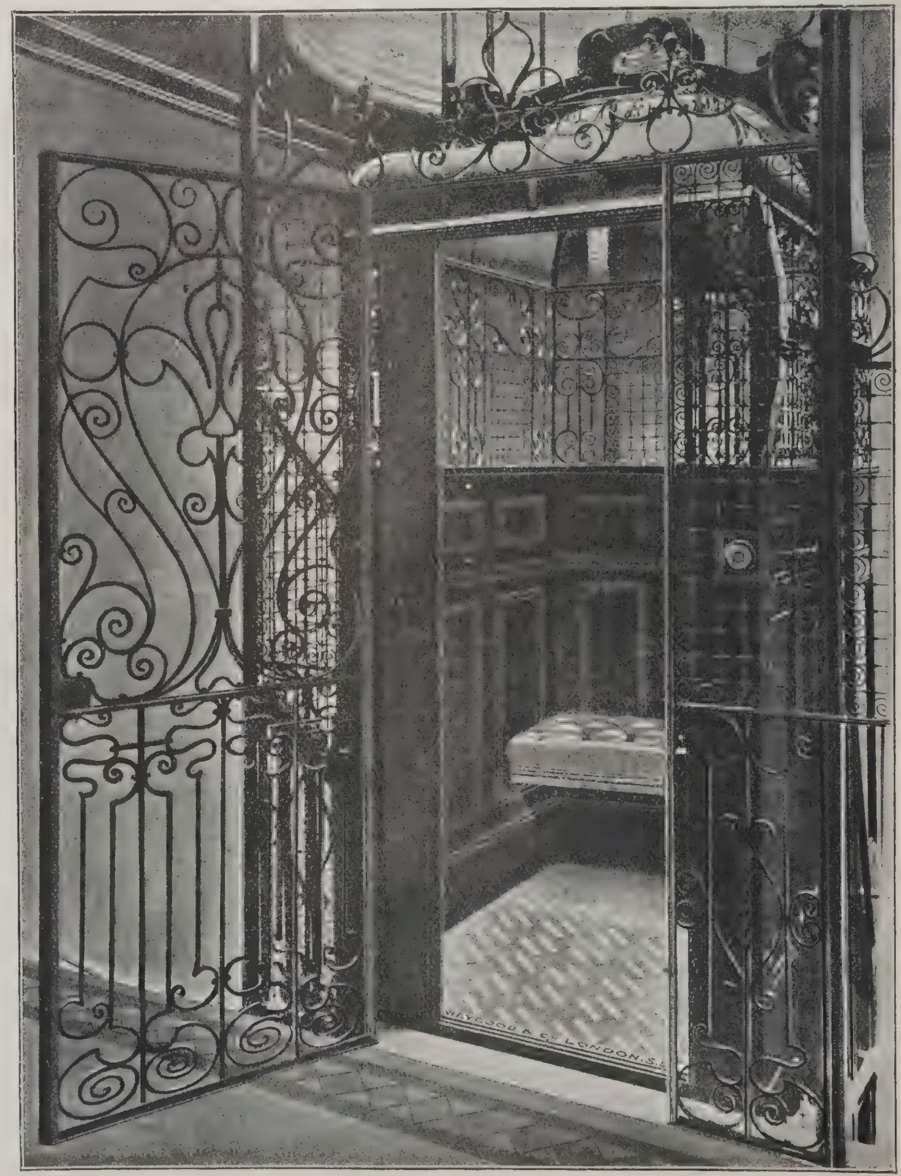
Bay 13.

The National Gas Engine Co., Ltd., of 75A, Queen Victoria Street, E.C., show one of their 8-b.h.p. special electric-light gas-engines, coupled direct to the crank-shaft of a 6-k.w. dynamo, from which set 90-16-c.p. lamps can be supplied. They also show a new type 1¾-b.h.p. high-speed gas-engine, arranged to run from 500 to 650 revolutions per minute. This little engine has been specially designed for small private-house installations, and will therefore be of interest to many architects.

A Passenger Lift.

Special Position No. 11.

We illustrate below the passenger lift exhibited at this stand by Messrs. R. Waygood & Co., Ltd., of Falmouth Road, Great Dover Street, S.E., of which some particulars were given on p. 230 of our issue for last week. This lift can be fitted with the automatic gear operated by buttons in the cage by which it is possible to bring the lift to any floor, without an attendant. The advantage of such a system is obvious.



PASSENGER LIFT BY WAYGOOD & CO.

COLUMBIAN FIREPROOFING Co., LTD.,

37, KING WILLIAM STREET, E.C.

CONCRETE FIREPROOF FLOORS

AND

Reinforced Cement Pipes

Telephone: 5060 Bank. Managing Director.

Brick Fireproof Partitions.

Bay, No. 12.

The Hempstead Patent Brick Co. are showing their partition blocks, which we noticed in our columns some time ago in connection with a test which was performed specially for us. The clay of which these blocks are made is very remarkable, being able to withstand a heat sufficient to melt steel. Tests have proved beyond doubt that partitions constructed of these blocks will resist the greatest heat for any length of time without expanding sufficiently to cause the slightest bulging or raising the temperature of the outside sufficient to ignite a match. The application of water from a hose has no effect. This firm show a new fireproof door which should be of the greatest service. It is constructed of these clay partition blocks in an iron frame, and plastered in cement. If a door were constructed to slide in a partition formed of these blocks, no ironwork need be exposed, only the blocks facing the flames; thus making an effectual barrier. The use of the slabs for ceiling protection is illustrated in a little building which forms a striking feature of this stand. The cost of these partition blocks is very little, and they are made with great accuracy, so that only a finishing coat of plaster is required. They will take nails or screws readily.

Slag Wool and Partition Blocks.

Special Position No. 8.

Messrs. Frederick Jones & Co., of Rylands Road, Kentish Town, are exhibiting their slag wool or silicate cotton, the many advantages of which are so well known as to need no emphasis on our part. This is a fireproof non-conductor of cold and sound, and is vermin-proof. The loose slag wool for pugging purposes is exhibited sandwiched between galvanized wire netting, so as to form a convenient felting for insulation. Another feature is the use of metal lathing instead of the wire netting for holding the slag wool. Sheets formed in this manner can be used for protecting girders, columns, &c., or for application to studded partitions, the metal lath affording an excellent key for plaster or cement. Messrs. Frederick Jones & Co. are the makers of the partitions with helical channels and interlocking edges for grouting well-known under the name of "Hercules," and another design, with mortices at the ends, to form dowels with plaster grouting. Fibrous plaster slabs are an invaluable help in construction, and are far superior to the ordinary plaster.

Fire-resisting Partitions, &c.

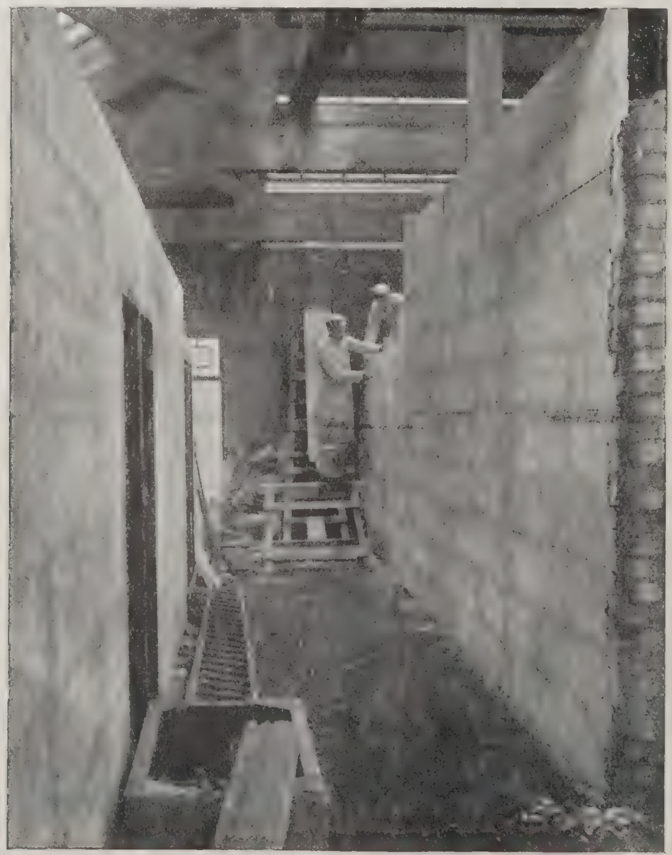
Bay No. 20.

To take something which has already passed through fire, either by natural or artificial means, is the only sure basis for a fire-resisting material. Hence at this stand we see the application of a volcanic ash to partitions, and for floor, stanchion and girder casings. The exhibit is that of Messrs. Horace W. Cullum & Co., of Craven House, Kingsway, W.C., and the name of the material "Kulm." This is not used in the form of mortar, but made up into slabs of different sizes which, for partition work, are nailed on to battens, or nailed into one another when used for encasing ironwork, &c. Thus, as the slabs can be nailed, there is no necessity for grounds or plugging for fixing skirtings, architraves, &c. No wires or iron rods are used in erection, and it is claimed that the partitions are absolutely rigid and soundproof. As to their fire-resistance, it may be stated that "Kulm" partitions have withstood a two hours' test by the British Fire Preventive Committee, obtaining the highest class for a width of $2\frac{3}{4}$ins.

Mack Slabs.

Stand No. 57, Row C.

In our last issue we referred to Messrs. J. A. King & Co.'s stand. We now publish an illustration showing the erection of a partition of their 2in. slabs at the new baths at Warrington (Mr. Thomas Beesley, architect). Several interesting applications of this firm's manufactures are shown, of which we may specially mention the method of column protection, their fibrous plaster slabs, and their slabs with tiles in the face, giving the appearance of brickwork.



ERECTING PARTITIONS WITH "MACK" SLABS AT WARRINGTON PUBLIC BATHS.

Plate Wall Partitions.

Stand No. 63, Row C.

In our notice of the partitions of the London Fireproof Plate Wall Co., Ltd., of 60, Watling Street, E.C., on p. 227 of our issue for last week, the reference to internal rods is misleading, as these are only necessary when extraordinary heights have to be built. The company show a suspended wall without any rods or ironwork—held in position by side grip simply—but this is only a novelty to show how floors can be relieved of weight. The slabs used are grouted together so as to become one solid piece, and being smooth on the face no finishing coat is required, and they may be papered or distempered shortly after erection. They are also made rough, with finishing coat, for tiling, &c.

Tubular Partitions and Floors.

Bay No. 3.

The British Fireproof Construction Co., of 11, Queen Victoria Street, E.C., are showing their partition blocks, terra-cotta tubes for floors and reinforced concrete floors. The partition blocks or tubes are 3ins. thick and hollow and weigh 14 lbs. per ft. super. when fixed. At the ends is a groove which carries the breeze-concrete joints that give strength and to which fixings can be nailed. These blocks are made in several sizes. The floor tubes are from $5\frac{1}{2}$ins. to $10\frac{1}{2}$ins. deep, 12ins. to 15ins. wide, and $\frac{3}{4}$in. thick. These tubes form a permanent ventilating centering for the concrete, which is little in amount. A reinforced concrete slab 12ft. from centre to centre designed to carry a distributed load of $1\frac{1}{2}$ cwts. per ft. super., with a factor of safety of 3, is shown carrying a load of 5 cwts. per ft. super. with a deflection of only $\frac{1}{2}$in.

Combination Baths and Kitcheners, &c.

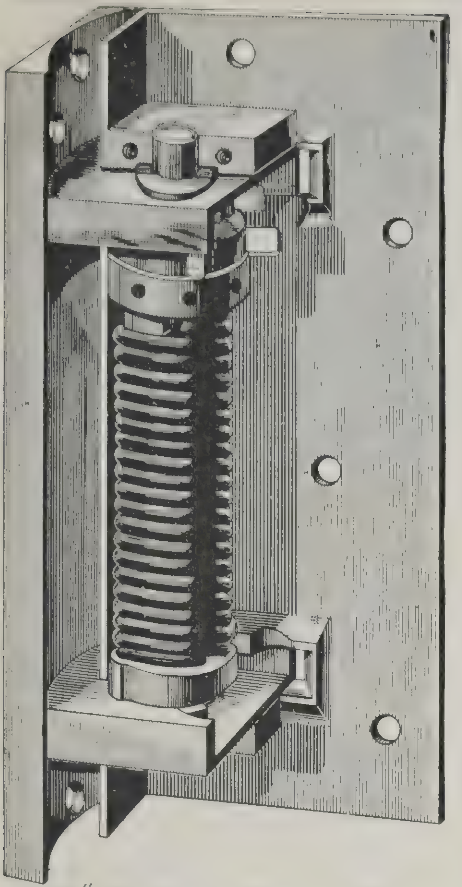
Stands No. 1, Arcade, and No. 127A, Wall Space.

The Ellkay baths are now well-known. They offer such advantages as to saving of space that they commend themselves. The company have now combined with the business of Mr. James Cornes as Ellkay & Cornes, Ltd., the capital of which is £80,000, so that they are now enabled to push their various specialities on a scale appropriate to their value. The patent combined kitchen-range, boiler, bath and copper invented by Mr. Cornes has been used in many workmen's dwellings. It saves much space and enables the working classes to be given comfort. The whole combination is most ingenious, and the cost is not prohibitive even in the cheapest houses. Another noteworthy feature is the enamelled steel bath in one piece. The advantage of steel is that the bath heats up so much more quickly when water is turned in.

Reinforced Concrete.

Stand No. 72, Row D.

The insistence of reinforced concrete upon the attention of the building public in the present day lends an interest to the exhibit of Messrs. Potter & Co., Ltd., 66, Victoria Street, who are showing various types of fireproof floors and their application of concrete. We draw attention to a little treatment which is interesting, namely, theatre steppings, as executed at the Chelsea and Walthamstow theatres, &c. These are constructed upon a permanent centering of corrugated galvanized sheets bent to special form. By this means the costly, elaborate and obstructive temporary boarding is avoided, and the time necessary to complete the work is considerably lessened. Fronts of balconies, galleries, boxes and crush barriers are formed by Messrs. Potter of concrete and small steel tension rods. The firm uses a special form of reinforcing rod, namely, corrugated. As several others are of a very different shape, the nearest description is to call them waved. Potter's well-known Century floor cramp, the great advantages of which are well known, is also exhibited.



THE "NEW IDEA" HINGE BY NORTON & GREGORY, LTD.

A New Spring Hinge.

Stand Nos. 21 and 22, Rows B and C, Gallery.

The accompanying illustration shows a new spring hinge which has been introduced by Messrs. Norton & Gregory, Ltd., of Castle Lane, Buckingham Gate, S.W. The great feature of this hinge is that it can be fixed on the door instead of in the floor, and thus it is specially adaptable to doors over concrete floors or girders, and in other positions where the fixing of floor springs would be extremely difficult if not impossible. As will be seen, the device is very simple in construction, consisting of two parts, one for fixing to the stile of the door and the other to the jamb, with the spring mounted on a pin between. The hinges, as supplied, are at the proper tension for ordinary doors, but the tension can be readjusted to suit any requirement. These hinges are made in polished gunmetal, bronze plated, or japanned iron, at prices ranging from 6s.

To Supersede the Old Method of Hanging Sashes.

Stand No. 99, Row E.

The breaking of sash lines and the jamming of pulley wheels are too often experienced to call for comment; hence the introduction of many devices to supersede the ordinary method of hanging windows. At this stand will be seen a patent pulley with specially strong teeth for use with a hardened steel chain. The workmanship of both is excellent. The device is applicable to new or old windows and is a great improvement on the ordinary method. It has been employed in numerous Government buildings, important hospitals and large business premises. The makers are the Rhodes Patent Sash Hanging Co., of Fairholt Road, Stoke Newington, N.

Columbian Fireproofing and Reinforced Concrete Pipes.

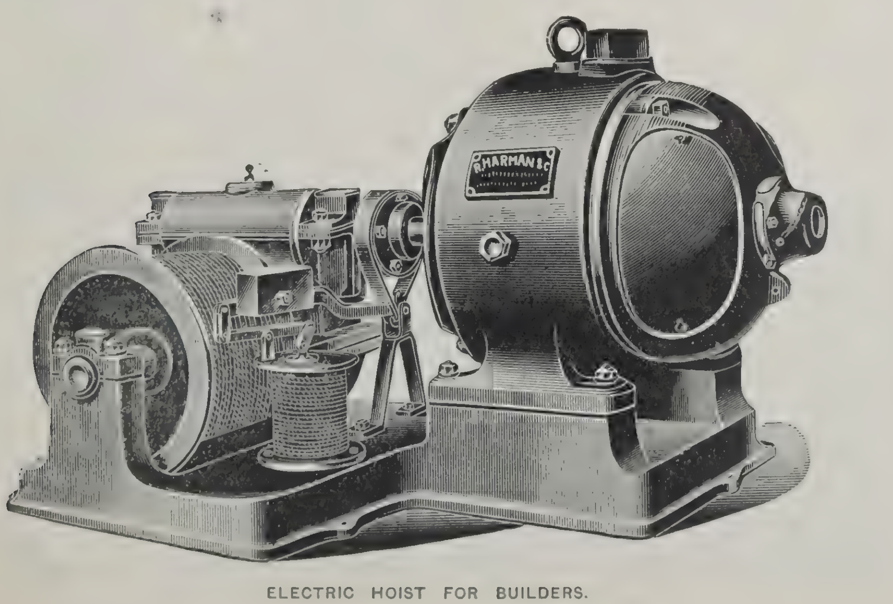
Stand No. 54, Row C.

In our last issue we made some reference to the exhibit of the Columbian Fireproofing Co., Ltd. We would add that their stand is one of the most striking in the hall. Consisting of a high steep roof with dormers, resting on piers, it is an exemplification of what is being done by this firm at the Ritz Hotel, the Waring Building, and the Shipping Combine's offices in Cockspur Street, London. At this stand a special feature is made of reinforced concrete pipes executed on the Bonna system, the patent rights of which have been acquired by the company. The advantages of these for water (under any pressure) or drainage systems is great, and the company are now prepared to take contracts for this class of work.

Electric Hoist for Builders.

Wall Space No. 127.

We give on this page an illustration of an electric hoist specially designed to meet the requirements of the building trade, as described on p. 224 of our issue for last week. This hoist, of which the makers are Messrs. R. Harman & Co., of 10, Westmoreland Buildings, Aldersgate Street, E.C., allows the most delicate adjustment to be effected—so desirable in the case of moving building materials on to scaffolds, and it has the special advantage of a mechanical break operated by an electro-magnet, which is only released when the attendant has the operating lever in action; thus avoiding all danger of the hoist running down in the event of the lever being suddenly released. This hoist has been supplied for several large building works, including the new Ritz Hotel in Piccadilly, where it is used by the Columbian Fireproofing Co. On this job during eight working weeks it lifted 11,000 super. yds. of concrete for double-construction ceilings and floors—60 tons per day—at the speed of 100ft. per minute, at a cost for current of 1d. for 3 tons.

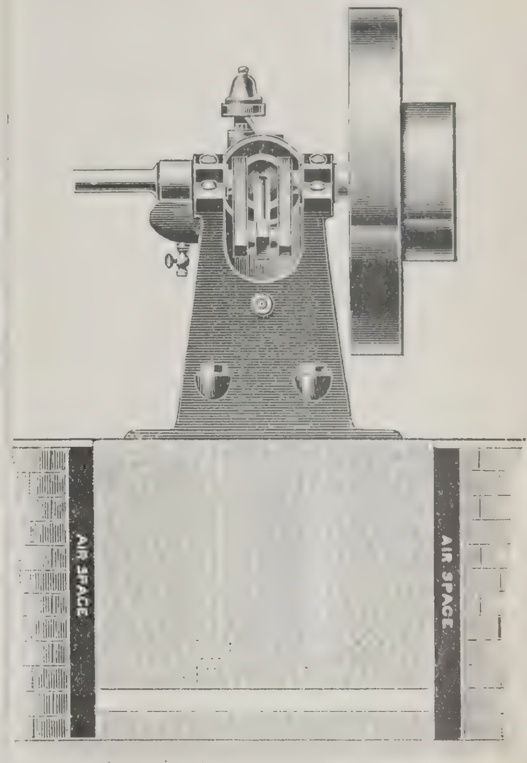


ELECTRIC HOIST FOR BUILDERS.

Impregnated Foundation Felt.

Stand No. 89, Row E.

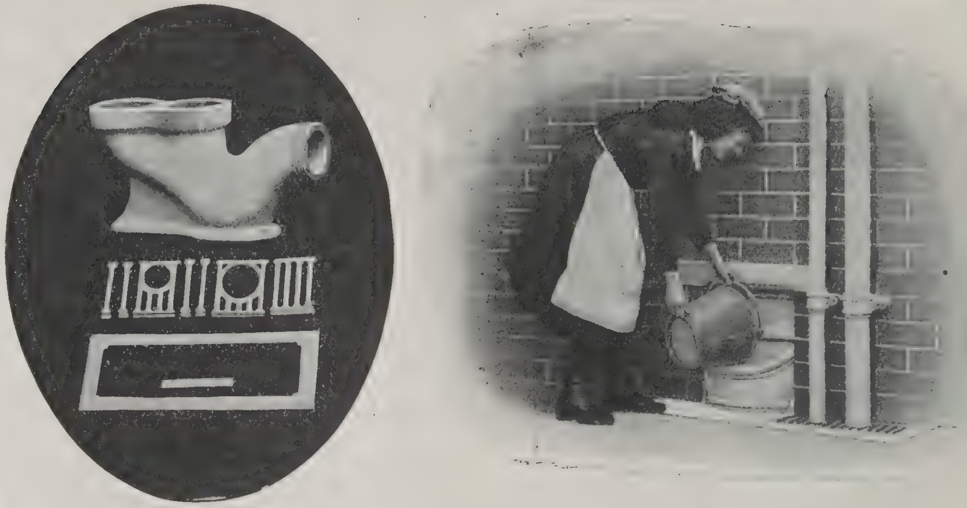
The reduction of vibration has become a very difficult problem with engineers and architects nowadays, and various expedients have been adopted to minimize the effects. It has been established that the imposition of a layer of some elastic material eliminates vibration to a very great extent, and probably the most serviceable of these is the patent impregnated felt made at Leeds by Messrs. Mitchells, Ashworth, Stansfield & Co., Ltd. (whose London office is at 12, Newgate Street, E.C.). This felt can be used for a variety of purposes in building and engineering work—such as for beds and filling for joists and stanchions, bridge work, engine foundations, &c.—and may be depended upon as thoroughly efficient. It is made entirely from wool, impregnated on the surface by a chemical process and in the body of the felt with a special oil, rendering it firm and impervious to moisture. There is no fear of the felt being pulped or squeezed out, but at the same time it retains the qualities of elasticity, enabling it to greatly overcome vibration and neutralize any jarring. The felt is made in sheets of any thickness from 5 to 30 mm. ($\frac{1}{4}$in. to $1\frac{1}{4}$ins.), the largest sheets measuring 5ft. by 2ft. 6ins. We give an illustration showing how it may be applied to engine beds. A layer of felt is interposed between the upper concrete engine-bed and the concrete foundation, and bolts are carried from each to the other and an air-space left on either side. This isolation, and the fact that the bolts holding down the engine bed are not continuous, prevents the vibration being transmitted, and the felt eliminates it. It will be seen what a saving is thus effected over the massive spreading foundations otherwise necessary. A non-flammable hair felt for insulating walls is also made by Messrs. Mitchells, Ashworth, Stansfield & Co., and should prove highly advantageous for protecting roofs and partitions, particularly as regards the latter, as it is a very efficient deadener of sound and would cure many a distressing echo.



Slop Chutes.

Stand No. 18, Row D, Gallery.

The exhibit of Messrs. J. Hirst & Son, of John William Street, Cleckheaton, will not be passed unnoticed by architects, as a very excellent sanitary device is shown, namely, a patent sanitary slop chute, with channels and grates, which has been recently awarded two bronze medals by the Sanitary Institute. We give two illustrations of them on this page. The Local Government Board's by-laws require an open channel, and the constant trouble which is caused by falling leaves, &c., stopping this up can only be prevented by a grating. Messrs. Hirst's patent grating has obvious advantages in this connection, as it is constructed in several parts, which can be shifted into convenient positions for the reception of fall-pipes, no cast-iron shoes being required. One illustration shows these fall-pipes, and the other illustration shows the method of releasing various portions of the grating by knocking out the key; this key, being on the end side, cannot be interfered with without removal and exposes no loose parts. Where the Local Government Board by-laws are not in force, various other forms can be used, as shown at this stand. The advantages of these slop chutes over the old-fashioned shallow slop dishes are obvious, for by their adoption leakages into foundations, smells and diseases are obviated, while the sink waste pipe is reduced in length and properly protected. One sanitary trap only is required and one connection to sewer. No blocking can take place. All parts are accessible and easily fixed, and the appearance is neat. A special form is made flush with the outside wall. At this stand is also shown a standard patent system of paving for roadways and pavements. This consists of inserting a thin strip of metal between the course of paving, this preserving the edges of the setts and preventing the road wearing down unevenly. The life of roadways paved on this system has been proved to be double that paved in the ordinary way; and there are many other points which will occur to those who have to deal with roads.



PATENT SLOP CHUTE BY J. HIRST & SON.

Setts.

Gallery Bay 6.

All kinds of setts are shown at this stand by Messrs. Brookes, Ltd., of 16, Great George Street, Westminster, Halifax, London, Manchester, &c. Chief prominence, however, is given to the "Ystehede" granite setts from the firm's Scandinavian quarries. These are blue and grey and are very close grained, with the mica uniformly distributed with the harder particles, ensuring perfect foothold on any gradient. The face, ends and edges are specially dressed to reduce noise to a minimum, as well as the quantity of pitch required for grouting. A portion of tramway track affords a good example of the appearance and quality of the setts, while an admirable series of photographs illustrates the process of quarrying and the method of shipment and transport. Coping, curbing, chippings and macadam are also exhibited, the last including the "Naesnes" variety, which is very tough and durable.

Non-slip Flags.

Gallery Bay 5.

The drawback to many artificially-made stones when used for paving purposes is that they wear to a very slippery surface, and therefore become really dangerous on staircases and steps. At this stand are shown numerous examples of a patent artificial stone which is free from this defect, being of such a texture as to wear like York stone. The exhibit is that of the Hard York Non-slip Stone Co., of 16, Great George Street, Westminster. Flags both red and white are supplied complete for laying in footways and cut for coal plates, &c., some, too, being grooved to carry away water and afford a good foothold. These flags have been supplied for numerous important works, including work for H.M. the King at Windsor and for more than 400 corporations and public bodies. The stone of which these flags are made is also used for architectural dressings, an example of which is shown at this stand in the shape of a facsimile of a window-head in the new head-offices of the company at Lightcliffe, near Halifax.

Sorel Cement.

Stand No. 70, Row D.

Sorel cement—that remarkably strong magnesian cement—was invented many years ago, but has been little known. The Rock Manufacturing Co., of Grays, Essex, who manufacture it, are showing artificial stone made with it. They also make a feature of "Rockwood" flooring composed of wood fibre and Baralite cement and laid *in situ*, upon any surface. The sale of the cement alone is also being pushed.

Standard Baths.

Although the Standard Sanitary Co. have no stand, a number of their baths are exhibited by various firms, and attention to these is drawn by the excellent finish inside and outside the baths.

Reversible Sash Windows.

Special Position No. 9, Row B.

The number of reversible sashes exhibited at the hall is large, but Webber's patent, shown by the Amhurst Building, Joinery and Patent Window Frame Syndicate, Ltd., at the stand of Messrs. Durolite, Ltd., is truly remarkable for the simplicity and quickness with which the operation of reversing the sashes may be performed, namely, in 4 seconds by one used to it. Casements that can be turned inwards by the same principle are shown. These exhibits deserve notice for their extreme simplicity.

Bitumen Damp-course and Sheeting.

Stand No. 77, Row D.

Messrs. George M. Callender & Co., Ltd., of 25, Victoria Street, Westminster, S.W., show various samples of their pure bitumen damp-course and the method of its application to different kinds of buildings. They have also constructed a tank on the floor of the hall, which is made watertight by means of their pure bitumen sheeting—a material largely used for lining reservoirs, swimming baths, ponds, tanks, ornamental lakes, filter beds, bacteria filters, &c. The damp-course and sheeting are manufactured from pure Trinidad bitumen, without the admixture of coal tar or pitch of any kind.

New Door Spring.

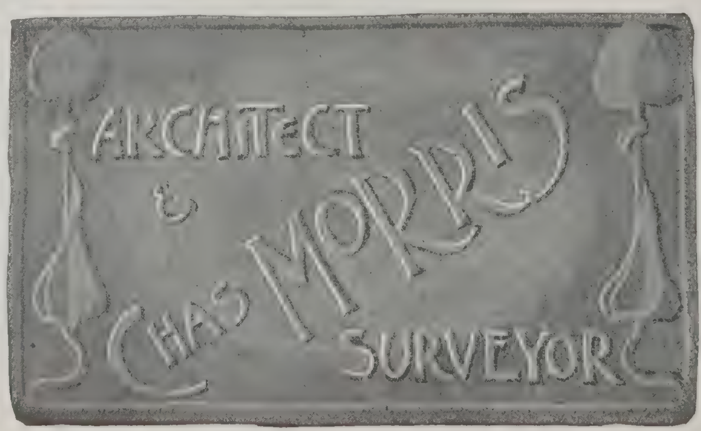
Stand No. 48, Row B.

The "Quadrant" door spring and the "Unique" reversible window sash are shown by Messrs. Martin's Patents Co., Ltd., of 11 and 12, Finsbury Square, E.C. The former consists of a curved tube fixed at one end to the door and at the other end to the frame. Inside the tube is a strong spring. A pin is fixed on top of the door and presses against the spring as the door is opened, while the spring presses against the pin and closes the door automatically when the latter is released. For ordinary single doors the price in polished brass is 12s. and for swing doors 22s.

Architectural Terra-Cotta.

Stand No. 96, Row E.

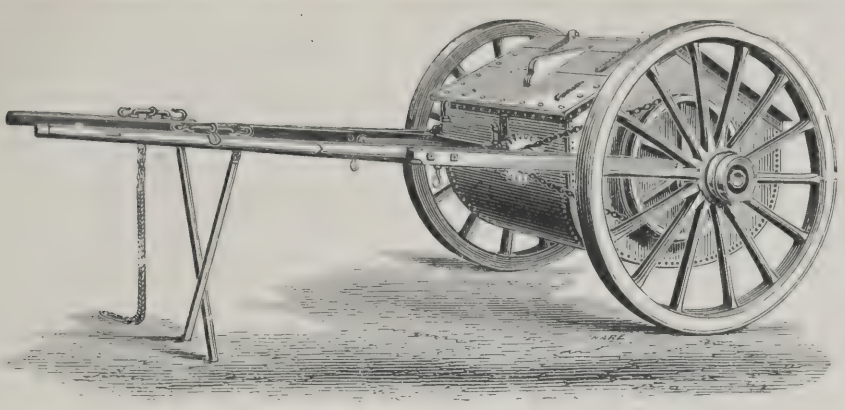
We regret that in the notice of the exhibit of Messrs. Carter & Co., of Poole, on p. 219 of our issue for last week, we inadvertently referred to stands "showing the latest patterns in wallpapers." We should have said "wall tiling." These patterns are very well chosen and are worthy of the attention of all architects and builders.



Name-Plates for Architects.

Wall Space No. 137.

The accompanying illustration shows one of the numerous signs made by The Brilliant Sign Co., Ltd., of 38, Gray's Inn Road, W.C., makers of all kinds of letters, facias, wall signs, &c. Many of the new designs made by this firm will be found to be a great improvement on the usual fancy styles, and as such we draw attention to them.



A MORTAR TUMBLER CART BY BARROWS AND CO., LTD.

A Mortar Tumbler Cart.

Bay 4.

Messrs. Barrows & Co., Ltd., of Cherwell Works, Banbury, Oxon, show an 8-n.h.p. single-cylinder portable engine, a No. 2 improved London timber trolley, an improved 200-gallon mortar tumbler cart fitted with eccentric balancing axle, and a portable under-geared 6ft. mortar mill with vertical engine and boiler combined, mounted on high travelling wheels. The last-named is found to be very useful in cases where the ordinary separate type of mill and portable engine is out of the question. It can be drawn directly on to the site and set to work within an hour, and is consequently specially suited for small jobs where it is not worth the trouble and expense of fixing a separate mill and engine.

Wallpaper Trimming Machines.

Stand No. 24, Row A.

Mr. James Oates, of 33, Trinity Street, Huddersfield, exhibits the "Empire" and "Express" wallpaper trimming machines in operation, a special feature being made of some attachable fittings enabling paperhangers to quickly trim "relief" materials. The "Express" machine is guaranteed to trim both edges clean and accurate and to rewind the thickest 12 yd. roll of "Lincrusta" "Lignomur," "Cameoid," "Anaglypta," &c., in one minute, automatically guiding the material. The prices of these machines range from £7 18s. to £9 15s. With an "Empire" machine 800 pieces of wallpaper can be trimmed in the time taken to trim 100 pieces with scissors or straight-edge tool. This machine is made in two patterns—one for papers up to 21ins. wide (price £2 19s. 6d.) and the other for papers up to 30ins. wide (price £3 12s.).

Automatic Gas Lighting.

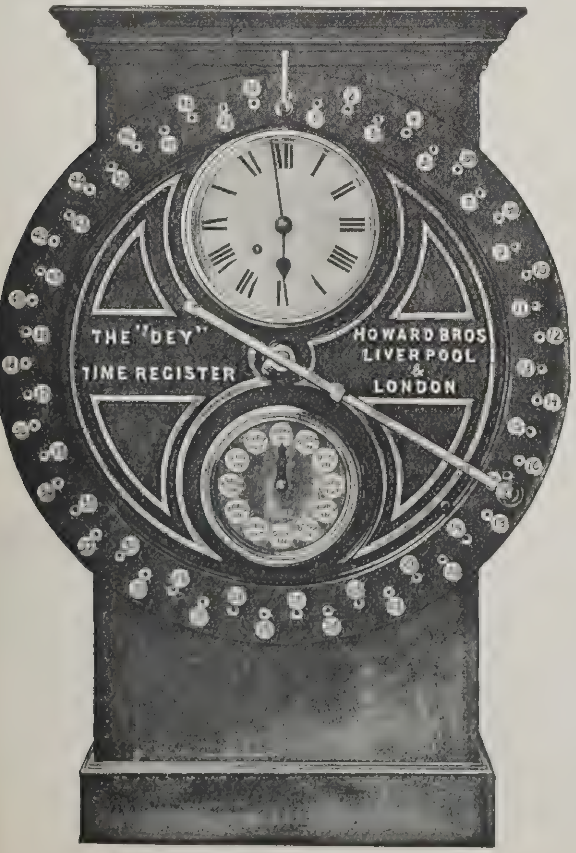
Stand No. 4, Gallery.

Mr. L. Soman, of 21, Redcross Street, E.C., shows the "Conus" gas lighter (a German invention). This is a very simple device, consisting of a piece of platinum wire inside a spiral attached to the top of the chimney. This wire becomes incandescent when the stream of gas issues, and the lighting is therefore automatic. Its special feature is, of course, that the gas consumption of a by-pass is done away with. Numerous devices of this nature have been invented, but as a rule they have suffered from fragility and short life. The "Conus," we understand, is free from these drawbacks. Its price is 1s. Mr. Soman also manufactures a pneumatic gas-lighter by which the gas can be turned on from a distance by merely pressing a button, the "Conus" doing the rest.

Time Registers.

Stand No. 46, Row B.

Time registers are indispensable in all large works and factories. Much ingenuity has been expended on them, and they are now perfect for all practical purposes. The "Dey" time register made by Messrs. Howard Brothers, of 100c, Queen Victoria Street, E.C., has several special features. It is very simple in construction, always accurate in working, and complete in itself, the record being made by each workman simply moving the pointer round to his number and pushing it in: thus doing away with all keys, checks and tallies. Each record is separate, and no matter in what order the employees arrive or leave, their numbers are bound to appear in consecutive order on the time sheet, with all the registrations for day or week printed in bold type in one line opposite each man's number. The ribbon which inks the type is fed automatically, requiring no attention for a year or so, and the register is provided with plate-glass doors on either side, thus allowing the record to be seen at a glance. The daily time-slip is ready for pay roll when it leaves the register, and can be pasted in the wages book. No transcribing of any kind is necessary. In conjunction with these time sheets there is an attachment which records on cards the time spent by workmen on outside or inside jobs, for the purpose of cost keeping. The rate at which the "Dey" time register can be used may be gauged from the fact that 2,000 men can record their time on ten machines in four minutes. Among London building trade firms who use the register may be mentioned Messrs. Holloway Brothers, J. Carmichael and George Trollope & Sons.



Contractors' Railways, Concrete Mixers, &c.

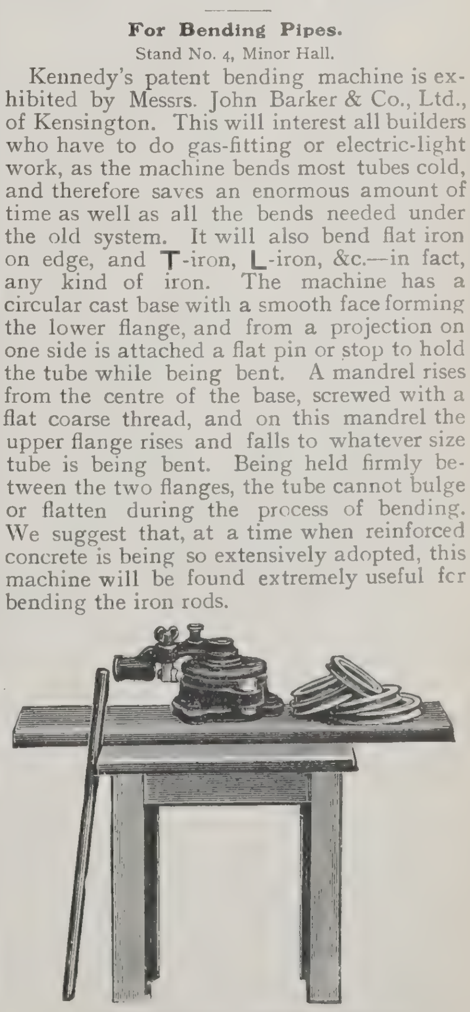
Bays 22, 23 and 24; Stand No. 2, Minor Hall.

As indicated above, Mr. Arthur Koppel has two stands, the latter consisting of a length of track around the minor hall where a neat little hydroleum locomotive runs to and fro. This small engine is made from 5-h.p. to 20-h.p., suitable for gauges between 18ins. and 24ins., and has a water-tube boiler fired by liquid fuel—such as Texas fuel oil, kerosene, water gas tar, &c. An oil-engine is undoubtedly the most efficient source of power yet discovered, and this small hydroleum locomotive embodies the best features of the machines of its class. The oil-feed and the water-feed are both automatically regulated, and there is consequently no stoking work, as with coal- and coke-fed boilers. For places where coal is dear, and for intermittent work, this engine is cheaper to work than the ordinary type; moreover, full working pressure can be raised in ten to thirteen minutes. Contractors will find this exhibit of much interest. The concrete mixer, too, calls for attention. This is all of iron and comprises a measuring box into which the material is tipped or shovelled, the box being then raised and the aggregate discharged into a feed hopper, whence it falls into a drum fitted with blades for thoroughly mixing the contents. Water is admitted by a pipe as required. When the mixing is complete a sliding cover on the drum is drawn aside and the concrete falls into wagons or barrows below, the opening and closing of the cover being automatically effected by the drum in course of rotation.

For Bending Pipes.

Stand No. 4, Minor Hall.

Kennedy's patent bending machine is exhibited by Messrs. John Barker & Co., Ltd., of Kensington. This will interest all builders who have to do gas-fitting or electric-light work, as the machine bends most tubes cold, and therefore saves an enormous amount of time as well as all the bends needed under the old system. It will also bend flat iron on edge, and T-iron, L-iron, &c.—in fact, any kind of iron. The machine has a circular cast base with a smooth face forming the lower flange, and from a projection on one side is attached a flat pin or stop to hold the tube while being bent. A mandrel rises from the centre of the base, screwed with a flat coarse thread, and on this mandrel the upper flange rises and falls to whatever size tube is being bent. Being held firmly between the two flanges, the tube cannot bulge or flatten during the process of bending. We suggest that, at a time when reinforced concrete is being so extensively adopted, this machine will be found extremely useful for bending the iron rods.



KENNEDY'S PATENT BENDING MACHINE.

Sheet-lead Damp-course.

Stand No. 74, Row D.

The exhibit of Messrs. Höfler, Ltd., of 26A, Soho Square, W., is divided into five sections, comprising French and German wallpapers, &c. Section 2 is devoted to Höfler's patent asphalted sheet-lead damp-course, a model exhibiting the adaptability of this material for railway work. It has been specified and used for many years by architects on the Continent. It is now being laid by the firm at the electricity generating station of the Westminster Corporation at Duke Street, Mayfair, under the supervision of Mr. C. Stanley Peach, F.R.I.B.A., the well-known architect. Permission having been obtained for the Corporation to excavate under an existing open space in Duke Street, this has been done to the depth of about 30ft., providing for the construction of a very capacious machinery hall. This extends 8ft. above the level of the roadway, and over it an Italian roof garden is being arranged, approached by flights of steps at either end. It was of course very necessary to prevent any damp percolating through from the garden on to the electrical machinery beneath, and Höfler's damp-course was selected for this important undertaking. It is laid over the concrete screeding, the whole afterwards being given a coating of volcanic cement; on top of this the damp-course is floated with cement and covered with tiles in geometrical design, the tiling being also carried out by the firm. Our illustration represents the work of laying the damp-course.

The Northern Polytechnic Institute's Exhibit.

Stand No. 26, Row A.

At this stand are shown examples of the work done by students in the building trade workshops of the Northern Polytechnic Institute, including a stone pedimented niche (after the design of Mr. E. W. Mountford, F.R.I.B.A., at the Liverpool School of Science building), some tracery work in Caen stone (based upon vaulting at All Souls' College, Oxford), various specimens of monumental masonry in Carrara marble and of turned and polished alabaster work, including an example just returned from the Institute's exhibit at St. Louis Exhibition. Similarly, from other workshops are niches in plaster-work and brick; doors, screens and dado framing in hardwoods, lead rainwater heads, and examples of signwriting from the painters' and decorators' classes. From the building and drawing classes are examples of class and homework drawing, including some measured drawings of St. Saviour's, Southwark. Apparatus used in class teaching is illustrated by lantern slides and models, in addition to which are samples of materials, and photographs of classrooms, together with apparatus from the chemical and physical laboratories, and samples of material tested to destruction in the testing machine of the Institute. The day courses for architects, surveyors and builders are specially illustrated by very large photographs showing the junior classes engaged in practical work in the brickwork, plastering and painting workshops, these practical courses of instruction being a special feature introduced by the head af the department, Mr. Hugh Davies, the exercises corresponding partly to those of the Frankfort Art Trade Schools and partly to those of the Pratt Institute, New York. These classes, for which the splendid trade workshops are exceptionally adapted, are interesting in view of the recent declaration of the Board of Architectural Education with regard to laboratory and workshop training in architectural courses. The architectural design day classes are under the direction of Mr. Percy A. Horrocks, A.R.I.B.A., and the trade courses are under skilled trade instructors.

LAYING SHEET-LEAD DAMP-COURSE AT ELECTRICITY GENERATING STATION, MAYFAIR.

Jointless Floorings.

Stand No. 5, Gallery.

Eubœolith patent flooring is shown at this stand by Mr. J. Percy Day, of 3, Victoria Street, Westminster. This flooring has many qualities to recommend it, especially for hospitals, schools and similar buildings. First, it is jointless and thus can be kept thoroughly clean, there being no cracks for the lodgment of dirt. Secondly, it can be laid quickly and cheaply, and when set has a durable surface, though with a certain resilience and warmth which makes it far more comfortable than cement. Thirdly, it is perfectly waterproof and fire-resisting, and can be flushed with a hose if necessary so as to maintain it thoroughly clean. These are in themselves qualities enough to warrant its adoption in all places where sanitation and cleanliness are requisite: but in addition it has other features to recommend it, such as being unaffected by atmospheric changes and producing little dust. It is usually laid ½in. thick on a concrete bed left rough from the straight edge, no cement rendering being required, but it can also be laid on old wood floors, if they are of sound construction; also on flagstones that have become worn and laminated. Large quantities are in use by His Majesty's Government, and it has been adopted by some of the largest hospitals, asylums, infirmaries, schools, factories, &c. In laying "Eubœolith" on concrete the latter must be at least 4ins. thick (screedings to be avoided in all cases, and consist of good, hard clean material and of good mixture (1 part best Portland, 1 part coarse washed sand and 3 parts clean gravel or clinker)—in the case of coke-breeze this must be well screened, and no plaster or earthy matter must be used. The surface of the concrete has to be well levelled off, but left rough, and brought up to within ½in. of the finished level, and must be perfectly dry before the material is laid upon it.

A Hunting Frieze.

Stand No. 62, Row C.

At this stand Messrs. Arthur Sanderson & Sons, Ltd., wallpaper manufacturers, of 52, Berners Street, W., show a coloured hunting frieze with a surround of green ingrain paper. There are four panels to the set, one representing "The Meet," another "Gone Away," the third "Full Cry" and the fourth "The Death." Each is 30ins. deep.

A Ventilating Stove; Ranges for Workmen's Dwellings.

Wall Space 131.

Messrs. Clark, Hunt & Co., Ltd., of 159 and 160, Shoreditch, London, show (in action) the "Francome" warm-air register stove. This has an air channel at the back to prevent heat being absorbed by the brickwork, and the general construction of the stove lessens the rush of air which usually carries so much heat up the chimney. The whole interior can be drawn forward for cleaning the air channel and sweeping the chimney. Numerous mantels, overmantels, tile slabs, hearths, &c., are also shown at this stand, as well as Bailey's patent "Geyser boiler" range with porcelain-enamelled bath and sink, and the new "Huntsmonde" portable kitchener, these two ranges being specially suitable to small flats or artizans' dwellings.

Armour-bright Fireplaces; Ranges and Stoves.

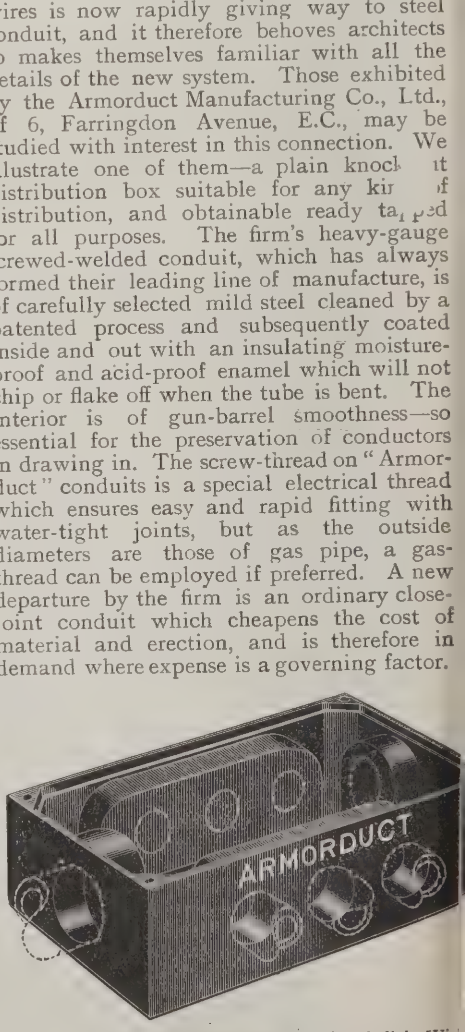
Wall Space 125.

Messrs. Smith & Wellstood, Ltd, of 11, Ludgate Circus, E.C., exhibit armour-bright fireplaces of Adam, Georgian and other periods; an independent "Durbanian" range with steam boiler, for hotel purposes; a variety of new brick-set ranges with improved iron flues, a special feature being a new coal-cooking range with gas-cooking attachment; "Francesse" and "Mutesse" continuous burning stoves for anthracite coal or coke; portable coppers for workmen's dwellings; and the "Bonnybridge" range, which is entirely independent and fitted with a high-pressure boiler. Country and borough surveyors will be interested at this stand in a large display of road indicators and motor-car signal-posts.

Conduit for Electric Lighting.

Gallery Bay No. 32.

The old wood casing for electric-light wires is now rapidly giving way to steel conduit, and it therefore behoves architects to makes themselves familiar with all the details of the new system. Those exhibited by the Armorduct Manufacturing Co., Ltd., of 6, Farringdon Avenue, E.C., may be studied with interest in this connection. We illustrate one of them—a plain knock-out distribution box suitable for any kind of distribution, and obtainable ready tapped for all purposes. The firm's heavy-gauge screwed-welded conduit, which has always formed their leading line of manufacture, is of carefully selected mild steel cleaned by a patented process and subsequently coated inside and out with an insulating moisture-proof and acid-proof enamel which will not chip or flake off when the tube is bent. The interior is of gun-barrel smoothness—so essential for the preservation of conductors in drawing in. The screw-thread on "Armorduct" conduits is a special electrical thread which ensures easy and rapid fitting with water-tight joints, but as the outside diameters are those of gas pipe, a gas-thread can be employed if preferred. A new departure by the firm is an ordinary close-joint conduit which cheapens the cost of material and erection, and is therefore in demand where expense is a governing factor.



Plain Knock-out Distribution Box for Electric-light Wir

Electric Lifts in Office Premises.

To the Editor of The Builders' Journal.

Sir,—On p. 194 of your issue for April 12th we notice some illustrations and particulars of the large block of office premises in Newcastle to be known as Milburn House. The lift service here is very complete, and we think it will be interesting to give a few facts in regard to it. The whole installation has been designed and carried out by us. The lifts are four in number and are entered from the central circular hall. They are high-speed electric passenger lifts controlled by a small switch in the cage, so arranged to give the option of running at two different speeds. These lifts are British-made throughout, and are of similar pattern to those recently erected by us in the vestibule of the Coliseum Theatre, London. To guard against all possibility of danger, the lifts are supported by four steel wire ropes, any one of which will bear ten times the weight of the cage with its full complement of passengers; and these ropes are connected to a gravity safety gear so constructed that the mere stretching or breaking of the rope has the immediate effect of stopping the cage.

Should the attendant fail to stop the lift at the top or bottom floors, three separate and distinct automatic devices are provided in order to bring the cage gently to rest, as if operated by the attendant.

It will thus be seen that every care has been taken to make these lifts as perfect and safe as possible; and in this connection it is interesting to note that although the safety gear mentioned above has already been fitted to upwards of five thousand lifts, not one failure has yet been recorded.—Yours truly,

ARCHIBALD SMITH & STEVENS.

Battersea, London.

GLASGOW INSTITUTE OF ARCHITECTS.

At the recent annual general meeting of this Institute—Mr. John Keppie, F.R.I.B.A., presiding—the secretary read the thirty-seventh annual report, which made appreciative reference to the new course of study for students of architecture to be followed jointly in the Glasgow School of Art and the Technical College, under the general direction in both institutions of M. Eugene Bourdon.

The Royal Infirmary Reconstruction.

In regard to the proposed reconstruction of the Glasgow Royal Infirmary it was stated that a communication had been received from the Glasgow Archæological Society intimating that they had appointed a committee to co-operate with the Institute and kindred associations with a view to opposing the adoption of any design which would result in permanent injury to the external effect of the cathedral, and recommending the preparation of a drawing for publication showing the cathedral and reconstructed infirmary side by side, so that the dwarfing effect of the latter might be realized by the public. A committee was thereupon appointed to deal with the matter, with powers to obtain the drawing suggested. The Glasgow Art Club have also appointed a committee in connection with the matter. The joint committee representing the three bodies mentioned has held several meetings, and although no formal report has yet been submitted it is understood that the drawings have been prepared, with the result that the apprehensions felt and expressed by the Institute have been fully justified.

The council for the ensuing year was elected as follows:—Messrs. A. N. Paterson, John Keppie, Horatio K. Bromhead, James Lindsay, T. L. Watson, James M. Munro, Alex. M'Gibbon, A. Balfour, Charles Gourlay, Thomas Baird, junr., R. D. Sandilands, James K. Hunter, J. M. Crawford, George Bell, Alex. Skirving and David Barclay.

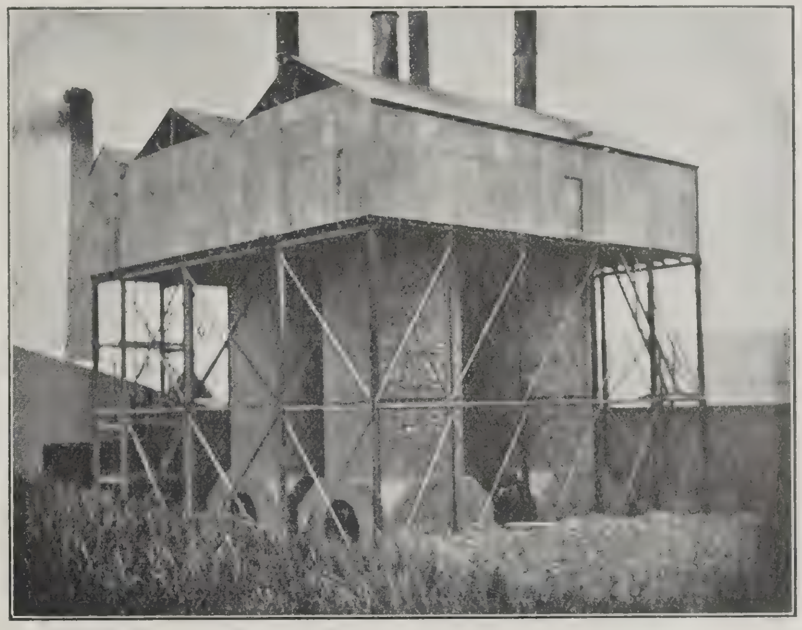
Mr. Keppie was re-elected president and Mr. James M. Monro vice-president.

CEMENT-MAKING IN SCOTLAND.

The First Works.

Though enormous quantities of cement are used in Scotland, yet the making of cement has not succeeded. Efforts were made to establish a factory near Glasgow, and more recently there was an endeavour for a company to start operations at Inverkeithing, near the new Forth naval base, but nothing practical came of the scheme. Thanks, however, to the enterprise of the Caledonian Cement Co., the first manufactory in Scotland is now in full working order at Cousland, which is a little hamlet about ten miles from Edinburgh, with a branch of the North British Railway Company's line from Ormiston passing close to the village and connected by a siding with the new cement works.

For many years limestone was burned at Cousland, and the old limekilns are still there, though now unworked. The limestone in the vicinity is of excellent quality, and is closely mixed with shale. The quarries are of the open surface order, and there is a practically unlimited supply of stone and shale.



SCHNEIDER CEMENT KILNS, COUSLAND, NEAR EDINBURGH.

Trollies take the material in its raw state to the engine-house, where a cable is attached to them and they are let down the incline to the works, which for convenience to the railway have been placed in the valley.

Galvanized iron has been plentifully used in the construction of the works—walls and roofs being of it. A brick cottage forms the office and laboratory. The stone and shale are dumped into the crushers, and thereafter until the material leaves the brick presses it is not handled at all. Screw-conveyors take it from mill to mill, and the factory is so planned that the raw material goes in at one end and arrives in due course at the kilns at the other end of the range of buildings. From the kominors the material is taken to the tube mill, being mixed on the way in right proportions of stone and shale. The chemist attached to the works draws samples every hour and tests them in the laboratory. From the tube mill the finely-ground mixture in a dampened state is made into briquettes by two brick presses having an output of 20,000 briquettes per day. These mills are by Messrs. Herbert Alexander & Co., of Leeds.

The briquettes are laden by hand on to trollies and sent up electric hoists to the top of the kilns—of which there are four, of the Schneider upright type—where they are burnt, and afterwards raked out as clinker, which is ground to a fine powder and stored ready for loading into trucks.

The works produce about 300 tons of cement per week, and there is ample room for extension. A Shank's engine supplies the motive power, being fed by two boilers, supplied by a Motherwell firm. Electric light is installed throughout, as Cousland is in a colliery district and coal is obtainable cheaply. Cottages for the employees have been erected in the village.

There is a ready market for cement in Edinburgh and Leith, Dundee and Glasgow. Some very large contracts have been in hand of late, the largest being that for the new waterworks at the Talla and the pipe line to Edinburgh, which is now almost completed. The Birmingham Waterworks used more than 120,000 tons of cement, and the Talla is on an even larger scale. Although quantities of foreign cement are imported, notably Belgian and German, it is satisfactory, from the British maker's point of view, to note that the Harbour Commissioners of one of the leading Scottish ports who had fixed a contract for one of the best-known German brands on the score of cheapness have just broken off the contract and refused to take delivery, as they found the quality was not up to specification. They have now returned to British makers. The Belgian cement has been offered at a ridiculously low price ex ship at Leith or Granton, but is made from the natural rock, and is not nearly so uniform nor so reliable as British cement.

Obituary.

Mr. Charles Longley, timber merchant, of Hayward's Heath, died recently, aged 65.

The late Mr. S. J. Thacker, A.R.I.B.A., of Rottingdean, left estate of the value of £60,194.

Col. Bird, C.B., died recently. He was well-known in the London building trade, having been one of the founders of the Institute of Builders. He was also the father of the Tylers' and Bricklayers' Company and managing director of the Builders' Accident Insurance Co.

Keystones.

Mr. C. Dickens-Lewis, of Shrewsbury, has been appointed school architect to the Cardiganshire County Education Authority.

A new Church at Edinburgh, in Ormidale Terrace, is to be built from designs by Mr. A. Hunter Crawford, F.R.I.B.A.

American Banks form the subject of a special issue of the "Architectural Review" of Boston, U.S.A., for March, price two dollars (8s. 4d.). Scores of excellent illustrations are given.

A new Bridge at East Molesey has been erected at the entrance to Hampton Court Railway Station. It will be reserved for pedestrians, whilst the old structure will be used for vehicular traffic.

Mr. Alfred Waterhouse, R.A., who was seized with paralysis some time ago, has not been so well of late, and has been unable to take carriage exercise in the neighbourhood of his country residence, Yattendon Court, near Newbury.

The new Olympia Theatre, Liverpool, in West Derby Road, seats 3,750 persons and has been constructed upon a scale twice as large as that of the London Hippodrome. No fewer than thirty-six exits have been provided. The arena is 42ft. in diameter.

The Forgetful Architect.—The man who built a house and forgot to put in the stairs has been overshadowed by the Swansea Corporation. They are building a fire-brigade station, and have just discovered that they have forgotten to provide room for the horses!

Competition for Clock Tower, St. George's Circus, S.E.—This competition has been decided as follows:—1st, Mr. J. F. Groll, Westminster; 2nd, Mr. Leslie Wilkinson, Ealing; 3rd, Mr. Alexander Peacock, Finchley. One hundred and six designs were received. Messrs. Thomson & Pomeroy were the assessors.

At the Royal Academy Banquet held on Saturday at Burlington House H.R.H. the Prince of Wales said that while visiting India next winter he hoped to lay the foundation-stone of the Queen Victoria Memorial Hall at Calcutta (designed by Sir William Emerson), "the first great architectural work which India under the British Crown has inaugurated."

Competition for new Parish Church, Epsom.—The following seven architects have been selected to submit designs for this church (each to receive £20):—Messrs. W. H. Bidlake, Nicholson & Corlette, Temple Moore, J. Bannister, C. H. M. Mileham, Charles Spooner and J. Hatchard Smith. Mr. G. H. Fellowes Prynne is the assessor. The building is to cost £14,500 and to seat 100 worshippers.

The Vauxhall Bridge Works have now been in progress for six years and a half, and in all probability another year will elapse before the structure is open to the public. The work has been given in two contracts. Messrs. Pethick Brothers were the contractors for the demolition of the old bridge and the construction of the new piers and abutments for a sum of £167,675, while Mr. C. Wall has the contract for the erection of the superstructure at a cost of £142,942. Nearly 300 men are employed. The materials required include 4,000 tons of steelwork, 250 tons of cast-iron work, 300 tons of cast steel, 100,000 cub. ft. of granite, 30,000 yds. of concrete and 100,000 ft. of timber. The work is being carried out under the direction of Mr. Maurice Fitzmaurice, chief engineer to the London County Council, and under the immediate supervision of Mr. Copperthwaite, bridges engineer to the Council, who, however, has only been associated with it for three years.

The Ruins of the Old Walls of Berwick-on-Tweed, including the ancient bell tower, are to be taken over by the Board of Works and enclosed as national relics.

The R.I.B.A. Examinations will be held on the following dates:—Preliminary, June 6th and 7th. Intermediate, June 6th, 7th, 8th and 9th. Final and special, June 23rd to 30th.

"Architect" or "Architect and Surveyor."—The Council of the Institute has passed a resolution expressing the opinion that members should not publicly designate themselves otherwise than as above.

The Oldest House in Winchester—an old Tudor timber house in Cheesehill Street—has come into the market on the death of the owner, and unless purchased by the Corporation, or some public-spirited person, is likely to be demolished.

Fulham Town Hall is to be enlarged at a cost of £25,000, in order to provide the mayor with a suitable parlour and give increased accommodation to the town clerk's and borough engineer's departments. The scheme provides for a projecting clock on the façade.

Leicester and Leicestershire Society of Architects.—In the thirty-second annual report, for 1904-05, just issued, extended reports are given of the papers on architects' registration by Mr. Cross and Mr. Hubbard. Six excellent reproductions are included of measured drawings of St. Nicholas's Church, Leicester, by Mr. J. F. J. Goodacre.

Lock-out of Tyneside Bricklayers.—No settlement has been arrived at in connection with the building trade dispute on Tyneside. The employers state that they are prepared to employ any man at the reduced rate of 9d. per hour and under the new rules, but the men remain firm against making any concession except on minor points.

The Restoration of the Parthenon was the most interesting subject under discussion at the recent Archæological Congress at Athens. It is reassuring to learn on the authority of M. Kavvadias that nothing in the shape of restoration, as the word is commonly understood, will be attempted in regard to either the Parthenon or any other of the ancient temples of Greece. He is of opinion that the fallen columns should be raised, and in this most persons will agree with him, though the late Mr. Penrose deprecated the idea on the ground that any effort to imitate the exquisite workmanship displayed in the fitting of the standing columns could only result in failure.

Indignant Manchester Architects.—Further protests were made at the annual meeting of the Manchester Society of Architects last Thursday against the action of the Lancashire County Council in deciding that all architectural work in connection with school buildings shall be left in the hands of an official of the county council instead of being thrown open to the profession at large. Another matter touched upon was the manner in which objections to plans lodged by architects with the Manchester Corporation were notified. Any objection to the passing of such plans was communicated not only to the architect, but to the owner of the building as well, and under such a system there was a probability of the former's interests being injured. It was decided to approach the committee concerned by deputation. Mr. J. H. Woodhouse, F.R.I.B.A., was elected president and Messrs. C. H. Heathcote, F.R.I.B.A., and J. W, Beaumont, F.R.I.B.A., vice-presidents. Council: Messrs. John Ely, J. B. Gass, E. Hewitt, Jesse Horsfall, A. H. Mills, J. D. Mould. Isaac Taylor, G. H. Willoughby, P. S. Worthington, Godfrey Colles, A. H. Corbett and J. H. Gibbons.

R.I.B.A.

Annual General Meeting.

THE annual general meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W. The annual report of the Council was presented. Most of the facts therein stated have already been published in our columns, but we may give the following as fresh information or worthy of publication as official statements:—

The present membership is 1,904, as compared with 1,829 last year and 1,787 for 1903.

Colonial Examinations.

The first intermediate examination held out of the United Kingdom took place last November in Sydney, when three candidates were examined. The Board of Examiners have not yet reported the result, the papers having only just come to hand.

The special examination for Colonial candidates will be held this year in Canada and Sydney.

Registration.

The Registration Committee appointed last session began their labours too late for any effective result, as the Council elections in May very considerably changed the personnel of the committee. Early in the present session the new committee appointed a sub-committee, which has met monthly, holding morning and afternoon sittings. A Bill for the enrolment of qualified architects prepared by the sub-committee with the assistance of counsel has been considered by the general registration committee, who have referred it back to the sub-committee for emandation. The Registration Committee hope to submit it for the adoption of the Institute at an early general meeting.

Education.

It was mentioned in last year's annual report that the Council had under consideration the proposals of a committee on architectural education consisting of members and non-members of the Institute which they had appointed. The Council have approved these proposals, and have established a Board of Architectural Education with a mandate to prepare a scheme for the co-ordination of architectural education throughout the country, and to secure, if possible, its adoption in the various schools. Of this committee Sir Aston Webb is chairman, Mr. Basil Champneys vice-chairman, and Mr. John Slater and Mr. Reginald Blomfield hon. secretaries. It consists of "Members," who are all architects, and "Advisory Members," who are representatives appointed by universities and other educational bodies. The first portion of the task has been accomplished by the Board, which is now laying the scheme before the teaching centres of the country with a view to its adoption.

Easement of Light Bill.

The judgment of the House of Lords in the case of *Colls* v. *The Home and Colonial Stores* induced the joint committee of the Institute and the Surveyors' Institution to drop Part III. of the Easement of Light Bill, which dealt with this subject, and also the only other clause relating to a change in the law, *i.e.*, Part V., headed "Right to Light passing over Streets," and the councils of the two bodies have approved the omission. The Bill as now about to be introduced into Parliament by Mr. J. Fletcher Moulton, K.C., M.P., is a Bill of Procedure, providing a simple machinery for the settlement of disputes on the lines of that already organized with regard to party-wall cases.

Board of Professional Defence.

Up to the present time the cases that have come before this Board have not been, in their opinion, of such a nature as to warrant positive action on their part.

L.C.C. Drainage By-laws.

The Council have issued invitations to those of the borough councils who expressed themselves as being in sympathy with the Institute as to the deposition of drainage plans to join the Practice Committee in a deputation to the London County Council. The Surveyors' Institution has also been invited to send representatives.

Education of the Public.

On the suggestion of the president, the Council have appointed a small committee to recommend steps whereby the ignorance of the general public in architectural matters may be somewhat mitigated. The committee have not yet issued their report.

Past-Presidents' Portraits, &c.

The Council have had an album prepared containing photogravures of the interesting collection of the portraits of past-presidents. Blank plates have been left for the insertion of future portraits. The price of the album is two guineas. There has been a loss on this album. The cost was £145, and only six copies have been sold. The presentation of the portrait of Sir William Emerson by Mr. J. J. Shannon, R.A., will take place at an early date. Mr. Solomon J. Solomon, A.R.A., has kindly accepted the commission to paint the portrait of Sir Aston Webb.

Competition for "The Palace of Peace."

At the request of the Minister for Foreign Affairs that the Council would advise him as to two architects whose names he might submit to the Dutch Government as fitting persons to be invited to prepare designs in an international competition for the Carnegie Foundation—"The Palace of Peace"—at the Hague, and as to a third who could serve on the International Jury, the Council nominated the president, Mr. John Belcher, and Sir Aston Webb, to represent Great Britain in the competition, and Mr. T. E. Collcutt, vice-president, to serve on the International Jury. The Council have since learned through the Genootschap "Architectura et Amicitia" of Amsterdam that the Carnegie Foundation Commission have decided to throw the competition open to all architects, while at the same time specially inviting representative architects from the various countries to compete.

The Council have granted £500 to the funds of the Seventh International Congress, London, 1906, the grant to be spread over two years. The balance of income over expenditure is £1,680—the largest on record.

Committees' Reports.

The Art Standing Committee have forwarded a resolution to H.M. Office of Works that it is desirable to replace with stone the present wood pediments and drum of the dome on Somerset House, but beyond a formal acknowledgment of the Committee's letter no reply has been made.

The Science Standing Committee are considering what tests can be put in specifications when only small quantities of cement are required. They are also enquiring into the present method of applying Dr. Angus Smith's solution and other preparations for protecting iron, as well as the subject of working loads and stresses. A proposal to form a collection of building stones at the Museum of Geology, Jermyn Street, is recommended. The report on brickwork tests is in type and will be published shortly.

OUR PLATE.

"BRACKENCLIFFE," Scarborough, is in course of erection for Mr. Walter Glaisby. It occupies a magnificent site on the edge of the cliffs, overlooking the Holbeck valley and gardens. The rooms are arranged to command very fine views of coast scenery. The house is faced with red sanded Leicester bricks and Farndale stone dressings. Oak is used for all external woodwork, and dark-red hand-made tiles for the roofing. Messrs. Barry & Sons, of Scarborough, are the contractors; Mr. Soule is the clerk of works; and Mr. Walter H. Brierley, F.S.A., of York, is the architect. The drawing is hung in the Royal Academy this year.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Architects' Charges.

OVENDEN. — PERPLEXED writes: "Where an architect is called upon by his client to prepare a schedule of prices and agreement for a contractor to fill up (together with himself), and for the contractor to sign, can the architect charge for the time and labour involved in doing the work, seeing it is principally technical work within his province, or will he have to charge for the drawing-up and filling-in of schedule only, and drop the agreement, the latter being within the lawyer's province, or will the architect have to put a price merely on the 'form of agreement,' as a separate item?"

The schedule of quantities is out of the architect's ordinary work, and should therefore be charged for, but the agreement is part of his ordinary percentage.

ILLINGWORTH.—DOUBTFUL writes: "If an architect agrees at a percentage to superintend the carrying out of the excavator, mason and bricklayer's work in erecting new shop property, on the amount of the contractor's work—giving employer a note to that effect—and the proprietor provides the stone and bricks, should not the charge be on the amount of the cost of labour and materials in carrying out the work?"

The charge should be upon both materials and labour, undoubtedly.

Isolation Hospitals.

CONSTANT READER writes: "I am about to prepare plans for an isolation hospital, and should be glad to know whether any rules and regulations are issued by the Local Government Board. In a block of wards for thirty patients to cost about £4,000, and for the treatment of six or seven different diseases, is it necessary to have an isolated block for each disease, or can the whole of the wards be under one roof (a one-storey building is required)?"

We do not know of any regulations and ideas, as hospital designs are various.

Architects' Assistants in Canada.

NOTTINGHAM.—J. B. writes: "Is there a good opening for a young architect (twenty years of age) in Canada; if so, which is the best way to obtain a situation?"

There are plenty of openings for men of push, but anyone going out should have sufficient to keep him for about a year. It is practically impossible to obtain a situation from this country.

Road Construction.

LONDON.—ROUTE writes: "(1) Where it is proposed to form a road across a field at such a level that filling is required underneath the road ballasting, is it necessary or desirable from a practical standpoint to remove the turf and top spit of the field over the area of road and footpaths? (2) Where a road across a field is proposed to be in a cutting, is it the practice of quantity surveyors to measure the turf and top spit as a separate superficial item from the rest of the excavation, even though the proprietor does not want the turf preserved for his own use?"

(1) Yes, it is advisable to remove the turf and top soil, so as to allow the road to bind properly. (2) Yes; it should be so measured, and stated if to be preserved or not.

A Bridge Contract.

MERTHYR TYDFIL.—W. B. writes: A district council is erecting a bridge and making roads, footpaths, &c. The bridge is a steel girder bridge supported on abutments and piers of masonry. The council gave the construction and erection of the steelwork to firm A, and (but some time later) the construction of the bridge, masonry, roads and footpaths to B, both contracts having been tendered for in open competition. As far as can be ascertained there was no date fixed for the completion of A's contract and no penalty for non-completion by A. But B was bound to complete the bridge masonry for the reception of the girders by September 1st, and the remainder of his contract by November 1st, 1904, under a penalty of £10 per week, such penalty to be deducted from the moneys due to B, the contractor. There is, however, nothing in the contract stating that the council shall be liable to B for any delay the council may cause him. B had the bridge masonry ready for the ironwork on August 27th, 1904; but A did not bring any of the ironwork there until after November 1st, and has not even yet completed the erection. It is impossible for B to complete the masonry and other parts of his contract until A has finished, and the consequence is that B has suffered considerable damage, direct and indirect, by his plant and machinery standing idle for so many months, and in other ways. (1) Are the district council liable to B for the damage caused by the delay? (As the district council are entitled to penalty for B's delay, it would seem the council are liable to B for delay caused by them, as every agreement must be mutual. B has pointed this out to the council, but they repudiate liability.) (2) If B has no remedy against the district council, has he any against A? (3) What course do you advise B to take?"

(1) Perhaps they are, but it is inadvisable to fight, as B might be held to have agreed to wait on A, as he had a knowledge of the conditions. (2) No; A made no contract as to time with B or with the council. (3) To put up with it, without making a fuss, and rely upon others giving him equal consideration when he needs it.

Book on Essex Churches.

LONDON.—X. writes: "Please name a book giving a concise description of the principal churches in Essex."

There is no book that gives a complete list of the churches of Essex. "Ecclesiastical Architecture of the County of Essex," by James Hadfield, and "Churches of Essex," by George Buckler, give good descriptions of the better-known churches.

L. G. R.

Cement Rough-Cast.

LONDON.—D. writes: "Kindly recommend the best method of producing a good lasting rough-cast on walls in a somewhat exposed position."

Portland cement and sand 1 to 3 is the best; it can be given almost any texture, and shingled if desired. If the colour is objected to, a good white may be obtained by using silver sand or a little powdered chalk.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
May 5	Llanartney, Wales—Bridge	Rural District Council	J. Saer, 7 Hall Street, Carmarthen.
,, 5	Langnor, Staffs—Bridge	Rural District Council	H. M. Whitehead, Crown Bridge, Penkridge.

HENDON URBAN DISTRICT COUNCIL

PRIVATE IMPROVEMENTS, SECTION 150, PUBLIC HEALTH ACT, 1875.

TO CONTRACTORS AND OTHERS.

The above Council are prepared to receive TENDERS for certain works of DRAINING, KERBING, CHANNELLING, METALLING, TAR PAVING, GULLIES, and other WORKS in fully making-up Ramsey and Argyle Roads, West Hendon.

The drawings and specifications may be seen, and forms of Tender obtained from Mr. S. SLATER GRIMLEY (Engineer to the Council), Council Offices, Hendon, N.W., on deposit of £10, which will be returned on receipt of bona-fide Tender, accompanied by the schedule of prices duly priced in, excepting in the case of the accepted Tender, when such deposit will be returned on the execution of the necessary Contract and bond. Failing such execution when required, such deposit will be forfeited.

Sealed Tenders, endorsed "Private Improvements," addressed to the CHAIRMAN of the COUNCIL, to be sent to the undersigned not later than FIVE o'clock p.m. on MONDAY, the 8th day of MAY, 1905.

The Council do not bind themselves to accept the lowest or any Tender.

Dated this 20th day of April, 1905.

HENRY HUMPHRIS,
Clerk to the Council.

Council Offices,
Hendon, N.W.

To Contributors.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

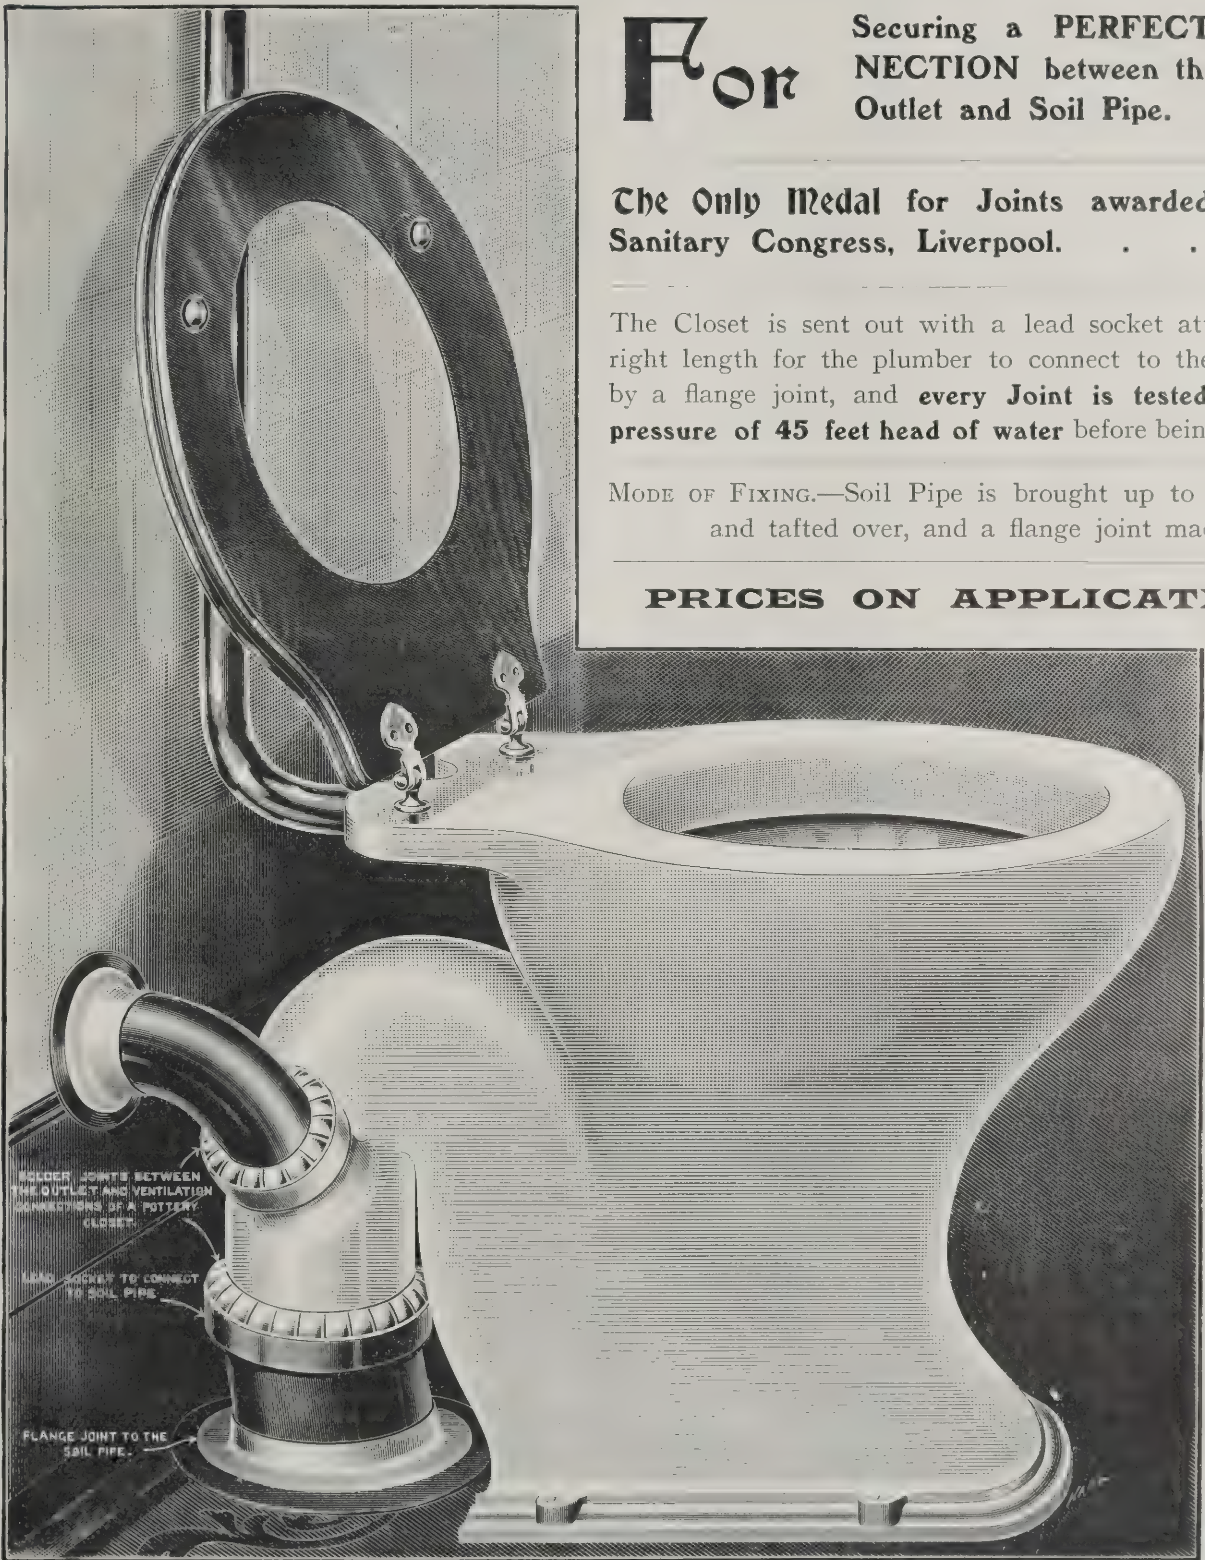
DOULTON'S Patent METALLO KERAMIC JOINT



SOLDER JOINTS BETWEEN THE OUTLET AND VENTILATION CONNECTIONS OF A POTTERY CLOSET.
LEAD SOCKET TO CONNECT TO SOIL PIPE.
FLANGE JOINT TO THE SOIL PIPE.

For Securing a **PERFECT CONNECTION** between the Closet Outlet and Soil Pipe. . . .

The Only Medal for Joints awarded at the Sanitary Congress, Liverpool. . . . .

The Closet is sent out with a lead socket attached the right length for the plumber to connect to the soil pipe by a flange joint, and **every Joint is tested up to a pressure of 45 feet head of water** before being sent out.

Mode of Fixing.—Soil Pipe is brought up to floor level and tafted over, and a flange joint made.

PRICES ON APPLICATION.

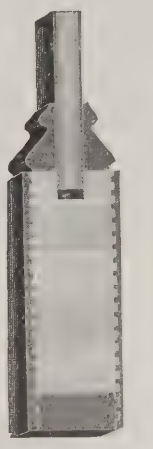
THE GILMOUR DOOR Co LTD.
Factories Trenton Canada
53 BERNERS STREET LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece

HARDWOOD
In Various Designs

From 35/- to £10.
DOORS

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

Agencies

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

May 10, 1905. Vol. 21, No. 535.

6, Great New Street, Fetter Lane, E.C.

Summary.

The R.I.B.A. suggestions for the conduct of architectural competitions have been revised. (This page.)

The Lightning Research Committee has issued its report, after four years' work. Out of 115 cases of lightning strokes, forty occurred to buildings provided with lightning rods. (This page.)

A question was asked in the House of Commons last week as to whether it was intended to clean up the façade of Buckingham Palace in connection with the Queen Victoria Memorial. Lord Balcarres, in reply, said the matter must stand over till the memorial is erected. (Page 269.)

Though the present system of triennial contracts for alterations and repairs to barracks and fortifications is not to be abolished, the War Office has decided to replace it in certain cases by the direct employment of labour. (Page 269.)

In an infectious-diseases hospital for thirty beds it is usual to provide three pavilions for the simultaneous treatment of scarlet fever, enteric and diphtheria, with perhaps a small block for doubtful cases. The provision for scarlet fever is usually greatly in preponderance over that for the other infectious diseases. The cost of a permanent hospital, efficiently equipped, will be from £300 to £450 per bed. (Page 263.)

Next autumn or next winter a committee of experts is to present another report on the ventilation of the House of Commons. (Page 269.)

Plumbing in America tends to very great complication of pipes: hence several modifications of the existing law are suggested. These modifications propose to abolish the present requirement of "back-venting" traps by a pipe extending from the sewer up to a point above the highest fixture, to omit the main house trap in the basement, to require every fixture to be constructed with an outlet large enough to fill its waste-pipe "full bore," to reduce the number of traps, to omit the trap on rain-water leaders, and to abolish the restriction of jointing cast-iron pipes with lead caulking. (Page 265.)

The London timber trade showed no improvement during April. The level of prices for Swedish and Russian deals is very low. Teak supplies are short and prices high, so that business in first-quality wood is likely to be generally restricted till next spring. (Page 262.)

There are two chief theories about colour—the Brewster theory, which gives the primaries as red, yellow and blue, and the Young-Helmholtz theory, which gives them as red, green and blue. By the admixture of the primaries other colours are produced. (Page 258.)

Competition Rules. At the annual general meeting of the Royal Institute of British Architects discussion took place on the paper on the conduct of architectural competitions as revised by the Competitions Committee, and which they propose should be issued under the title "Regulations for Architectural Competitions." After certain amendments had been passed, the meeting was adjourned to June 5th. Although several small alterations in the wording have been made in these "Regulations," they are practically the same as the "Suggestions" at present in force, except as regards the following innovations:—

(1) The particulars, conditions and suggestions are to be so drawn up as to form an agreement between the promoters of a competition and the competitors.

(2) The amount of the premium or remuneration for the competitive designs other than that placed first should be fixed under the advice of the assessor or assessors.

(3) If a deposit is required for supplying the instructions, it should not exceed the sum of one guinea.

(4) A design shall not be disqualified on the question of cost if it will probably not exceed by 10 per cent. the outlay stated in the instructions, or the estimate of the competitor should no outlay be stated.

(5) All designs, with the exception of that placed first, should be returned to their authors, carriage paid, at the close of the exhibition.

(6) Except in the case of works of inconsiderable magnitude, it is desirable that two or more assessors should be appointed.

(7) The R.I.B.A. scale of charges for assessing competitions is at the minimum rate of 30 guineas, plus $\frac{1}{5}$ per cent. upon the estimated cost of the proposed building.

At the meeting several alterations were agreed to, namely, that—

(1) If the architect were subsequently employed, the $1\frac{1}{4}$ per cent. commission previously paid should merge in his commission.

(2) The words "other than that placed first" in paragraph 2 above should be omitted.

(3) The drawings of the competitor placed first should also be returned after the exhibition.

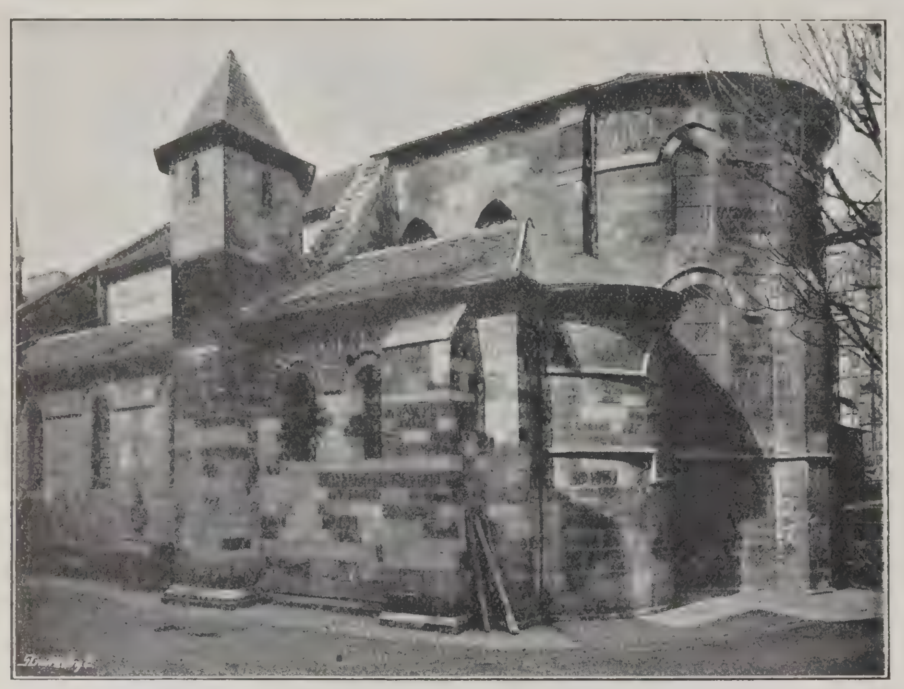
(4) In works of considerable magnitude it was desirable that three assessors should be appointed.

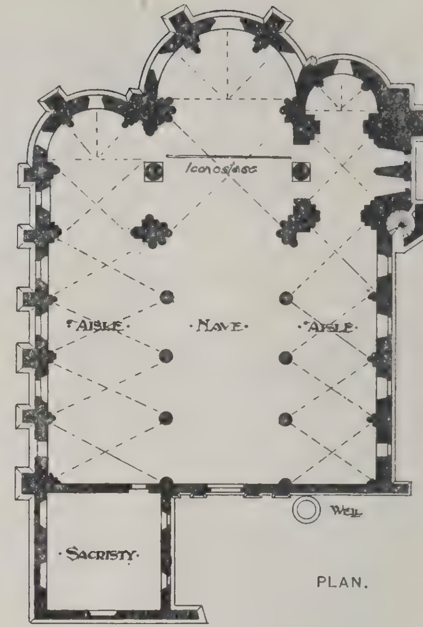
(5) A scale of charges for assessing competitions was undesirable.

The meeting was adjourned on the bone of contention that the Council should be included with the president in advising promoters in their appointment of assessors.

The regulations as amended at the meeting are on the whole commendable.

Report of the Lightning Research Committee. The report of the Lightning Research Committee is now published in the Journal of the Royal Institute of British Architects, with a preface by Sir Oliver Lodge, F.R.S. The Committee have summarized in it their four years' work, and have made suggestions and drawn up rules which are based on their observers' reports on the damage to buildings in 115 cases of lightning strokes. Forty of the buildings in question were provided with lightning rods. Sir Oliver draws attention to the two kinds of discharge likely to occur, one being of the simple type which arises when an electrically-charged cloud approaches the earth without an intermediate cloud intervening, and the other of a complex type where another cloud intervenes, the two clouds practically forming a condenser. In the first case the ordinary system of lightning conductors is efficient, but in the second case the disruptive discharge is so erratic that no series of conductors of the hitherto recognized type will suffice to protect the building. In this second case a hot column of air rising from a chimney may be preferred to a conductor. In cases where protection is considerable desirable, but heavy expense is not justified, the Committee recommend the erection of two lightning rods, on either side of spire, tower or stack, these being connected by horizontal conductors along the ridge and at or near the ground line. All metal finials, ridging, lead flashing, cowls, &c., on the roof and the rainwater drain-pipes should be metallically connected and well earthed. Copper of high conductivity increases surges and side-flash, and therefore is positively objectionable. Iron is much better. For subsidiary conductors the Committee recommend No. 4 S.W.G. It is inadvisable to connect church bells and turret clocks with the conductors. As to earthing, cinders and coke appear to have a chemical or electrolytic effect on copper and iron; hence charcoal or pulverized carbon is recommended, packed in a tubular earth. The various cases noted by the Committee show that, while even single conductors tend to diminish the damage done to buildings by lightning, no reliance can be placed on an area of protection—which view is confirmed by the latest foreign practice. No cases of damage to modern steel-frame structures have come under the notice of the Committee, but it is pointed out that the ordinary method of construction in this country does not provide full protection, for in many cases the steel columns stand on stone foundations and the metal is not carried deep enough for effective earthing: such columns ought to be earthed when erected.





PLAN.

ST. JULIEN-LE-PAUVRE, PARIS.

By F. H. CHEETHAM.

ONE of the most interesting, if least known, of the Gothic buildings of Paris is the little church of St. Julien-le-Pauvre, which stands not far from the Seine, on the left bank, immediately opposite the Ile de la Cité, in what is known as the Quartier Maubert.

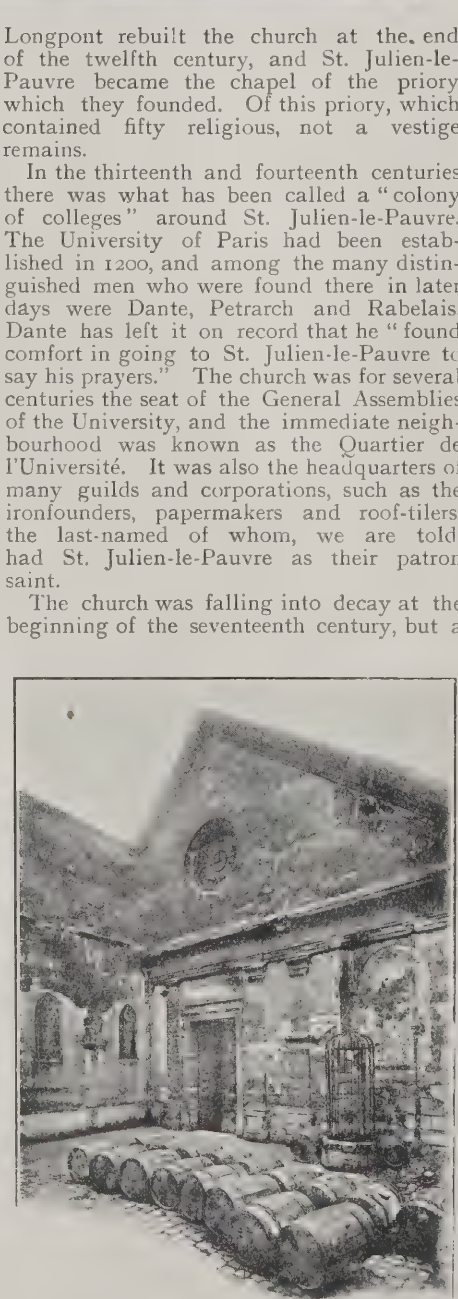
The Rue Saint-Jacques, which is a continuation of the Petit Pont and the street of that name, runs between St. Julien-le-Pauvre and the larger church of St. Séverin, so prominent an object above the roofs of the houses in the view from the towers of Notre-Dame as you look south-west. The Quartier Maubert, formerly a tortuous mass of narrow streets and culs-de-sac, has undergone many changes since the days when students from all parts of Europe congregated there intent upon the learning to be obtained in the mediæval University of Paris. Some of the old streets yet remain and more retain the ancient names. Thus we still have the Rue du Fouarre, the Rue Galande, the Rue Lagrange, and the Rue St. Julien-le-Pauvre, though the alignment of all these streets is not in every case what it was in former days.

The church of St. Julien-le-Pauvre stands at the bottom of a court which opens from the street which bears its name, a narrow street going nowhere in particular, connecting the Rue Galande with the Rue de la Bucherie. Unless the visitor to Paris goes there with deliberate intent it is unlikely that he will ever find St. Julien-le-Pauvre. The church, however, is but a stone's-throw from St. Séverin, and it is a pity that anyone visiting the larger church (itself, however, too little known) should omit at the same time to pay a visit to the smaller and less known one, even if it involve a little seeking after: the trouble is well repaid.

The history of St. Julien-le-Pauvre may be briefly recounted as follows. A church existed here as far back as the year 507, and possibly the remains of some of the ancient foundations still exist. This building was destroyed in 886 by the Normans, but we hear of the church again in 1031 or 1032, when Henri I. gave it to the Bishop of Paris. At the commencement of the twelfth century it belonged to Etienne de Vitry and Hugues de Monteler, who gave it to the Abbey of Longpont, near Monthléry. The monks of Longpont rebuilt the church at the end of the twelfth century, and St. Julien-le-Pauvre became the chapel of the priory which they founded. Of this priory, which contained fifty religious, not a vestige remains.

In the thirteenth and fourteenth centuries there was what has been called a "colony of colleges" around St. Julien-le-Pauvre. The University of Paris had been established in 1200, and among the many distinguished men who were found there in later days were Dante, Petrarch and Rabelais. Dante has left it on record that he "found comfort in going to St. Julien-le-Pauvre to say his prayers." The church was for several centuries the seat of the General Assemblies of the University, and the immediate neighbourhood was known as the Quartier de l'Université. It was also the headquarters of many guilds and corporations, such as the ironfounders, papermakers and roof-tilers, the last-named of whom, we are told, had St. Julien-le-Pauvre as their patron saint.

The church was falling into decay at the beginning of the seventeenth century, but a few years later it was put in a state of repair by the prior Pierre Méliand and his master-mason Bernard Roche, who in 1651 unfortunately pulled down the west front (which dated from the thirteenth century) and two bays of the nave, and constructed the present classic façade. Roche is also responsible for the disappearance of the bell tower and the vaulting of the nave. In 1655 St. Julien-le-Pauvre was attached to the Hotel Dieu and was used as the hospital chapel till the time of the Revolution, when it was turned into a salt depôt. A decree of Napoleon gave back the church to the Hotel Dieu, but it was not till 1826 that religious offices were once more celebrated there. From that time till 1873 St. Julien-le-Pauvre served once more as the chapel of the Hotel Dieu, and within its walls nearly all the Augustinian sisters who served the sick in the hospital (Sœurs Hospitalieres de l'Hotel Dieu) took their vows. The old Hotel Dieu, after undergoing all kinds of repairs and being condemned as too small and ill-ventilated, gave place to the existing building on the north side of the Place du Parvis-Notre-Dame. Once more St. Julien fell into desuetude, and so it remained until 1889, when, by a decree of the Minister of the Interior, it was appropriated to the use of the Greek Catholic Church (Melchites), in whose possession it now is.



THE COURTYARD FRONT, WITH OLD WELL-HEAD.

The church of St. Julien-le-Pauvre consists of a nave of four bays, north and south aisles, and choir. The aisles are of unequal width, the northern one being the same width as the nave. The nave and aisles terminate eastwards in three semicircular apses differing in size. The interior dimensions of the building are: length, 71ft.; breadth, 53ft.; height 35ft. The nave originally consisted of six bays, the two westernmost having been destroyed, as previously mentioned, in the seventeenth century when the present Doric front took the place of the Gothic facade. A portion of the old nave remains in what is now used as the sacristy, to the left on entering.

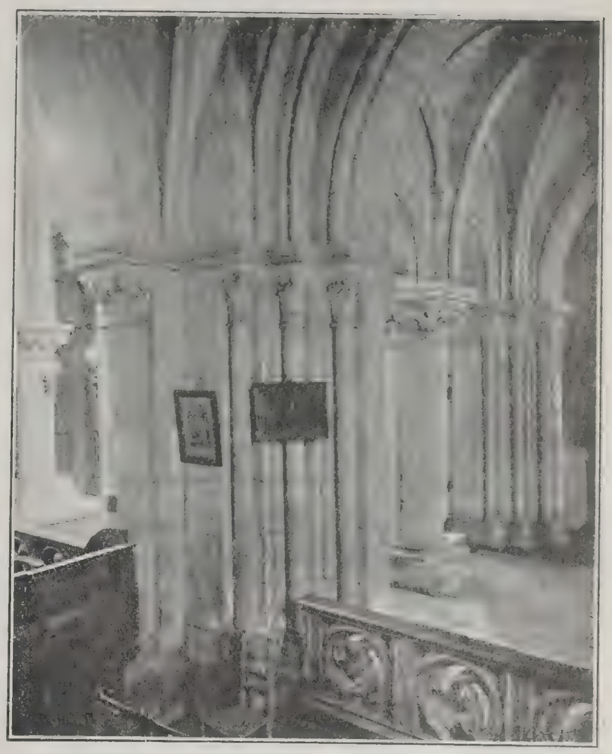
The building as a whole is a good example of the transition from Romanesque to Gothic. The body of the church, with the exception of the barrel-vault to the nave, reconstructed in the seventeenth century, is Romanesque; while the choir dates from the end of the twelfth century.

The exterior of the church presents no remarkable feature. From the court off the Rue St. Julien-le-Pauvre all that you can see is the uninteresting Doric front, with the outer wall of the sacristy to the left. Two arches of the destroyed nave are incorporated in this wall and can be distinctly seen. The pilasters of the façade are cut away in places, a reminder of the times when the building was no longer in use as a church, and when sheds and temporary buildings obstructed the court and were placed against the wall of St. Julien itself. In the courtyard, immediately to the right of the doorway as you enter the church, is a well with an iron guard. This well is supposed to be as old as the nave, and must therefore have originally stood inside the church in the south aisle. The best view of the exterior of St. Julien-le-Pauvre is from the south-east, in the open space at the back, which is approached from an entry in the Rue de la Bucherie.

Although the interior appears to be of an extreme simplicity, there is a remarkable absence of anything like symmetry, either in plan or detail. There is an ingenious variety which is at first hardly noticeable, but which becomes more and more apparent with study. The general effect of the interior is, of course, entirely marred by the presence of the iconostasis, a large screen with three openings separating the altar from the nave, made necessary by the use of the church for the Greek cult. The screen, besides striking a false note by reason of its incongruity of design, effectually blocks the view of the central apse.

The interior, nevertheless, is not unimpressive, and a certain air of neglect—at any rate an absence of the often - too - evident presence of the restorer—rather adds than otherwise to its interest. Portions have, however, been restored, but in a conservative spirit. The building falls naturally into two parts : a short Romanesque nave with heavy round pillars and slightly stilted semicircular arches, and an early Gothic choir. The apse at the end of the north aisle contains an altar to St. Joseph, that to the south to the Virgin. At each side of the entrance to the choir is a massive irregularly-shaped pillar with slender shafts and capitals. The capitals are of excellent detail. These pillars are separated from those of the apse by a heavy circular column, recalling on a smaller scale those of Notre-Dame, and supporting a pointed arcade of two arches. The capitals of these two columns are remarkably fine, especially that on the south side. From a mass of acanthus foliage spring, at the four corners, figures having female human heads, and the bodies, claws and outspread wings of birds. The capital on the north side consists of foliage only. The sculpture of the capitals, of which there are more than 150 in this little church, is extremely good, consisting almost entirely of simple applications of the acanthus and leaves of water plants.

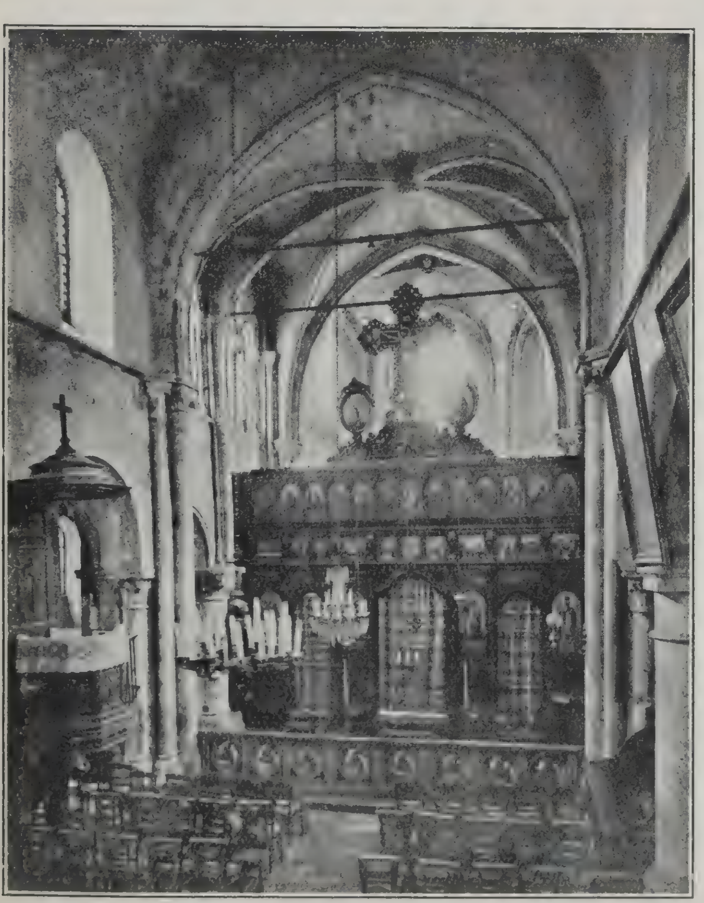
The screen, or iconostasis, which suggests to M. Huysmans the front of a penny theatre on the boulevards, recalls the interior decoration of Russian churches in its gaudiness of inlaid woods and painted richness. Curtains "like Cashmere shawls soaked with rain" hang before the three openings, through the central one of which the Communion is carried to the people, who must not see the altar where the mystery is accomplished. The Greek Catholics must not be confounded with the Greek Church. They acknowledge the authority of the Pope while following the Greek rite. The united Melchites, or Greek Christians of the Levant, retain the liturgies of St. Chrysostom and St. Basil, and it is this rite which obtains at St. Julien-le-Pauvre. We may regret, with M. Huysmans, this "intrusion of the Levant into the parish of St. Séverin," and think it absurd, but it is possible that but for the taking over of St. Julien by the Greek Catholics the building would have fallen on worse days.



ST. JULIEN-LE-PAUVRE, PARIS.

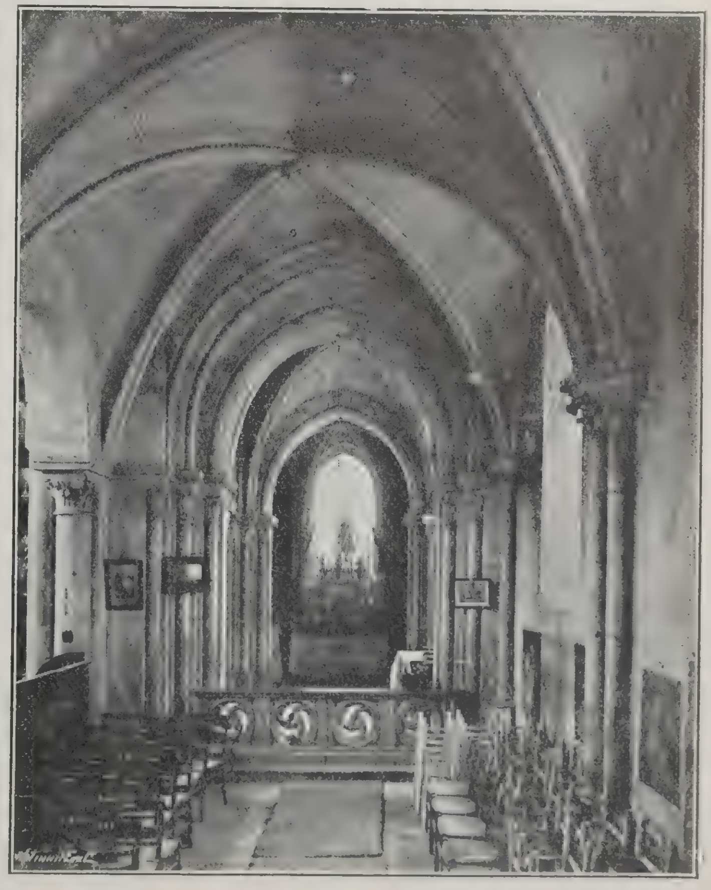
The church contains a few monuments, but none of any artistic interest. A statue of Montyon, the founder of the Prize of Virtue, indicates his burial in St. Julien-le-Pauvre.

Mr. Hilaire Belloc, in his scholarly and fascinating book on "Paris," thus speaks of St. Julien-le-Pauvre : "St. Julien-le-Pauvre, rebuilt in the thirteenth century and altered again in the next two hundred years, is



The Iconostasis at the End of the Nave.

ST. JULIEN-LE-PAUVRE. PARIS.



Chapel of the Virgin.

curiously desolate. It should, if age and tradition could lend reverence to everything, be among the most revered of the city shrines; but the people of Paris, careful as they are of old customs, are capricious of their choice of idols and the little church is so much abandoned that foreign lovers of Paris pass it a hundred times without remembering it. This is a little due to the contrast between those old neglected streets and the new boulevards. St. Julien lies in a dark passage off the Rue du Petit-Pont; and though the demolition of some old houses lets you now see the curious triple apse from the Rue de Fouarre, it has been for centuries, and will be, I think, again covered in from its neighbourhood."

It has often been asserted that the mediæval façade of St. Julien was destroyed by fire in the eighteenth century. But such was not the case. M. Lebrun, and later M. Viatte, who have both written monographs on the church of St. Julien-le-Pauvre, conclusively show that owing to neglect and negligence the façade had become unsafe at the beginning of the seventeenth century, and in the subsequent restoration it was demolished together with the west end of the nave. The ancient façade appears to have followed the lines of the roofs of the nave and aisles, showing a large central gable with a smaller one on either side.

Baedeker devotes seven lines to the church of St. Julien-le-Pauvre, but a longer description will be found in Miss Sophia Beale's "Churches of Paris." Miss Beale's account is borrowed largely from M. Lebrun's monograph, which is, I think, now out of print. M. Viatte's monograph contains a set of measured drawings of the building, besides sketches of the monuments. Guilhermy in his "Itinéraire Archæologique de Paris" devotes four pages to the building, and gives illustrations of the interior and exterior of the choir. Lastly, M. Huysmans has devoted some twenty-four pages of his very interesting sketch of "Le Quartier Saint-Séverin" to the church of St. Julien-le-Pauvre.

PAINTS AND PAINTWORK.—II.

(Continued from p. 203, No. 532.)

COLOUR.

TO embark on an account of the many theories that have been promulgated in reference to colour is outside our present purpose, and we shall only state the view of the matter which seems to us most worthy of acceptance and helpful in the study of paints. It is possible—indeed, probable—that the present theories of colour will undergo very considerable modification, for the subject has been far too little investigated, and we are forced to make finite statements from the inability to convey in a few words the roughly-shapen form that present knowledge takes.

Colour is Light,

and the organs by which we apprehend it are the eyes. Modern theory assumes that there is a medium called the ether which conveys vibratory motion, like waves on water or in air, that strikes upon the nerves of the eye and conveys to the brain the impression of light. In all cases of wave motion there is no transference of matter from the source of the movement onwards, but simply a to-and-fro motion which is imparted from particle to particle of the medium in which the wave is advancing. This vibratory or undulatory motion of the ether has always the same velocity, but varies in rate of promulgation. Upon this vibration-frequency of the waves depends the colour, and this frequency is measured by wave-length, *i.e.*, the distance from crest to crest. Certain bodies emit their own light, such as the sun, a gas flame, an electric lamp, &c., and are known as self-luminous bodies, while others do not emit light and are therefore non-luminous. These latter, however, are rendered visible by reflecting light from luminous bodies which falls upon them. To this category paints belong.

Spectrum Colours.

White light is not a simple wave motion, but is composed of many waves of different length, and if we pass it through a triangular glass prism, in the classic experiment of Sir Isaac Newton, we bend these waves out of their course (to a greater or less extent, dependent upon their wave-length) so as to form a band of variously coloured light, called the spectrum. These are known as the spectrum colours, and range from red at one end through orange-red, orange, orange-yellow, yellow, greenish-yellow and yellowish-green, green, cyan-blue, blue, to violet at the other end. The wave length has been measured to extend from $\frac{76}{100000}$ of a millimetre at the red end to $\frac{39}{100000}$ of a millimetre at the violet end.

White and Coloured Bodies.

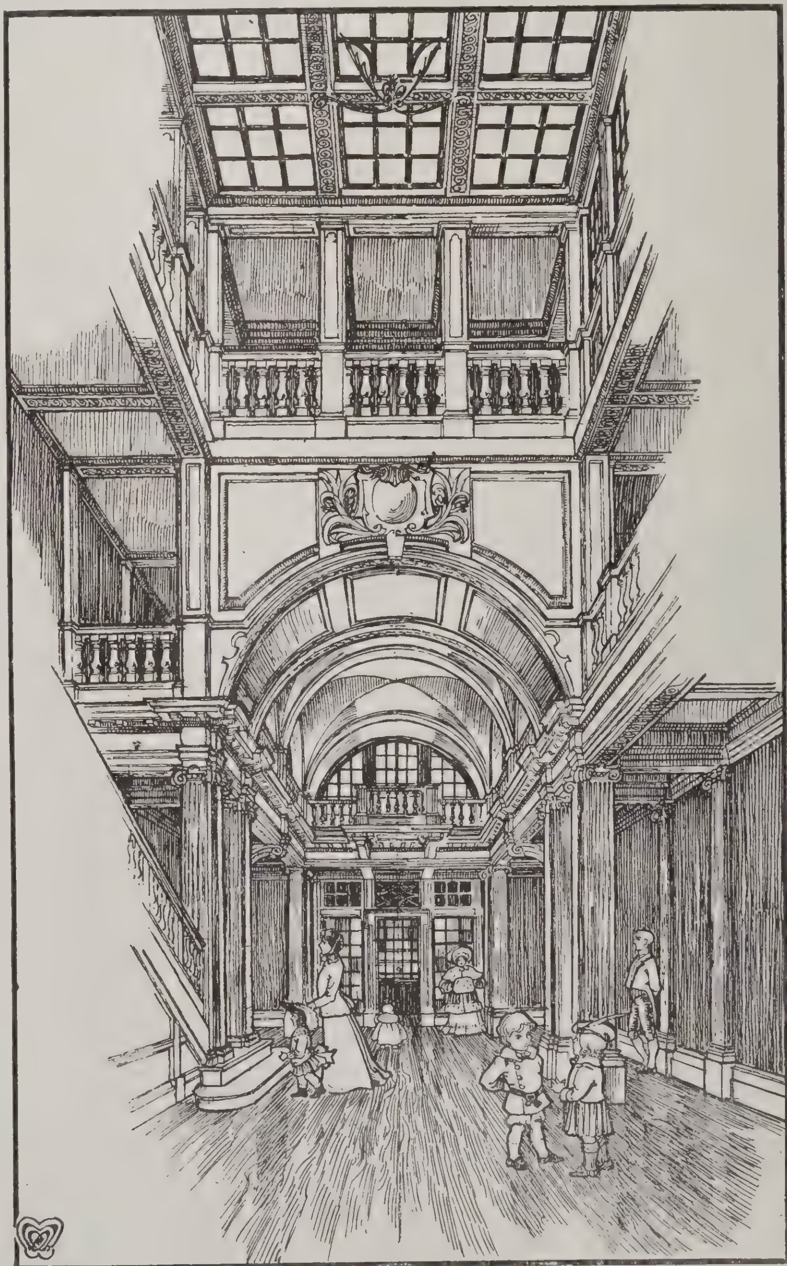
Certain bodies reflect light impinging upon them without changing the proportions of the various motions of different wave-length of which they are composed. On the other hand, other bodies absorb some of the waves and reflect back part only, and thus appear to be coloured red, green, blue or yellow, &c. Just as white light can be split up into many coloured lights, so by combination of coloured lights in proper proportion white light may be reproduced.

For the observation of colours an instrument known as the spectroscope is used: this contains a prism or prisms to resolve the entering light into its constituents, and means to observe the amount of each.

A colour has three distinguishing constants, namely, hue (denoted by the wave-lengths of its component parts), luminosity (which is its measure of brightness), and purity (measured by the proportions of lights of differing wave-lengths which compose it).

Primaries, Secondaries, Tertiaries.

Several theories have been advanced as to colour, all of which agree in this, that they formulate primary colours from the admixture of which in various proportions other



MESSRS. SPEAIGHT'S PREMISES, 157, NEW BOND STREET: THE GALLERY.
C. H. B. QUENNELL, ARCHITECT.

The entrance hall and gallery here illustrated form the reception part of the photographic premises of Messrs. Speaight. The staircase leads up to dressing-rooms at the half-landing level and again up to the studio over the gallery. Mr. H. Roffey, of Putney, was the general contractor. Messrs. Goodall, Lamb & Heighway executed the oak work to pilasters and entablature over staircase, &c., and the carving was done by Messrs. Martyn & Co., of Cheltenham. The fibrous plaster vaults, &c., were made and fixed by the Veronese Co. The design of the building was much influenced by stringent conditions of light and air and party-walls of adjoining premises.

colours can be produced. The admixture of two primaries is called a secondary and of three primaries a tertiary. The old Brewsterian theory assumed the primaries to be three—red, yellow and blue—while the newer Young-Helmholtz theory differs as to the three, stating them as red, green and blue. By the latter theory we can explain the admixture of spectrum colours and contrast of colours; whereas the older theory failed to account for such anomalies as the admixture of ultramarine with yellow ochre, producing not a green but a greenish-grey. The transmitted or reflected light from colouring matters is always compound, and to judge the effect of mixing we require to know the constituents of the light from the colouring matters. The Brewster theory is sufficient for rough and ready use in the mixing of paints, dyes, &c., but the later theory is distinctly more scientific, and unless the spectroscopic examination of colouring matters is utilized the mixing of colours cannot but be haphazard and doubtful.

The Eye.

These theories as to primaries are naturally dependent upon the physiology of the eye. The eye is unable to pick out the different constituent rays of a compound colour, and only sees it as one whole, though the sensation is doubtless built up of a number of impressions. An impression endures upon the retina for a perceptible period of time (note, for instance, the continuous line of one hue produced by a rapidly revolving wheel portions of which are painted with different colours), and this persistence of vision gives rise to many of the illusive phenomena of colour, such as after-images, contrast, &c. According to the Young-Helmholtz theory there are three sets of nerve fibres in the eye—one set sensitive to green light, another to red, and a third to blue or violet light, corresponding to the primary colours—and that when one is affected by a colour the nerves of the colour complementary to that first colour are excited to a lesser degree. Thus, when the red nerves are excited the green are also excited, though in a minor degree, and these sensations are transmitted to the brain, which is, however, unable to single out the real objective colour sensation from the subjective one, both arriving simultaneously; so that one colour only is apprehended. This means that a red must always appear yellowish (red and green producing yellow), a green more bluish and a blue more greenish than they really are. This offers an explanation of the contrast effects that occur when two colours are seen in juxtaposition, the three sets of nerves being excited so that we see neither colour as it really is or as it appears alone.

We may now investigate the two theories of colour more closely.

The Brewster Theory.

According to this theory the three primaries are:

Red. Yellow. Blue.

By the admixture of any two a secondary colour is produced. Of these there are three, thus:—

Red + yellow = orange.
Red + blue = purple.
Yellow + blue = green.

By the admixture of three primaries tertiary colours are produced, the hues of which are almost infinite. We classify them according as either or both of the primaries predominate:—

One primary predominating.	Red Tertiaries Blue ,, Yellow ,,
Two primaries predominating.	Orange Tertiaries Green ,, Violet ,,
Three primaries balancing	Citron Tertiaries Russet ,, Olive ,,
Nearly neutrals, slight predominance of either red, yellow or blue.	Brown Tertiaries Cold Grey ,, Warm Grey ,,

This theory does not account for the admixture of spectrum colours, though it applies fairly well to pigments.

The Young-Helmholtz Theory.

According to this theory there are three primary colours:

Red. Green. Blue

(Maxwell's theory only differs in taking scarlet, green and violet as the primaries.)

When two of these primary colours are mixed, secondary colours are obtained thus:—

Red + green = yellow.
Green + blue = greenish-blue.
Red + blue = purple.

Thus when colours are mixed the tint is obtained which is intermediate between them in their position in the spectrum.

When three colours are mixed white light is produced.

All this seems absurd compared with the actual result from admixing pigments, but it is absolutely truthful with coloured light. The theoretical explanation offered as to the effect of mixing colouring matters is as follows:—These colouring matters have an absorptive action on the light which impinges upon them and so reduce the intensity of the light. Thus a colour produced by the mixture of two or three colours will be weaker as regards its light intensity and therefore appear duller or darker, until black is reached with the total absorption of light.

Mixing of Colours.

The examination of the absorption spectra of colouring matters will give a clue to the effects produced by admixture. An absorption spectrum is found by examination of the light transmitted through a solution of a liquid or a thin film upon glass, or reflected from a pigment-surface. Various portions of the white light are permitted to pass or reflected but diminished in intensity, the measure of which can be gauged. These absorption spectra show that a blue colour, for instance, while stopping out almost all the other colours in the spectrum, may permit a small amount of red and still less green rays to pass, while another yellow colour may stop almost all the rest except for a small amount of red. The colour resulting from a combination of these two, it naturally follows, will not be a green but a reddish-toned tertiary—red being the colour common to both.

We shall deal with this subject further in future articles.

(To be continued.)

WAKEFIELD CATHEDRAL EXTENSION. THE LATE J. L. PEARSON, R.A., ARCHITECT.

WAKEFIELD CATHEDRAL EXTENSION.

THE extension of Wakefield Cathedral as a memorial to Dr. Walsham How, first bishop of Wakefield, who died in 1897, was consecrated and opened at the end of April. The work has cost about £50,000, and has been carried out from the designs of the late Mr. J. L. Pearson, R.A., under the direction of his son, Mr. F. L. Pearson, F.R.I.B.A., of London. The chancel of the old church has been extended eastwards about 16ft., and a retro-choir constructed, together with short north and south choir transepts and aisles. Underneath, by reason of the slope of the ground, it has been found possible to provide a chapter-house and large vestries. At the extreme east end is a morning chapel, dedicated to All Saints, 35ft. by 24ft., having a richly-groined ceiling in stone. The whole of the cathedral fittings, especially in the chancel and choir, have been overhauled and modified. New choir stalls have been provided for about sixteen extra seats; canopies, too, have been constructed. Messrs. Abbott & Smith, of Leeds, have for some time had in hand the complete renovation of the organ, which is now in a chamber which was formerly a vestry. The Walsham How memorial tomb, by Mr. R. L. Forsyth, is near the south transept window, and the children's memorial window in the south transept aisle. The marble and alabaster reredos has been designed by Mr. Oldrid Scott in conjunction with Mr. Pearson. The old sounding-board, which was in the Pilkington Chapel, has been fixed over the pulpit in the nave, and the old portion of the building, formerly fitted with gasaliers, has, like the new portion, been lighted with electricity by Mr. Taylor, of Huddersfield. The contractors were Messrs. Armitage & Hodgson, of Leeds. The extension has occupied five years, during which time Mr. W. J. Crook has acted as clerk of works.

Keystones.

Sir William Grantham's Cottages at Barcombe were certified for occupation last week.

Change of Address.—Messrs. Harris & Harris, quantity surveyors, have moved from 22, Surrey Street to 9, John Street, Adelphi, W.C.

Messrs. The Well Fire Co., Ltd., have opened new showrooms at Dover Street, Piccadilly. In noticing their exhibit at the Building Trades' Exhibition we gave their old address at York Buildings, Adelphi.

A new Book on Concrete-Steel, by Mr. W. Noble Twelvetrees, M.I.M.E., will be published shortly by Messrs. Whittaker & Co. It will deal fully with the theory and practice of reinforced-concrete construction, and will contain numerous diagrams and tables.

The Subways under the City Streets under the control of the Corporation amount to about 1½ miles. The lengths of gas, water and hydraulic mains, telegraph, telephone and pneumatic tubes and electric-lighting conduits laid in the subways under the control of the Corporation amount to 13½ miles.

Mr. W. H. Wrightson, a pupil of Mr. C. Edeson, of Scarborough, and since with Mr. A. W. West, of Maddox Street, W., Messrs. Flockton & Gibbs, of Sheffield, and Mr. Penty, of York, has entered into partnership with Mr. T. H. Baker, architect and surveyor, of London, Colchester and Clacton-on-Sea. The style of the firm is Baker & Wrightson, architects and surveyors, 21, Liverpool Street, E.C., and Clacton-on-Sea.

A Firm of Quantity and Measuring Surveyors.—In consequence of the death of the late Mr. H. T. Northcroft, the business hitherto carried on by H. T. Northcroft, Son & Neighbour and H. T. Northcroft, Son & Nicholson will in future be carried on by the three surviving parties, Mr. Henry Northcroft, Mr. W. F. Neighbour and Mr. Guy M. Nicholson, under the name of "Northcroft, Neighbour & Nicholson," at 9, Regent Street, Waterloo Place, S.W.

Hereford Cathedral West Front.—The building of the west front of the north aisle of Hereford Cathedral is progressing slowly, and it is a question whether the work will not have to be stopped for want of funds, which means that the tower at the north-west corner will not be completed. The porch, with its elaborate carving, similar in character to that on the central porch, has been finished and an oak door with iron tracery will be hung shortly. Mr. Oldrid Scott is the architect.

Queen Victoria Memorial, York.—The memorial statue of the late Queen Victoria for the city of York has now been completed by Mr. George W. Milburn, sculptor, of York, and will be placed on a pedestal in the ancient guildhall of the city. The statue, which is a seated full-size figure, is carved in Carrara marble. The block weighed about seven tons originally, and now weighs about three or four tons. The sculptor first made a full-size model in clay, which was afterwards cast in plaster, and from this model the marble was carved.

The Scheme for restoring Carisbrooke Church having been rejected by a vestry meeting because it contained a proposal to rebuild the ancient chancel, which was pulled down by Walsingham, the vicar now proposes to call a meeting for constituting a fresh restoration committee. He says that the chancel is bound to come some day, but they must leave that to the next vicar and proceed with a scheme for repairing the walls, roof and tower, removing the organ from the west to the east end, converting the tower base into vestries, opening the ancient west door, and reseating and repairing the south porch.

Great Tangley Manor House, Chilworth, near Guildford, is to be sold by public auction.

The Emerson Restaurant, Blackett Street, Newcastle, was opened last week. Mr. B. F. Simpson, F.R.I.B.A., was the architect, and Mr. W. T. Weir the contractor.

Famous Kentish Church in Danger.—Northfleet Church, one of the oldest and largest and most interesting in Kent, is in a dangerous condition, but no funds are available for the very necessary repairs.

Kingston Bridge is to be widened so as to allow trams to cross. The present bridge, which is about 100 years old, is 25ft. wide; it is to be widened by an addition of about 30ft. on the south side.

Mr. J. H. Martindale, architect, of Carlisle, has been appointed cathedral surveyor at Carlisle, in succession to the late Mr. Ormiston. The appointment of diocesan surveyor, also held by Mr. Ormiston, is in the hands of the rural deans, who have not yet filled the vacancy.

M. Rodin's Bust of Henri Becque is to be set on a column at the corner of the Boulevard de Courcelles and the Avenue de Villiers, Paris. The municipal council has decreed that there shall be no more monuments in the Champs Elysées or the Parc Monceau.

A Little Dispute.—Mr. J. Muller, architect, of Bedford Street, Strand, called recently at the office of the surveyor to the Chiswick Urban Council (Mr. John Barclay) to enquire why certain plans submitted had not been approved. The upshot was a "technical" assault on the architect, though in defence of the surveyor at Acton Police Court on Wednesday it was urged that no more force had been used than was necessary to recover plans which the architect had taken from the table. The bench imposed a fine of 10s. A cross-summons against Mr. Muller for damaging a hall-stand, which was pulled over during the dispute, was dismissed.

Gas to Replace Electricity for Lighting City Streets.—At last Thursday's meeting of the Court of Common Council a scheme was adopted for experimentally lighting Queen Victoria Street, Fleet Street and a portion of Lower Thames Street with high-pressure or incandescent gas lamps, in place of the electric light, at a cost of about £2,000. The annual saving was estimated at £400. Mr. A. C. Morton said that for street lighting electricity was an absolute failure. It had been abandoned in Vienna and Berlin, and was being gradually given up in Paris.—The Court adopted a suggestion of the London County Council to give the name of "Cheshire Court" to what has hitherto been known as Three Falcon Court, Fleet Street.

Additions to St. John's Church, Richmond.—The following particulars of the new chancel, &c., at the church of St. John the Divine, Richmond, Surrey, have been forwarded to us by the architect, Mr. Arthur Grove, of 15, Clifford's Inn, E.C., a pupil of the late John D. Sedding: "The illustration given on p. 240 of your issue for May 3rd, in connection with your notice of the Academy, is from a water-colour drawing by Mr. T. Hamilton Crawford. The alterations consist of a new chancel, chapel, organ-chamber and vestries, forming a considerable addition at the east end of this uninteresting church in the New Road, Richmond, designed by Mr. Vulliamy in 1831 and considered by some at that time to be a good specimen of church architecture. The new part is built of stock bricks and Corsham Down Bath-stone dressings on the outside, with Ham Hill stone dressings inside; and was completed in February last at a cost of £3,500. The rood with the marble pulpit and screens and other fittings have yet to be added. Outside on the east gable there is a large crucifix and figures of St. Mary and St. John modelled and carved by Mr. Richard Garbe. In the existing nave the galleries have been cut back and splayed against the north and south walls, which have been decorated with figure subjects by Mr. N. H. J. Westlake. The old glazing has been replaced by new with Prior's glass in various colours and patterns executed by Messrs. Britten & Gilson. The electric light has been installed by Messrs. Wenham & Waters, with fittings designed and executed by Messrs. Bainbridge Reynolds, Ltd. The heating has been carried out by Mr. J. Jeffrey. The general contractors were Messrs J. Dorey & Co, of Brentford."

Builders' Notes.

Messrs. Doulton & Co., Ltd., have been selected to supply the sanitary fittings for the new Ritz Hotel, Piccadilly.

Cardiff Building Trade Dispute Settled.—The committee of the Cardiff Master-Builders' Association have met the representatives of the various trades, and an amicable agreement has been arrived at, the masters withdrawing the demand for an alteration in the winter working hours.

Dublin Building Trade Dispute.—At a meeting of the Dublin Trades Council held last week a resolution was adopted asking the masters to submit to arbitration the cause of dispute—the refusal of the bricklayers' society to accept the employers' demands concerning piecework.

Berlin Building Trades.—May Day was celebrated in Berlin by between 30,000 and 40,000 workmen connected with the building trades. Meetings were held and resolutions were passed expressing confidence in trade-unionism as the only means of securing for workmen the social reforms for which they are striving.

The "Ellkay" Patent Bath Syndicates have amalgamated their businesses with that of Messrs. Cornes & Haighton, of Leek, Staffs., under the title of Ellkay & Cornes, Ltd., with a capital of £80,000. The new company have retained the services of Mr. James Cornes, who will be chairman of the board of directors, and Mr. E. W. Lancaster, the patentee of the "Ellkay" bath, who will jointly manage the business.

Newcastle Building Trades Dispute.—In accordance with resolutions passed by their various societies, the masons, bricklayers, plasterers and builders' labourers on April 29th struck work against the demand of their employers for a reduction of wages and certain alterations in the conditions of work. It is too early to estimate the number of men actually affected, or what the result will be upon the building trade of Newcastle and district, but the men maintain that the numbers leaving work are so considerable as to seriously delay the completion of important contracts.

Scottish Building Trades Federation.—The half-yearly meeting of the executive was held in Inverness last week, Mr. William Macdonald, president, in the chair. The trades disputes in Glasgow, Edinburgh and Aberdeen were considered, and it was reported that the dispute between the operatives and master-joiners in Aberdeen had been settled, the employers' terms having been accepted. It was also reported that the Edinburgh bricklayers' dispute had been settled on terms satisfactory to the employers. The state of trade throughout the country was dull. It was resolved that uniform dates for the renewal of by-laws affecting operatives should be adopted throughout the country. The Edinburgh and Aberdeen delegates suggested June 1st annually as a suitable date, but it was ultimately agreed that the fixing of dates should be left to each separate trade, uniformity for each branch of the building trade being all that was desired.

THE TIMBER TRADE.

London Market in April.

DURING April there has been no improvement in the London timber market. Messrs. Churchill & Sim state that the deliveries from the docks have fallen off another 3,600 standards in comparison with April 1904, the two weeks affected by the Easter Holidays both falling in April in each year.

The total deficiency for the first third of the year, as compared with the same period of 1904, amounts now to nearly 10,000 standards, and sadly belies the hopes of better trade to come which were indulged in and acted upon at Christmas time. Messrs. Denny, Mott & Dickson, however, state that on the whole there has been no reason for any weakening of the general impression that business is gradually, if in some branches of the trade almost imperceptibly, improving. The lack of demand shows in the figures of the dock stock, which is not reducing so quickly as it should do, and is also slightly reflected in the course of prices during the month, which are weaker than they were in March last. These have been still more affected by the reductions made by Swedish selling agents during the month for fresh supplies for arrival. So far as can be judged from the ships chartered, very little preparation has been made to bring any of these supplies to London early, and this market will have very little selling pressure to withstand for the present.

The abstract of stock, consumption, &c., for April, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on April 30th was:—

	Pieces.
Foreign deals and ends - - -	974,000
Do battens - - - -	1,740,000
Pine deals and battens - - -	998,000
Spruce do. do. - - -	750,000
Boards, rough - - - -	2,770,000
Do. prepared - - -	3,369,000

Totalling 13,601,000 pieces, as compared with 15,457,000 in 1904, 14,591,000 in 1903, and 15,432,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - -	192 pieces.
Do oak timber - - -	779 loads.
Do. fir timber - - -	561 do.
Do. Oregon pine, &c., spars and masts - -	4,343 do.
Colonial oak timber - - -	1,368 loads.
Do. birch timber and planks -	1,567 do.
Do. elm and ash timber -	634 do.
Do. yellow pine - - -	379 do.
Do. red pine - - -	243 do.
United States pitch-pine timber -	17,048 do.
Do. do. deals -	61,000 pieces.
East India teak - - -	7,017 loads.

Deliveries during January, February, March and April.

The deliveries for the first four months have been:—

	Pieces.
Foreign deals and ends - - -	1,111,000
Do. battens - - - -	2,036,000
Pine deals and battens - - -	375,000
Spruce do. do. - - -	530,000
Boards, rough - - - -	2,150,000
Do. prepared - - -	4,975,000

Totalling 11,177,000 pieces, as compared with 12,615,000 in 1904, 13,502,000 in 1903, and 13,885,000 in 1902.

The deliveries for April

have been as follows:—

	Pieces.
Foreign deals and ends - - -	250,000
Do. battens - - - -	473,000
Pine deals and battens - - -	120,000
Spruce do do - - -	118,000
Boards, rough - - - -	391,000
Do. prepared - - -	1,281,000

Totalling 2,633,000 pieces, as compared with 3,181,000 in 1904, 2,948,000 in 1903, and 3,619,000 in 1902.

Deliveries from Ship to Craft

For the first four months of the year the deliveries direct from ship to craft have been:—

	1905. P.s.h.	1904. P.s.h.	1903. P.s.h.	1902. P.s.h.
Deals and battens -	8,118	7,657	8,297	6,347
Boards - -	3,764	3,265	4,345	5,386
Total -	11,882	10,922	12,642	11,733

and for April—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	2,947	2,852	3,704	1,093
Boards - -	1,461	1,841	1,947	1,832
Total -	4,408	4,693	5,651	2,925

Soft Woods.

Swedish Wood.—Messrs. Churchill & Sim state that the course of the market for Swedish wood in London has been downwards in April. The level of prices is so low that there has been no room for any pronounced fall, but there has been no support from any active demand, and the further concession made for fresh stocks for arrival has been the reverse of encouraging, so that quotations both for deals and battens are now rather under those current here in March. Deals have held their own on the whole better than battens; the latter had not fallen much here so far, and have now only weakened in sympathy with other sizes. Prepared boards have been steady throughout the month, and there is no change to report in them since March.

Norwegian Boards.—The importation of prepared boards from the Norwegian ports in April has been less than half that of April last year. Prices have remained quite steady, and without change from those current here in March.

Russian Deals.—There is little change to report for April. Prices for deals are a point down if anything, in consequence of a weak demand and a belief that still further reductions would be faced by shippers to secure contracts for clearance quantities for arrival.

Finnish Battens.—The market for Finnish battens in London has been a weak one during April. There is small justification for this in the prospects ahead, but the lack of demand is telling severely against this class of stock especially.

Prussian Timber.—A small arrival of fir timber in April has made no difference to the London market, which remains without change from the quotations of the previous month. For foreign oak the London market has advanced a point in April, and there seem to be many causes operating in this direction, but the demand is so small that it takes much time for a reduced supply to have any effect.

Canadian Timber.—Pine deals are the only things for which the demand has shown some improvement in April, and this is probably only the reflex of freer selling here at vastly reduced prices. For spruce the arrivals from the lower ports are on a very small scale, and quotations for shipment continue firm at a prohibitive level so far as London is concerned. The market here is nevertheless very dull, and prices are a point down since March. Oak, birch and yellow-pine timber have been held for rather better prices than of late, in obedience to the prospects ahead. The few logs of elm and ash that have been sold have only found a market at reduced rates.

For sawn timber the market has been disappointing in April. The deliveries have improved, and the cost of further shipments is much enhanced, but in London certainly the market sales have been at lower rates than in March, although the quantities sold have been small. Probably there is much contract work going on concurrently with this. Pitch-pine deals arrived here with some freedom during April, and the market has weakened under the pressure.

Teak.—Messrs. Denny, Mott & Dickson report that the landings in the docks in London during April consisted of 85 loads of logs and 235 loads of planks and scantlings, or a total of 320 loads, as against 584 loads for the corresponding month of last year. The deliveries into consumption were 563 loads of logs and 361 loads of planks and scantlings—together 924 loads, as against 555 loads for April, 1904.

These figures are significant in respect to the continuous depletion of stocks and the very inadequate arrivals from India. It must be noted, however, that a Moulmein cargo of about 850 loads has come to hand, but not having completed discharge is not included in the stock of 3,922 loads of logs. The cargo consists entirely of short logs, but even these will be a very welcome contribution to the unwholesomely bare stocks—although the fact of a whole cargo being composed of short logs only is a further proof of the inability of the shippers to meet the requirements of the home market. Prices are already sufficiently high to have brought out all possible reserves at the shipping ports, and merchants and consumers have to accept the fact that the limited supplies of teak for the present year will greatly restrict, if not altogether strangle, business in first-class teak until the spring of 1906

Mahogany.—The import has been light, and the consumption, though moderate, has been sufficient for the supply. There has, therefore, been little desire to press wood for sale, although small and inferior timber hangs somewhat heavily on hand. Prices on the whole have been well maintained, with little or no variation.

Odessa Oak.—The demand for logs has continued unchecked, and shippers are still able to meet the same; but the recent burning down of the chief producing mill has for a time put a stop to business in flooring and other conversions.

Oregon Pine.—The demand has been moderate, but prices are well maintained, as the strength of the pitch-pine market has a reflex action on this wood, which comes into competition when exceptional lengths and sizes are required for constructive work.

Abstract of Stock, Consumption, &c., for April.

FRAMING FOR DOOR-OPENINGS WITH EXPANDED METAL.

USES OF EXPANDED METAL.

On this page we illustrate two applications of expanded steel which will be of interest to architects and builders.

Fig. 1 shows some details for framing door-openings for solid partitions, walls, &c. Vertical wrought-iron tension rods are fixed 12ft. apart at top and bottom, to which the expanded metal lathing is fixed with galvanized soft iron wire, and where the openings occur the framing is fixed to the vertical rods with staples, as well as being dowelled or spiked to the flooring and stapled to the lathing over the door-head.

Fig. 2 shows a method of trimming around well-openings in flooring. It will be seen that steel channels are used, and all rivets countersunk in the face of the well to obtain a flush finish. The well-openings in expanded steel and the concrete flooring at Messrs. Armstrong, Whitworth & Co.'s works at Elswick were constructed in this manner.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Book on Essex Churches.

In answer to "X" (see p. 253 of our issue for last week) Mr. W. Arthur Webb, A.R.I.B.A., writes: "This month will be published a book on 'Mediæval Architecture in Essex,' written by Mr. Ernest Godman, the secretary of the Memorials of Greater London, with fifty illustrations (photographs and line drawings), the letterpress portion being the work of the Essex House Press. The price will be 12s. Mr. Godman's address is Sunnyside, Banstead, Surrey."

METHOD OF TRIMMING AT WELL-OPENINGS.

Isolation Hospitals.

In reference to the enquiry under this head on p. 253 of our issue for last week, G. B. (Hythe) writes: "The Local Government Board issues a pamphlet under the heading 'On the provision of Isolation Hospital Accommodation by Local Authorities' (Eyre & Spottiswoode, 1d). This contains typical sketch plans of miniature hospitals of this class, rules as to the minimum floor and cubic space allowed for each patient, and hints as to the mutual isolation of the drainage systems from the various blocks of buildings. The primary objects of the provision of this class of hospital being the isolation of patients from the public and from patients suffering from other infectious diseases, it is obvious that widely separated pavilions should be provided for each disease under treatment. In the course of a long experience and special study of this class of building I have never met with a case in which specific provision has to be made for the treatment of 'six or seven different diseases.' In a hospital of the size mentioned by the querist (thirty beds), it is usual to provide three pavilions for the simultaneous treatment of scarlet fever, enteric and diphtheria respectively, with perhaps a small block for one or two patients of each sex for cases of doubtful diagnosis. The provision for scarlet fever is usually greatly in preponderance over that for other infectious diseases, and accommodation must of course be based upon and proportioned to the relative frequency of cases as reported to the medical officer of health, whose returns are usually available for public inspection. Where the number of patients justifies such an arrangement, it is now considered desirable to provide, in connection with the main wards, small wards for each sex for moribund, acute, septic and doubtful cases respectively, and care should be taken in planning to see that the patients are, as far as possible, under the immediate surveillance of the nurse in charge. With regard to the cost, it is not possible to provide a permanent hospital, with proper adjuncts and with any pretence to efficiency, for a less sum than from £300 to £450 per bed, according to the prices of local labour and materials, so that the sum mentioned by the querist (£4,000 for thirty beds) is totally inadequate."

C. E. writes: "Querist can get a block plan of isolation hospital from the Local

Government Board for 6d., and other information on application. The Local Government Board will not have several diseases treated under one roof, and insist on their rules being complied with. The medical officer of health or the surveyor of the district concerned would probably be glad to give all necessary information."

R.I.B.A. NOMINATIONS.

THE following have been nominated as vice-presidents and members of council for the ensuing year of the Royal Institute of British Architects:—

Vice-Presidents.

Edwin T. Hall
Sir John Taylor

Members of Council.

Maurice B. Adams
R. Stephen Ayling
Frank Baggallay
John Bilson
J. J. Burnet
W. D. Caröe
A. W. S. Cross
Herbert Davis
E. M. Gibbs
J. Alfred Gotch
E. A. Gruning
G. Hubbard
E. W. Mountford
A. N. Prentice
G. H. Fellowes Prynne
C. Harrison Townsend
Paul Waterhouse

Associate Members of Council.

W. A. Forsyth
T. E. Pryce
E. A. Young.

OUR PLATE.

THE village at Sandon forms part of a scheme which is now being carried out to the designs of Mr. E. Guy Dawber, F.R.I.B.A. The village club, with reading- and billiard-rooms and gymnasium, &c., is already built opposite the new buildings shown in our centre plate, and the entrance lodges and gates to the park were done two or three years ago. The village is not new; it contains some old houses, &c.; but this particular portion at the junction of two roads is going to be formed into a green with more new buildings around it. The present "Dog and Doublet" will be pulled down and a new one built as shown. Oak grown on the estate, with local stone and rough-cast, will be used. The drawing is exhibited at the Academy.

Correspondence.

Baryta Treatment of Stonework.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In noticing our exhibit at the Building Trades' Exhibition, on p. 246 of your issue for last week, you state in reference to the baryta treatment of stonework that "the soluble sulphate of lime . . . . is converted . . . . into soluble sulphate of baryta": whereas the reverse is the fact, the lime being converted into insoluble sulphate of baryta. It is the fact of turning a soluble salt, such as sulphate of lime, into an insoluble salt, such as sulphate of baryta, which stops the decaying process, by preventing the sulphate of lime decomposing and crumbling away.—Yours truly,

JULIUS HÜLSEN & Co.

NEWCASTLE-ON-TYNE.

[Our statement of the chemical changes effected by the baryta treatment was based on the printed instructions of Professor Church, dated December 7th, 1904, as furnished to us by you, and the words quoted are as they appear in these instructions. The error is of course due to a misprint.—ED. B.J.]

Are Lightning Conductors Dangerous?

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Permit me to point out that the article in the "Electrical Review" to which you refer appears to have been based on the mistaken idea that, as a large proportion of the cases under consideration by the Lightning Research Committee had lightning conductors, more protected than unprotected buildings were damaged by lightning. The writer overlooked the fact that, whereas in the first year of their existence the Committee received reports of about one-sixth of the cases of damage that occurred, in the succeeding years they received a very small proportion because they intimated that only accounts of damage to protected buildings were desired.

From a close investigation of the subject extending over seventeen years I have found that from 300 to 400 buildings are damaged by lightning in this country every year, out of which fewer than a dozen were fitted with conductors. Most of these had been in use for from twenty to sixty years, and had mostly been applied by men whose calling did not imply that they were experts in this admittedly complex subject!

It would be absurd to hazard a guess as to the number of lightning flashes that occur in this country annually. It is sufficient to say that it must be enormous. Now, as the loftiest buildings are obviously somewhat more liable to be struck than low ones, and as the majority of the former are fitted with conductors, one would expect a very large number of failures if conductors, instead of being safeguards, were a source of added danger.

If a case of failure occurs it is fully advertised, but when lightning conductors are struck by lightning and no damage results nothing is said about the matter—in fact, even the inmates of the building are not generally aware that the conductor has averted a disaster. There are unmistakable signs by which one can tell that a conductor has been struck by lightning, and when testing conductors one of the first things I do is to see whether Nature has been testing the conductor before me. It is quite a common occurrence to come across these signs. I have in my possession three examples, and might have collected a great quantity but that the owners generally prefer to keep them as curiosities, or say that as they have answered so well they will not have them disturbed.

If the Committee had asked for particulars of such cases I venture to say that they would have received a much more formidable list than the one they have of failures, and that a field of investigation would have been opened that would have produced most interesting and valuable results.

Lightning conductors have been employed for the protection of buildings for over a century and a half, and the adoption of them has been increasing year by year—this in spite of the strongest opposition by fanatics, cranks and those whose limited knowledge or want of knowledge of the subject has led them to form erroneous views as to what a conductor is and what it is intended for; and their use would not have increased in this way if they had been harmful or even useless.—Yours truly,

ALFRED HANDS, F.R.M.S.

LONDON.

Manchester Town Hall.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your issue for April 26th, referring to the proposed county hall for London, you give the cost of the town halls in five large cities, heading the list with Manchester Town Hall, the cost of which you put at £1,050,000. I should like to know what is your authority for this figure, as I have reason to believe that the cost of the building—exclusive, of course, of furniture—was £495,950. It is possible that your larger figure includes the value of the site.—Yours truly,

PAUL WATERHOUSE.

[Our authority for the figure stated was the "Daily Chronicle." The £1,050,000, we take it, includes everything—site, building and equipment: though, making ample allowance, it certainly seems extravagant. The cost of the Westminster Bridge site for the proposed county hall is put at £600,000, with £44,000 for making the embankment, as against £1,056,000 for the building.—ED. B.J.]

Competitions.

Public Library, Hamilton.—The architect of this building is Mr. Alexander Cullen, F.R.I.B.A., selected in competition.

Elementary School, Aylesbury.—1st, Messrs. J. Moir Kennard & H. Kennard; 2nd, Mr. A. Hendry and Messrs. John Cash & M. S. Hack (divided).

New School, Taunton.—This competition has been decided as follows:—1st, Messrs. H. Dare Bryan (Weston) and F. W. Roberts (Taunton); 2nd, Messrs. Samson & Cottam, Taunton and Bridgwater; 3rd, Messrs. Price & Jane, Weston-super-Mare.

Laboratories at Aberystwyth University College.—In limited competition Mr. A. W. S. Cross, F.R.I.B.A., has been selected architect for the Davies memorial laboratories to be erected at the University College of Wales, Aberystwyth, at a cost of about £20,000.

Schools, Wolverton.—The competition for a new elementary school at Wolverton has been decided as follows:—1st, Messrs. Harrington, Ley & Kirkham; 2nd, Mr. Frank T. Bagallay. Messrs. Harrington, Ley & Kirkham were also awarded the first premium in the competition for a new secondary school at Wolverton, and Mr. G. Sedger the second premium. Mr. T. W. Cutler, F.R.I.B.A., was the assessor.

Stockport Sunday School Centenary Memorial Hall, &c.—The fifteen competitive designs submitted in this competition were exhibited last week at Stockport. The scheme is to cost £15,000. Accommodation is provided for 3,000 persons, with twenty-four classrooms. The design of Messrs. Potts, Son & Hennings has been placed first by the assessor, Mr. A. Murgatroyd, of Manchester.

Competition for Housing Scheme, Norwich.—The committee of the Competition Reform Society disapprove of the conditions in this competition because the information to competitors is insufficient, there is no independent assessor, and the committee reserve the right to use any of the plans submitted, whether successful or not, without payment, and do not bind themselves to carry out the successful or any other design. Architects are requested to abstain from competing unless the conditions are satisfactorily revised.

Obituary.

Mr. Walter Aston, F.R.I.B.A., of Macclesfield, left gross estate valued at £5,429.

Councillor John Wright, head of one of the largest building and contracting concerns in Nottingham and district, died recently, aged 65.

Mr. W. G. Scott, head of the firm of Messrs. W. G. Scott & Co., architects and surveyors, Workington, died recently, aged 67.

The late Mr. William Sturge, an ex-president of the Surveyors' Institution, who died on March 26th last, left estate which has been valued at £155,256.

Mr. T. P. Worthington, engineer and architect, Blackpool, died last week, aged 64. He was engineer to the Victoria Pier, Blackpool, and honorary architect to the Blackpool Victoria Hospital. He acted as engineer to the central pier extensions and designed many residences in Blackpool and the surrounding district.

AMERICAN PLUMBING.*

By J. PICKERING PUTNAM, Fellow of the American Institute of Architects.

THE committee on the revision of the building laws appointed in 1904 by the Boston Society of Architects have invited their fellow architects to aid them by sending suggestions, and the present paper is written with that end in view.

I have before me the plumbing ordinances of Boston, which are substantially in accord with those of the majority of large cities throughout the United States.

Fig. 1 shows the system of plumbing required by these ordinances. Let us first enumerate the amendments now advocated by the best authorities, in the order of their importance, and afterwards explain the reasons for each in detail.

(1) More than half of the increased complication is due to the so-called "back-venting" of the traps of all fixtures. We have, for instance, bath-tubs, wash-basins and other fixtures whose traps consist in bends in the pipe deep enough to present a barrier to the passage of drain-pipe air into the house. Our building law requires every such trap to be vented by a special air-pipe extending from the sewer side of the trap up to a point above the highest fixture on the stack, as shown in Fig. 1 by the smaller pipe between the fixtures and the 4in. soil-pipe. The original purpose of the law was to protect the trap seals from what is called "syphonage." But soon after it was enacted it was discovered that the air-current induced by the back-vent pipe was itself far more mischievous than the danger it was expected to remove, in that it operated to destroy the seal by evaporation; and so rapidly did it do this in some cases that in at least one large city the Board of Health felt obliged to issue notices to house owners advising them to have the traps refilled by hand in houses temporarily unoccupied, as often as once a fortnight, in order to restore the seal destroyed by back-venting.

It was also very soon found that the system was unreliable on account of deposits of greasy sediment within the vent-pipe and of snow or frost at its top, which rendered it inoperative; and other difficulties and dangers revealed themselves as time went on.

On the other hand methods of securing positive protection without back-venting were multiplied, until to-day the thinking man is puzzled to understand how the public can continue to allow to exist such a foolish and costly method of ensuring insecurity.

(2) The next important modification of the law recommended consists in the omission of the main house trap in the basement, and of the external sewer vent often resulting from its use.

(3) A third modification consists in requiring every fixture to be constructed with an outlet large enough to fill its waste-pipe "full bore," in order to keep these pipes clean by thorough flushing.

(4) A fourth consists in reducing the number of fixture traps required. The law now calls for a separate trap under each fixture, no matter how near to one another they come. An exception is made in the case of several adjoining wash-trays, which are allowed to have a single trap between them. This good feature should be extended to all adjoining fixtures. In such cases it is much more scientific as well as much safer and more economical to use one trap than several.

(5) Moreover, it is for important reasons better to place the trap at or below the floor-level than close to the fixture it serves, as is now required by law.

(6) A sixth modification consists in omitting, in most cases, the trap now called for on all rainwater leaders, because a trap here reduces the ventilation and increases the complication and expense. Moreover, this trap prevents the use of the main soil-pipe as a rainwater conductor. There is no possible way of flushing the soil-pipe better than by admitting rainwater, where the combined system of sewerage is used.

(7) A seventh modification consists in striking out the restriction in the law limiting the jointing of cast-iron pipes to lead calking. Probably no more unscientific method of construction now exists in the whole domain of house-building than this, iron and lead having no more constructive affinity for each other in jointing than cats and dogs. Other really scientific methods of jointing cast-iron have recently come into the market which are both reliable and much cheaper.

(8) Finally, the provision requiring water-closets to be supplied from cisterns with flush-pipes not less than 1in. in diameter should be modified. Better and simpler means for flushing are now known.

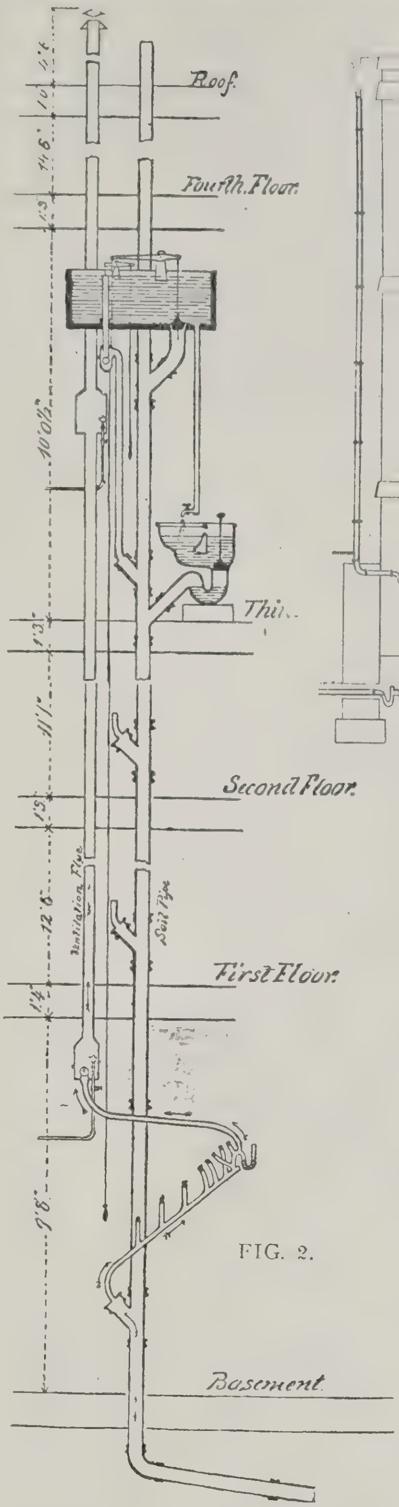

FIG. 2.

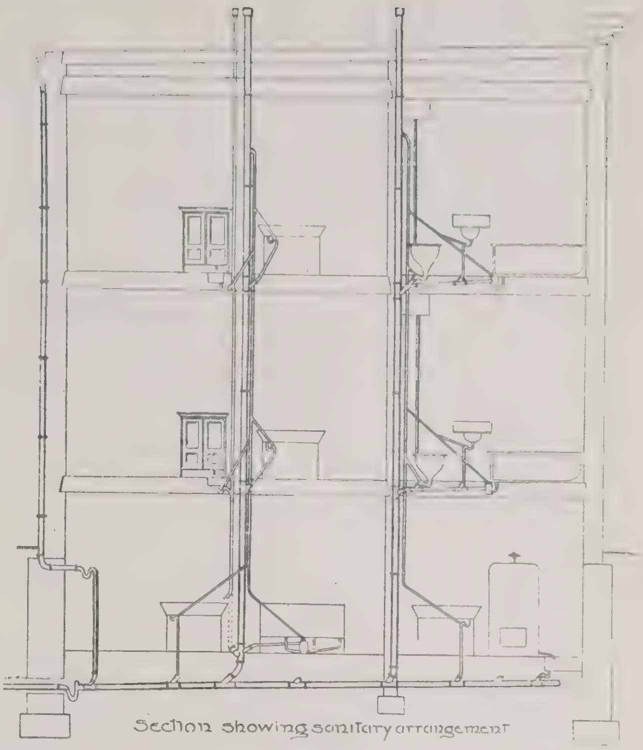

FIG. 1.

Syphonage.

Let us now examine more in detail our first proposed modification relating to the trap-vent law, and in order fully to understand this we must have a very clear idea of the phenomena of "syphonage" and "back-pressure."

Fig. 2 gives us a very clear idea of these mischievous forces. The main soil-pipe is shown in the centre and the back-vent pipe at the left. It is taken from the actual plumbing work used in a four-storey office building in Boston.

When water is discharged from the tank in the third storey it descends through the soil-pipe in the form of a plug or piston, and rarifies the air behind it, because the friction of the walls of the pipe prevents the air from the top of the pipe from following the water as fast as it falls. Consequently the water-seal of a trap placed on either of the branches below the tank will suffer by syphonage, since nature abhors even a partial vacuum, and therefore allows air to rush through all the traps in her effort to break it.

To speak more scientifically, the inertia of the water in the trap affords less resistance to the air than the friction along the sides of the soil-pipe, and if the trap is improperly constructed its water-seal is forced out in advance of the inrushing air-current, and this action is called "syphonage."

Back-pressure

is the reverse of syphonage. As the plug of water discharged from the tank descends toward the sharp bend in the basement, the air in front of the falling plug is compressed because the sharp end retards its escape, and this compressed air seeks a passage at every outlet. Back-pressure is therefore evidently strongest at branches which are near the bend in the basement, and syphonage is strongest at branches which are farthest from this bend. We have at the end of the basement branch an ordinary so-called S-trap. This trap possesses in itself almost no power of resistance to syphonage.

If a partial vacuum is produced in this large pipe, which represents our soil-pipe, and we allow air to pass through this small S-trap by opening the stop-cock between it and the soil-pipe, you see that the air has actually forced out enough of the water to entirely destroy the seal, leaving a free passage for soil-pipe air, sometimes called "sewer gas," to enter directly into the house.

---

* Extracts from a paper read before the Society of Arts, Boston, U.S.A.

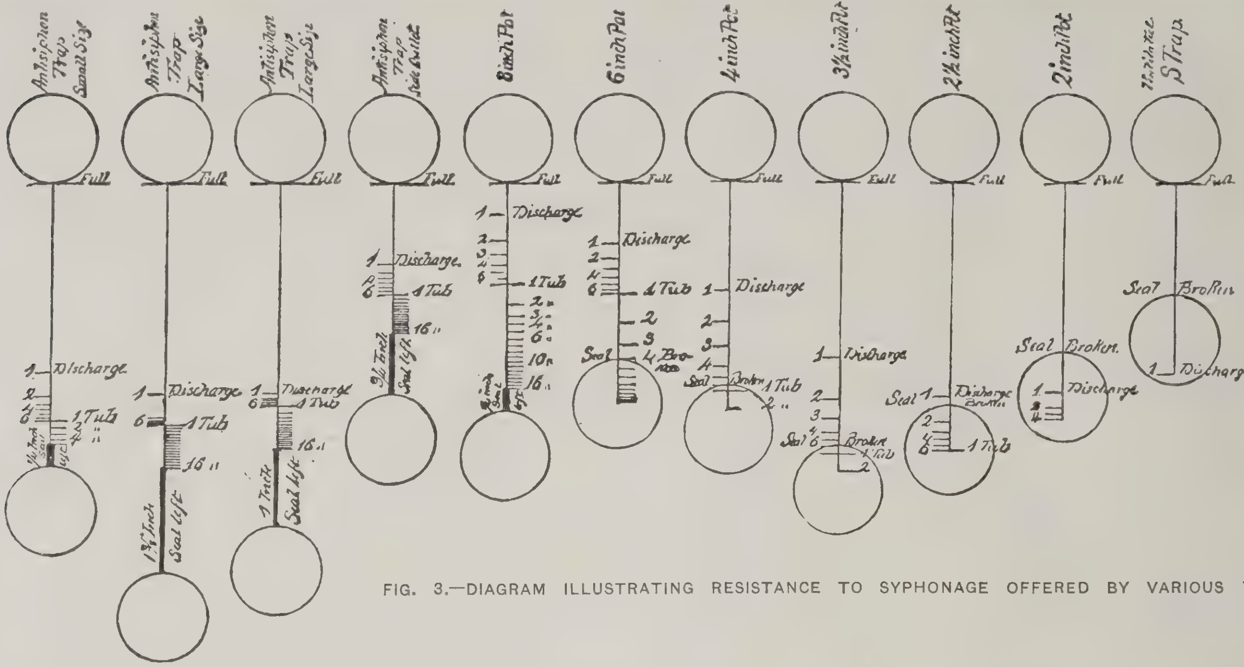

FIG. 3.—DIAGRAM ILLUSTRATING RESISTANCE TO SYPHONAGE OFFERED BY VARIOUS TRAPS.

Now the back-vent pipe was invented with the idea of providing an inlet for the air on the soil-pipe side of the trap, so that it could fill the vacuum in the soil-pipe without passing through the fixture and trap-seal, and in some cases the device actually does protect the seal. But, as already stated, it was soon found unreliable on account of friction, clogging, sagging and leaking, and because of its action in evaporating out the water seal.

How Evaporation Takes Place.

Fig. 2 shows how this evaporating action takes place. The air of a house being warmer in winter than the outer air, the ventilating current rising through the pipe in the direction shown by the arrows is conducted over or near the crown of the trap and escapes at the roof. In summer the reverse movement takes place with a similar result. This current evaporates out the trap-seal with a rapidity proportioned to its proximity to the trap, its dryness, temperature, rapidity of movement, and, in short, in proportion to its efficiency in performing its function of ventilating the branch waste-pipe and guarding the seal from syphonage, and in experiments which have been published from time to time it has been found that seals have been destroyed by this cause in actual plumbing work in less than ten days. If the vent is not connected with an S-trap at or near its crown it will not protect it from self-syphonage—hence the requirement in the Boston laws, which leads to a quick destruction of the seal by evaporation.

Fig. 3 indicates the power of resisting syphonage possessed by various kinds of traps. The vertical line between the two circles shows the depth of the trap-seals, and the short horizontal lines the amount of water removed at each discharge from the tank.

Clogging, Rusting and Sagging.

Fig. 4 illustrates some of the many ways in which the back-vent pipe fails in practice. Clogging with grease, as shown here over the sink-trap, is very common.

At every quick bend under a vertical run of iron vent-pipe rust is certain to collect. A comparatively small amount of flaking off of rust or sediment in such a place may suffice to destroy the efficiency of the pipe.

Sagging, as shown higher up, is another frequent cause of failure. Water and sediment collect in the sagged portion, and failure is again the result. Finally, hoar frost and snow often close the upper opening of the pipe above the roof, again producing failure.

Moreover, the chances of leakage by bad jointing are evidently increased in proportion to the increase of piping, and, what is more important still, no water-flush passes through the vent-pipes, and there is consequently nothing to announce to the eye the presence of leaks, which may therefore do mischief before the leaks are discovered.

Who are for and against the Law.

Although the amount of rough work in plumbing is increased by venting, yet the expense tends to decrease the number and quality of fixtures which the public can afford to instal, and reduces the confidence of the house owner in plumbing in general, so that plumbers do not see any advantage to themselves in the law. Pride in their work and a knowledge of the great advances made in the science of plumbing since the law was enacted prompt them now to advocate a change.

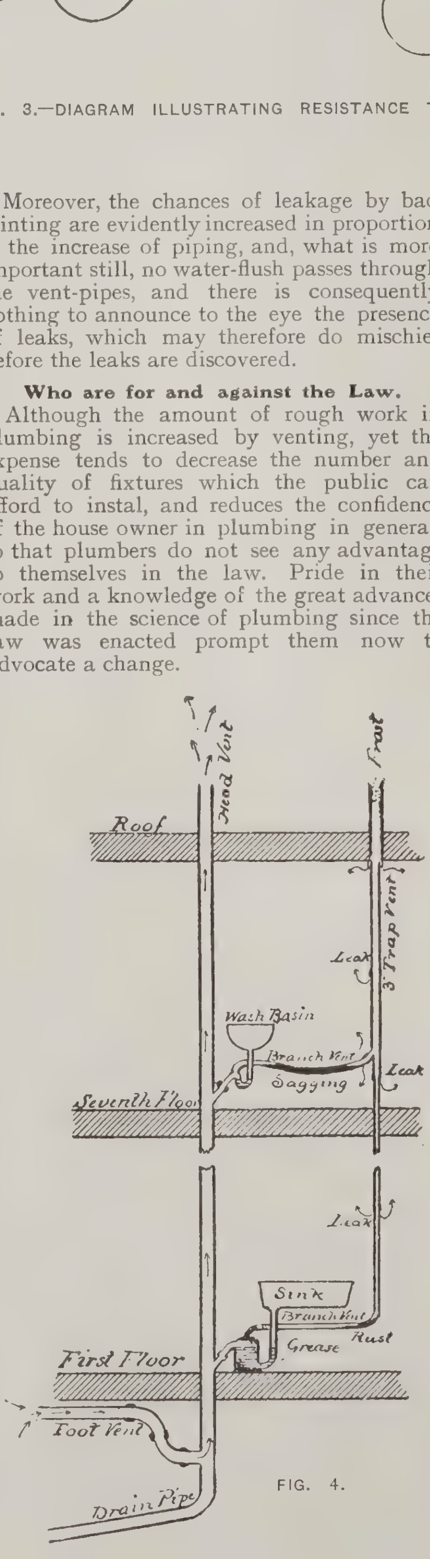

FIG. 4.

The pipe-dealers, on the other hand, appear to be the only gainers by the law, and these have, no doubt, constituted a powerful and active influence tending to its perpetuation.

Advantage of Anti-Syphon Traps.

I am now going to show that the back-vent system is not only not equal to the anti-syphon-trap system in power of resistance, but that it is so far inferior to it as to be altogether out of competition even with the poorer forms of anti-syphon traps. Let us first try the ordinary "round" or "pot" trap, of which I have here samples in several sizes with glass faces so that you can see the results of the tests. The depth of seal is the same in all, namely, 4½ins. We have applied to these traps the severest strains our apparatus can produce, which is a vacuum of 26ins., and we find the large sizes capable of resisting even this strain many times repeated. Indeed, it is practically impossible to syphon out our 5in. pot-trap.

Our 4in. and 3in. pot-traps have a lower resisting power, but are practically unsyphonable in plumbing work so long as they remain clean. They are thus immeasurably superior to the vented S-trap. We find their power of resistance is directly proportional to their diameter, and has nothing to do with their depth of seal.

Nevertheless, although the ordinary unvented pot or anti-syphon-trap is infinitely superior in all ways to the vented S, yet it has the one grave objection that it is not in all cases perfectly self cleansing.

Figs. 5, 6 and 7 show how sediment will collect in these traps, ultimately converting them into S-traps. The mouth of the vent-pipe is shown at the crown, and, never receiving a scour by the flushing, it is precisely the place where the floating greasy matters and fatty vapours most quickly collect. It thus loses its efficiency sooner than do the cesspool traps. The body of the S-trap is self-cleansing so long as a good flush is provided. Is it possible to obtain an anti-syphon-trap which shall possess this quality of the S? If so, our trap must be so formed that its sectional area shall in no place exceed the area of the fixture waste-pipe which it serves. This requirement confines us to the use of some form of plain piping, either straight or bent, in the construction of the trap. It is evident, also, that a considerable amount of this piping will be required in the formation of the trap in order to provide the necessary water capacity for resistance to back-pressure and evaporation; and all the piping used must be on a horizontal plane in order to preserve the required minimum depth of water-seal, as will be explained directly.

The first form of trap answering to these requirements is shown in Fig. 8 (No. 10). It consists of a 1½in. S-trap-seal proper and a long horizontal body made of a plain round 1½in. pipe. Opposite the trap proper is the sewer-connection piece, also made of a bent 1½in. pipe. I call the long body the "reservoir chamber." The water lies along the lower half of this chamber, leaving room, under syphonage, for air to pass above it without disturbing the water below it, provided the syphoning action is not too severe. The action is shown in Fig. 8 (No. 7). Less and less water is driven out of the trap at each syphoning action, because the air-space above the water is each time correspondingly enlarged and the resistance to syphonage is accordingly increased until a point is reached where no further reduction of its level by syphonage is possible; the water spray caused by the suction adheres to the long body while air escapes.

Nevertheless this form is too long and unwieldy to be practicable. Moreover, under strong syphonage waves are formed which, when they reach the top of the pipe, act like pistons in driving out the rest of the water. The wave may be broken up and the length reduced by bending the pipe back and forth on itself, as shown in Fig. 8 (No. 9). This trap has been tested and found able to withstand indefinitely the most powerful syphonage which can be applied, namely, a strain which in a single discharge destroyed the seal of a fully vented S-trap with a new vent-pipe only 10ft. long. The same strain broke the seal of an unvented 4in. pot-trap and syphoned out an S-trap having a seal 6ft. deep, Fig. 8 (No. 4).

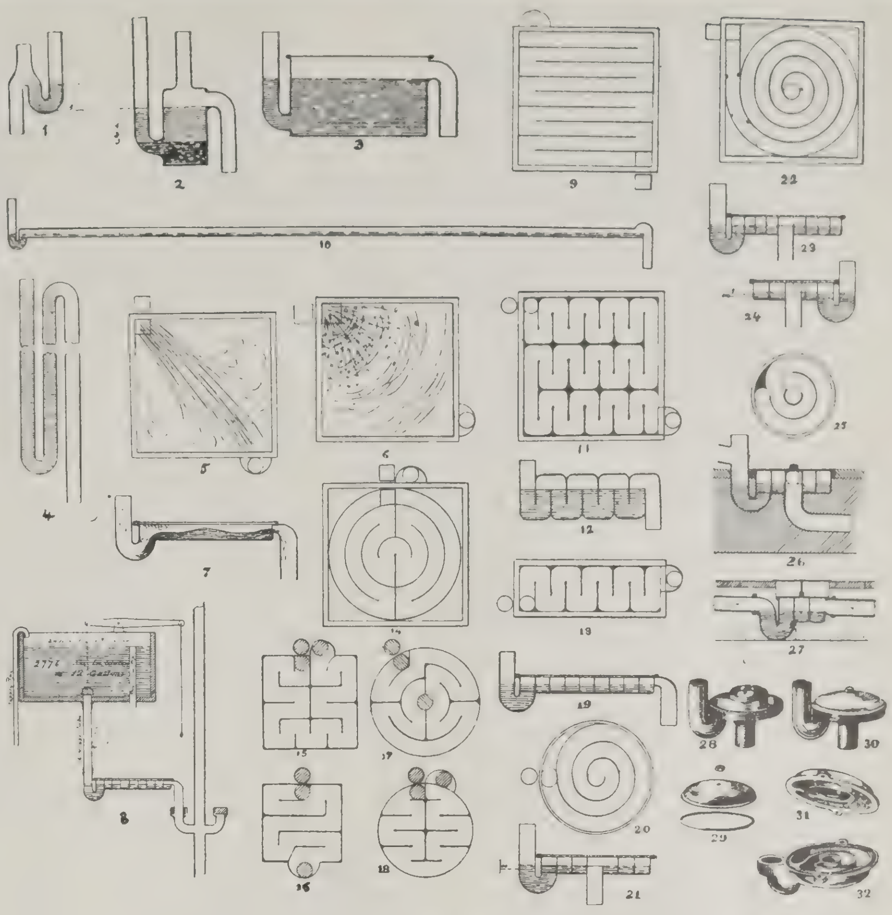

FIG. 8.

Another arrangement of the pipe is shown in Fig. 8 (No. 11), which may be reduced in size, as in No. 13, when it will be seen by comparing it with No. 12 to be nothing but a series of ordinary S-traps laid on their sides, and we have thus really succeeded in rendering an S-trap permanently anti-syphonic. The trap is, in fact, vented through its own inlet-pipe.

This trap can, however, still be improved by giving it the form shown in Fig. 12, in which friction is reduced and centrifugal force aids in the separation of the air from the water, leaving the latter in the trap while the former escapes. The resisting power of this trap is now so great that we can materially reduce its size until we have the forms shown in Fig. 8 (Nos. 20—21 and 25—32). Should this trap be used under a fixture having a small outlet, and therefore furnishing little or no scour, it will act like a straight pipe, and will, like it, in time suffer a diminution of its area by accumulation of greasy or gelatinous deposit along its wall. But, as in a straight pipe, the accumulations will be substantially uniform throughout, because the scour and form is uniform throughout, and its resistance to syphonage will remain the same, because its principle of resistance thereto will remain unchanged. Indeed, the size of the trap in respect to its proportion to the sectional area of its waterway will increase and thus correspondingly increase its resistance to syphonage. Should it ever be completely closed, its closure will announce itself by the simple cessation of the waste-water to flow out, and then the obstruction can be removed through the clean-out cap.

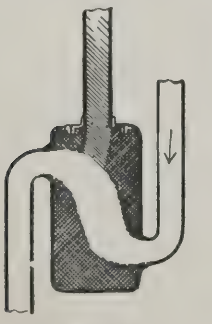

FIG. 5.

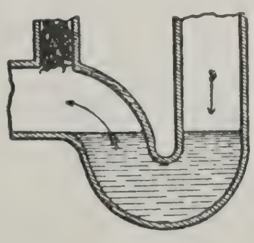

FIG. 6.

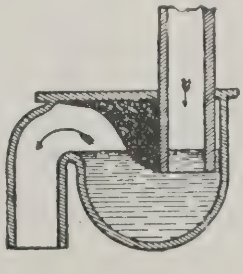

FIG. 7.

Flushing.

The champions of back-venting have abandoned their original claim that it served to protect trap seals from syphonage. They occasionally adhere to it, however, on the argument that it is needed to purify the branch waste-pipes by aëration.

But it is now recognized that ample water-flushing through properly constructed fixture outlets, followed by an equally thorough pure-air flushing from the room through the fixture and trap, is infinitely more effective than ventilation with foul air alone from the soil-pipe through the back-vent pipe, and is, indeed, altogether sufficient.

Hence the law should require every fixture to be constructed on the principle of the "flush-tank" by having outlet and outlet-valves large enough to fill their waste-pipes and traps "full bore" at every discharge.

Some Examples from American Buildings.

Fig. 9 is a diagram of a tall building in which, in compliance with the law, I was obliged to specify trap-vent pipes 125ft. in height. As you see, the lavatories are placed over one another in such a position that the distance from their traps to the main ventilated soil-pipe is not more than 18ins. or 20ins. These short branch wastes were powerfully flushed at each usage of the fixtures by a stream of water filling them "full bore" and discharging at the rate of nearly half a gallon a second. Traps were specified which cannot by any possibility be syphoned out or even have their seals seriously lowered. No better illustration of the wastefulness of this requirement could be found, except in the case of alterations where the installation of the vent-pipe may destroy much valuable property and create loss for the greatest part of the cost of the whole work. My client, in the case of this tall building, lost over a thousand dollars for the privilege of seriously endangering, through evaporation, the seals of his traps.

Figs. 10 and 11 show the same fixtures in a house plumbed in two different ways—Fig. 10 being in accordance with my recommendations and Fig. 11 being in accordance with the manner now sometimes seen in the finest houses. On the extreme left of the latter is the outside sewer vent, and on the inside, next to this, is the house-trap and circulation-vent. We have also back-vents, drip-vents and rainwater pipe, and all of these unnecessary stacks are very common in the modern house.

Fig. 12 shows a part of this work enlarged. It is taken from a well-known house in New York. Fig. 13 is taken from two other

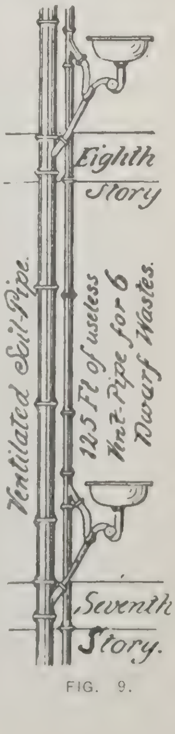

FIG. 9.

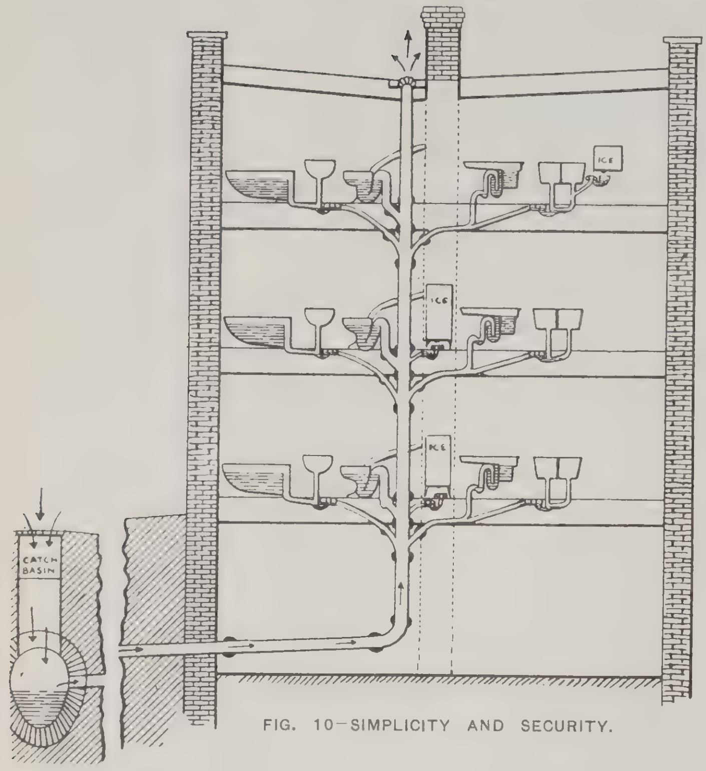

FIG. 10—SIMPLICITY AND SECURITY.

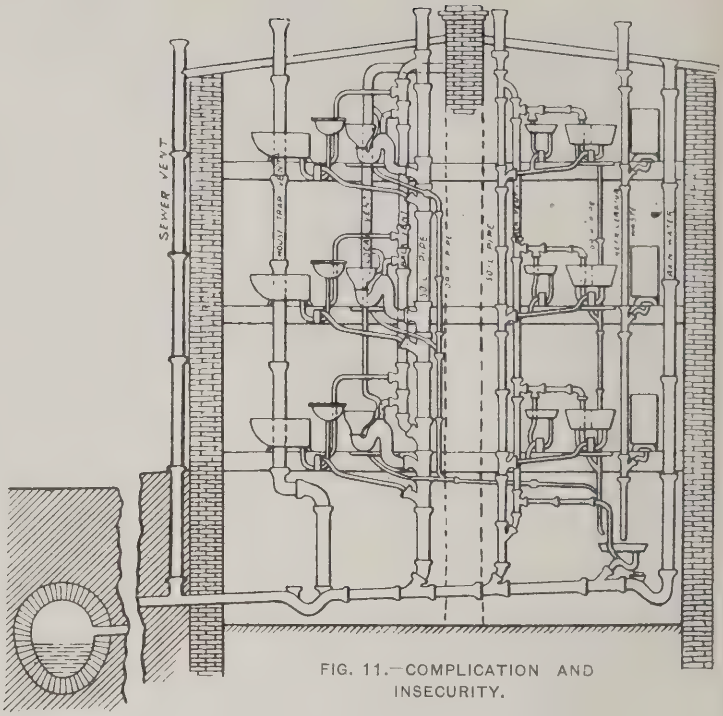

FIG. 11.—COMPLICATION AND INSECURITY.

handsome New York residences, and Fig. 14 from still another house in the same city. If this absurd complication continues at the rate it has been going for the last two decades, the public will feel disposed to return to the old-fashioned method of sewage-disposal shown in Viollet-le-Duc's picture.

Against the Intercepting Trap.

My reasons for urging legislation prohibiting the use of the main house trap or "intercepting" trap are, first, because its use prevents the best and only efficient and practical method of adequately ventilating the sewers, and, second, because it adds an altogether useless expense and complication to the plumbing.

Fallacies about Germs in Sewers.

Recent investigations by eminent scientists have shown us the fallacy of the popular idea that the air of sewers abounds in disease germs, and so sightseers may now visit the famous sewers of some of the great cities of the world with the same feeling of safety they enjoy while seeing other regular "sights."

Germs are "particulate," as Dr. Carmichael, of Scotland, expressed it, and have no more power to raise themselves from the water or moist surfaces of sewers than have any other particles of vegetable matter, like leaves or small sticks. If, by any chance, parts of the sewage above the normal level of the flow become dried, as in periods of drought, and are then lifted and wafted along by some unusually strong air-current, it is found that they very soon fall again into the water by gravity or are carried against a wet surface in a bend or branch of a sewer by the same air-current that lifted them. Furthermore, it has lately been discovered—and the discovery satisfactorily corroborated, especially by the noteworthy and most interesting researches of the Englishmen, Lawes and Andrewes—that the specific germs of disease do not thrive even in the water itself of sewers. They appear to be destroyed by other species of germs, harmless to man, which abound there.

In short, it has been determined that the dreaded germs of specific diseases are, of all places, least to be sought for in the air of sewers. They may abound in the air of the streets above the sewers, but not in that of the sewers themselves. Hence, if they are borne into our dwellings by air-currents at all, they must enter by way of doors and windows and not by way of the drains.

Note that we are speaking of germs and not of odours and gases.

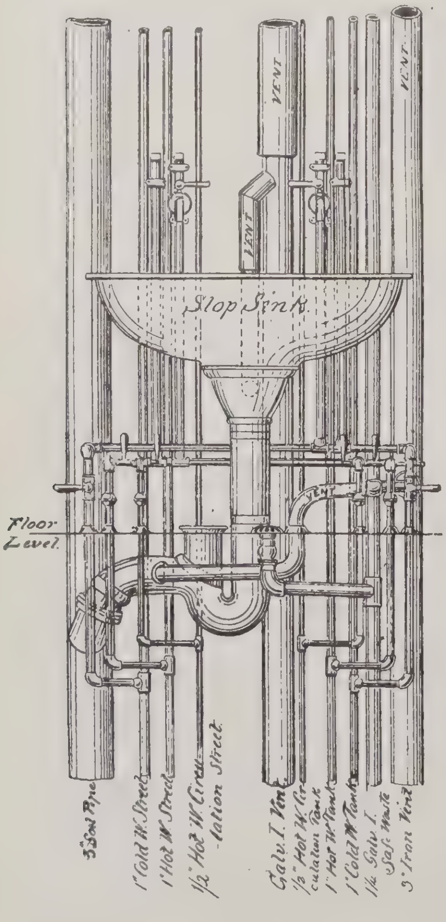

FIG. 13, FROM A NEW YORK RESIDENCE, ILLUSTRATING THE COMPLICATION OF PIPES.

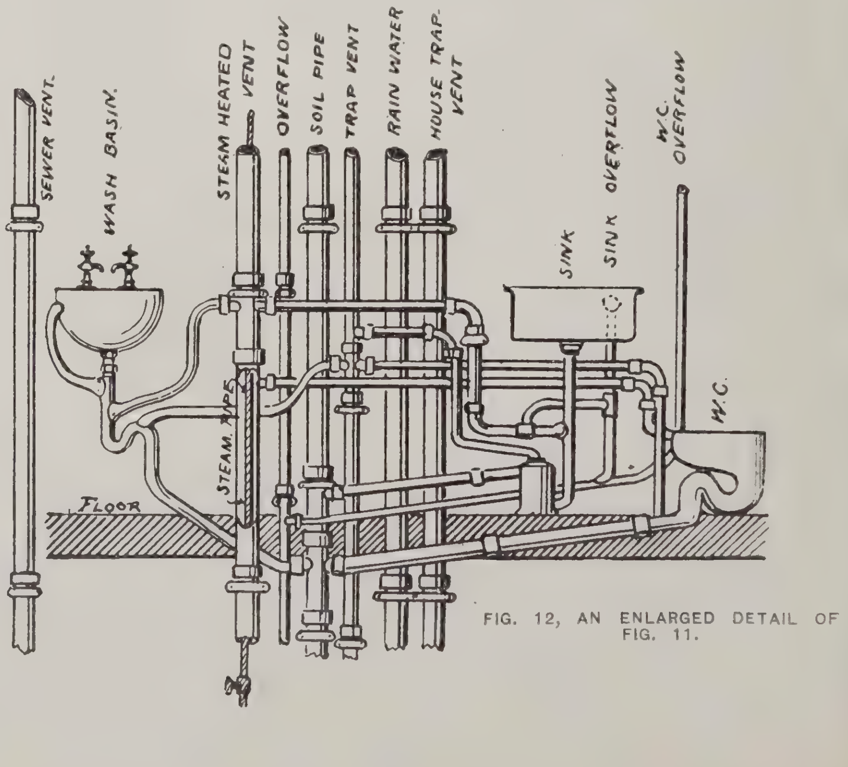

FIG. 12, AN ENLARGED DETAIL OF FIG. 11.

These latter do abound in the air of badly-ventilated sewers and are unwholesome to breathe continuously. But they are immediately dangerous only when in an exceedingly concentrated form, and are easily excluded from houses by simple precautions and by proper plumbing regulations One of the most effective and rational of these precautions is thorough sewer and drain-pipe ventilation.

Ventilation of Sewers.

In the past sewers were sometimes ventilated by means of tall chimneys and fans and other devices built especially for the purpose at intervals in their length. But these experiments have proved failures because they produced too powerful a suction in the immediate vicinity of the ventilators and none at all a short distance away from them, and were, withal, exceedingly costly.

Simple openings into the sewers at intervals along the streets are common, but they provide no motive-power to effect proper ventilation. The foul sewer may thus remain foul, and an opening here and there at the street level only concentrates the nuisance in the worst manner at special places for the annoyance of the public.

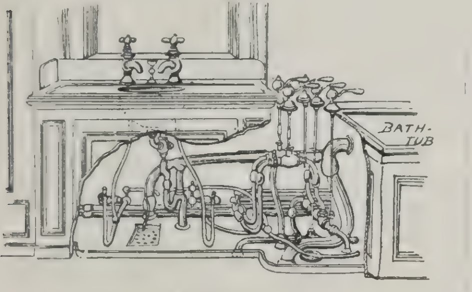

FIG. 14.

It is much better to carry the foul gases to the tops of the houses than to emit them at the street-level under the very noses of the passers-by. Soil-pipes can now be constructed and jointed so as to be absolutely tight, and the objection that it is dangerous to carry the sewer-air through the houses is no longer tenable.

A public sewer becomes very well ventilated and practically safe when its ventilation is effected by making every house-drain and soil-pipe a ventilating flue. The sewer has then, in cities, special 4in. suction tubes every 10ft. or 15ft. throughout its entire length, the houses averaging, say, 20ft. or 25ft. in width. We know that whatever putrescible matter, excepting street washings, is to be found in the sewers comes from the house drains themselves.

Assuming, then, that the houses average 25ft. wide and 50ft. high, the number of running feet of soil and drain pipe in each would average at best not less than 100ft., and the interior surface would therefore contain probably at least twice as much decomposing matter as the 12ft. of sewer serving each house. Hence it would be absurd to insert a disconnecting trap and a vast increase of extra piping for the mere purpose of excluding this small extra drain-pipe air, even if it were not demonstrated that this very complication increased rather than diminished the chances of its entrance.

Even the foulest sewers and cesspools must cease to be foul the moment they are ventilated through every soil-pipe. Probably the most dangerous substance in our sewers to-day is illuminating-gas escaping from leaky mains, which modern science has (I believe it can be maintained) at last rendered unnecessary. The house-trap is responsible for the presence of this gas in cellars and subways.

It it exceedingly important that it should, where formed, be diluted and carried up above the houses and thus rendered comparatively harmless.

IN PARLIAMENT.

(By Our Press Gallery Representative.)

On Thursday last the House of Commons occupied its time chiefly in affairs of domestic concern.

The Ventilation of the House.

Mr. Wylie criticized the ventilation and sanitation of the House. He contended that there was an insufficient distribution of air in the chamber, and that the system of forcing air up through the floor was radically wrong. The air was too dry, and he was supported in his opinion by that eminent sanitarian, Dr. Gordon. Dr. Gordon declared that, in view of the unsatisfactory results of the present system, some better means of ventilation should be sought, especially those systems which included overhead ventilation.

Mr. Dillon said the problem of ventilation was an extremely difficult question. When he first entered the House the conditions were such as would have disgraced a common lodging-house. Members were being poisoned, and many lost their lives by atrocious and scandalous conditions, which had only been remedied at great expense.

Lord Balcarres' Statement.

Lord Balcarres, referring to the criticisms of the existing system of ventilation, pointed to the difficulty of making the temperature suit every member. The temperature of the House at the moment was 61. Mr. Bowles had suggested opening the windows, but if any member went down below with the engineer-in-charge and saw the system of ventilation at work, he would revise his opinion if he thought that system could be condemned. It was simply astonishing to observe the amount of dirt that was intercepted in foggy weather three floors below the House and which would otherwise come through the windows or the floor if they did not possess the cleansing apparatus. It was no empiric system that they had put in. It had been examined by expert after expert, and as far as he could see it was a very good system indeed—suitable, that was to say, for their special requirements. He had been asked whether the recommendations of that distinguished bacteriologist, Dr. Gordon, were compatible with the present arrangements. He was informed that those recommendations were not incompatible with the exising system. The First Commissioner of Works had asked Dr. Gordon to go into this matter, the report of the Ventilation Committee not being definite or final on certain points.

Mr. Dillon asked whether Dr. Gordon condemned the system of air passing through the floor.

Lord Balcarres: Far from it. Acting on Dr. Gordon's advice, certain improvements in the existing system were made. A committee of experts had been appointed, consisting of Sir Michael Foster, Dr John Haldane and Dr. M. H. Gordon, and they would report to the First Commissioner in the autumn or next winter. A comparison had been made between the House of Commons and a town hall, but he pointed to the prolonged sittings of the House of Commons as proving the necessity of having a system like the present one, by which automatic and almost unconscious improvement of the air was going on from moment to moment. As for the bacteriological tests that had been applied to the House, no owner of a town hall or theatre and no incumbent of a church would dare to submit his building to similar tests. He would by doing so create a panic in the audience.

Abingdon Street Improvement Scheme.

Replying to Mr. Dalziel and Mr. Whitley, Lord Balcarres said a sum of £10,000 in the Estimates was money paid to the County Council in respect of a house in Abingdon Street which had been recently acquired under their improvement scheme. The arrangement would enable the County Council to carry out a great improvement, while the block of property obtained by the First Commissioner would in all probability be used hereafter for Government offices.

New Works at the Royal Palaces.

Mr. Whitley called attention to the increase in the vote for new works, alterations and additions in connection with the Royal Palaces.

Lord Balcarres said the two large items which caused the increase were the extension of the electric light in St. James's Palace and Hampton Court Palace. At Hampton Court there were a large number of people resident who used paraffin oil lamps and candles. The safety of this historical monument would be better preserved by the use of electric light than by the use of hand-lamps.

The Facade of Buckingham Palace.

Colonel Welby asked if there was any intention to bring Buckingham Palace façade more into harmony with the Queen Victoria Memorial. He asked whether there could not be any cleaning of the façade or painting of the woodwork.

Lord Balcarres said the question of Buckingham Palace could not be properly dealt with until the memorial was erected. Probably when the memorial was up, the Palace would look more handsome than it did now. The question must, in the meantime, stand over.

The New Road in the Green Park.

Mr. Bowles complained of the cutting-down of trees in the Green Park, the destruction of two acres of grass, and the making of a "nefarious, hard, broad road," which was supposed to be for foot passengers but which bore the marks of a road for vehicular traffic. He denounced the path as a gross outrage, which practically spoiled the most precious park in London. He suggested spending another £4,000 in getting the unemployed to restore the path to its original grassy condition.

Sir. A. Hayter joined in the protest.

Lord Balcarres said Mr. Bowles did not quite appreciate the situation. This path did not make a thoroughfare across Green Park. It was an integral part of the memorial, and it had been planted on either side with three rows of trees. In the course of time they would have an avenue of trees leading from a great thoroughfare to a great memorial analogous to the Broad Walk at Kensington. The object was to have a fine vista. There was no intention of using the road for carriage traffic, and it had not been constructed for that purpose.

War Office and Triennial Contracts.

Before the House rose for the Easter Holidays,

Sir Lewis M'Iver asked the Secretary of State for War whether it had been decided to abolish the triennial-contract system of executing alterations and repairs to barracks and fortifications, and whether instructions had been issued in the Southern Command to employ labour at once, by way of experiment, with a view to the War Department eventually adopting a system of carrying out the repairs by means of labour employed directly.

Mr. Arnold Forster: It has not been decided to abolish the system of triennial contracts of repairs altogether, but it is the intention in those cases in which the work can be done satisfactorily and efficiently, to replace the present triennial-contract system by the employment of day labour. It is understood that this plan has been adopted by the Admiralty with success. Instructions have been issued to the various general officers commanding requesting them to enquire and report whether the conditions of the various divisions of their commands are suitable for the adoption of the new method.

Complete List of Contracts Open.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
		BUILDING:		
May	10	Golden Grove, Llandilo—Alterations, &c., to Church	——	D. Jenkins, Architect, Llandilo.
,,	11	Wilsden, Yorks—House	——	Wilson Bailey, Tanfield Buildings, Bradford.
,,	11	Cardiff—Panelling, &c., Council Chamber	County Borough	J. L. Wheatley, Town Hall, Cardiff.
,,	11	Oldbury—Block of Schools	Education Committee	A. Long, New Street, West Bromwich.
,,	11	Bristol—Sheds	Docks Committee	W. W. Squire, Cumberland Road, Bristol.
,,	11	Chumleigh, Devon—Residence, &c.	Mr. F. B. Mitchell	T. Sanders, Chawleigh Week, Chumleigh.
,,	11	Gilfach, Wales—Chapel, &c.	English Calvinistic Methodists	W. Harris, Gilfach, Pengam.
,,	11	Scunthorpe, Lincs—Market Buildings	Urban District Council	A. M. Cobban, Home Street, Scunthorpe.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending May 5th seventeen failures in the building and timber trades in England and Wales were gazetted.

J. S. HANNAFORD, builder, Plymouth. R.O. April 28th.

M. A. LYNEX, builder, Walsall. Adj. April 28th.

A. HAIGH, painter and decorator, Mexborough. R.O. April 27th.

R. HUNT, builder and contractor, Sheffield. R.O. April 28th.

A. LYONS, builder and contractor, Malton. Adj. April 27th. Liabilities £3,564; deficiency £768.

EVAN & DAVIES, builders and contractors, Trawsfynydd. R.O. April 26th.

J. WOODGATE, builder, Eastbourne. P.E., Eastbourne Town Hall, May 30th, at 2.30.

A. GALE, builder and contractor, Fleet. R.O. April 28th.

J. T. McCLUNG, plumber, glazier and contractor, Manchester. R.O. April 28th.

T. W. RICHARDS, joiner and builder, Tibshelf. Adj. April 27th.

J. BRIDGEMAN, builder, Weymouth. P.E., County Hall, Dorchester, May 26th, at 2.30.

B. J. BERRY, builder and contractor, Altrincham. R.O. April 29th.

TOPPING & BOUGHEY, builders, New Brighton. First meeting, O.R.'s, Liverpool, May 10th, at 2.30. P.E., Birkenhead C.C., June 29th, at 11.

W. FORSTER, plumber, Carlisle. R.O. April 26th. P.E., Carlisle C.C., May 15th, at 11. First meeting, O.R.'s, Carlisle, same day, at 3.

BROMWICH & CLARK, slate merchants, Croydon. R.O. April 28th. First meeting, London Bankruptcy Court, May 12th, at 11. P.E., same, May 31st, at 11.30.

H. & F. FEARMAN, builders and decorators, Hatton Garden. P.E., London Bankruptcy Court, May 25th, at 12.

W. LAYTON & Co., builders, Fulham. R.O. April 26th. First meeting, London Bankruptcy Court, May 15th, at 2.30. P.E., same, June 2nd, at 11.30.

JOHNSON BROTHERS, stone merchants and contractors, Hartley, Monkseaton and Whitley Bay. P.E., Newcastle-on-Tyne C.C., May 11th, at 11.

C. J. EDWARDS, builder, Thornton Heath. First meeting, 24, Railway Approach, London Bridge, May 10th, at 11.30. P.E., Croydon C.C., May 17th, at 11.

H. W. COATES, plumber, Leeds. First meeting, O.R.'s, Leeds, May 10th, at 11. P.E., Leeds C.C., May 30th, at 11.

C. A. HADLET, painter and paperhanger, Stockton-on-Tees. P.E., Stockton-on-Tees C.C., May 17th, at 10.30. First meeting, O.R.'s, Middlesbrough, same day, at 3.

,,	1	Perth—Erection of new Hall	50, 30 and 20 guineas	——	J. Begg, City Chambers, Perth.

* *Where a dash is given it does not necessarily mean that no premiums are offered and no deposit is required, but that we have not been informed what these are (if any).*

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Barnard Castle.—Accepted for the erection of a villa at Startforth, for Mr. J. Moffatt. Mr. T. Farrow, architect, 7, Market Place, Barnard Castle:—

Bricklayer and mason.
R. Wilson, Victoria Terrace East, Barnard Castle.
Carpenter and joiner.
P. Robinson, Lartington, Barnard Castle.
Slater.
J. Mascall, Bishop Auckland.
Plumber and glazier.
C. Raine, Horse Market, Barnard Castle.
Painter.
P. Robinson, Lartington, Barnard Castle.

Biggleswade (Beds).—For the erection of Sunday schools, for the Trustees of the Biggleswade Wesleyan Methodist Society. Mr. Thomas Cockrill, A.M.I.C.E., architect, Market Square, Biggleswade:—

W. Wade, St. Neots	£1,675
W. Howard, Huntingdon	1,650
G. Wrycroft & Sons, St. Neots	1,505
C. Wright, Longford,* Biggleswade	1,444

* Accepted.

Doncaster.—For the erection of two new shops and premises, for Mr. A. Stubbs. Mr. J. Athron, architect, 10, Priory Place, Doncaster. Quantities by architect:—

D. Gill & Son	£2,997	0	0
C. Sprakes & Sons	2,850	0	0
F. Beastall	2,670	0	0
Mullins & Richardson	2,643	15	5
S. Beastall & Sons,* Doncaster	2,562	15	11
B. Ashton & Sons†	2,467	11	3

* Accepted. † Withdrawn.

Gravesend.—For the erection of Wesleyan church and schools. Messrs. W. J. Morley & Son, architects, Craven House, Kingsway, London, W.C.:—

Gann & Co., Whitstable	£5,857	0	0
T. Pearce, Thornton Heath	5,850	5	0
F. Miskin, Ltd., Gravesend	5,849	6	9
A. S. Ingleton, Herne Bay	5,678	16	0
J. Wilford, Snodland	5,639	0	0
Lawrence & Son, Waltham Cross	5,562	19	0
L. Seagar, Sittingbourne	5,341	19	0
A. E. Tong, Gravesend	5,325	16	2

And other tenders varying from £5,892 to £8,200.

Hanley.—For extensions to the municipal secondary school, for the Hanley Education Committee. Mr. Edward E. Scrivener, architect, Howard Place, Hanley:—

J. Bagnall, Fenton	£3,387	0	0
A. Ward, Hanley	3,774	0	0
Tompkinson & Bettelley, Longton	3,530	0	0
G. Thomas,* Hanley	3,319	0	0
Cornes & Sons, Hanley	3,315	0	0
P. H. Bennion, Longton	3,130	15	0

* Accepted subject to sanction of Board of Education.

London, E.C.—For restoration works at the Shoreditch Town Hall, for the Borough Council:—

J. Fergusson & Co., Tottenham	£22,853
W. Nash, Deptford	21,570
F. & A. Willmott, Ilford	21,359
Spencer, Santo & Co., Westminster	21,137

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

Sample and Shadecard on application to
Sissons Brothers & Co., Ltd., Hull.
London Office—199B Boro' High Street, S.E.

CAUTION—See the name Hall's Distemper on all tins; refuse imitations, which are inferior.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect, Consulting Editor.

**Number 7.
May, 1905.**

FIRE PREVENTION AND THE INTERNATIONAL FIRE SERVICE COUNCIL.

THE International Fire Service Council, which was founded in 1900 on the occasion of the Paris International Exhibition, and originally only dealt with the interests of the fire service, is gradually becoming an important factor on the fire-preventive side. This is due in the first instance to the increasing importance attached to fire-prevention by officers of the professional brigades having control of largely-populated areas, and secondly to the fact that since 1903 not only fire-brigade corporations but also fire-preventive associations are represented on this body. There can be no doubt that eventually fire-protection will comprise mainly the science of fire-prevention supplemented by fire-service work, and that the fire service will in a manner become an auxiliary body to that of general building control, as is already the case in several countries. It is also evident that eventually practically all chief officers of fire brigades will be men of high technical standing, such as officers of the technical branches of the Army and Navy, civil engineers, borough surveyors and architects. The whole tendency at the present moment is for the fire service to be controlled by the technical professions, and not to be looked upon merely as work controllable by superior artizans.

Thus with pleasure we see from a public announcement that the International Fire Service Council have now formed a standing committee on fire-prevention, the two English representatives on which are Mr. Edwin O. Sachs, F.R.S.Ed., and Mr. Ellis Marsland, the district surveyor.

The headquarters of the Council are at Luxemburg, and from the Luxemburg offices enquiries on fire-preventive questions are now answered with the aid of the standing committee, which meets from time to time and also carries out a considerable amount of its work by correspondence.

Another matter which we are pleased to hear was decided on at the recent International Fire Service Council's meeting at Brussels was that a dictionary of technical terms relating to fire-prevention and fire service will be issued in the German, French and English languages. This should fill a long-felt gap.

The influence of the Council is rapidly on the increase, and the Council's delegates, which now number about 150, represent a general membership of close on three million persons, and the Council has again elected an executive of high technical standing, eleven in number, under the chairmanship of Colonel Sextus Meyer, late of the Danish Royal Engineers, who is chief of the Copenhagen fire brigade.

It is well to know that technical enquiries can be put to the Council through the agency of the societies represented on it in this country, which are—the National Fire Brigades Union, the British Fire Prevention Committee and the Association of Professional Fire Brigade Officers.

IMPENDING FIRE TESTS.

THE testing station of the British Fire Prevention Committee is to be moved from Porchester Road, Bayswater, owing to the widening of the line of the Great Western Railway, which abuts on to one side of the property, and which has made it impossible for the Committee to have its lease renewed.

The move is, of course, one of great inconvenience and at the same time very serious expense to the Committee; but having regard to the importance of the investigations it has been decided to re-instal the testing station at an early opportunity so that new tests may again be expected towards the middle of June. The extra expense is no doubt again being met by the public-spirited minority of the members who have so long from time to time put their hands in their pockets to assist in the possible conduct of these operations, which are necessarily of such a costly character. It has, of course, long been suggested that the Committee might well move its testing station away into the country, where its tenure would be permanent, and where, owing to cheapness of ground, it could obtain such an area as to have no immediate neighbours. We understand, however, that the Executive have decided to meet the wishes of the general membership and of the workers of the Committee and keep the testing station within an easy cab drive of Charing Cross so as not to make the attendance of members subject to train journey and time-tables, as this would probably very much interfere with the attendance of many who are interested and prevent their giving the work the attention they can afford. For this reason we understand that a site has been obtained in the neighbourhood of the Committee's first testing station near Hanover Gate, Regent's Park, and an announcement may shortly be anticipated to that effect. The Committee at the new testing station, we understand, will not erect any small-sized huts but only large sized huts, measuring 20ft. by 10ft., and it is also now intended to have one extra large hut 20ft. by 15ft.

Materials and systems of construction awaiting test at the present moment are as follows:—

Wire glass casements and skylights by Messrs. Ramsey Speer (U.S.A.).

Concrete floor with broad flange girders by Messrs. Skelton & Co. (London).

Floor by Messrs. Faber (Berlin).

A floor and girder coverings by Messrs. the New Expanded Metal Co.(London) (2nd test).

Wire glass skylights by Messrs. Pilkington (London) (5th test).

A partition by the Asbestic Brick and Tile Co. (London) (2nd test).

A floor and a partition by the National Fireproofing Co. (U.S.A.).

A roller shutter door by Messrs. Gibson & Co. (London).

A door test by the Gilmour Door Co. (Canada and London).

It will thus be seen that the Committee have their hands full with their summer testing operations, and we understand that additional applications are to be expected in respect to several floor and partition systems which have not yet come under investigation.

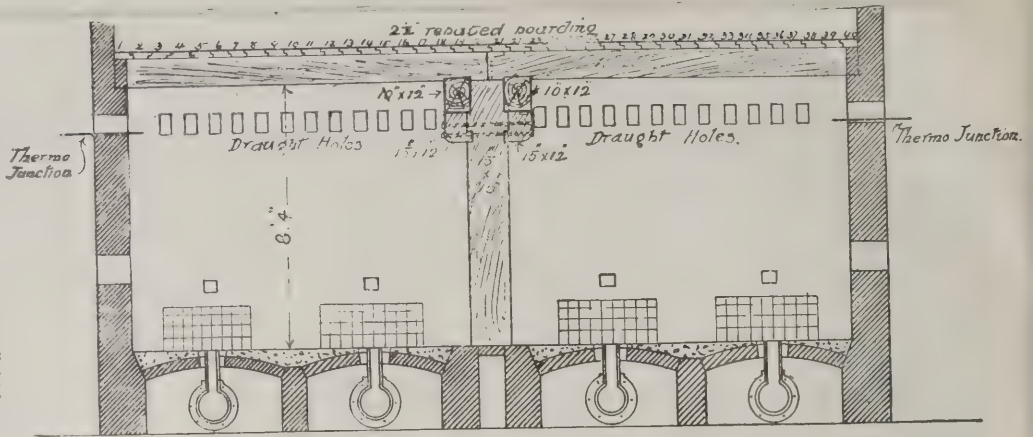
THE BUILDING TRADES' EXHIBITION.

THOSE who will recollect the first organized attempt to call attention to the growing importance of the exhibits relating to fire prevention at the Building Trades' Exhibition will marvel at the rapid strides that have been made during the last four years in this special department of the building trades. Although there have, of course, long been individual exhibits relating to fire-prevention at the earlier Building Trades' Exhibitions, it was not until 1901 that the British Fire Prevention Committee, in conjunction with Mr. Montgomery, arranged for a special hall to be reserved for what were at that time termed the "fireproofing" exhibits, and for the year in question an eminently interesting show was certainly made. The primary supporters of this "fireproofing" section were the late Mr. Arthur Cates, the late Mr. Thomas Blashill, and Sir John Taylor, K.C.B., the senior members of the Council of the Committee at that time. The Minor Hall, which was allotted to the subject in 1901, is somewhat isolated in its location, and it would perhaps have been better already at that time for the organizers to be so ambitious as to have made a group of these exhibits in the main hall. But this little group of fire exhibits of 1901 nevertheless fulfilled its purpose, and whilst the 1903 exhibition already showed a material advance in exhibits of this class, this year's exhibition showed such a number of floors, partitions, &c., intended to be fire-resisting that the space occupied by these specialities certainly formed a very considerable proportion of the space occupied on the main floor of the great Islington hall.

It was certainly most appropriate that Lord Windsor called particular attention to the fire-preventive exhibits in his address at the opening of the exhibition, for it was these exhibits in particular which mark the evolution of the building trades in the direction of safer and better building and formed the *clou* of the 1905 show.

Individual exhibits we have dealt with in our previous numbers, but perhaps we should specially mention that a number of the exhibitors very wisely made a point of indicating that their work had been tested officially. We are pleased to see also that tests with non-proprietary articles have had their influence upon various manufacturers. Taken all round, the exhibition certainly advanced the movement of fire-prevention, and those interested in the subject should appreciate the sound way in which Mr. Montgomery is conducting this eminently satisfactory enterprise. We trust he will also accord fire-prevention a place in his colliery exhibition, in respect to which it is likewise of primary importance.

SLOW - COMBUSTION CONSTRUCTION.



LONGITUDINAL SECTION OF TESTING CHAMBER.

In a previous supplement we had occasion to publish an interesting paper by Chief Officer Westphalen, of the Hamburg Fire Brigade, who was formerly a district surveyor of the Hanse city. The paper was illustrated by sections of warehouses erected in Hamburg in which the so-called slow-combustion construction was being used as distinct from the so-called fire-resisting construction.

Our attention has been called to the fact that whilst we have so far dealt in these supplements mainly with questions relating to fire-resisting construction, there is a very lage school who firmly believes in "slow combustion" construction for warehouse work rather than fire-resisting construction, and that we should call attention to some of the results of the British Fire Prevention Committee's tests in this direction, with systems of construction of a non-proprietary character, more particularly at a time when the questions relating to ferro-concrete are so much to the fore.

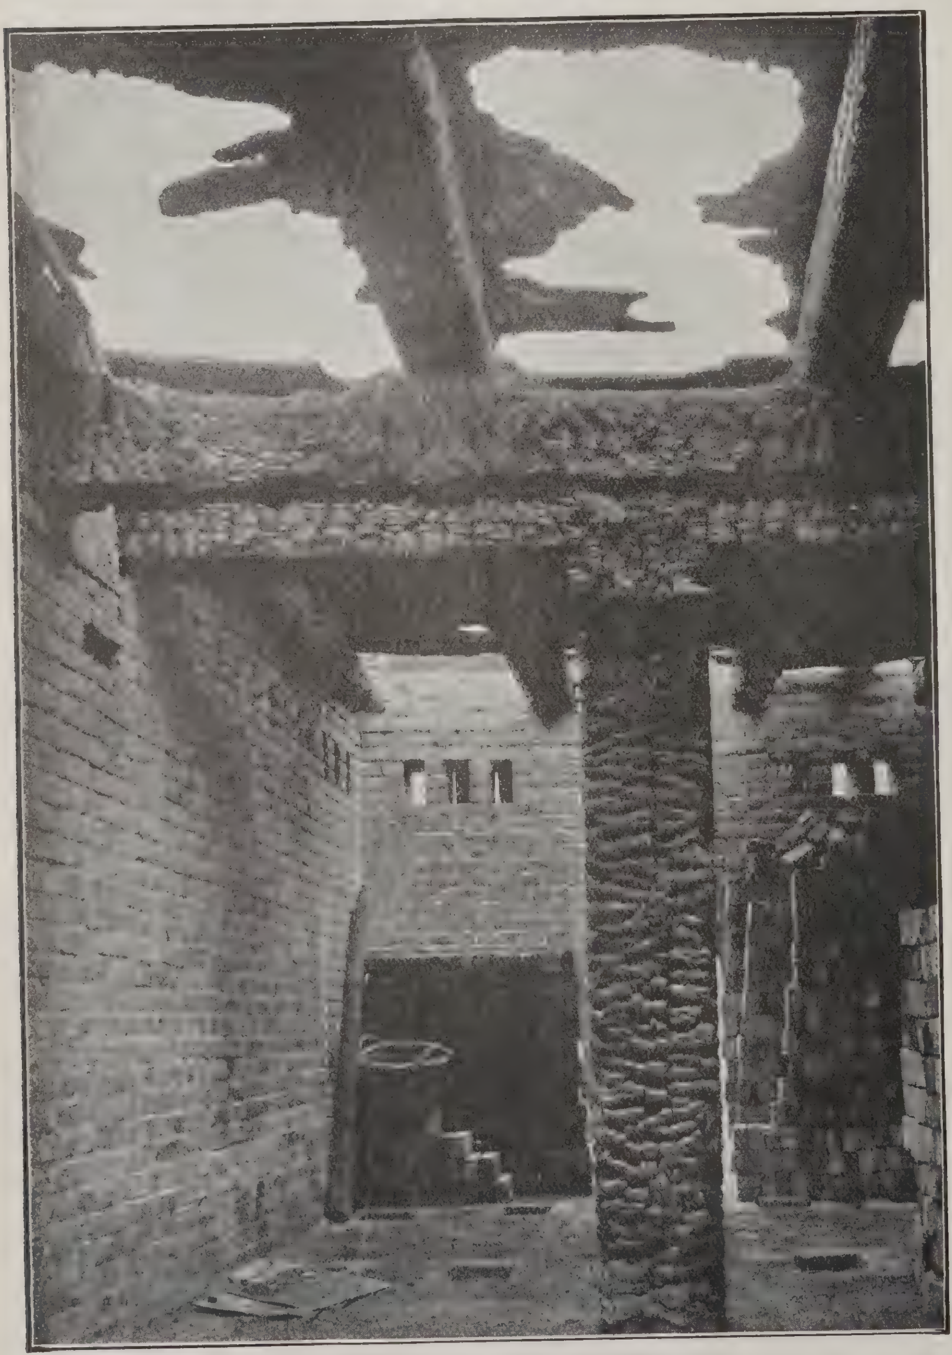
For this purpose we again reproduce a detailed section of a Hamburg warehouse, and in conjunction therewith the reproductions from the results of tests made with constructional timberwork of this kind, both with the common ordinary timber (fir and oak) and with Australian hardwood.

There can, of course, not be the slightest doubt that sound timber balks are splendid resisters of fire, and also that 3ins. of hardwood well jointed and carefully fixed affords considerable fire-resistance. Although not generally appreciated, it is of course well known to those primarily interested that the British Fire Prevention Committee have undertaken more tests with non-proprietary articles, *i.e.*, with materials and systems of construction in common every-day use, than with proprietary articles, *i.e.*, articles subject to patents or monopolies; and many hold that these tests with work of an ordinary character, not subject to any rights, are of a most far-reaching importance because they influence that wide circle of the building world which does not utilize specialist work.

Viewed with a section of the Hamburg work reproduced herewith, the result of two of these tests, reproduced herewith, should be most valuable, and it is for this reason that we are according them considerable space in the current supplement.

The two tests are each two-hour tests with floors constructed, in one case, of 2in. oak planking; in the other, of 2in. jarrah planking—in the first case supported by fir supports, in the latter by jarrah supports.

The object of the tests is taken from the official report, followed by a summary in each case explaining same. The diagrams explain the construction of the floors. If there is anything we would particularly like to call attention to in respect to the excellent illustrations we have produced, it is the remarkable manner in which the Australian wood chars as compared with ordinary fir, the difference in charring being most clearly shown in the photographs.



THE OAK FLOOR WITH FIR SUPPORTS AFTER THE TEST.

A Floor consisting of Fir Supports and Oak Flooring.

Object of the Test.—To record the effect of a fire of two hours' duration at a temperature gradually increasing up to 2,000° F.

Note.—The area of the floor under investigation to be 222ft. 6ins. super. in the clear (10ft. by 22ft. 3ins.). The floor was to be loaded with 232 lbs. per sq. ft., distributed as described.

Summary of Effect.—In four minutes smoke came from the joint between the parapet wall and oak flooring.

In eighty-nine minutes flame first appeared through the floor.

In 109 minutes a small portion of oak flooring fell and left the underside of bricks exposed. The post beams and joists were considerably reduced in size and charred, the post to a depth of about 1¼ins. and the beams and joists to a depth of about 2ins.

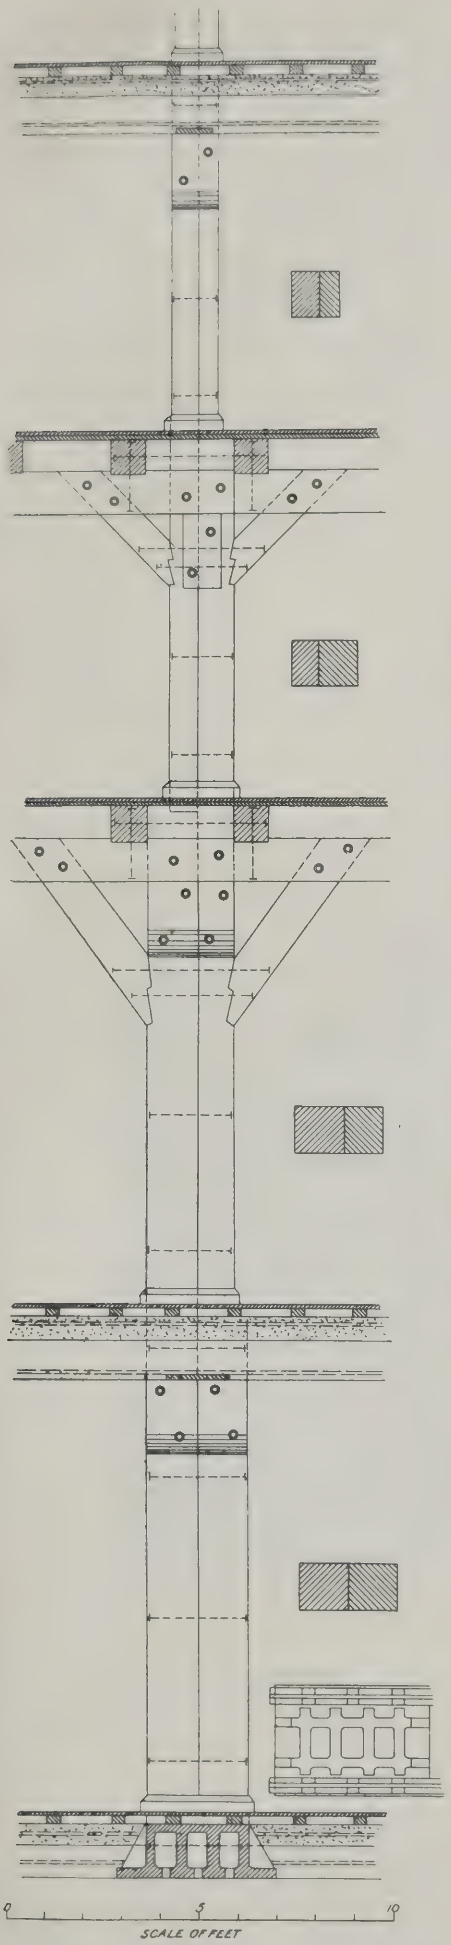
A Floor of Jarrah Supports and Flooring.

Object of the Test.—To record the effect of a fire of two hours' duration at a temperature gradually increasing up to 2,000° F.

Note.—The area of the floor under investigation to be 222ft. 6ins. super. in the clear (10ft. by 22ft. 3ins.). The floor was to be loaded with 232 lbs. per sq. ft., distributed as described.

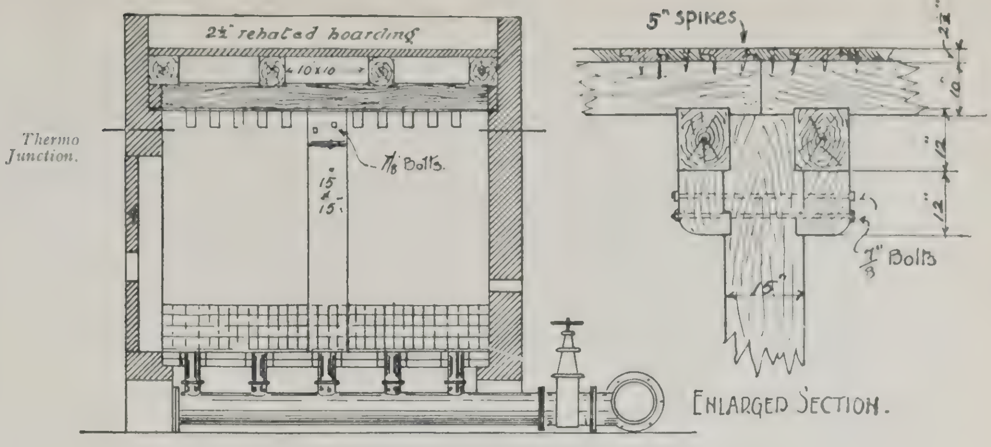
Summary of Effect.—In sixteen minutes some of the joints of the underside of the flooring were opening.

In seventeen minutes smoke appeared through a joint of the flooring.



WAREHOUSES AT HAMBURG: SECTION SHOWING SLOW-COMBUSTION TIMBER CONSTRUCTION.

(NOTE.—The 1st and 4th floors are pugged.)

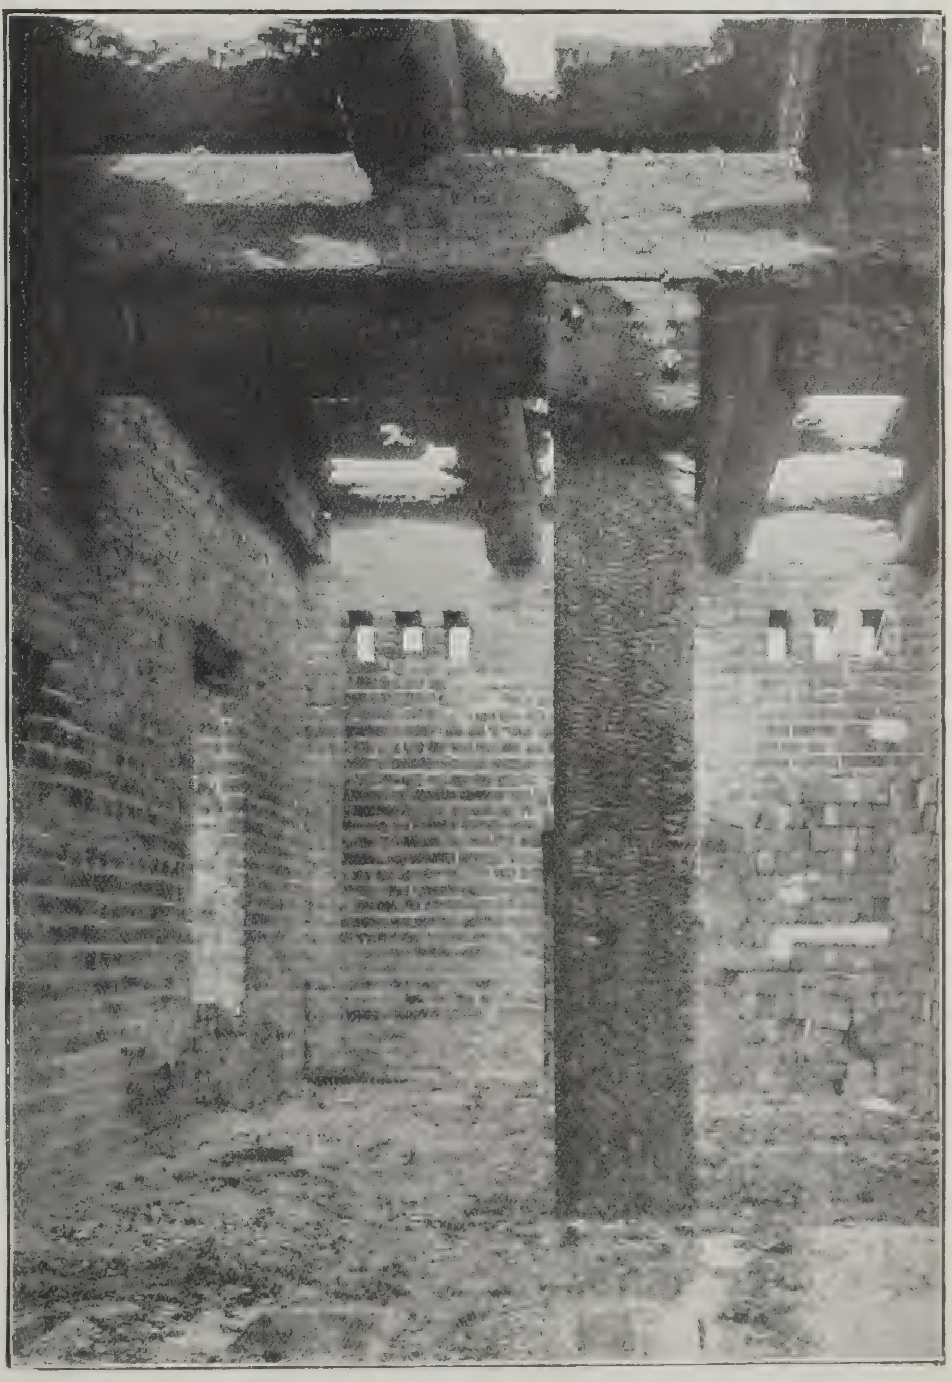


CROSS-SECTION OF TESTING CHAMBER.

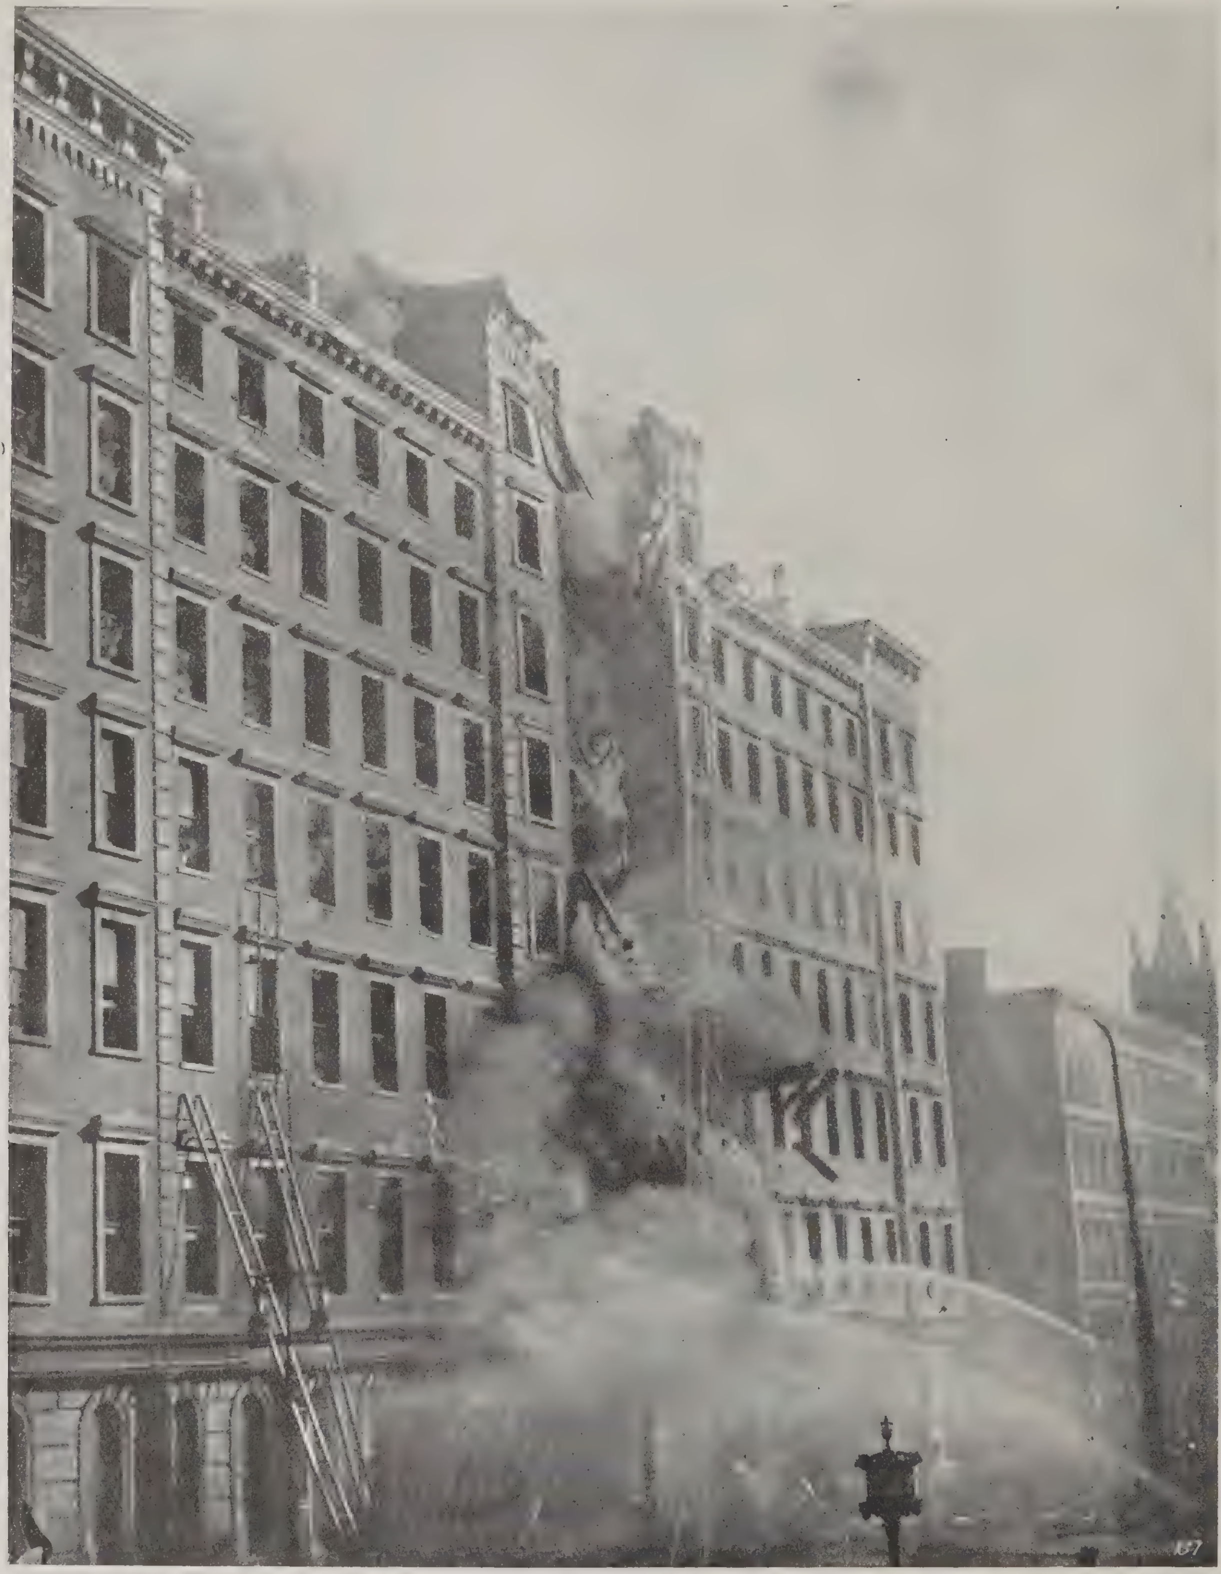
In sixty-nine minutes the underside of the flooring was burnt and flaked off, so that the rebated joints were visible in many places.

In eighty-four minutes flames came through the flooring.

In 119 minutes there were numerous holes in the floor, with flames coming through them, considerable portions of the flooring being burned away from under the stacks of bricks. The post, beams and joists were reduced in size and charred to a depth of ¾in.



THE JARRAH FLOOR AND SUPPORTS AFTER THE TEST.



THE WINDSOR HOTEL FIRE, NEW YORK: VIEW TAKEN WITHIN HALF AN HOUR OF THE ALARM BEING GIVEN.

HOTEL FIRES.

The Object-lesson of the Last Decade.

SO much hotel work is at present being done in the Metropolis that we think we should call attention, by way of reminder, to the disaster at the Windsor Hotel fire in New York in 1899. We do this advisedly, having regard to the nature of some of the hotels which are being put up; for whilst some of the new buildings show everything that modern knowledge can do, there is not the slightest doubt that others are of very inferior design and execution.

The Windsor Hotel fire occurred on the 17th of March, in the afternoon. At about 3 p.m. someone noticed a curl of smoke coming from an upper storey window, beneath the flag pole. The alarm of fire was at once given, reaching the nearest fire station at 3.15 p.m., and the first engines to respond were there in three minutes. Unfortunately a panic arose in the building, and although the rescue work was commenced immediately the result was nevertheless that about forty lives were lost.

The character of the building was that of an ordinary hotel building without fire-resisting floors, or, in other words, there was a very considerable amount of woodwork in the building, which dated from 1872. The rapidity of the fire was probably due to the very considerable extent to the lift shafts and small areas, to the length of the corridors, and the spaces left for pipes, wires, &c.

The photograph we show was taken within the first half hour of the fire. Within one hour the whole building had entirely collapsed, and within two hours there was nothing to be seen but a heap of ruins, of the character of an enormous rubbish heap.

Chief Officer of the Berlin Fire Brigade.—We have much pleasure in announcing the appointment of Mr. Reichel, late chief officer of the Hanover Fire Brigade, to be chief officer of the Berlin Royal Police Fire Brigade. Mr. Reichel is a civil engineer by profession, and he held the chair for fire-prevention at the Royal Technical College at Hanover. He is eminently suited to the post, as a man of great experience and scientific training.

FIRE RESISTANCE OF PARTITIONS.

THE impending enactments of the London Building Act have raised the question in many directions as to which of the partitions on the London market have already been examined as to their fire resistance under the official tests of the British Fire Prevention Committee; and as this question is certainly one of considerable importance we have compiled the following list, from which it will be seen that fourteen proprietary partitions or partition systems have been under investigation by this Committee.

It is interesting to observe that one proprietary firm put forward a partition of impregnated wood; two firms jointly, two partitions of wood filled in with slag wool; one firm a partition of metal supports with corrugated metal filling plastered both sides; two firms partitions in which metallic lathing forms an important feature; one firm a porous terra-cotta brick partition; one firm a sand-brick partition, whilst the remaining firms all dealt in slab partitions, the slabs being of various aggregates, the aggregates of late taking more the form of concrete aggregates in which pumice or other similar materials were a feature.

The list of partitions is given in order of rotation of tests, and at a future date we hope to publish a summary of the results of these tests for purposes of comparison. Some of the tests were naturally failures, whilst others were remarkably successful, but for the moment we would simply refer one to the official reports for further details. We are informed that a number of other partition tests will be undertaken in the course of this year:—

Two matchboarded partitions filled in with silicate cotton (slag wool) by Messrs. T. Anderson & Son, Ltd., and Messrs. T. Broadbent & Co., London. (Two tests.)

A partition of non-flammable deal by the Fire Resisting Corporation, Ltd., London.

A partition by the "Gypsine" Brick Co., Ltd., London.

A partition erected by the Mural and Decorations Syndicate, Ltd., London.

A partition formed with "Mack" patent slabs, and erected by M. J. A. King & Co., London.

Two partitions known as the "Cunnah-Wright" partition, by the Fireproof Partition Syndicate, Ltd., London. (Two tests.)

A partition erected by Banks' Helical Fireproofing System, Ltd., London.

A partition formed with "Phœnix" fire-resisting slabs, erected by Excelsior and Phœnix Partitions Co., Ltd.

A partition formed with Jabez Thompson's thin white partition slabs and erected by Jabez Thompson, Northwich, Cheshire.

A partition formed with Jabez Thompson's patent "Terrawode" brickwood and erected by Jabez Thompson, Northwich, Cheshire.

A partition formed with "Kulm" partition slabs and erected by Horace W. Cullum & Co., London.

A partition formed with Brunckhorst partition slabs and erected by H. Gust & Co., London. *Report not yet issued.*

Two partitions formed of thin "Mantada" slabs by the Adamant Co., Ltd., London and Birmingham. (Two tests.) *Reports not yet issued.*

A partition of asbestic bricks by the Asbestic Brick & Tile Co., Ltd. *Report not yet issued.*

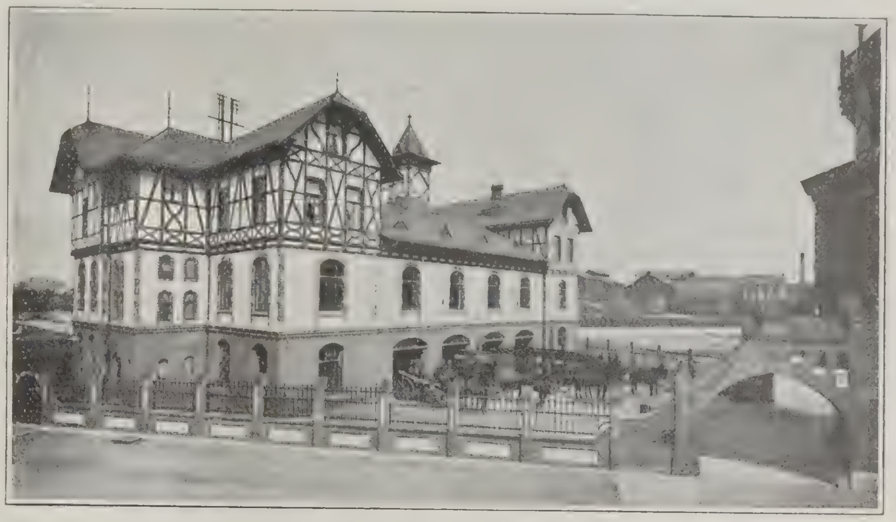
FIRE STATION AT BREMEN.

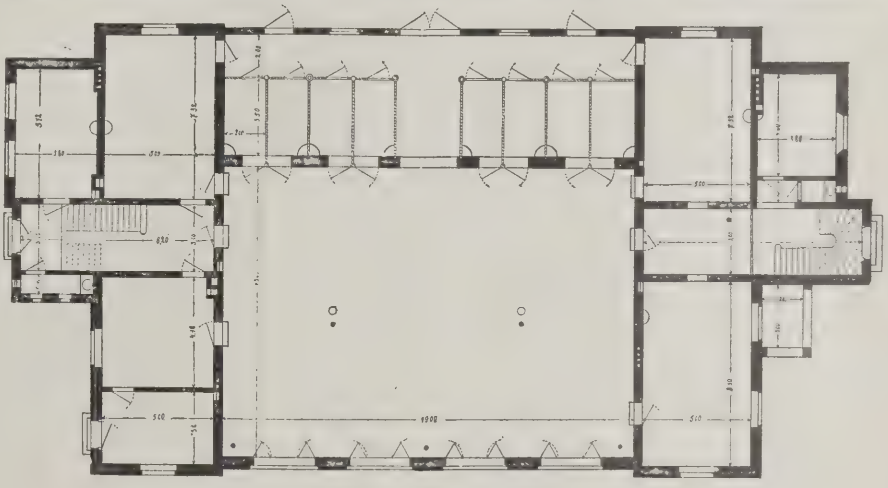
THE fire station at Bremen, here illustrated, is most carefully and effectively planned, and its architectural treatment is also above the average. The fire station is a district station planned so that four appliances can be housed with four pairs of horses. We give the ground-floor and basement plans; the dimensions will be seen figured on the plan on the metric system.

In this case the principle has been observed of putting the horses behind the fire-engines, and separating the stables from the engine-house by means of a solid wall fitted with doors, the doors opening automatically, allowing the horses to come out and get on each side of the appliances. There is a considerable economy in space in this building.

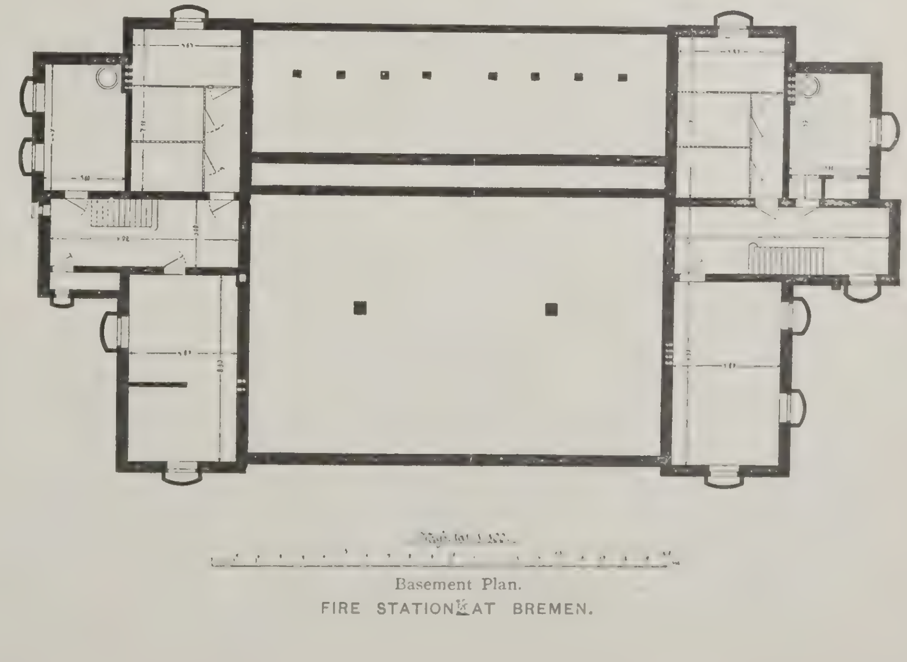
At the same time we take the opportunity of illustrating a drill and look-out tower which has been erected in connection with this fire-station. These towers are generally in the first place monstrosities, and in the second place are unreal and do not afford sufficient variety of conditions for the firemen's drill. In this instance, however, it will be seen that the drill tower shows a portion of the building with ordinary openings in it, another portion with balconies; there are cornices; there is some overhanging half-timber work, a projecting gallery, and a somewhat inaccessible turret. The photograph, by-the-bye, shows the firemen drilling with an 80ft. mechanically raised long ladder, with hook ladders, and with life lines. We think the drill tower in question might well merit the consideration of those entrusted with the design of fire-stations for municipal departments, and thus we reproduce some of the drawings, *i.e.*, a full set of plans, two elevations and a section to scale.

The Bremen brigade, by the way, is one of considerable efficiency and remarkable for its excellent management. It is commanded by Chief Officer Dittman, who is well known in this country and who has made a special hobby of fire-station design.]



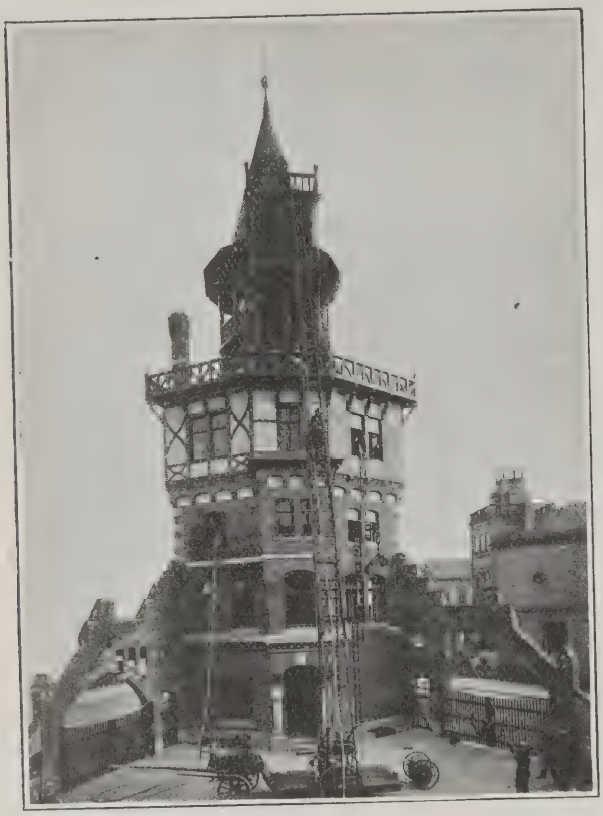


Ground-floor Plan.



Basement Plan.

FIRE STATION AT BREMEN.



GLASGOW FIRE BRIGADE.

We observe the Glasgow Fire Brigade is to be materially improved by the addition of modern appliances. The city has been the subject of a number of serious fires of late, which its very efficient brigade has, however, been unable to limit to the extent one might have desired, owing not so much to any lack of suitable appliances as to the lack of legislation limiting the cubic contents of buildings.

As to how the matter of additional appliances stands, the deputation representing the Glasgow Fire Brigade, which recently visited a number of cities in England to view the equipments of other brigades, has recently issued a report. The deputation recommends, among other appliances, the addition of a motor first-aid carriage and a motor fire-engine at an estimated cost of £1,500, and an extension fire escape with adjustable turntable at an approximate cost of £600. The points which most impressed the deputation were—(1) the unanimity of opinion of the various fire-brigade officials in regard to the advantages and superiority of motor-driven engines over horse haulage; (2) the utility of carrying on the first-aid machine a length of rubber hose with a small nozzle, the gain derived from it being a saving of time in its being used and the diminished water damage done; (3) the advisability of having in the equipment of the brigade an extension fire escape, in view of the increased height to which buildings are now being erected; and (4) the variety of smaller appliances at the disposal of the brigades of the cities visited being relatively greater than that provided in Glasgow.

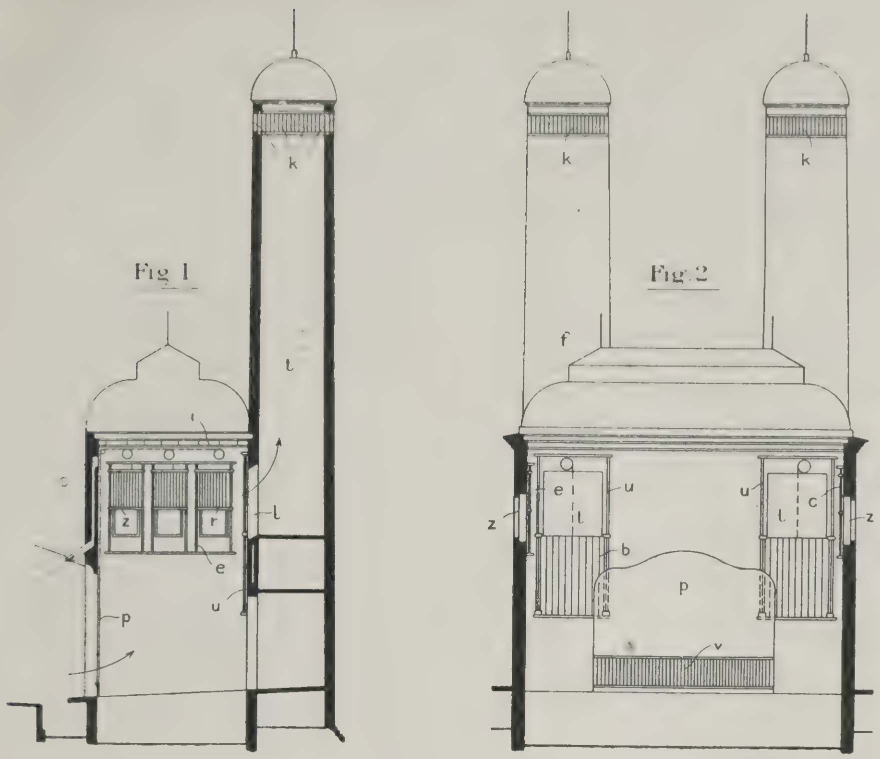
DRILL AND LOOK-OUT TOWER AT A BREMEN FIRE STATION.



AN HUNGARIAN SCHEME FOR SPECIAL EXHAUST FLUES TO THEATRE STAGES.

THEATRE SAFETY.

We present several communications in this Fire Supplement appertaining to the safety of theatres from fire. The first is a paper by M. de Breuer, an officer of the Budapesth Fire Brigade, who deals mainly with a proposal for rapidly ventilating the stage on an outbreak of fire, and thus drawing off the smoke away from the auditorium. Another communication is one in respect to a second or auxiliary fire-resisting curtain which is being constructed from the design of Chief Officer Reichel. Lastly, we present some notes as to some fire-protective safeguards relating to Berlin theatres.

The whole question of safety in theatres and places of public entertainment from fire is so important that we think it merits the consideration of all architects, whose work lies in this direction, as also of the many surveyors attached to our public authorities.

SAFETY OF THEATRES FROM FIRE.

By Constans de Breuer, Budapest Fire Brigade.

The architect Mr. Koloman Rimanóczy, of Nagyvárad, in Hungary, has taken out a patent for a double theatre-curtain with a special construction to lead the smoke out of the building. This invention has been tried for the first time at a small experimental theatre which the inventor had put up in Nagyvárad. The experimental theatre consisted of an auditorium provided with doors at the sides and an upper window, and a stage 7 metres wide, 3 metres deep and 5·2 metres high (107 cub. metres volume). The stage was separated from the auditorium by an iron curtain, while the ceiling consisted of reinforced concrete. The curtain consisted of two iron-plates, each 3 metres wide by 2 metres high, which were placed at a distance of 16 millimetres from one another, with iron netting 40 centimetres high at the bottom. In the outer plate several small holes were made near the floor, while in the inner curtain such holes were bored near the top in such a way that between both plates an air draft circulated.

On the back part of the stage there was provided an opening of 1 sq. metre, connected to the chimney of the brick-yard alongside of which this experimental theatre had been put up. The inner area of the chimney was also 1 sq. metre.

For the 3,500 cub. metres large stage-room of the Nagyvárad theatre Mr. Rimanóczy projected two large openings (17·5 sq. metres), with iron doors, of which each one would end in a tower-shaped chimney. From the auditorium the consumed air as well as the smoke produced there would be conducted into ventilation shafts provided in the proscenium wall and ending at the dressing-floors. The windows of these floors, although provided with iron doors, could be opened for ventilation.

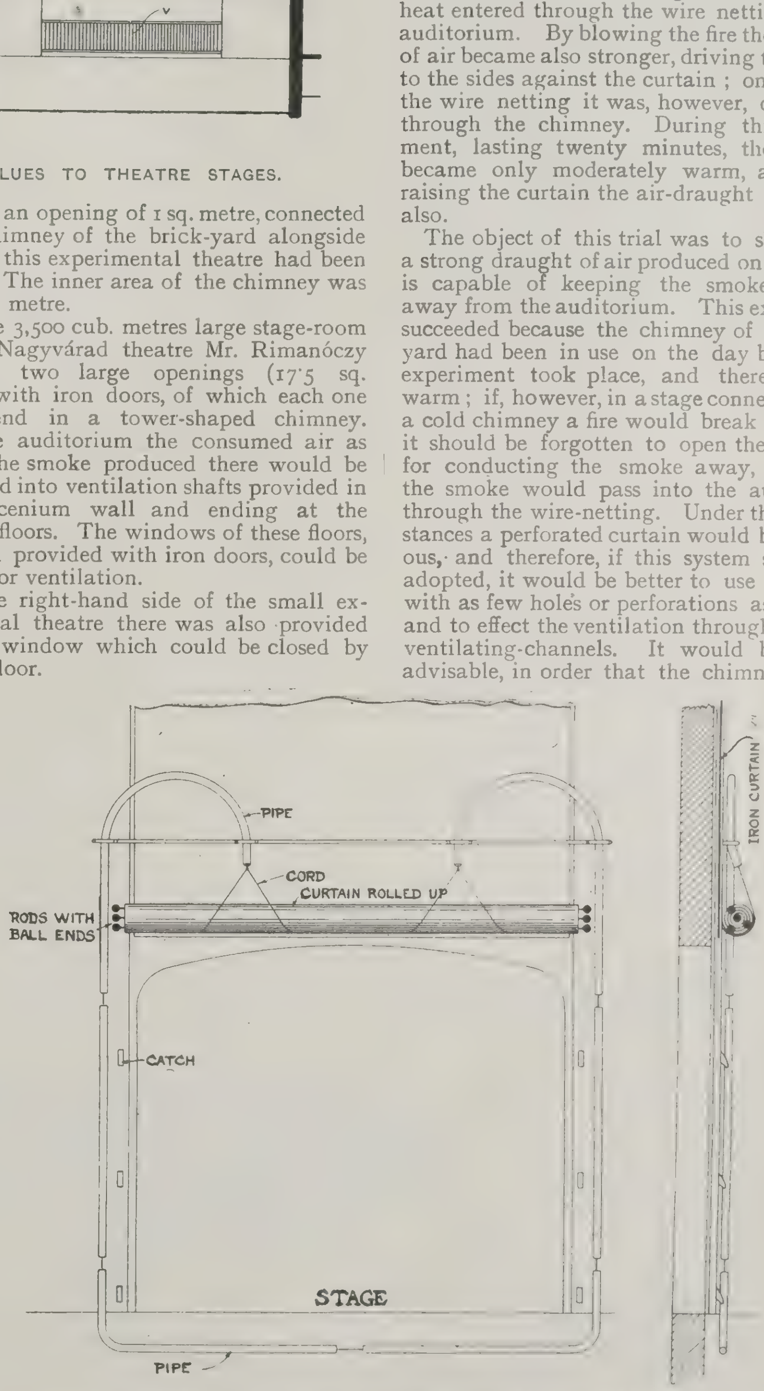
On the right-hand side of the small experimental theatre there was also provided a small window which could be closed by an iron door.

At the experimental test a light wooden frame was fixed around the stage and reeds and wood-shavings placed thereon. After kindling these shavings the iron curtain was lowered. The draught of air passing from the auditorium to the stage was so strong that some of the shavings were blown from their places, so that the fire hardly spread. After five minutes only half of the frame was burning, while the smoke was nearly entirely drawn away up the chimney; after seven minutes the doors of the auditorium were closed, whereupon the fire as well as the generation of smoke became more lively. After nine minutes the side-windows were opened; this, however, had no influence on the draught of the air. After twelve minutes the fire went out, although not even the whole of the reeds had been consumed by the fire, while the iron curtain was only moderately wärm.

When the curtain was raised most of the smoke entered the auditorium, but it descended only as far as the wire-netting of the curtain.

At the second trial we lit a basket containing wet straw and wood-shavings placed near the curtain on the stage, whereupon the heat entered through the wire netting to the auditorium. By blowing the fire the draught of air became also stronger, driving the smoke to the sides against the curtain; on entering the wire netting it was, however, drawn off through the chimney. During this experiment, lasting twenty minutes, the curtain became only moderately warm, and after raising the curtain the air-draught decreased also.

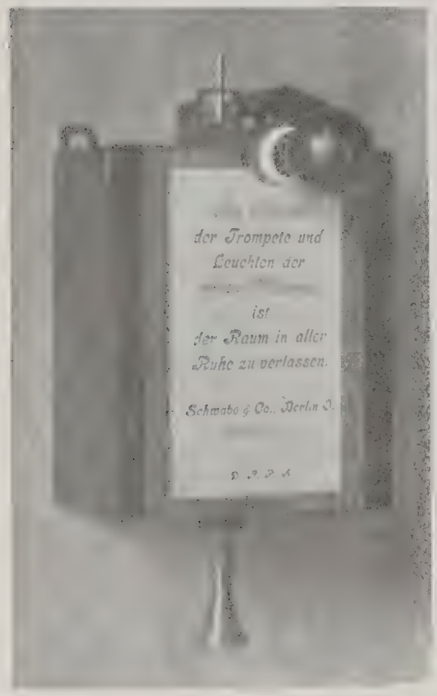
The object of this trial was to show that a strong draught of air produced on the stage is capable of keeping the smoke entirely away from the auditorium. This experiment succeeded because the chimney of the brick-yard had been in use on the day before the experiment took place, and therefore was warm; if, however, in a stage connected with a cold chimney a fire would break out, or if it should be forgotten to open the openings for conducting the smoke away, doubtless the smoke would pass into the auditorium through the wire-netting. Under the circumstances a perforated curtain would be dangerous, and therefore, if this system should be adopted, it would be better to use a curtain with as few holes or perforations as possible and to effect the ventilation through separate ventilating-channels. It would be further advisable, in order that the chimney should



CHIEF OFFICER REICHEL'S AUXILIARY CLOTH FIRE-RESISTING SCREEN FOR THEATRE PROSCENIUM OPENINGS.

always be warm, not to lead the ventilation channels from the auditorium to the dressing-floor, but to the chimney, as in this way the warm air in the auditorium would suffice for keeping the chimney moderately warm, and in this way a continuous draught of air would be created, which, if the smoke-discharge openings were open, would take away the smoke.

The system of Mr. Rimanóczy is theoretically quite good. Generally it might be said that this system would work satisfactorily only if the air-draught produced is strong enough to overcome the expansion of the smoke-gases, and if the chimney is capable of leading this large quantity of smoke away—otherwise the whole smoke would be forced into the auditorium. A further drawback to this system is that it requires the building of a large chimney.



HOOTER AND SIGNAL LIGHT FOR THE BERLIN THEATRES.

The principle of this system, *i.e.*, to conduct the smoke away from the auditorium, is sound; and it is very surprising, that at almost all theatres just the opposite has been done. The opening above the great lustre, as well as the doors and windows in the galleries, has, probably speaking, only the object of conducting the smoke away in case of fire, but this is done in such a way that it is carried right into the faces of the public instead of drawing it away from them.

Ventilation openings of suitable size, or provided with sufficiently strong exhausters, should be provided next to the proscenium wall in order that the smoke may be drawn to this part and discharged through the upper part of the building.

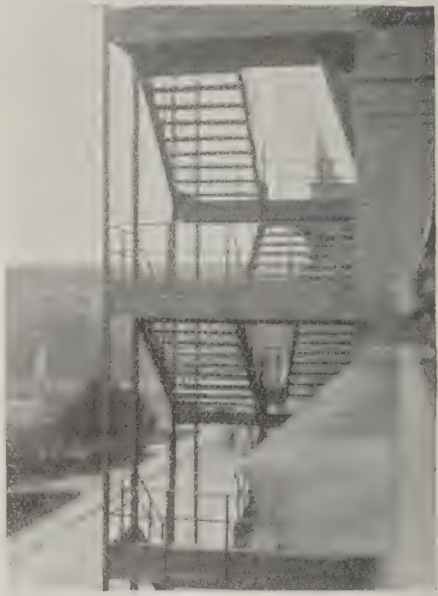
Especially objectionable is the roof construction of the modern theatres, as the ceiling of the uppermost gallery is often situated higher than the opening above the great lustre. The smoke produced cannot pass this narrow opening and, after first filling the space under the main ceiling, penetrates these more loftily situated large compartments and thereby renders the escape of the public through the upper doors almost an impossibility, as the smoke would here accumulate before the public could reach them.

AN EMERGENCY CURTAIN.

Herr Reichel, the chief of the Hanover fire department, has invented an emergency fire-curtain for theatres that are already provided with an iron drop-curtain. The object of this second or emergency curtain is to provide protection for the spectators in case a fire breaks out on or back of the stage and the regular iron curtain fails to work, as happened in the Iroquois disaster in Chicago. The "emergency" curtain can also be used to supplement the regular fire-curtain and accord additional protection, if only temporary. The main thing for it to accomplish is to prevent the flames and smoke from penetrating into the auditorium until the spectators escape.

The illustration on the preceding page shows the arrangement. The emergency curtain is attached to or combined with a system of vertical wire cords and stout horizontal iron rods. The curtain bears no part of the weight of the horizontal rods, as these are independently carried by the wire cords, which are attached to the upper and the lower curtain rollers and rolled-up with the curtain itself. There are about five of these wire cords to support the rods for an ordinary stage-opening width. At each end of each iron rod there is a metal ball. When the curtain is lowered, either slowly or rapidly, these balls engage in the catches so that, although there might be a strong draught from the stage towards the auditorium, it would not be able to blow the curtain out into the latter space or even belly it outward. As these rods could be only in tension when thus resisting the draught from the stage outward, they need not be of very great diameter. The curved pipe-line through which is led the endless cord that holds up the curtain has in its length several gaps at convenient places; and by each of them there is chained a stout, sharp knife with which to cut the cord in case of fire. Of course cutting the cord at any one point suffices to let the curtain (and with it, naturally, the cross-rods) down with a run, covering the entire stage opening from within and effectually cutting off communication of smoke or flame between stage and auditorium. There is no complication about the device. If the cord is cut anywhere in its length the curtain must be released; the weight of the lower roller, together with that of the curtain, suffices. The curtain is rolled up by the use of inclined ladders, boards or poles, as may be convenient.

There is naturally nothing to prevent the cords and the curtain from being tested monthly, or even weekly, if desired; there is only the trouble of running the corp through the tube line, an affair of about fifteen minutes.



OUTSIDE THE ESCAPE STAIRCASE AT THE BERLIN OPERA HOUSE.

PRECAUTIONS AT BERLIN THEATRES.

Among the numerous precautions being taken at the theatres at Berlin we note the installation of a somewhat novel appliance intended to warn the audience of danger. This is a kind of combined hooter that shows a red light. The illustration presented explains the appliance. A notice is printed informing the public that they have to leave the theatre when the hooter sounds.

Another feature of the precautionary measures at Berlin is the wholesale application of outside staircases irrespective of their inartistic appearance. We illustrate one of these staircases as applied to the Opera House at Berlin, which is a structure of architectural pretensions in Renaissance style.

We certainly do not think much of the idea of the hooter, though some form of signal, such as a red lamp, if unaccompanied by any noise for giving warning to the attendants might be valuable.

As to the outside staircases at Berlin, they are very useful, but we doubt if it is advisable to overdo their application as at the Opera House.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

May 17, 1905. Vol. 21, No. 536.

6, Great New Street, Fetter Lane, E.C.

Summary.

The four chimneys at the "underground" power station at Chelsea are each 275ft. high and 19ft. in diameter, built of perforated bricks. At Mill Hill Park car-sheds more than 800ft. long have been erected. (Page 277.)

The greater the weight in the upper part of a dome the greater will be the horizontal thrust: therefore a dome requires less thickness and is more stable when an eye is formed in the top. Pointed domes are more stable than spherical ones, and this form should be used when a lantern has to be supported on the top. (Page 272.)

The new pier at Falmouth has been completed after two years' work. It is largely constructed of reinforced concrete on the Hennebique system. (Page 281.)

The new Gaiety Restaurant and Hotel was opened last Wednesday. (Page 281.)

The Coventry City Council has decided to make no alteration in the practice of architectural work being carried out by its officials. (Page 281.)

The R.I.B.A. council elections will be decided again on the registration question. (Page 279.)

Mr. W. A. Pite has won the competition for the new King's College Hospital to be built at Camberwell, and Messrs. Warwick & Hall have been placed first in the competition for new municipal buildings at Lambeth. (Page 282.)

A well-preserved length of London's Roman wall has been found in Jewry Street, Aldgate. (Page 281.)

Papers on sculpture and architecture were read before the R.I.B.A. on Monday evening by Mr. T. Stirling Lee and Mr. W. Reynolds Stephens. (Page 282.)

The L.C.C. Bill for the preservation of London squares has been rejected by a Select Committee of the House of Lords. (Page 282.)

In the United States a man named Farley has a regularly organized business for fighting a strike. On his books he has as many as 40,000 names, and he can always call up 1,000 men at a moment's notice. (This page.)

The Royal Sanitary Institute propose to move to larger premises. Towards the expense £10,000 is in hand, and £15,000 more is wanted. (Page 282.)

The Bill for amending the Public Health Acts, so as to secure more reasonable by-laws for rural districts, has passed its second reading in the House of Lords. (This page.)

A Point to Remember. We desire to remind our readers just now of the fable of the old man and the donkey, because from some quarters we have received grumbling criticism of our Fire Supplement and the policy of representing constructional work in progress. It is, of course, impossible to please everyone; one reader likes this and another that; one architect, who designs hotels and business premises, will turn with the greatest interest to our photographs showing the erection of the Ritz Hotel, for instance, while another architect, who builds houses far away in the country, may perhaps find nothing attractive in such illustrations. These varied interests we ask our readers to bear in mind. In the architectural and building world the policy of running a paper for any particular class or clique has never succeeded. The numerous interests have all to be represented, and—what is of paramount importance—special attention has to be given to the future. It has long been recognized that the study of the architectural past only, leads to lifelessness. Nowadays we see a reversion of the old ideas, and one expression of the change may be found in the general practice of visiting new buildings in course of construction. With that fact in view, we are devoting special attention to the representation of such work by photographs and drawings; while, as to the Fire Supplement, we may say that it deals with what is more and more becoming a necessity—fire-resisting construction—and should therefore interest all architects and builders. To those who are so fossilized as to have little taste for such affairs we would point out that the Supplement is added to this Journal without any extra charge, and is something quite extra to our ordinary issue, and it can be read or not according to the particular taste of each reader.

Fighting a Strike. Some particulars of Mr. James Farley, the "strike breaker," who has been called in to settle the teamsters' strike in Chicago, have been furnished by an American correspondent of the "Times." This worthy generals the forces of "blacklegs" for the masters just as the Union "boss" generals the forces of labour against capital. His record is an amazing one. He has broken a number of huge strikes all over the United States. He has made it his business for the last five years to keep in touch with men who were ready to work for employers suddenly left without employees, and it is stated that he has on his list nearly 40,000 names. Not all who are enrolled in his army are immediately available, as many may happen at any particular time to be in situations which they would not care to throw up, but there are at least 1,000 who can be called upon at a moment's notice, and several thousands besides can be mobilized within a few days. In accordance with the rules of this warfare, this general does not ride at the head of his men, but directs operations over the wire from a secluded office. As long as a strike lasts Farley is absolute despot, not even the capitalists venturing to interfere with his plans nor to offer a suggestion, for he is no subordinate or adviser, but contracts to break a strike. In this "one-horse country" we have not as yet anyone who has taken up this new profession, nor have we the armed private bodies of detectives that apply their persuasion to the settlement of a dispute. But then we are not a democratic and free republic.

Rural By-laws. The Public Health Acts (Amendment) Bill was read a second time in the House of Lords last Thursday, and referred to a Select Committee. The provisions of this Bill are briefly as follows:—

Clause 1 enacts that the Act shall be construed with the Public Health Acts and apply co-extensively with them.

Clause 2 exempts any building (except a public building or a factory over one storey in height or with a gallery) from the operation of any existing or future by-law within any "county district" with respect to the structure of walls, foundations, roofs, floors, chimneys or hearths, space about buildings, ventilation, giving of notices or deposit of plans or sections, provided it is situated 15ft. from the boundaries of the curtilage thereof or from the centre of a street—or if the height of the building to the spring of the roof exceeds 15ft. the distance from the boundaries or street must be extended equal to such height. The distance from any other building must be not less than 30ft., but a stable or offices of a detached house are exempted. Two dwelling-houses separated by a party division of fire-resisting material are deemed to be a single building.

Clause 3 provides that if alterations are made in a building that diminish the space about it, the exemption shall cease to apply.

Clause 4 provides that nothing in this Act shall exempt any building from the operation of any by-law with respect to the drainage of buildings or with respect to water-closets, earth-closets, privies, ashpits or cesspools in connection therewith.

Clause 5 empowers the Local Government Board, upon the representation of five ratepayers, to disallow by-laws after confirmation where any such are found unsuited to the district in respect to which they apply or to operate contrary to the public interests.

While we think the Bill is a step in the right direction, and should help to settle the housing problem in rural districts, it requires careful consideration in Committee. Clause 2 is on the whole reasonable, but if it is admitted that two attached houses ought to be exempted, then equally so ought a block of eight, six, or four at least, which would be safe, better to drain, and economical. It would be right, of course, then to insist upon a greater space about the buildings. Means of escape from fire in buildings more than two storeys high surely require regulation as much as sanitation. It is doubtful if clause 5 will become law, though it would be a great benefit, for there ought to be some appeal against unreasonable restrictions.

THE CONSTRUCTION OF A STONE DOME.*

By JAMES S. BOYD.

THE construction of a stone dome is of great interest to the architect and to the craftsman: to the former because the study of masonry is of value both from an artistic and a constructive point of view, while to the latter its practical importance is self-evident.

The dome as an architectural feature is not here under consideration, nor is it proposed to go into the matter of the theory of dome construction.

The treatment of the subject will be confined to the constructional and more practical part of the work connected with a dome of moderate size, as well as the principles of stone dome construction.

Principles.

A dome may be generally described as a spherical roof rising like an inverted cup over a circular or polygonal base.

If we cut a spherical dome by four vertical planes equidistant from the centre and at right angles to each other, the spandrel portions of the dome contained between the plane surfaces are called pendentives, and this is the proper form of a pendentive dome (see Fig. 4).

When a spherical dome covers a square compartment of a building (such as is shown in Figs. 1, 2 and 3) it requires some means of support for the whole of its base. This is usually provided by corbelling out a pendentive from the internal angle of each pier to meet the base of the dome: and all domes of this nature are commonly styled "pendentive" domes.

The outward thrust of a dome near its base requiring to be counteracted, it is usual to add mass on the outer surface just above the springing to do this (Fig. 5). This mass counteracts the outward pressure of the dome near its base, directing it into a more vertical direction. Metal ties embedded in the masonry near the base of the dome serve the same purpose.

If a dome is hemispherical in form, with a proper thickness of material and without a lantern on the top, the ties need not be used in any bed joint making a greater angle than 23 degs. to the horizontal base (Fig. 1), because this has been proved to be the inclination of the weakest joint in a hemispherical dome, and all the stones above this angle press inwards, each circular course forming a horizontal arch keying itself.

The dome is therefore independent of a keystone.

Copper cramps from 10ins. to 12ins. long have been used to tie the stones of a lower course together. They are inserted in the upper bed of the stone, but the objection to the use of cramps is that each stone in this course is brought into tension.

A much better arrangement is to have a continuous ring of iron or copper sunk into the bed of the stone (Figs. 6 and 7), which method is quite suitable for a dome of moderate span.

Whether the ring or cramps be used, they should be properly embedded in Portland cement.

The cement used in building the dome may help a great deal, as it also acts as a tie to a certain extent, depending on the tensile strength of the cement used.

It has been found that the weakest joint in a dome of a pointed form makes a much smaller angle than 23 degs. with the horizontal.

A stone dome need not be uniform in thickness throughout, for, if reduced gradually towards the crown, it can do with less material (Fig. 1).

If the reduction at the crown is such that it is half the thickness at the base, the weight is then only little more than half of that required for a dome of uniform thickness and of the same size.

The greater the weight in the upper part of the dome, the greater will be the horizontal thrust. Therefore a dome requires less thickness and is more stable when an eye is formed in the top.

When circular openings are cut through the lower part, the stability is greatly diminished, both by the loss in weight and by the reduction of the base area of the dome.

Any increase in weight at the top (such as adding a lantern) will decrease the stability in a much higher ratio than the weight cut out near the base.

Pointed domes are more stable than spherical ones, and this form should be used when a lantern has to be supported on the top.

It is now my intention to deal with the setting-out of the dome as required in actual practice, and then to describe the working of the stones in it, after which the work connected with the pendentives will be taken up.

Setting-out of the Dome full size.

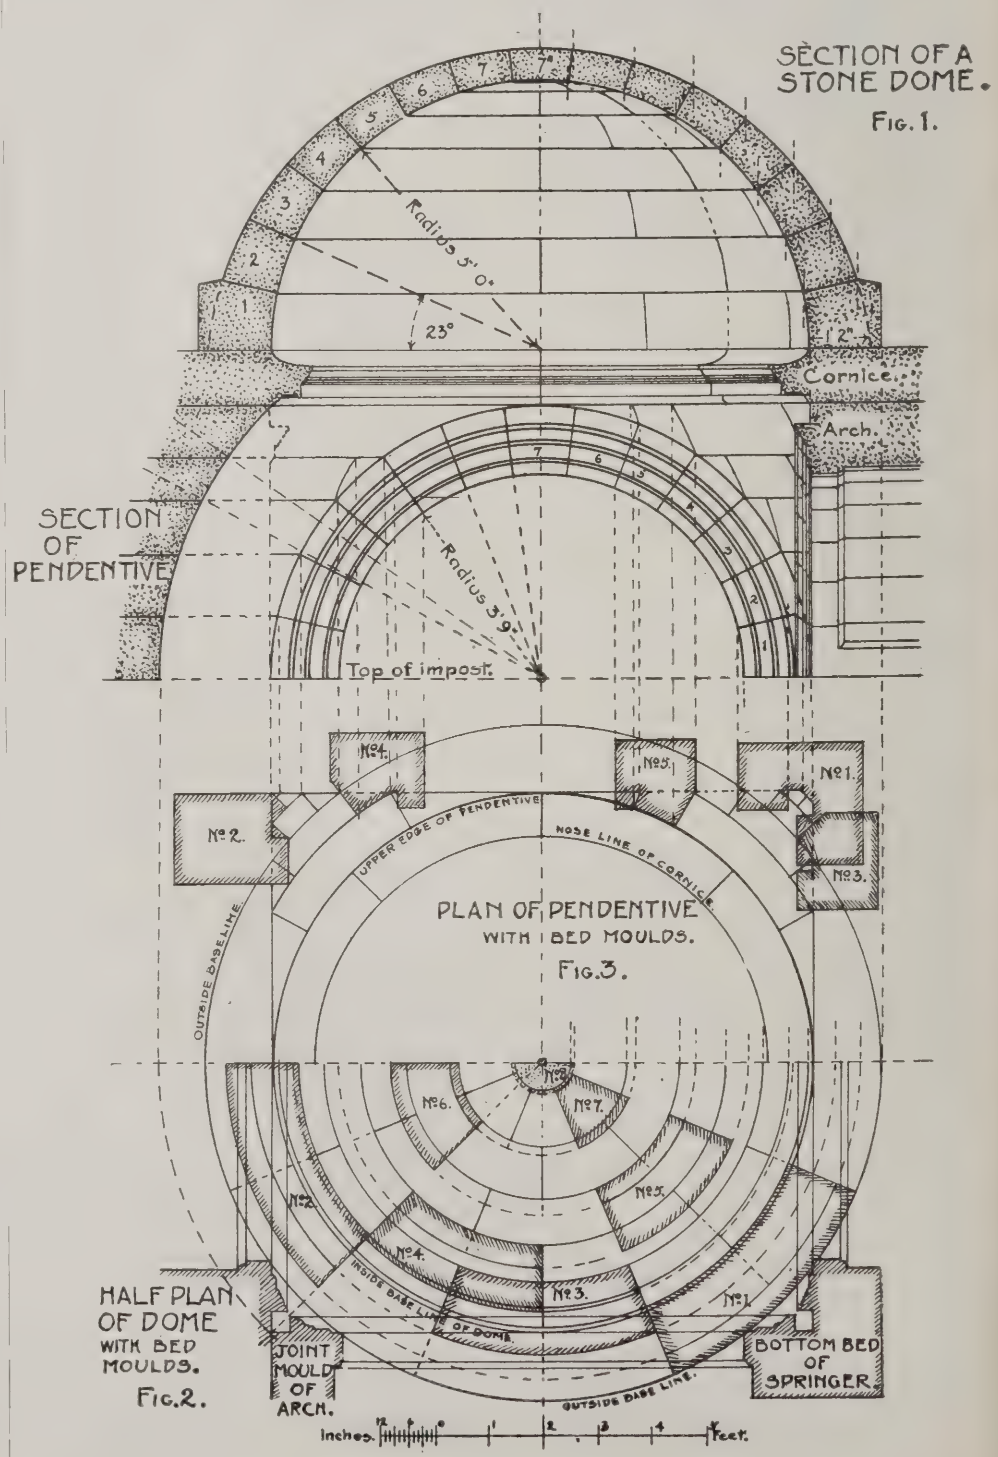
All the bed moulds could be developed from a quarter plan drawn down full size, but in order to show the "setting out" clearly, a half plan looking up (Fig. 2) has been drawn.

The lines of the joints on plan are very easily traced if the soffit joints are shown in solid lines and the extrados joints dotted.

The bed moulds are here shown longer than would be used, so as to avoid confusion of the lines, but whatever length of stone is fixed upon, each stone should, if possible, be of the same length in that course, because the bed mould will then give the exact length of each stone in the course.

Before the plan can be drawn complete, at least one-half of the section (Fig. 1) would be required. The section gives all the joint moulds necessary (one for each course).

The thickness of the joints should be deducted when the moulds are cut, and the moulds should be made of stout zinc.



SECTION OF A STONE DOME. FIG. 1.

PLAN OF PENDENTIVE WITH BED MOULDS. FIG. 3.

HALF PLAN OF DOME WITH BED MOULDS. FIG. 2.

---

* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

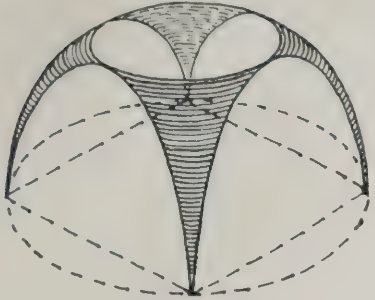


FIG. 4

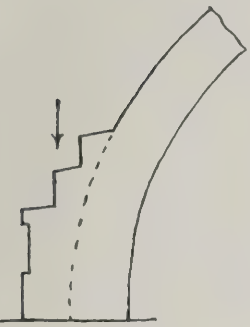

FIG. 5

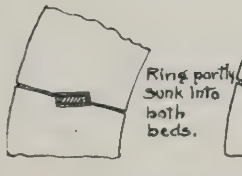

FIG. 6

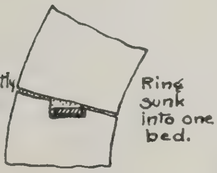

FIG. 7

There is some difference of opinion as to the most economical method of working the stones for a dome. In regard to simplicity, the method about to be described is the most suitable, especially for the lower and higher courses, and may also be adopted for the other courses, but with these there is greater waste of material.

The saving in material effected by any more intricate method will not compensate for the loss of time involved in the work.

The working of a Stone in Course No. 1.

The form of the block required for working any of the stones is a rectangular prism; the length equal to the full length of the bed mould, as in Fig. 8, and the full height of the joint mould for that course, as in the section (Fig. 1).

First, work the bottom bed and scribe in the bed mould (Fig. 8). The inner arris line on this bed may be marked by a pencil through small perforations formed in the mould, or it may be scribed in with a templet taken from the corresponding arris line on plan.

Next, work the vertical joints to the end of the bed mould square from the bed, as in Fig. 9. Square up lines on each joint from the arris lines on the bed. These lines guide the application of the joint mould which is now scribed on each joint. A top bed is now worked parallel to the bottom bed and to the exact height of the joint mould. This bed is only a surface of operation, and labour need not be thrown away on it where it is not required.

It may be mentioned here that the stones for each course can be machined down to a gauge x (Fig. 9), the exact height of each joint mould, and this is a great saving in labour, but in each example described here it is assumed that the stones are entirely worked by hand labour.

Next, apply the bed mould on this bed and scribe in the lines required (Fig. 10).

A draft is sunk at the lower arris of the splay joint; the templet used for this is taken from the corresponding arris line on the bed mould on plan.

Roughly square down the small part of the stone directly above the draft to the inner arris line drawn on the top bed (Fig. 10). This arris can now be trammelled in from the top bed.

We next work off the conical splayed bed, drafts radiating from the centre of the dome being sunk between the outer and inner arrises by the aid of a short straight-edge (see Fig. 11).

In Fig. 1 the back of the springer course is shown vertical, but if the back has to be cut to the extrados curve, it can now be worked off guided by a templet (Fig. 12) taken from the extrados curve in the section (Fig. 1).

The soffit can also be worked out by sinking drafts to a templet taken from the soffit curve in section (Fig. 1).

In each case, when templets are used, they should be held plumb and radiating to the centre of the plan.

The working of a Stone in Course No. 3.

The shape of the rough block required for this stone is also a rectangular prism; length equal to that of bed mould and height equal to that of joint mould.

The stones may be gauged down to the height x in Fig. 14 by a planing machine, as already mentioned, or we may begin by working a bottom bed by hand, on which scribe in the bed mould (Fig. 13). All that is left of this bed when the stone is finished is the lower arris, so that labour may be saved on the bed where possible. The vertical joints can now be cut square from the bed, and the joint mould accurately applied and scribed on the joints, as in Fig. 14. The stone is now brought to a parallel thickness by working the top operation bed to the height of the joint mould.

Apply the bed mould on this bed, and scribe in the lines required (see Fig. 15).

A draft is next sunk to contain the upper inside arris by the aid of a templet taken from that arris line on the plan or from the bed mould. Trammel in the arris from the top bed, as in the first stone, and clean out the splay bed guided by the short straight-edge.

To work off the bottom splayed joint, take a templet to the bottom outer arris curve on plan, and sink a draft to contain the arris, which is now trammelled on from the bottom bed (Fig. 16). The splay is now worked off, aided by the straight-edge.

Lastly, clean out the soffit and the back as explained in connection with stone No. 1. As an alternative method, the soffit may be cleaned after the top splay joint has been worked by means of the soffit templet; then the bottom splay joint may be worked by an arch bevel applied from the soffit, as in Fig. 17.

As already stated, when this method is applied to the middle courses of the dome, it involves a great loss of stone, as we can see by comparing the finished block (Fig. 17) with the rough block (Fig. 14).

In order to save material, the stone can be worked as a polygonal prism, as in Fig. 23.

To obtain the moulds, a sectional elevation of one block is drawn on a vertical plane passing through the centre of the block and centre of dome (Figs. 18 and 19). The stone prism (the base of which is the polygon F′ B′ E′ K′ P′ Q′ in elevation) is worked straight through, as in Fig. 23.

Measure the distances J E, M F and R B from the base of the prism, shown on the plan of the block (Fig. 19). These give four points which will enable the vertical joint to be worked at this end of the block.

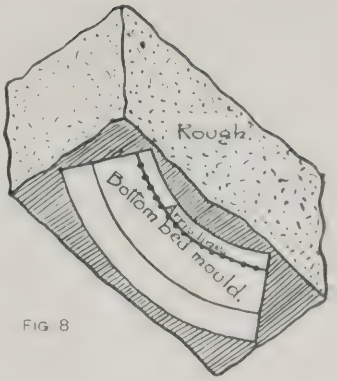

FIG 8

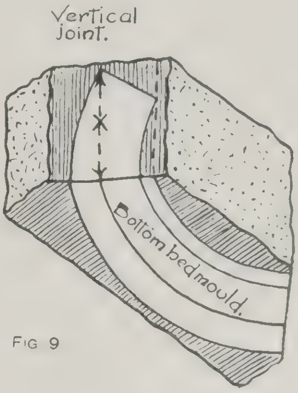

FIG 9

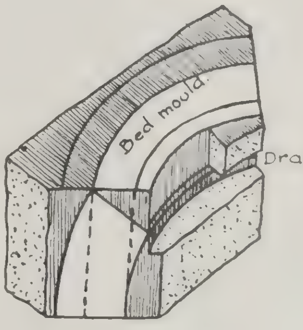

FIG 10

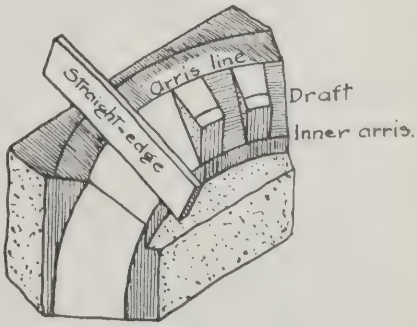

FIG 11

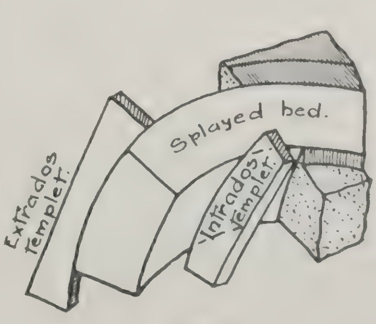

FIG. 12

On the top bed, Q F of Fig. 23, the topmost arris is scribed in, using a templet to this arris, F G on the plan. A mould of the inner

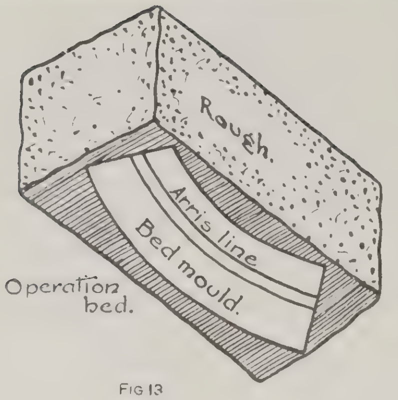

Fig 13

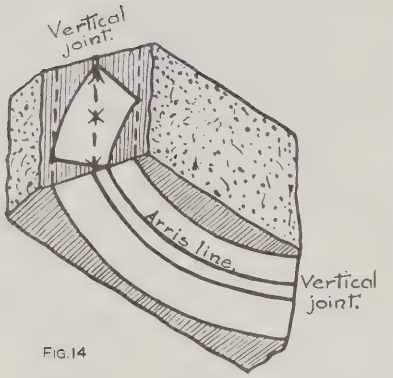

Fig. 14

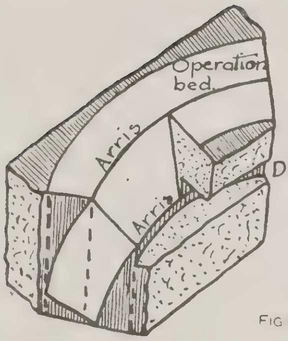

Fig 15

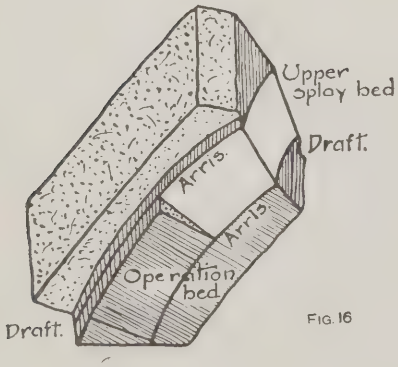

Fig. 16

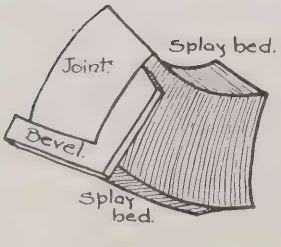

Fig. 17

operation plane is developed, as shown in Fig. 21, and with this mould draw on the inner surface of the prism its intersection by the conical surface of the upper splay bed (Fig. 24). The upper conical bed can now be worked through to the two curves just drawn, the straight-edge used always held radiating to the centre of the dome.

The lower bed can be worked in a similar manner. The bottom arris line is drawn on the bottom bed of the prism, as in Fig. 24, with a templet to E K H on plan (Fig. 19).

Develop an outside operation plane mould, as in Fig. 20, and with this draw on the outer surface its intersection with the bottom conical joint (see Fig. 23). The bottom conical bed is now worked to the two curves, aided by the straight-edge, as already explained (see Fig. 25).

Flexible moulds of the upper and lower beds are developed as shown in Fig. 22. The moulds are pressed into and around the conical surface, to scribe in the interior arris of the upper splay bed and the exterior arris of the bottom splay bed (Fig. 25).

Guided by templets taken from the soffit and extrados curves, the spherical surfaces are now worked (see Fig. 26), a joint mould being scribed on the vertical joints as indicated.

The pendentive has already been defined.

The arrangement of the bed joints is worthy of some attention. These are much better if worked as conical or splay beds as in the dome, but as this requires more material and causes more trouble in working, they are generally horizontal, as shown in the section (Fig. 1).

Sometimes the lower courses only are worked with level beds, and the higher courses with splayed beds, as indicated by dotted lines in the section.

Observe also in the same figure that the courses are arranged to suit the stones in the arches, and a haunch is worked on each arch stone, which thereby forms a good bond with the pendentive.

The bonding of the two together in this way is often omitted, the pendentive courses being simply splayed on the back of the arch with a plain joint.

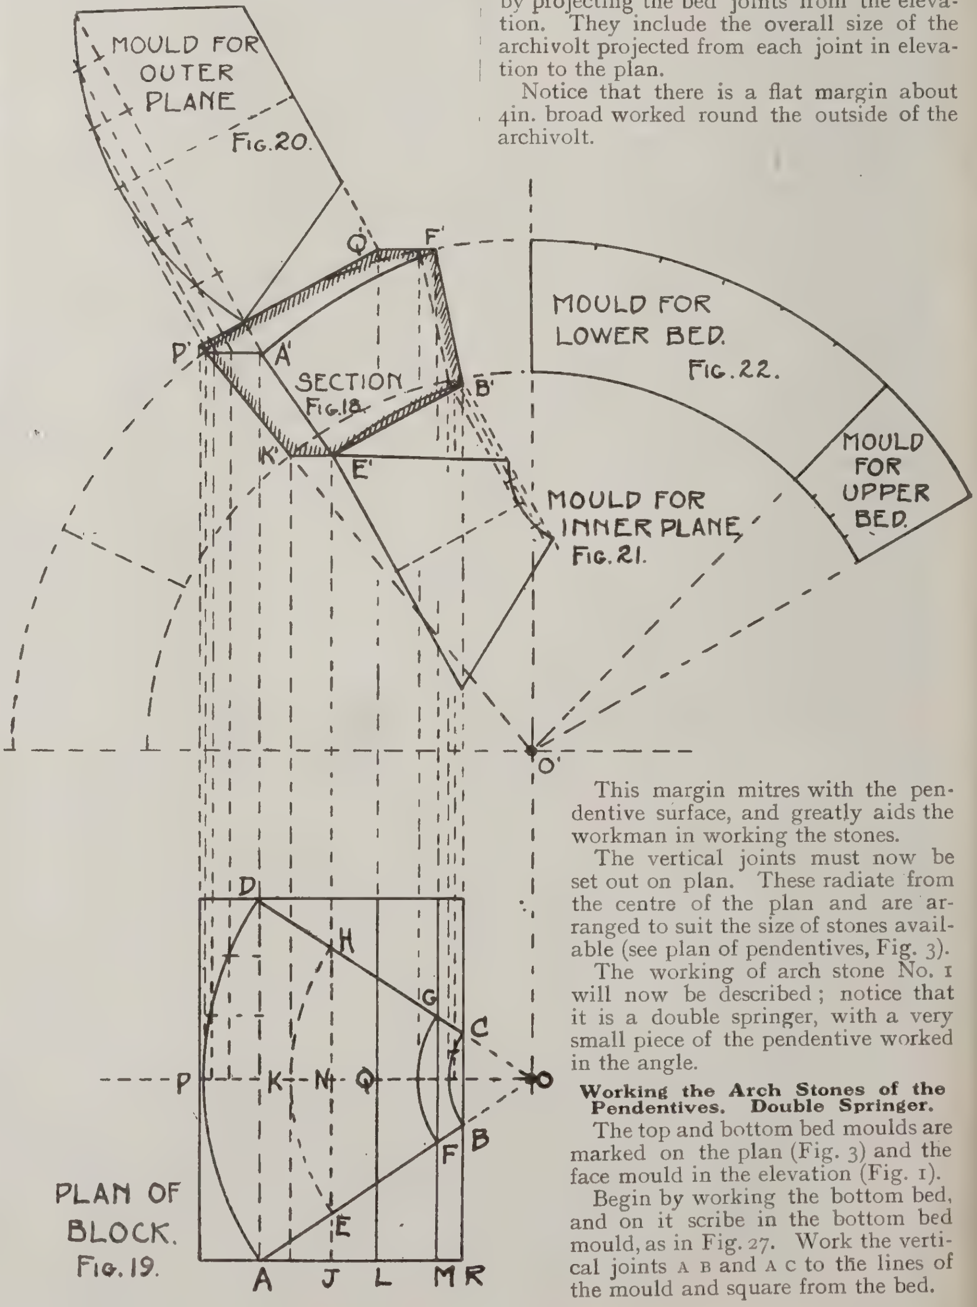
The profile of the pendentive (Fig. 1) is found by describing an arc of a circle with a radius equal to half the diagonal of the square plan (Fig. 2).

The bed joints are now projected through the profile, and we thus find the depth of each course in the pendentive. This shows the arrangement of the corbel, and how the courses vary in depth and form.

From the section of the pendentive a joint mould is made for each course except the bottom one.

Bed moulds are got from the plan (Fig. 3) by projecting the bed joints from the elevation. They include the overall size of the archivolt projected from each joint in elevation to the plan.

Notice that there is a flat margin about 4in. broad worked round the outside of the archivolt.



This margin mitres with the pendentive surface, and greatly aids the workman in working the stones.

The vertical joints must now be set out on plan. These radiate from the centre of the plan and are arranged to suit the size of stones available (see plan of pendentives, Fig. 3).

The working of arch stone No. 1 will now be described; notice that it is a double springer, with a very small piece of the pendentive worked in the angle.

Working the Arch Stones of the Pendentives. Double Springer.

The top and bottom bed moulds are marked on the plan (Fig. 3) and the face mould in the elevation (Fig. 1).

Begin by working the bottom bed, and on it scribe in the bottom bed mould, as in Fig. 27. Work the vertical joints A B and A C to the lines of the mould and square from the bed.

On these joints scribe in the face mould (Fig. 27).

Now work the top bed parallel to the bottom bed and to the exact height of the face mould (Fig. 28).

Scribe in the top bed mould and work the check D through from bed to bed, keeping the plane containing the archivolt moulding clean, as in Fig. 29.

Apply the archivolt face mould (which is taken from the face mould already used), guided by lines squared down from the top bed, and scribe in the soffit line, the splay joint, and breadth of archivolt (Fig. 29).

Next work the splay joints as shown in Fig. 30, and scribe in the section mould of the archivolt and soffit panel.

The soffit, panel mouldings and archivolt are worked through, guided by templets where necessary (see Fig. 31). Then, lastly, the small part of the pendentive (marked P in the figure) is worked. The templet required for this is taken from the section of the pendentive at the springer course (Fig. 1).

Arch Stone No. 3 in Third Course of Pendentive.

The bed mould is shown in the plan (Fig. 3) and the face mould in elevation (Fig. 1).

First work the top bed (a part only of which will remain) and on it scribe in the bed mould (Fig. 32).

Next work the vertical joint A B, and the pendentive joint square from the top bed. Scribe the face mould on the joint A B, and the section mould of the pendentive for this course on the other joint, as in Fig. 32.

Rough out the surface of the pendentive, working from the joint towards the mitre, and point off the vertical part between the joint A'B and the pendentive joint (Fig. 33).

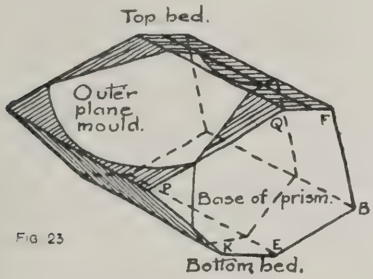


FIG 23

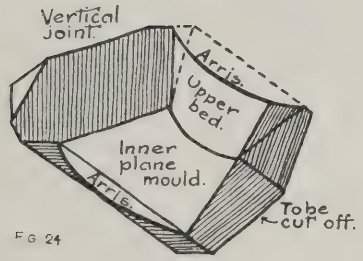

FIG 24

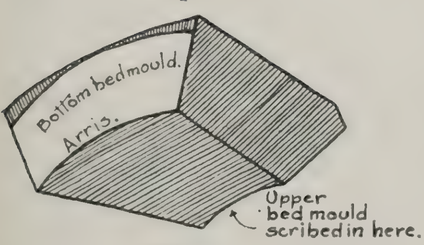

FIG 25

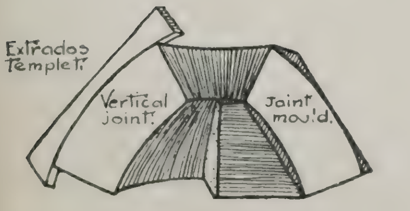

FIG 26

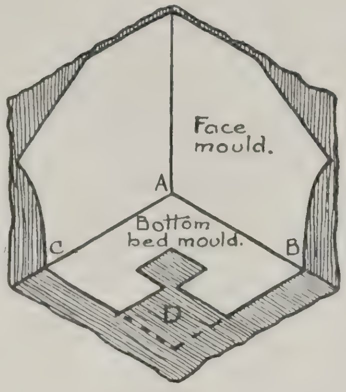

FIG 27

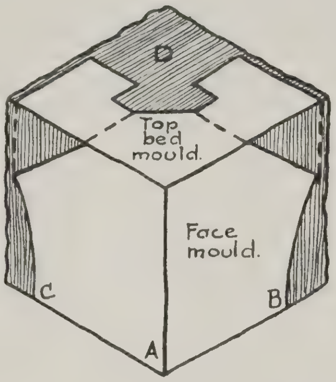

FIG. 28

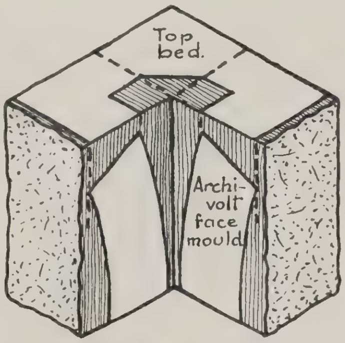

FIG. 29

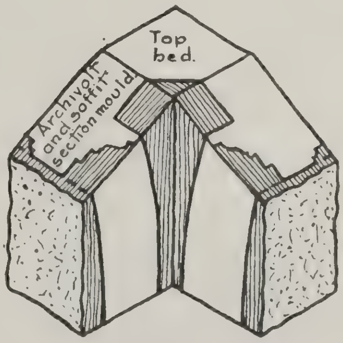

FIG. 30

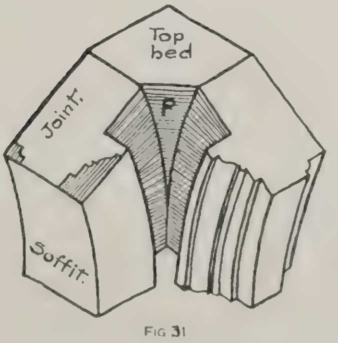

FIG 31

Also work a plane surface to contain the archivolt moulding, and scribe in the archivolt face mould, the application of which is guided by lines squared down from the bed. The splay joints are now worked through from the face to the side A B.

Scribe in the section mould of soffit panel and archivolt on both joints (Fig. 34), and work the mouldings through.

The small part of the pendentive and the outer margin of the archivolt are now cleaned into the mitre, as in Fig. 34.

Setting the Courses in the Dome.

In building up the courses in the dome, the mason requires some means of checking the work as it proceeds.

In the arch the stones are tested by a trammel working from the centre, but this cannot be applied to the inside of the dome surface owing to the position of the centering.

A very accurate method is to cut a wooden mould to the outer section curve for each course with the top edge level, as shown in Fig. 35.

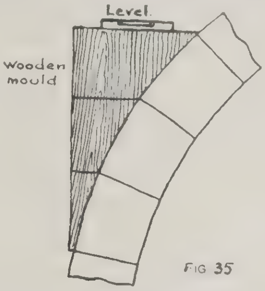

FIG 35

The mould is held exactly to the top and bottom arrises of the stone, and a spirit-level is applied on the top edge. The mould must be held plumb, and radiating to the centre of the dome.

It may be made to take in a number of

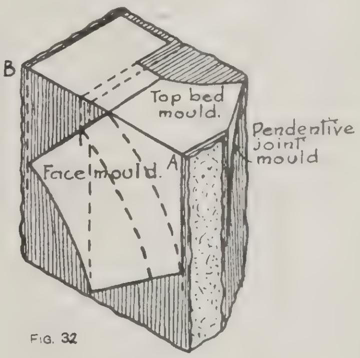

FIG. 32

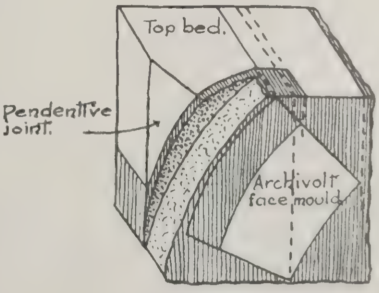

FIG 33

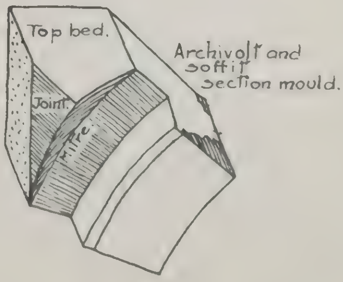

FIG 34

courses if desired, in which case the lines of each course would be marked on it to check them properly.

Another method is to work with a trammel revolving on a centre point at the top of the dome, but this is not so accurate as the method already described.

In conclusion, great importance should be attached to the study of the science of masonry, both by the architectural student and craftsman.

Builders have at times had their wits highly exercised by difficult masonry problems, of which the one we have now considered cannot be classed as the most difficult.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

School Requirements.

West Dulwich.—W. writes: "I believe the Board of Education issue a schedule of requirements in regard to new schools. Where can I obtain this, and what is the cost of it?"

Messrs. Eyre & Spottiswoode, the King's Printers, of East Harding Street, Fetter Lane, E.C., issue these, price 3d.

Power of Rural Council to lay Drains.

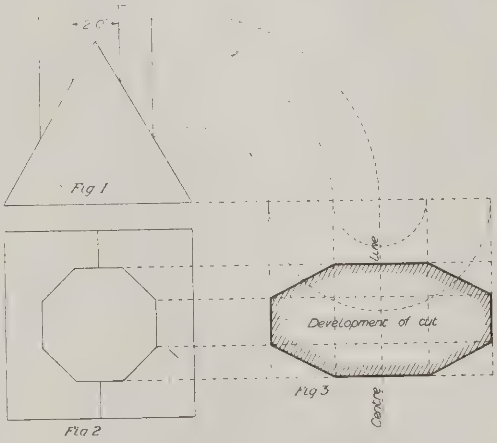
Sheringham.—Heather writes: "Have a rural district council power to lay a drain across private property? If so, what Act empowers them, and are they bound to compensate?"

Yes, under section 16 of the Public Health Act, 1875 (38 & 39 Vict., c. 55) the authority may "after giving reasonable notice in writing to the owner or occupier—if on the report of the surveyor it appears necessary—(carry any sewer) *into through or under any lands whatsoever within their district.*" Failure to give such notice is good ground for granting an injunction to restrain a local authority from constructing a sewer through private lands (*New River Co.* v. *Ware Union R.S.A.*, 1883, &c.). But if the owner has consented he cannot afterwards obtain the injunction even though the notice has not been served (*Long* v. *Fulham Vestry*, 1898). "Into, through or under" means that you must take it in and take it out either by "through or under"; the authority cannot take the sewer "into" private land and leave it (*Cator* v. *Lewisham B. of W.*, 1864). A notice is reasonable when it specifies the object of an entry on private premises to be the construction of a sewer of certain dimensions, and shows that the entry will go from that point in an oblique direction; it is not necessary that a map should accompany it (*Cleckheaton Industrial Self-help Society* v. *Jackson*, 1866). The notice must be given to the owner or occupier. The word "through" gives the authority power to construct the sewer above the ground level and support it by a permanent embankment. So far as decisions go, no right of an authority for *lateral* support for a sewer has been made out; but the Act is held to imply *subjacent* support for the sewer, and a corresponding obligation on the landowner so to deal with his land as not to take away support from a sewer which the authority have placed there, or which is vested in them (*Corporation of Dudley*, 1881, 8 Q.B.D. 86). By application to a court of summary jurisdiction the authority may, under section 305 of the Act of 1875, obtain an order authorizing them to enter on lands where entry has been refused by the owner or occupier (*Lamacraft* v. *St. Thomas R.S.A.*, 1880). The word "sewer" as used in the Act is sufficient to include manholes. The words in section 16, "if on the report of the surveyor it appears necessary," relate not to the notice but to the necessity of carrying the drain through the lands. (*New River Co.* v. *Ware Union R.S.A.*, 1883). The surveyor is the person to determine the necessity; if he exercised his judgment and came to a conclusion in good faith the court ought not to interfere, even though other courses might be shown to be practicable by which entry on private lands might be avoided (*Lewis* v. *Weston-super-Mare, L.B.* 1888). The surveyor must be a fit and proper person appointed to the position under section 189 of the 1875 Act. Under section 308 of the Act the owner of private land so entered upon can claim full compensation, to be settled by arbitration in manner provided by the Act, or, if the compensation claimed does not exceed the sum of twenty pounds, by application to a court of summary jurisdiction. The owner of the land cannot compel the authority to exercise their right of purchasing the lands.

Roof Surface cut by Octagonal Chimney.

Bolton.—Assistant writes: "An octagonal chimney shaft, of which each face is 2ft., cuts centrally through the ridge of a roof of 60 degs. Draw the plan and determine the exact shape of the opening. I cannot find a solution in my geometry books."

Books on practical geometry cannot show all the applications that arise in practice, and it is therefore incumbent on students to consider well the principles of what they read so that they may make their own applications as occasions arise. Fig. 1 shows an end elevation and Fig. 2 a plan of the proposed chimney shaft. The roof is cut to the smallest dimensions, and may be made to any span by simply continuing the lines. Fig. 3 shows the part cut out by the chimney from the two roof planes, both being shown opened out flat. The principle of the construction is to produce lines from the various points in two directions so that their inertsection will give the true plan.



HENRY ADAMS.

Books for Examinations.

Pembroke.—Interested writes: "Which are the best books (not too expensive) to study for the examinations of the Society of Architects and the Royal Sanitary Institute?"

The following are the best books to study for the Society of Architects' examination, although other books should be read to obtain a wider knowledge of the various subjects:—"History of Architecture," Fletcher; "The Orders of Architecture," R. Phené Spiers; "Greek and Roman Architecture," Anderson and Spiers; "Italian Renaissance," Anderson; "Gothic," Rickman; "Gothic," Prior; "How to Estimate," Rea; "Quantities," Davis; "Specifications," Leaning; "Building Construction," Longman; "House Drainage," Middleton; R.I.B.A. Conditions of Contract; "Specification No. 8." For the Royal Sanitary Institute examination the following books should be obtained:—"Lessons in Elementary Physics," Balfour Stewart; "Experimental Chemistry," Parts I. and II., Reynolds; "Modern House Construction," Sutcliffe; "Hygiene," Fletcher; "Hygiene" Parkes; "House Drainage," Middleton; "Building Construction," Longman; "Sanitary Engineering," Moore.

Buildings to measure near Rayleigh.

London.—H. S. writes: "Is there anything suitable to measure at or near Rayleigh, Essex, for the R.I.B.A. intermediate examination?"

Stanford-le-Hope, Fobbing, Hadleigh, Prittlewell, Horndon, Woodham Ferris and Mucking should supply plenty of good examples to measure. Churches at Morgeretting, Mountnessing, Ingatestone and Hutton, all close together, within easy train distance of Rayleigh, will furnish ample field for sketching. Chelmsford and the surrounding district contain many fourteenth and fifteenth-century churches. L. G. R.

Book of House Designs.

London.—F. H. F. writes: "Have you published any book showing designs, &c., of a house costing about £1,500 to £3,000, say, within a radius of thirty miles from London?"

No, we have not, but we can supply readers with any of the books on house design mentioned in our book lists.

Charges for Architect's Services.

Loughborough.—Ignorant writes: "During my residence in a suburb of London my landlady's son asked for my 'professional opinion' upon some houses which he thought of purchasing. I visited several, and gave an opinion upon their respective values, &c., and he afterwards bought one. Later he again sought my help in reference to the building of a shed in the garden. I made a rough sketch plan in pencil, took out quantities, ordered materials and supervised the work, which was carried out by himself and his brother. I gave him the invoices for materials (which were made out to me), and called for payment, which was not forthcoming. When leaving the district (in October last) I deducted the larger portion of the amount from what I owed to my landlady—his mother. He has not paid the balance, and evidently does not intend to do so. Am I not entitled to charge fees for my services and to claim them through the county court in addition to the balance upon cost of materials? I have not at present sent in any account, and should not have charged him if he had behaved decently. He was, I think, just under age at the time of these transactions (last March—July)."

As the client was a minor, you appear to have little chance of redress, and we advise you not to go to law.

Stippling for Greenhouse.

Surrey.—C. writes: "What are the best constituents and proportions for a white stippling solution for the roofs of greenhouses, to stand all the summer and be removable in the autumn?"

We suggest the use of one of the washable distempers or water paints.

Preservation of Stonework.

Southsea.—W. A. C. writes: "What is the best way to treat a Portland head-stone in order to preserve it?"

The baryta treatment is the best to adopt. Particulars are given on p. 246 of our issue for May 3rd.

THE "UNDERGROUND" POWER STATION AT CHELSEA.

IN our issue for February 15th last we gave some illustrations showing the erection of the large new power station at Lot's Road, Chelsea, for the London "underground" railway, together with particulars of the steelwork by Messrs. Mayoh & Haley. We now give a series of other photographs showing different parts of the station, in course of erection and as completed, supplemented by particulars of the work carried out by the several sub-contractors.

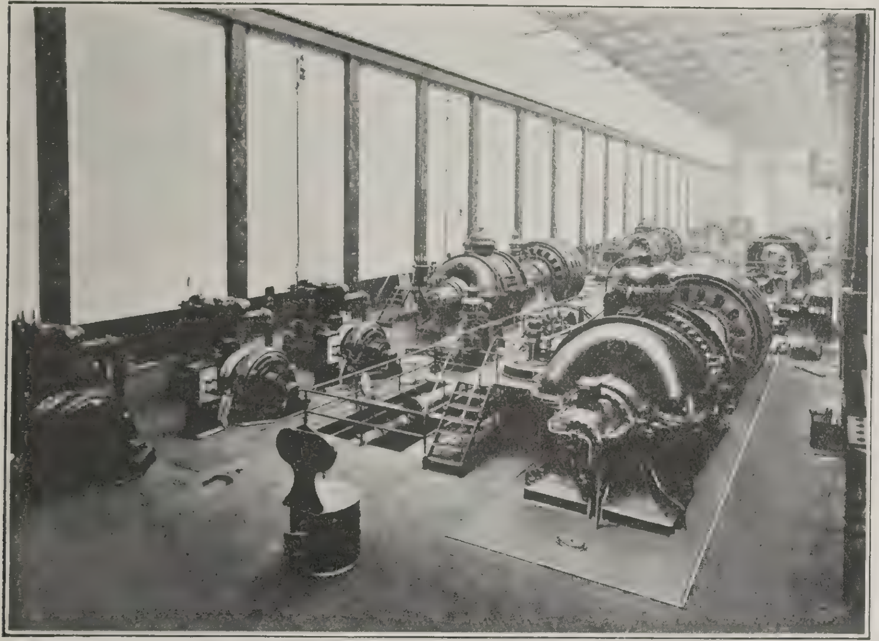
ELECTRICITY GENERATING STATION, LOT'S ROAD, CHELSEA.

Electrical Equipment.

Particulars of the electrical capacity of the station, which has been equipped by the British Westinghouse Electric and Manufacturing Co., Ltd., were given in our first article, and in connection with this part of the work we need only refer to the substation at Hounslow, illustrated on p. 280 of this issue, where the current of 11,000 volts is reduced by static transformers to about 440 volts, converted into a continuous current of 600 volts, and supplied at that pressure to the rails.

Plumbing; Paving.

The plumbing work at the station was executed by Messrs. Doulton & Co., Ltd., of Lambeth, while the paving of landings, lavatories and offices with marble mosaic was carried out by the Atlas Stone Co., Ltd., of Cambridge.



INTERIOR VIEW, SHOWING TURBO-GENERATORS.

Glazing.

The glazing of the skylights was placed in the hands of Messrs. Mellowes & Co., Ltd., of Sheffield and London. It is of the greatest importance that buildings of this kind, where there is expensive machinery running at high speed, should be protected in such a way that no water either from rain, snow or condensation, nor dust and blacks, may have the slightest chance of falling down upon the machinery, as it would do irreparable damage in a very short time. Messrs. Mellowes & Co. have used their well-known "Eclipse" system of glazing for this purpose. Their steel sash bars, enclosed in a soft inoxidizable metal, carry the longest squares of glass without any possibility of breakage, either from the vibration of the machinery or from expansion or contraction of the roof itself. It is a great success, and is much appreciated by the engineers. The particular advantages of this glazing are that it requires no painting either outside or inside, and it gives the largest amount of light with the greatest amount of strength; while, as the steel bars are entirely enclosed in soft metal coverings, the glazing is practically indestructible. As showing the confidence which Messrs. Mellowes have in the permanence of their work, we may state that they have undertaken to maintain the glazing free of all cost to the railway company for a period of ten years after completion.

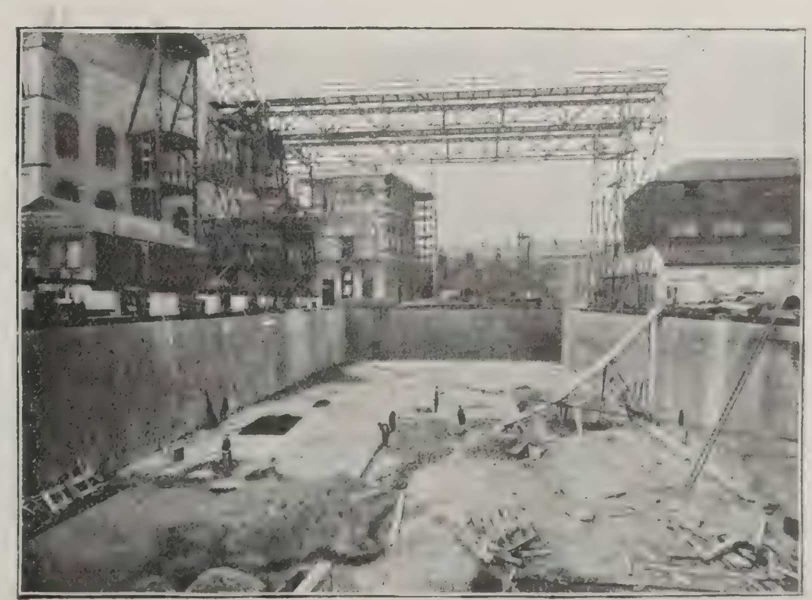
The whole of the window mullions and sills of the engine- and boiler-house roofs were covered with galvanized iron by Messrs. H. Pontifex & Sons, Ltd., of London, E.C., to protect the steel framework from the weather.

Joinery.

The joinery work at the station was executed by Messrs. Ford & Walton, Ltd., of Kilburn, the whole of the material for the main building being executed in Californian red pine, rendered non-flammable. The locks and fastenings were specially made in America. Non-flammable joinery was also furnished by the Fire-Resisting Corporation, Ltd., of Fulham.

Expanded Metal Flooring.

The flooring at the station, as well as at the sub-stations and the car-sheds, railway stations, &c., is on the expanded metal system. We give several illustrations showing the work in course of erection. Expanded metal has also been used for reinforced-concrete work in the foundations, retaining walls, roofing, bridge decking, &c.



DOCK, WITH EXPANDED STEEL AND CONCRETE BOTTOM IN COURSE OF CONSTRUCTION.

TERRA-COTTA CAP TO CHIMNEY.

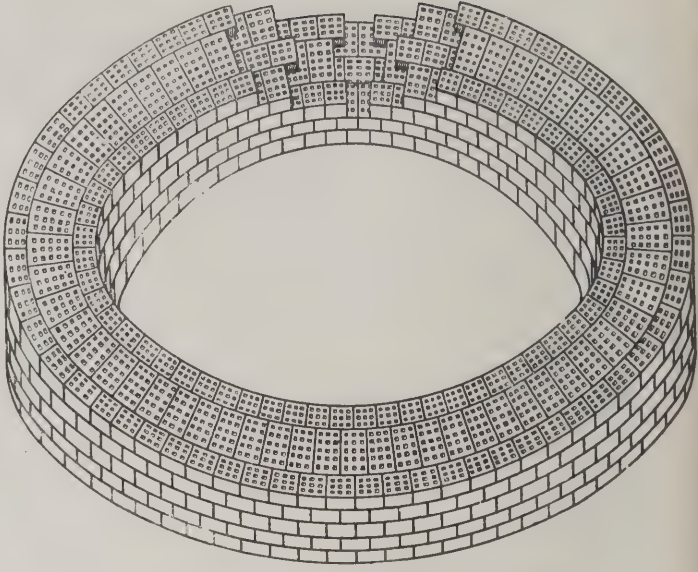


DIAGRAM SHOWING CONSTRUCTION OF CHIMNEY.

The Chimneys.

Very noticeable features of the station are the four huge brick chimneys. These have been erected by the Alphons Custodis Chimney Construction Co., of 119, Victoria Street, S.W., on a patented system originated by the company in Germany thirty years ago. As the illustrations on this page show, the bricks or blocks used are set out to a radius and are each perforated with six holes to allow of more thorough burning in manufacture, thus increasing their density and strength, while reducing their weight. These perforations also form dead air-spaces in the wall of the chimney and prevent the rapid heating and cooling of the wall. The blocks are laid in cement-mortar, which is worked into the perforations for about ½in. so as to lock the whole together. Each of the four chimneys is 275ft. high and 19ft. in diameter, and has a terra-cotta cap. In our issue for February 15th we gave sections and elevations of these chimneys, with a view looking up one in course of erection.

Other Contracts.

Of the other firms who carried out work at the station we may mention the Columbian Fireproofing Co., Ltd., of 37, King William Street, E.C., by whom the concrete roofs and coal bunkers were erected; Messrs. The Crittall Manufacturing Co., Ltd., of 98, Leadenhall Street, London, E.C., who supplied the steel sashes and staircases; and Mr. J. Percy Day, of 3, Victoria Street, S.W., by whom a quantity of "Eubœolith" flooring was laid on portions of the basement, ground- and first-floor levels of the office block.

An Electric Crane.

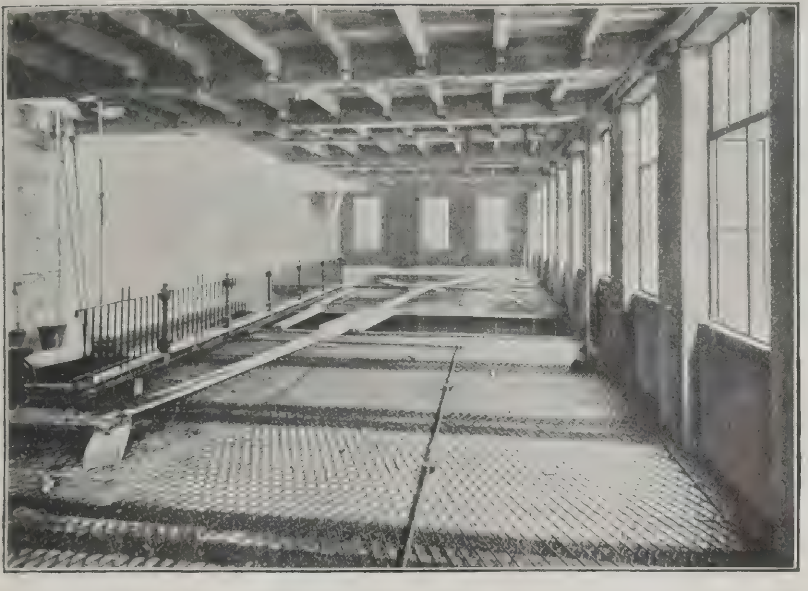
The 40-ton portable electric crane illustrated on this page was specially built by Messrs. Jessop & Appleby Brothers, Ltd., of Leicester and London, for use at the station, arrangements being made to enable the crane to safely handle its full load without attachments to the track on which it travels. The undercarriage frame is of mild steel, and is mounted on eight wheels with central flange and double treads, and each pair is carried in steel equalizing frames so that every wheel bears its share of the load. The wheels are of cast steel, bushed with gunmetal. The gauge is 12ft. 6ins., and all appliances for travelling by electric power are controlled from the driver's platform. The jib, constructed of mild steel, is curved to afford the utmost possible clearance, this being required for handling armature rings, and other large and heavy pieces of machinery and plant, in very limited space. The radius of the jib is 24ft., and the height from rail-level to the underside of lifting hook is 35ft. Messrs. Jessop & Appleby Brothers also supplied 8-ton and 12-ton hand-power overhead travelling cranes to the sub-stations of the "underground" railway.

Mill Hill Park Car Sheds.

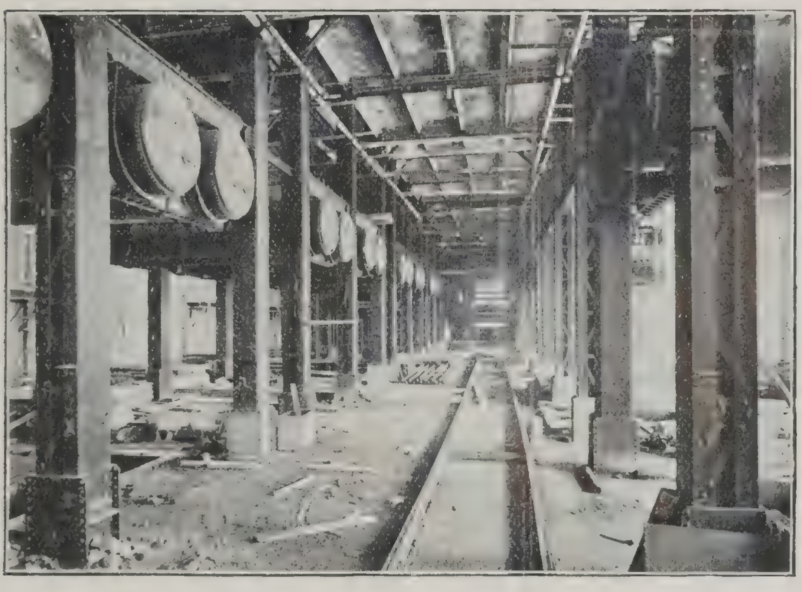
While dealing with the main station at Chelsea it is opportune to refer to the large car-sheds for repairs which have been built by the company at Mill Hill Park. The building is 803ft. long and 216ft. 6ins. wide, divided in three bays, two being 41ft. 3ins. high from footings to apex of gable and the other bay 55ft. high. The brickwork, which was carried out by Messrs. Ford & Walton, Ltd., was started on April 22nd, 1904, and completed by November 7th, 1904, which, after allowances for wet weather, was under the contract time of six months. 1,750,000 bricks were used (excluding special-made blue brick copings, sills and dressings), with about 400 tons of Portland cement and lias-lime. There are six lengths of breeze-concrete and asphalt gutters, each 802ft. long, and 102 lengths of special heavy rainwater-pipes with copper heads and guards. The steel roof was manufactured and erected by Messrs. Mayoh & Haley, and the skylights by Messrs. Mellowes: the lantern has a particularly light appearance, as the squares of glass used are more than 10ft. long in one piece. We give exterior and interior views of these car-sheds on p. 280. For the interior view we are indebted to "The Tramway and Railway World."

The Auld Brig of Ayr is to be taken down and rebuilt, stone for stone, on new foundations, adhering as far as possible to the present form and structure. Mr. Young, burgh surveyor, will act as engineer for the work, Mr. Eagleham as consulting engineer, and Mr. J. A. Morris as consulting architect.

40-TON PORTABLE ELECTRIC CRANE FOR USE AT POWER STATION.



EXPANDED STEEL AND CONCRETE FLOORING IN COURSE OF CONSTRUCTION.



EXPANDED STEEL AND CONCRETE FLOORING FINISHED ON FACE AND SOFFIT.

ELECTRICITY GENERATING STATION, LOT'S ROAD, CHELSEA.

Correspondence.

R.I.B.A. Council Elections.

To the Editor of The Builders' Journal.

Sir,—In the circular issued by Mr. George Aitchison, R.A., Mr. J. Macvicar Anderson, Sir William Emerson and Sir Aston Webb, R.A.—all past-presidents of the Institute—these words occur: "It appears to us of the greatest importance that the members of its council should be representative architects of the highest standing, whose names are well known to the profession and the public, for without the experience and assistance of such men we are convinced the work of the Institute cannot prosper, or confidence in it be maintained"; and they "urge the importance of selecting only the most representative men as members of its council, in whom all can have confidence while this important question (compulsory registration of architects) is being considered. If this is not done, we are convinced a very serious crisis will arise in the affairs of the Institute which will paralyze, if it does not wreck, its usefulness, and thus defeat the object we all have in view, *i.e.*, the advancement and the highest interests of the art of architecture."

These are weighty words, and it behoves all members to consider them well if they seek to advance the highest aims of the Institute; to record their votes in accordance with the advice given, and to refuse their support to those candidates whose avowed aim is to force through the compulsory registration of architects under Parliamentary powers.

I have voted in every election since I was elected a Fellow and have sometimes been surprised at seeing the names of those nominated and elected, but never have I been more surprised than in the *personnel* of the present council. When the list came out, it appeared to me—and to many I venture to think—as a veritable *débâcle*, when men by no means "representative architects of the highest standing" occupied the seats of many who were.

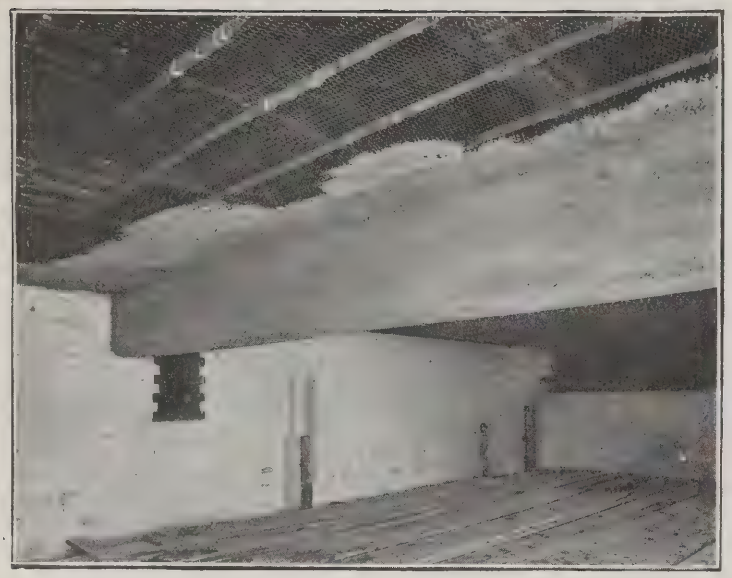
To those entitled to vote and who have not yet done so, not knowing among the extensive list of candidates this year against whom to place an X, I would suggest that the circular issued by Mr. W. Gillbee Scott offers some valuable hints.—Yours truly,

COLE A. ADAMS.

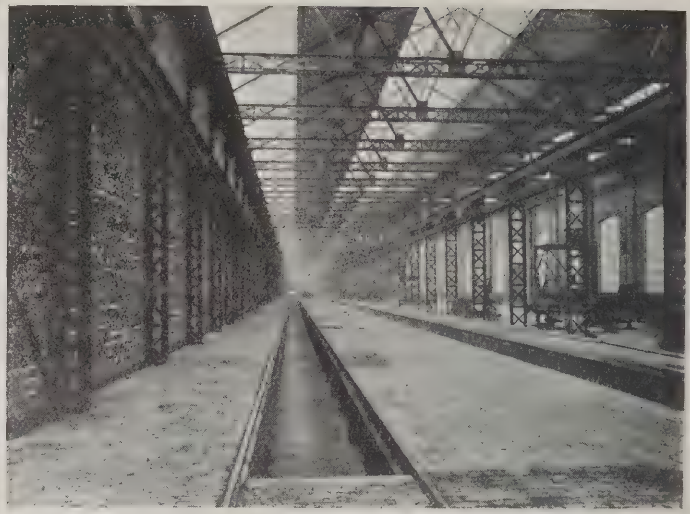
To the Editor of The Builders' Journal.

Sir,—That small minority forming the anti-registrationist body of the Royal Institute, still suffering from the shock caused by the slaughter amongst their ranks at the last elections, realize that their only hope is to adopt the electioneering measures which they so mercilessly condemned in their opponents, and to appeal to the electorate for its vote and support. This minority have issued a circular intimating that the "leading architects" (under which vainglorious heading it must be inferred the signatories class themselves) are the only persons through whom the Institute can ever hope to maintain its dignity or conduct business of "the nicest and most delicate nature." This is their platform. It looks new, but it is only the old worm-eaten platform the remnants of which have been fished out, patched up and ill-disguised by a clean coat of paint. In short, they invite the electorate to return to the old "do-nothing" policy and all will be forgiven.

Not a hint is given in their circular that any one of those subscribing is in any way predisposed to registration even as a principle. It is considered sufficient that they dub themselves "leading architects" and that they promise to be very nice and delicate, and above all, dignified—dignity of course being a quality incompatible with the holding of



SUSPENDED FIRE-RESISTING CEILING AND STEELWORK ENCASING IN BATTERY ROOMS, CHELSEA.



ONE BAY OF MILL HILL PARK CAR-SHEDS.

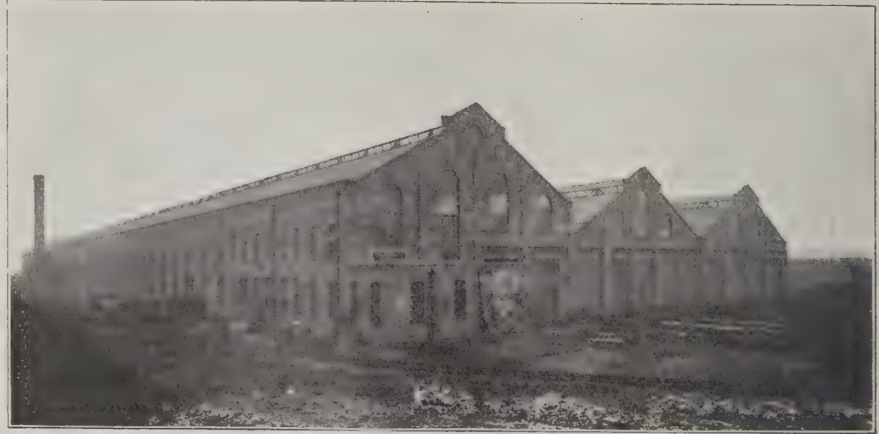
registrationist views. Think how important it is that the Turveydrop manner should be well in evidence at the forthcoming international congress of architects, which is casually referred to in the circular. Here is exhibited a thinly-veiled dread that the registrationist party will, at the time of this great congress, be still in power, and will grasp the not-to-be-missed opportunity of bringing the registration question prominently forward, of passing a monster vote in favour of the movement, of presenting a memorial for signature by practising architects. The opponents of registration have realized, perhaps more keenly than its supporters, the bearing which this great congress may have upon the realization of events.

The last council elections transformed that body from a côterie which persistently ignored the wishes of the majority into a body representative of those desires, a body which in one year of office has practically completed the draft of a registration Bill, a body which should be again returned in order that it may continue the good work.

It therefore behoves every good registrationist to cast his votes only for those who are declared partisans of the movement and have proved their sincerity by positive and energetic action on the late council.—Yours truly,
ANTI-STAGNATION.

OUR PLATE.

THE church of St. Stephen, Springfield, Wolverhampton, is to be built in red brick. It is planned on the three sides of an irregular triangle, the large court between the body of the church and the proposed priests' house being planned as a garden for the clergy. The vestries lie between the tower and the body of the church, and on their inner side is an open cloister. Below the tower is a baptistery, which is connected with the church by an open cloister, and which centres with the west entrance. Architecturally, therefore, there is a vista from the font of the baptistery to the altar at the extreme east. This altar is raised very high, and beneath it is a mortuary chapel, approached from the extreme north-east. In the tower is a bell-chamber, which is approached from the west end of the church by a ringers' gallery seen over the great circular arch which connects the church with the tower. From the centre of this arch is designed to hang a great arc light. Springfield Church is planned to stand in a very poor suburb of Wolverhampton, where there is a rapidly-growing population of artizans and labourers. It is designed with the intention of serving a great communal want in the neighbourhood, and is the only building of architectural importance there. The drawing reproduced as a centre plate shows the body of the church, the vestries and the tower, while that on p. 281 shows as well the suggested clergy-house and parsonage.



MILL HILL PARK CAR-SHEDS.

Obituary.

Mr. John Tweedale, for twenty-six years a partner in the firm of Messrs. Smith & Tweedale, architects, of Leeds, died last week, aged 51.

Keystones.

The new City Engineer, Mr. Frank Sumner, will enter upon his duties on Midsummer Day. Meanwhile Mr. D. J. Ross continues in office.

The new Carnegie Library at Leicester was opened last week. It has cost £12,000 and occupies a central site near the town hall. Mr. Edward Burgess was the architect.

A new Baptist Church is being erected in Shooter's Hill Road, Blackheath, from designs by Messrs. Dottridge & Walford. The builders are Messrs. Patman & Fotheringham, Ltd.

Messrs. Groome & Bettington, architects and surveyors, of Palace Chambers, King Street, Hereford, have been instructed to carry out their scheme for the extension of the Wesleyan Church, Bridge Street, Hereford.

Mr. G. Bertram Bulmer, F.R.I.B.A., has been elected president of the Leeds and Yorkshire Architectural Society for the current year, and Messrs. H. S. Chorley, M.A., A.R.I.B.A., and W. G. Smithson, A.R.I.B.A., have been elected vice-presidents.

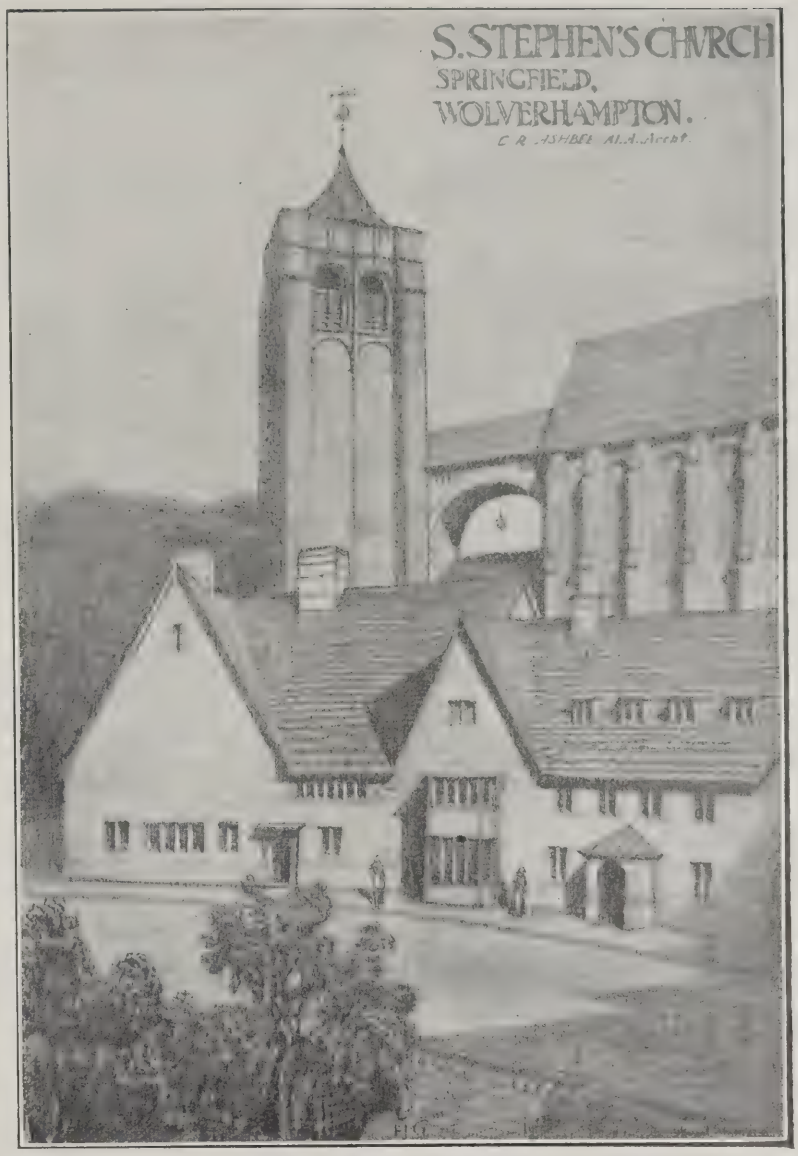
Society of Architects' Proposed Visit to Chester and Liverpool.—With the object of enabling some of the provincial members to meet together, the Society of Architects propose to organize visits to Chester and Liverpool on Friday, June 2nd, and the following day.

The Edinburgh Architectural Association recently visited Niddrie Marischal. Much interest was evinced in the old tower, begun about 1600 and converted later into a spacious staircase to serve the south wing, which was built by Sir John Wauchope, who succeeded to the estate about 1632. Sir John afterwards decorated the dining-room ceiling, still existing, with devices in honour of Charles II.

A Huge Furniture Sale.—About £35,000 worth of art furniture—the stock of Messrs. Norman & Stacey, Ltd.—is now offered for sale by Messrs. Oetzmann & Co. at 62-79, Hampstead Road, W., at greatly reduced prices, varying from 30 to 50 per cent. off the original prices. Purchasers, too, can pay on the deferred instalment system if they wish. Messrs. Oetzmann will send an illustrated catalogue post free on application.

The New Gaiety Restaurant and Hotel in the Strand was opened last week. The architects were Messrs. Ernest Runtz & Ford, assisted by Mr. Norman Shaw, R.A. The façades are in Portland stone. Among the features of the interior are the restaurant (over which is the ball-room), the Adam banqueting hall, the masonic temple, and the Dutch buffet. On the Strand front are three private dining-rooms named respectively after Nelly Farren, Kate Vaughan and Fred Leslie. The furnishing and decorations have been carried out by Messrs. James Shoolbred & Co., Ltd. The contractor was Mr. J. Carmichael, of Wandsworth.

Another Length of London's Roman Wall.—In the course of some excavations in Jewry Street, Aldgate, for the foundations of a new block of offices which are to be erected to the designs of Mr. W. H. Waterman, a perfectly preserved specimen of the old London wall 40ft. long., 12ft. high and 8ft. 6ins. thick has been discovered by the contractors, Messrs. N. Fortescue & Sons. The foundation of the wall when originally exposed was found to consist of a course of 2ft. of flint and clay, and in the height of the wall there were several courses of red bonding tiles, each about 16ins. to 17ins. long, 11½ins. wide and 1½ins. thick, between which was the masonry, the facing being well-dressed Kentish rag and the backing of rubble and cement.



(Royal Academy Exhibition, 1905.)

Mr. Vye-Parminter, architect to the British Embassy, Paris, and the Legation, Brussels, was presented to His Majesty the King when the latter was in Paris recently.

Art Treasures in French Churches.—Some time ago the French Minister of the Fine Arts sent a circular to the Prefects of the eighty-three Departments of France asking them to supply an inventory of the art treasures in the various churches in their jurisdiction. The result shows that the treasures in the Louvre, Luxembourg, Cluny, Carnavalet and other public galleries and museums are small in comparison with the artistic wealth of the country. The cathedral of Rheims contains "The Nativity," probably the finest piece of tapestry in the world, and the tapestries of Beauvais are appraised at a million and a half francs, while nearly two million francs is the sum divided between "The Virgin" at Mans, by Germain Pilon, and "The Vierge Dorée" at Amiens Cathedral.

Municipal Architecture.—At last week's meeting of the Coventry City Council it was decided to make no alteration in the practice followed in preparing and carrying out plans and designs for new public buildings and alterations to existing buildings. The mayor said the General Purposes Committee had fully considered the memorial from local architects on the matter. Two amendments were proposed and defeated to the effect that professional architects be employed on important undertakings instead of the work being carried out in the engineer's department. It was pointed out that the council would have an opportunity of voicing its opinions when important works had to be carried out.

The new Pier at Falmouth, called the Prince of Wales's Pier, has now been completed after two years' work at a cost of £7,000. The total length of the pier is 310ft., the portion nearest the town being of solid granite work; from that point the pier extends 200ft., constructed on the Hennebique system of reinforced concrete. The width of the outer pier is 36ft. The end of the pier is rounded, and provision has been made for extension, if necessary. The deck is formed with concrete from end to end; there is no timber about the construction. The contractor for the work was Mr. E. H. Page, of Cardiff. The Town Quay also has been enlarged at a cost of £3,000 by Messrs. Rickard & Son, of Penryn. The works have been carried out under the direction of Mr. L. G. Mouchel (the representative in this country for Hennebique reinforced concrete construction) and Mr. W. H. Tresider, borough surveyor of Falmouth.

Reinstatement of a Scottish Mansion.—A few weeks ago it was reported that a fire had occurred at "The Glen," Sir Charles Tennant's fine Peebles-shire seat, built fifty years ago by David Bryce. The damage caused by the fire, which gutted all that portion of the house containing the public rooms, was about £30,000. In the old building there were joisted floors and wood "safe lintels": the latter were burnt out, and the whole weight of the walls came on the stone outside sills and lintels, which of course cracked. The reinstatement and rebuilding of the mansion is now being undertaken under the direction of Mr. R. S. Lorimer, A.R.S.A., who is putting in reinforced concrete lintels and Stuart's Granolithic floors, 4½ins. deep, reinforced with rods on the underside—the rods being 1in. above the soffit, which is plastered 1in. thick. On the upper surface of the floors are arranged the electric-light tubes and bell tubes, with the necessary junction-boxes, &c., which are flushed up with 3ins. of breeze, and oak-boarding secret-nailed over. The 3ins. of breeze greatly assists in deadening sound. Screwed boards are left in the floors above all junction-boxes, &c., so as to afford easy access to these.

Messrs. Davis & Newman have set up in practice as architects and surveyors at Blackwood, Mon.

The Home Arts and Industries Association will open its twenty-first annual exhibition of woodcarving, inlay, metal repoussé, &c., at the Royal Albert Hall, S.W., on Wednesday next, May 24th.

The Royal Sanitary Institute held its annual dinner on Friday evening at Prince's Restaurant. The Duke of Northumberland, who presided, said that the Institute had been in active operation for thirty years, and had 3,200 members and an annual income of £8,000. It was proposed to move the Institute to larger premises, and a site was being considered. Towards the expense of the change the Institute had £10,000, but £15,000 more was wanted, and an appeal was now being made for funds.

The building over of Dean's Yard, Westminster, so as to form a large temporary building for the historical bazaar to be opened on May 23rd by the Duke of Connaught, is being carried out by Messrs. Simmonds Brothers, Ltd., under the superintendence of Mr. Percy Armytage, M.V.O. More than 40,000ft. run of floor boards will be laid on top of 16,000ft. of joisting. This, together with the rest of the materials used in the work, will weigh 70 tons. To keep this boarding in position 80,000 screws and about 8 cwts. of nails will be needed.

Edinburgh Architects and the Parish Council.—At a meeting of the council of the Edinburgh Architectural Association held last week the terms and conditions upon which the parish council propose to elect an architect and superintendent of works were under review. On the ground that the remuneration offered was far below the recognized scale of professional charges, the council of the Edinburgh Architectural Society expressed disapproval of the same, and resolved to communicate with the parish council on the subject and to ask them to reconsider the conditions of appointment.

London Squares: L.C.C. Preservation Bill rejected.—On Friday a Select Committee of the House of Lords considered the London Squares and Enclosures Bill, promoted by the L.C.C. Only one petition was presented against the Bill, the opposition coming from the Westminster City Council, who alleged that certain powers of the borough councils would be interfered with. Lord Robert Cecil, K.C., explained that there were 400 garden squares in London, covering about 400 acres, all of which might be built over by the owners. The Bill provided that no structures should be placed on the squares except such as were necessary for the use and enjoyment of the garden. Originally all the 400 squares were scheduled to the Bill, but now only 139 were affected, the remainder having been withdrawn on the objection of the owners. Evidence having been heard, the Committee decided that it was not expedient that the Bill should proceed, and it was accordingly rejected.

Birmingham Architectural Association.—At the annual general meeting held last week the following elections took place:—President, Mr. Thomas Cooper, F.R.I.B.A.; vice-president, Mr. J. L. Ball; members of council, Messrs. H. T. Buckland, Arthur Harrison, William Henman, Alfred Hale, A. E. McKewan, E. L. Percival and E. F. Reynolds. The annual excursion was discussed, and it was decided to go to Mont St. Michel at Whitsuntide.

Academy Professors.—There are two vacancies in the ranks of the Royal Academy professors, caused by the retirement of Mr. Alfred Gilbert, R.A., and Mr. George Aitchison, R.A., who filled the chairs respectively of sculpture and architecture. The election of their successors will take place at no distant date, but it is probable that the number of candidates for the posts will be small. The duties are not heavy, for the professors have nothing to do with the teaching in the schools except when they take their turn as visitors. The sole business of the Academy professors of painting, sculpture and architecture is to deliver each winter a series of addresses (usually six), and for this they are paid at the rate of so much a lecture. Formerly the honorarium for each address was £10, but lately this has been largely increased.

R.I.B.A.

Sculpture and Architecture.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. John Belcher, A.R.A.

It was announced that Mr. William Beddoe Rees had been expelled from the membership of the Institute for unprofessional conduct.

Papers on sculpture and architecture were read by Mr. T. Stirling Lee and Mr. W. Reynolds Stephens. Mr. Alfred Gilbert, R.A., and Professor Lanteri, who were to have spoken, were unable to be present.

Mr. Stirling Lee said that since he had spoken before the Royal Institute of British Architects in 1901 he felt that under their present and their late presidents sculpture in connection with architecture had made much progress. From the earliest times man had desired to express his thought in form—he had taken this as a language. The great ideals of the whole world had been written in that language. If it had not been for sculpture on our buildings, how much knowledge should we have lost. We wrote our history—the history of the thoughts of our time—in that which was the most open of our books, namely, the art of architecture. No sculptor who had anything to do in public buildings or anything serious could approach it from any other point of view. He had to hand down to the future those thoughts of his time. Every sculptor needed to be a very deep thinker, and must always have been. He must note down the environment in which he lived. But did we as a nation understand the figurative language when we put sculpture in our buildings? Did we grasp the fact that we were putting on a language which was going to be read and understood by the public? How many persons were there who could be said to stop and read it; and yet that was the use of sculpture in building. In the old days they had no books, and people went about reading the language of Nature, but we had lost that, and we had lost that use of sculpture on our buildings. We now came to the æsthetic side of sculpture. As long as architecture existed it would use ornament, and sculpture was the highest form of ornament, and no doubt there was with every architect the desire to use that highest form of decoration. In sculpture the scale and lines of the building had to be harmonized with, and proportion, too. Every problem that they had in architectural sculpture was to be found solved in the Parthenon, and he used this to illustrate his remarks. He emphasized how well the Greeks understood the composition of line, and light and shade in sculpture. In the design of sculpture we first had thought, then line, proportion, light and shade, impressionism and colour—these governed them in their work in relation to architecture. Their position that night was that they had to classify sculpture as plastic and glyptic. Too often sculpture was a stone rendering of a clay figure. In comparing the work of Michaelangelo and Phideas we saw the difference of the anatomical science of the modeller and the geometrical science of the carver. If a modeller was put on to execute sculpture on a building his work would be found to be full of holes, but if a stone carver he would love the planes. We had unfortunately few stone carvers. It was raised as an objection that the carver took too long, but it was not so, for after he got his ideas the mason could take off the rough as the Greeks did, leaving the stone for his work.

Mr. W. Reynolds Stephens agreed generally with the remarks of Mr. Lee. He pointed out how often a sculptor in dealing with a structural feature suggested weakness when the material was really strong. Such laws of fitness should be obeyed. He called attention to the way in which sculpture was often placed in buildings in positions where it was impossible to properly see it, as in narrow streets. He also urged the importance of protecting sculpture from weather, and mentioned an interesting case in mediæval work where if an arm crossed a figure's chest it was inclined upwards to throw off the water and detached at the elbow so as to allow the water to escape. The exposure of statues on buildings by the French he disagreed with. He thought figure work in ceilings was a mistake.

A discussion followed in which Sir John Taylor, Prof. Beresford Pite, Mr. Hugh Stannus and Mr. John Belcher took part.

Competitions.

New Vicarage, St. Mary's, Rochdale.—The design of Mr. Jesse Horsfall, F.R.I.B.A., has been selected in limited competition.

Shire House, Norwich.—For additions to this building an open competition is to be held, with premiums of £100, £50 and £25.

Elementary School, Aylesbury.—In notifying the awards in this competition, on p. 264 of our issue for last week, the name of Mr. Alfred Hendy, of Nottingham, was inadvertently given as "Hendry."

Hospital for Infectious Diseases, Altrincham.—The design of Mr. W. Owen, of Manchester, has been selected in limited competition. Mr. Frank Briggs, F.R.I.B.A, of Liverpool, was the assessor.

Lambeth Municipal Buildings.—This competition has been won by Messrs. Warwick & Hall, of London (design No. 66); second premium (£200), Mr. H. P. Burke-Downing, London (design No. 75); 3rd premium (£100), Messrs. Crouch & Butler & Savage, Birmingham (design No. 94).

King's College Hospital.—The King's College Hospital Removal Committee, on the advice of their assessor, Mr. Rowland Plumbe, F.R.I.B.A., have awarded the first place in this competition to the design of Mr. W. A. Pite, F.R.I.B.A., who has been appointed architect for the new hospital, which is to be built at Camberwell. Five architects were invited to submit designs.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; 'O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending May 12th twenty-one failures in the building and timber trades in England and Wales were gazetted.

H. J. SHEPPARD, builder, Cheltenham. R.O. May 2nd.

J. T. MORRIS, builder, Newport, Mon. R.O. May 5th.

A. R. COOK, builder, Long Stratton. Adj. May 4th.

E. J. HODDINOTT, carpenter and builder, Milton. R.O. May 5th.

TATTON & FITZGERALD, timber merchants, Manchester. Adj. May 1st.

F. DALTON, joiner and builder, Buxton. R.O. May 2nd.

J. T. MCCHUNG, plumber, glazier and contractor, Manchester. P.E., Manchester C.C., June 5th, at 10.

A. HAIGH, painter and decorator, Mexborough. First meeting, O.R.'s, Sheffield, May 17th, at 12. P.E., Sheffield C.C., May 18th, at 2.

R. HUNT, builder and contractor, Sheffield. First meeting, O.R.'s, Sheffield, May 17th, at 1. P.E., Sheffield C.C., May 18th, at 2. Creditors unsecured £1,520; creditors fully secured £16,956.

ELECTRIC SAW MILL CO., Swansea. R.O. May 5th. P.E., Swansea Town Hall, May 19th, at 11.30. First meeting, O.R.'s, Swansea, same day, at 2.30.

W. HARRIS & SONS, LTD., builders' merchants, 339 to 343, Edgware Road, London. Liabilities £4,566; £3,374 expected to rank; estimated nett assets £2,923.

H. & F. FEARMAN, builders and decorators, London, E.C. Liabilities £915; £729 expected to rank; estimated nett assets £427. P.E. May 25th.

W. JOHNSON, plumber, Manchester. R.O. May 3rd. First meeting, O.R.'s, Manchester, May 17th, at 3.30. P.E., Manchester C.C., June 5th, at 10.

G. BECKER, merchant and timber broker, London. R.O. May 1st. First meeting, Bankruptcy Court, May 18th, at 11. P.E., same, June 7th, at 11.30.

T. M. VAUGHAN, builder, decorator, &c., Willesden. R.O. May 4th. First meeting, London Bankruptcy Court, May 18th, at 12. P.E., same, June 6th, at 11.30.

J. S. HANNAFORD, builder, Plymouth. First meeting, O.R.'s, Plymouth, May 18th, at 11. P.E., East Stonehouse Town Hall, June 1st, at 12.

A. GALE, builder and contractor, Fleet. First meeting, 24, Railway Approach, London Bridge, May 18th, at 12.30. P.E., Guildford Town Hall, June 13th, at 1.

J. J. BERRY, builder and contractor, Altrincham. First meeting, O.R.'s, Manchester, May 17th, at 3. P.E., Manchester C.C., June 5th, at 10.

A. E. MAGGS, carpenter, late speculating builder, Bristol. R.O. May 1st. First meeting, O.R.'s, Bristol, May 17th, at 11.30. P.E., Bristol Guildhall, June 2nd, at 12.

W. REYNOLDS, builder, Maidstone. R.O. May 2nd. First meeting, 9, King Street, Maidstone, May 17th, at 10.30. P.E., Maidstone Sessions House, same day, at 11.30.

Trade and Craft.

Terra-cotta.

Mr. Walwyn T. Chapman, of Grimsby Road, Cleethorpes, has just issued a new catalogue and price list of his stock patterns in terra-cotta details and moulded bricks. The diagrams are clear. All the articles can be supplied in buff or red terra-cotta at the same price. The number of designs included in this list is large and it is therefore of the greatest service to architects and builders alike. Mr. Chapman executes architects' designs with despatch, and the work produced by him is accurate in form and even in colour.

A Pipe Screwing Machine.

Messrs. Charles Winn & Co., of St. Thomas's Works, Granville Street, Birmingham, have made a speciality of high-class screwing machines for tubes or bolts for many years, and they have recently brought out a light compact pattern for a machine suitable for pipe-fitters' work, taking out to jobs, &c. This screwing machine has been designed to meet the demand for a lighter and cheaper tool, embodying the labour-saving features of the more expensive machines as far as is possible at the price, but the necessary economy has been effected without detriment to strength and durability, the best material being used throughout. The vice is self-centering and of novel design. It will hold firmly all sizes of tubes from $\frac{1}{4}$in. to 2ins. inclusive without splitting or distorting them; it will also hold $1\frac{1}{2}$in., $1\frac{3}{4}$in. and 2in. bends. Three dies are provided, each consisting of a set of four chasers of ample strength, to screw tubes of the sizes named, $\frac{1}{4}$in. to 2ins. inclusive, and these dies will screw the standard sizes when adjusted to the marking on the edge of the die-box; but they are adjustable, if required, to screw tubes larger or smaller in diameter than the standard size; while they can at any time be sharpened without softening by grinding upon a stone like an ordinary chasing-tool. There is no necessity to wind the machine backwards after screwing a thread, as an instantaneous releasing motion is provided, operated by loosening a nut at the back of the die-box. The machine is double-geared to give ease in working, and the driving lever is adjustable in stroke to provide a leverage suitable to the different diameters of the tubes being screwed, thus saving time; while it has been kept as light and compact as possible, and is therefore easily portable, the weight being under $1\frac{1}{2}$ cwts.

Builders' Notes.

The erection of the new Municipal Buildings at South Shields will be commenced shortly by the contractors, Messrs. Niell & Sons, of Manchester.

Newcastle Building Trade Dispute.—As the result of a meeting of masters and men convened by Mr. R. T. Leeson, architect, of Newcastle, a round-table conference has been decided on.

Messrs. Hahn & Co., importers of foreign hardwoods, 66, Mark Lane, London, E.C., have secured the Alexandra Wharf in North Woolwich Road, Tidal Basin Station, Victoria Docks, E., for storing their large and carefully-selected stock. This wharf has an area of about 140,000 sq. ft., with a long frontage to the Thames and a railway siding into the premises, so that trucks can be loaded and dispatched at once.

Dissolution of Partnership.—Messrs. Masters & Binning, master-plasterers and builders, of Middlesbrough, have dissolved partnership.

Employment in the Building Trades.—Wage-earners interested in the building trades attach great importance to the reports of the workers' organizations which are issued during May. The reports for the present month show an improvement in some branches of the trades, but their general purport is unsatisfactory to those who had hoped that the period between Eastertide and Whitsuntide would provide full employment

The Welsh Slate Industry and Tariff Reform.—In the course of a discussion which followed the reading of a paper on "The Tariff Question as affecting Wales" at Caxton Hall, Westminster, last week, under the auspices of the London Welsh Conservative and Unionist Association, it was pointed out that the slate industry in North Wales had been seriously affected by the dumping of cheap French and American slates. Before capital would be invested in Welsh slate quarries there must be some safe market for their products.

Bradford Builders and Corporation Contracts.—A movement is on foot in the Bradford building trade to secure that the Corporation shall not let contracts to contractors outside the city without compelling them to adhere to the fair contracts clause, as ratepaying firms in the city have to do. Contracts, it is stated, have been let to outside contractors who are not paying the standard rate of wages to their men. This puts a double hardship on the ratepayers, whether they are interested in the building trade or not. It means that Bradford men are out of work where they might otherwise be employed, and that practically a handicap is made in favour of firms outside the city.

Builders' Journal Office, Great New Street, Fetter Lane, E.C.

Advertising Notes.

The Japs are little pocket-editions of men, but there's a full-sized cyclone wrapped up in every one of them. Advertisement space may be small like the Jap, but if it is filled with pungency instead of palaver and ginger instead of jam it will git there every time.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

Contracts Open.

RUGBY URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The above Council invite TENDERS for the CONSTRUCTION of a MAIN OUTFALL SURFACE WATER DRAIN about 600 yards in length commencing at the 36 in. Culvert in Mill Road, thence across the Cattle Market and along Wood Street as far as Lodge Road, together with the Manholes and other Works connected therewith, the Plans, Specifications and Conditions of Contract can be seen at the office of the undersigned, where also copies of the Bill of Quantities and form of Tender can be obtained by intending Contractors on and after WEDNESDAY, the 10th inst., on payment of £1, which sum will be returned on the receipt of a bonâ fide tender. Tenders on the Form prescribed endorsed "Main Drain," to be sent to T. M. WRATISLAW, Esq., Clerk to the Council, High Street, Rugby, on or before the 24th inst.

The Council do not bind themselves to accept the lowest or any Tender.

By Order,
D. G. MACDONALD, Assoc. M.Inst. C.E.,
Surveyor to the Council.
Rugby, May 4th, 1905.

CONTRACTORS.

TENDERS are invited for the Erection and Completion of a Block of Dwelling-houses, Clowney Street, Glasgow.

Plans, specifications, and particulars of the work can be obtained at my office.

The lowest or any tender not necessarily accepted.

W. J. MOORE, Architect,
Royal Chambers, 35, Royal Avenue Belfast.

EVERY READER of THE BUILDERS' JOURNAL should be INSURED against ACCIDENT.

One of the holders of The Builders' Journal Insurance Policies has just received the sum of £6 in settlement of an accident claim.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

VOLUMES I. to XIX. of

THE BUILDERS' JOURNAL.

Handsomely bound in cloth gilt, 7/- each.

Binding Cases for any of the above Volumes can now be obtained, price **1/9** each.

To Contributors.

The Editor will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of The Builders' Journal, 6, Great New Street, E.C.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the Builders' Journal during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the Builders' Journal is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the Builders' Journal for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the Builders' Journal for one year.

Those readers who order the Builders' Journal through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

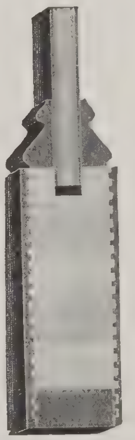
THE GILMOUR DOOR·Co LTD.

Factories Trenton Canada

53 BERNERS STREET LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece

HARDWOOD

In Various Designs

From 35/- to £10.

DOORS

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

AND ARCHITECTURAL RECORD.

May 24, 1905. Vol. 21, No. 537. 6, Great New Street, Fetter Lane, E.C

Summary.

The attention of the Government is to be called to the fact that there is something like a "ring" of architects for county asylums. (Page 295.)

The length of the old Roman wall found in Jewry Street, London, is to be preserved. (Page 295.)

The master-masons of Glasgow protest against the use of terra-cotta for the walls of the Royal Infirmary extension next the Cathedral. (Page 292.)

The King's College Hospital designs are on exhibition this week at Carpenters' Hall. (Page 292.)

The common formula for the strength of rolled joists is $W = C\frac{ad}{L}$, where W = breaking weight in tons in centre; a = nett area in square inches of one flange + $\frac{1}{6}$ of web (remainder of web assumed to resist shearing only); d = total depth in inches; L = span in feet; C = constant = 7 for rolled iron joists and 10 for rolled steel joists. (Page 294.)

Leeds Associates of the R.I.B.A. indignantly protest against the present large influx of members to the Institute by direct election to the Fellowship, without having qualified by examination. (Page 289.)

At the annual members' dinner held on Thursday last Mr. E. Guy Dawber said they did not want to feel that the Architectural Association was a cramming institution, but a sort of large students' club where they helped forward their fellow-students. (Page 289.)

Papers on the statutory qualification of architects were read by Messrs. Hubbard and Cross before the Society of Architects last Thursday. (Page 285.)

The steel framing of the Ritz Hotel is enclosed by a skin of Portland stone bonded to a brick backing with flat iron bars. (Page 284.)

Speaking at the coming-of-age dinner of the Society of Architects on Friday last the president said the Society was prepared to stand aside in favour of the Institute if that body was prepared either to adopt the present Registration Bill or to substitute another one of a character to satisfy the members of the Society of Architects that the principle which they had so long upheld should be adhered to. (Page 294.)

A huge new soapery is being erected for Messrs. Lever Brothers at Port Sunlight. (Page 295.)

The Buxton sewage works were declared by members of the deputation of eminent French engineers visiting this country on behalf of their Government to be the finest and cleanest they had ever seen. (Page 295.)

The work of preserving the frescoes in the Sistine Chapel at Rome has now been completed. It consisted mostly of strengthening the ceiling and filling up cracks; no cleaning or painting of any kind has been done. (Page 285.)

Rebuilding Regent Street Quadrant. In our issue for April 12th last, on p. 195, we announced that Mr. R. Norman Shaw, R.A., had been appointed by the ground landlords, H.M.'s Office of Woods and Forests, to get out the design for the rebuilding of Regent Street Quadrant, necessitated by the erection of the Piccadilly Hotel, the elevation of which to Piccadilly we published in our issue for February 8th. At yesterday's meeting of the London County Council the Building Act Committee reported that they had considered an application by Mr. Norman Shaw, on behalf of Mr. J. F. F. Horner, a Commissioner of H.M.'s Woods and Forests, for consent to the rebuilding of the Quadrant between Piccadilly Circus and Vigo Street on the south side, and Piccadilly Circus and Glasshouse Street on the north side, with the front portions of the upper floors of the new buildings carried over the entrances to Air Street on both sides of Regent Street. It was stated that the reason for desiring to carry the upper floors of the new buildings over the entrances to Air Street was to preserve unbroken the curved sweep of the upper cornice, and it was pointed out that the entrance to Swallow Street had always been similarly built over. Mr. Norman Shaw had expressed his willingness to make satisfactory provision on the second floor for the ventilation of Air Street, and also for that of Swallow Street, although the latter street did not come within the limits of his application. The Committee were of opinion that the proposed rebuilding would effect a great improvement in the appearance of Regent Street and recommended that the Council should give their consent subject to the following conditions—that satisfactory provision be made by means of an opening at the second-floor level in the buildings over Air Street, on both sides of Regent Street, for the ventilation of Air Street; that the buildings be commenced within twelve months and completed within two years from May 23rd; and that the buildings be otherwise erected and retained without any addition thereto and in exact accordance with the application for the consent, and the plans and particulars which accompanied such application. From this it appears that the completion of the scheme cannot be long delayed. The appointment of Mr. Norman Shaw to design the elevations is satisfactory to the architectural profession and enlightened public opinion, who feared the same vulgarization as has occurred in other parts of Regent Street. Mr. Norman Shaw fortunately occupies the peculiar position of being trusted by the architectural profession, and may be played as a safe card by those in authority when stirred to action by strong opinion. But it is only a make-shift arrangement, and the profession should agitate for this principle to be established as a precedent—that eminent architects be appointed to design or advise on buildings on important sites under the control of public authorities.

A Caustic Letter. The recent death of Lord Grimthorpe (to whose feud with architects we referred at the time of his decease) recalls a letter which must be among the most caustic ever addressed to the Institute. In resigning his position as Honourable Associate, Lord Grimthorpe thus wrote to the secretary of the Institute: "I have for some time observed that your meetings are more and more occupied with discussions about the constitution and supposed professional interests of the R.I.B.A., and less and less with anything tending to advance architecture. According to your own calendar for this year, 50 per cent more meetings are devoted to what are simply trades-union discussions of your own than to reading and discussing architectural subjects; and those that have been read have been more uninteresting than I remember in any former year. One of your meetings yearly is occupied with utterly unprofitable speechmaking on presenting the medal you obtained from the Queen for the advancement of architecture to some architect whose reputation is already made: the most foolish of all applications of prizes, and quite contrary to the object for which they were intended or adopted in all seats of learning, and even in learned societies. In some of them, indeed, they have declined into mere personal compliments or conflicts, but in none have they so little of their original and proper use as in yours. . . . . In short, the primary object of the Institute is becoming, more and more distinctly, to advance not architecture but architects; at least, if they put your letters after their names, which only a very small proportion of them do. You have a right to do so if you choose, as any other trade or professional society has; but the more you do, the more ought other people to stand aloof, and not to help you by pretending to be members of your body and concurring in your objects, while, in fact, we have nothing at all to do with them. The Honourable Associates are a mere sham for every purpose except contributing about £220 a year to your finances and giving some appearance of weight to your proceedings by their names. Therefore, I, at any rate, shall do so no more, but retire from what has always seemed to me a false position, since I was obliged by well-known circumstances to pay some attention to your proceedings . . . ." Comment on this is not needed: the letter stands by itself.

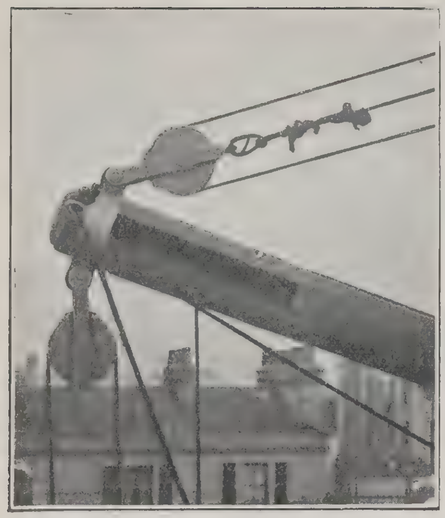

FIG. 1.—HEAD OF CRANE.

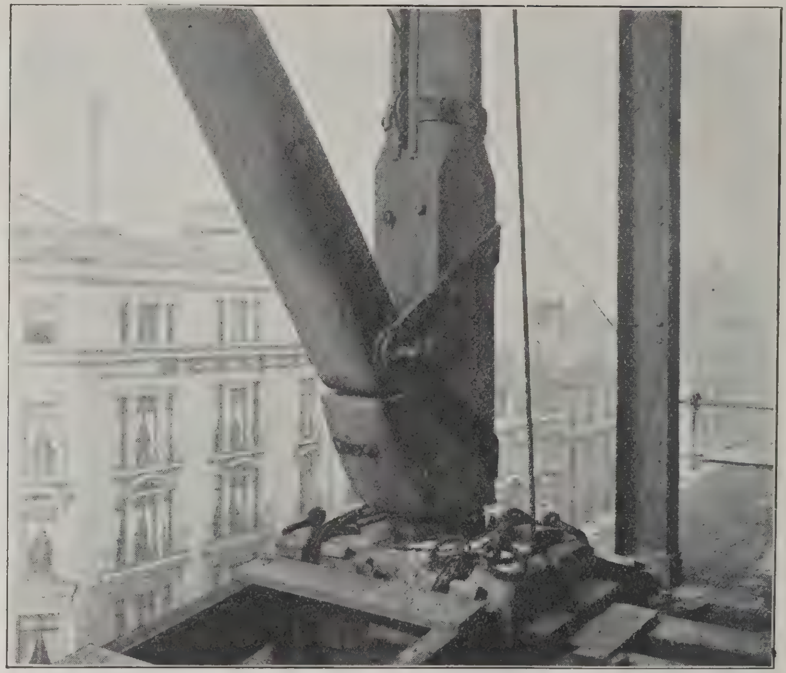

FIG. 2.—BASE OF CRANE.

THE RITZ HOTEL.

IN this issue we give a further series of photographs of the Ritz Hotel, Piccadilly, London, in course of erection. The photograph taken on April 14th (see p. 286) shows the stonework up to the fourth-floor level, with the steelwork practically completed.

Between ground and first floors there is a gantry, laid with track for distributing the stone along the frontage.

The derricks at the front for hoisting stone rest on timber cantilevers supported on the fifth-floor spandrel beams. The cranes consist of boom, mast, one stiff leg and two wire-rope guides. The design of head and base is shown in Figs. 1 and 2.

To the left of the building, on the Arlington Street front, can be seen two small "house derricks" used for setting stone. These are very practical, as they can be so easily moved from place to place.

The scaffolds are cantilevered on wooden planks set on edge, and rise as the erection of the stonework proceeds.

The other general view on p. 286 brings our record of the work up to date. From this it will be seen that the Portland stone is now erected up to the sixth-floor level, showing the good progress made in a month.

Fig. 3 shows the back wall built on plate-girder at the first-floor level. The concrete covering of the girder flange can be seen temporarily held in place by iron strips and wooden sticks. The concrete ceiling construction, executed on the Columbian system, can be seen behind the girder.

On pp. 290 and 291 we publish the steel-framing plan of the second floor (the framing plans for lower, ground and first floors were published in our issue for March 22nd last). This plan shows the method of indicating dimensions of the levels of beams and girders and the distances from centres of columns to the building line or the face of the area walls. The steel beams are indicated by single lines and their sections by stating depth in millimetres and their weight per lineal metre in kilos. If they are compound girders the section of the plates is stated, but lengths are not given. The sections of plate-girders are given on separate schedules. Figures in brackets thus [ ] indicate the distance from the finished floor-level to the bottom of beam. Figures in brackets thus ( ) indicate the "number" of beam for this floor. This number is given on the shop detail drawing and before the finished beam leaves the shop is stencilled in for reference at erection. The number of a beam is made ten times one of the column numbers in the same panel, which arrangement makes it very simple for the erector to find any beam number on the plans.

Between the ground floor and the second floor, columns 60, 62 and 64 are omitted, these columns and exterior back walls being carried on triple-web plate-girders about 37ft. long. In a future issue we shall publish a shop detail drawing of one of these plate-girders, namely, between columns 59 and 61.

The span over the dining-hall is about 30ft. and no girder was allowed to show below the ceiling. Trusses between the first and second floors were therefore designed to carry the first-floor beams and columns 36, 53 and 56 above the second floor On p. 112 of our issue for March 1st we published a photograph of these trusses, and in a future issue we shall reproduce the shop detail drawing of one of them.

Figs. 4 and 5 show the setting of the Portland stone. The bent flat iron bars are built into the brick backing and to the steel in order to secure good bond. Fig. 5 shows this particularly, the brick backing being seen erected on the right-hand side. Other

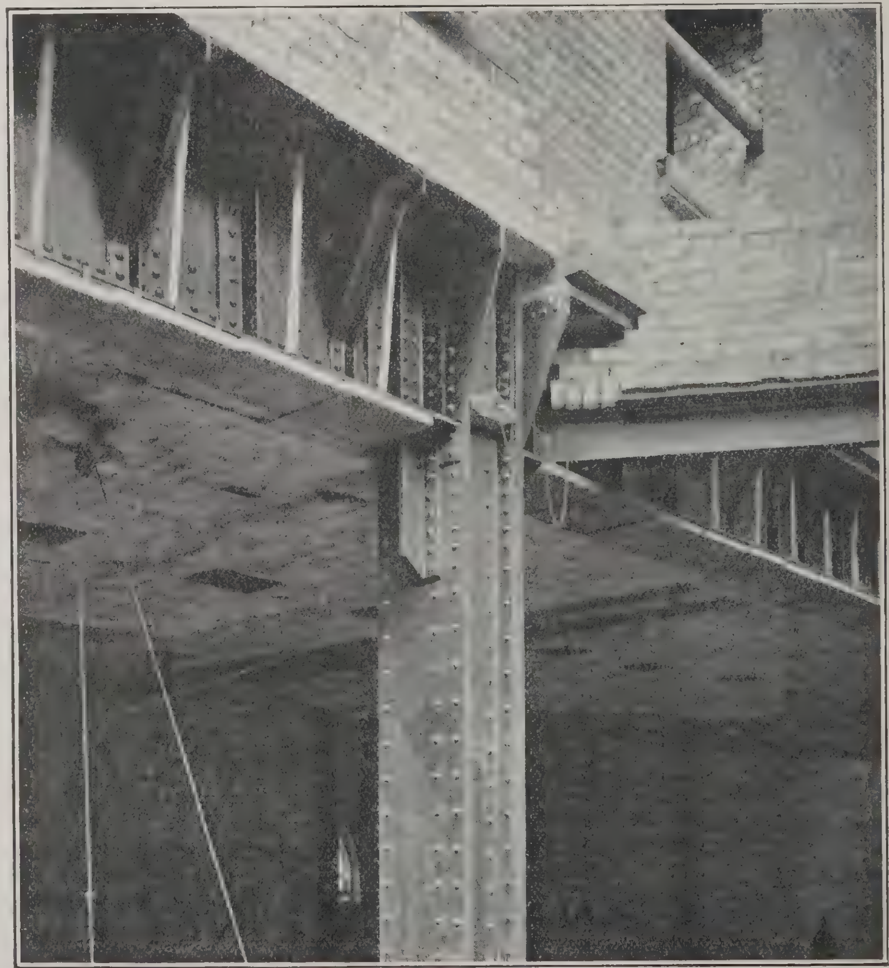

FIG. 3.—PLATE-GIRDER SUPPORTING BACK WALL.

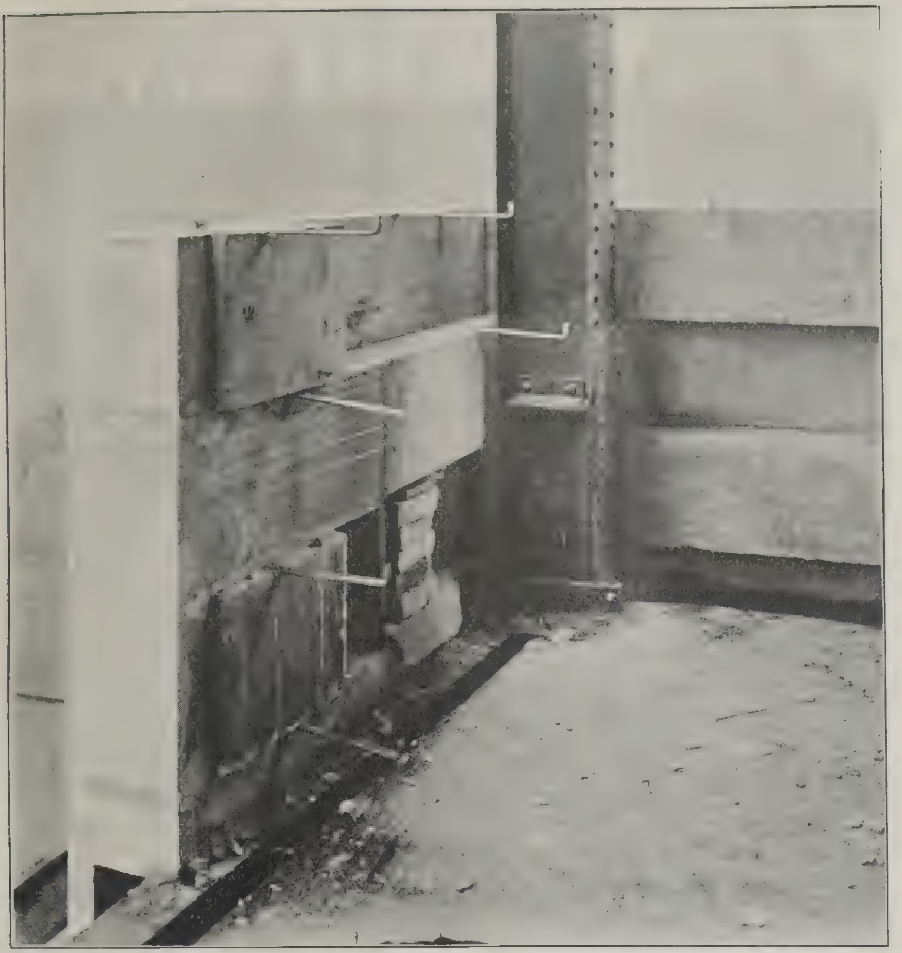

FIG. 4.—PORTLAND STONE FACING AT RITZ HOTEL.

features of this view are the lattice stanchion, the lead down-pipe, and the concrete encasing to the beam.

In our issue of March 1st the photograph on p. 111 showed the granite partly erected. Later we shall give detail views of this work. The granite used is "Standard grey," supplied and erected by Messrs. A. & F. Manuelle, of 57, Gracechurch Street, E.C., and obtained from their Norwegian quarries. The stone is very bright, remarkably uniform in colour throughout, and free from black spots. It will also be noticed on inspection that there is very little mica (and that only in very small grains) in the composition of this granite, and therefore it makes a good weathering stone. The carved heads, of which there are twenty-seven, cut in the keystones of many of the arches, show how readily the stone can be carved; in fact it has been suggested that the stone should be re-named "carving granite." The use of such a hard material as granite for the building from the ground- to first-floor level certainly gives an appearance of solidity and prevents the arrises being damaged so readily as in softer stones.

Recent Restorations in the Sistine Chapel.—The preservation work that has been carried on during the last two years in the Sistine Chapel is now completed, says the Rome correspondent of the "Times." The hold of the plaster on the ceiling needed strengthening. T-shaped metal clamps were driven here and there through the plaster into the roof; and the crevices between the plaster and roof, and the interstices and cracks in the plaster itself, were filled with a mixture of lime and finely-powdered porcelain, so that the frescoes present an even and compact surface. No cleaning or painting of any kind has been done, and no colour has been added. The actual work was carried out by Signor Cecconi Principi, a restorer of great experience, who was assisted by Signor Giovanni Cingolani.

REGISTRATION.

Papers by Mr. Hubbard and Mr. Cross.

AT last Thursday's meeting of the Society of Architects papers on the proposed statutory qualification of architects were read by Mr. G. Hubbard, F.S.A., F.R.I.B.A. and Mr. Alfred W. S. Cross, M.A. Cantab., F.R.I.B.A.

Mr. Hubbard's Paper.

Mr. Hubbard said that as a London practising architect and as a Fellow of the council of the R.I.B.A. he was very anxious to know more of the general feeling of the profession in respect to registration—not merely from idle curiosity, but because he desired to make some practical use of it so that the Bill might receive the unanimous support of the profession throughout the country.

The allied societies of the Institute had made up their minds on this question while the London men had remained apathetic; and it was very much, if not almost entirely, due to the representatives of the allied societies on the council that London was at last rousing itself.

In a broad sense it was easy to see that a Bill for the protection of qualified architects was very desirable; but it was not so easy to see how a Bill could be framed which should be constitutional in its clauses. It was obvious that no Bill would be acceptable to Parliament which was unconstitutional, nor would it be likely to get through its Committee stages if undue opposition were brought to bear against it. Certain judicious compromises might have to be made in matters of minor importance, though in all matters essential there must be unity.

Retrospection.

Guidance for the future could best be gained by studying the past.

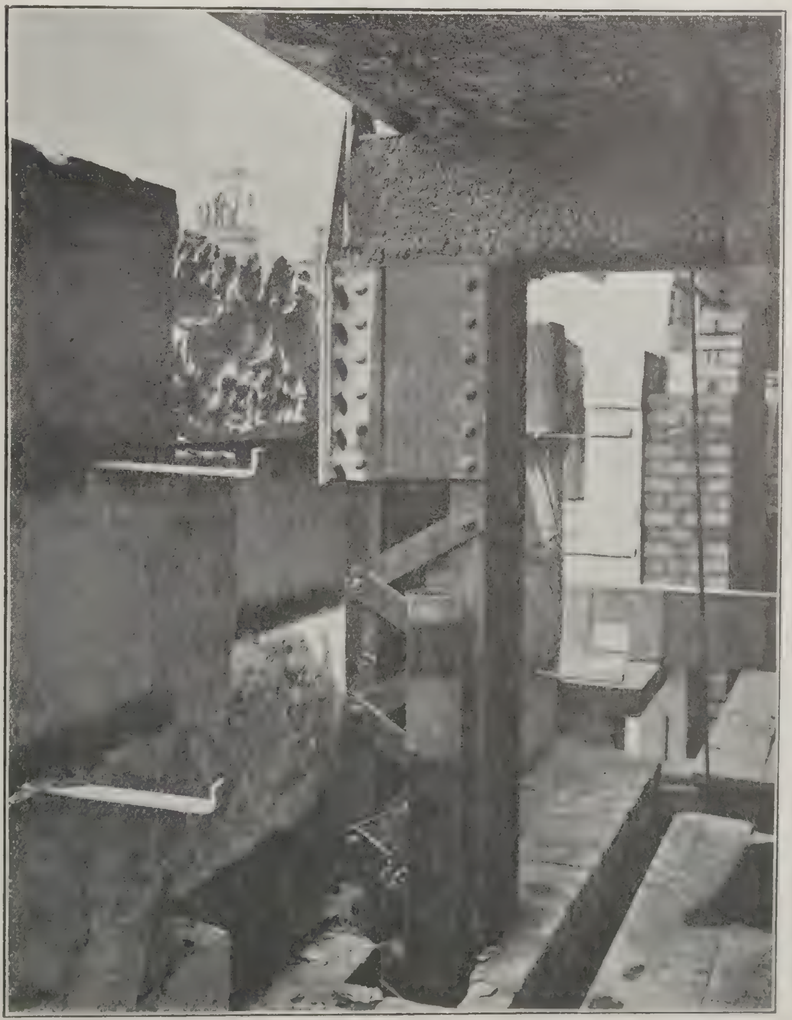

FIG. 5.—BRICK BACKING TO STONE FACING IN COURSE OF ERECTION.

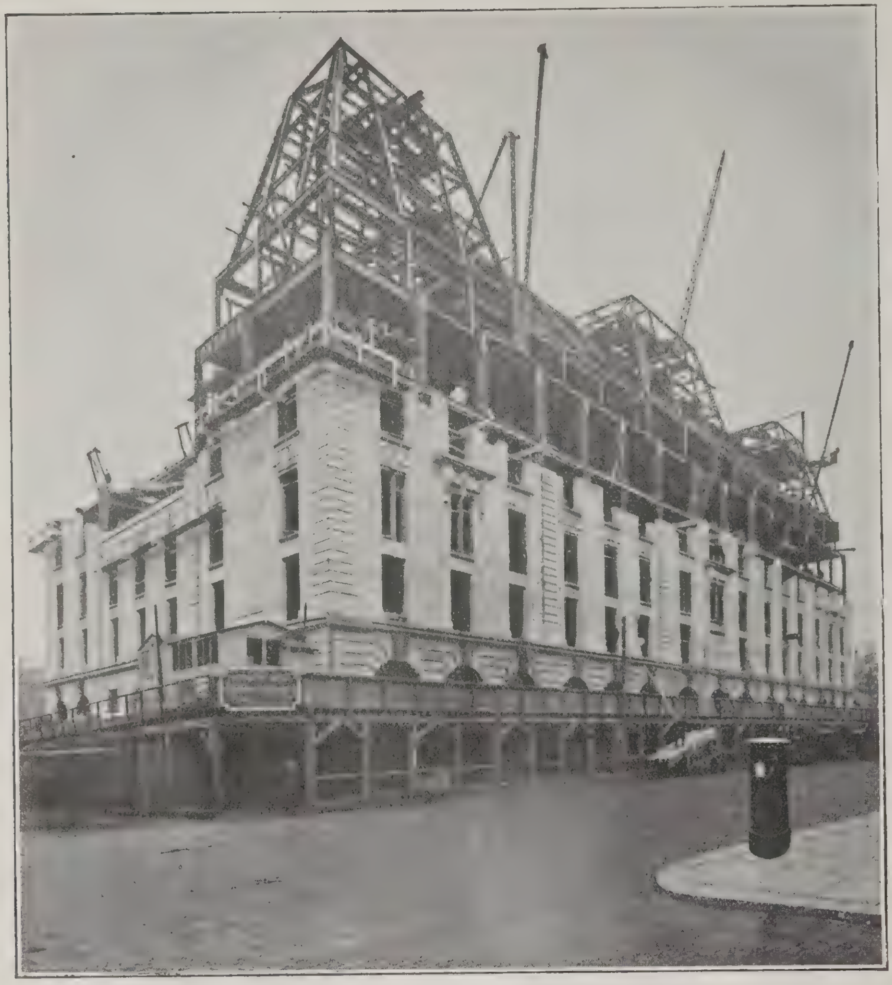


(*Photograph taken on April 14th, 1905.*)

If we looked back a quarter of a century we found that there was no compulsory examination for the Associateship of the R.I.B.A. There was, however, a voluntary examination, though few candidates ever presented themselves.

It was not till the year 1882 that the compulsory examination for Associateship was started, and the immediate result of converting the voluntary to the compulsory examination was that there was an immediate rise in the number of candidates. And ever since that compulsory examination was started in 1882, there could be no question as to the superior class of men who had joined the Institute or of the superior quality of their works.

Compulsory Examination

had encouraged candidates to study the art they intended to practise with a great access of competence to themselves and of dignity to the art of architecture; and what held good for the few might be fairly assumed to apply equally well to the many. A general application of the principle of excluding the incompetent from the profession would result in protecting the competent, and the art of architecture from its most flagrant debasers.

The Two Bills.

For many years the profession had had before it a Bill promoted by the Society of Architects. This Bill, in his opinion, was excellent in its general scheme, but capable of improvement in detail. The Institute was, however, the right body to bring forward such a measure.

No Bill would be acceptable to the profession which did not recognize the R.I.B.A. as being the official head and which did not give each provincial society and the Society of Architects a reasonable representation upon the governing body. Also, no Bill would be acceptable to Parliament which did not give the Privy Council representation, and possibly right of final appeal.

Recognition of all Practising Architects.

It was essential that vested interests of all practising architects would have to be recognized. All who were now gaining their livelihood as practising architects had this vested interest, and it would be unconstitutional to prevent any, even the most incompetent, from continuing thus to earn his living. As the ignorant and incompetent died, however, the vacancies would be gradually filled by the properly trained and qualified; so that in the generation to follow architecture would gradually recover when entrusted only to the qualified to practise.

Medicine and Surgery.

It was just thirty years since internal jealousies delayed the passing of the Medical Act, and it was now just fifty years since that Act was passed, and yet throughout the land it was doubtful if a single medical practitioner was to be found who had not passed the necessary medical qualification.

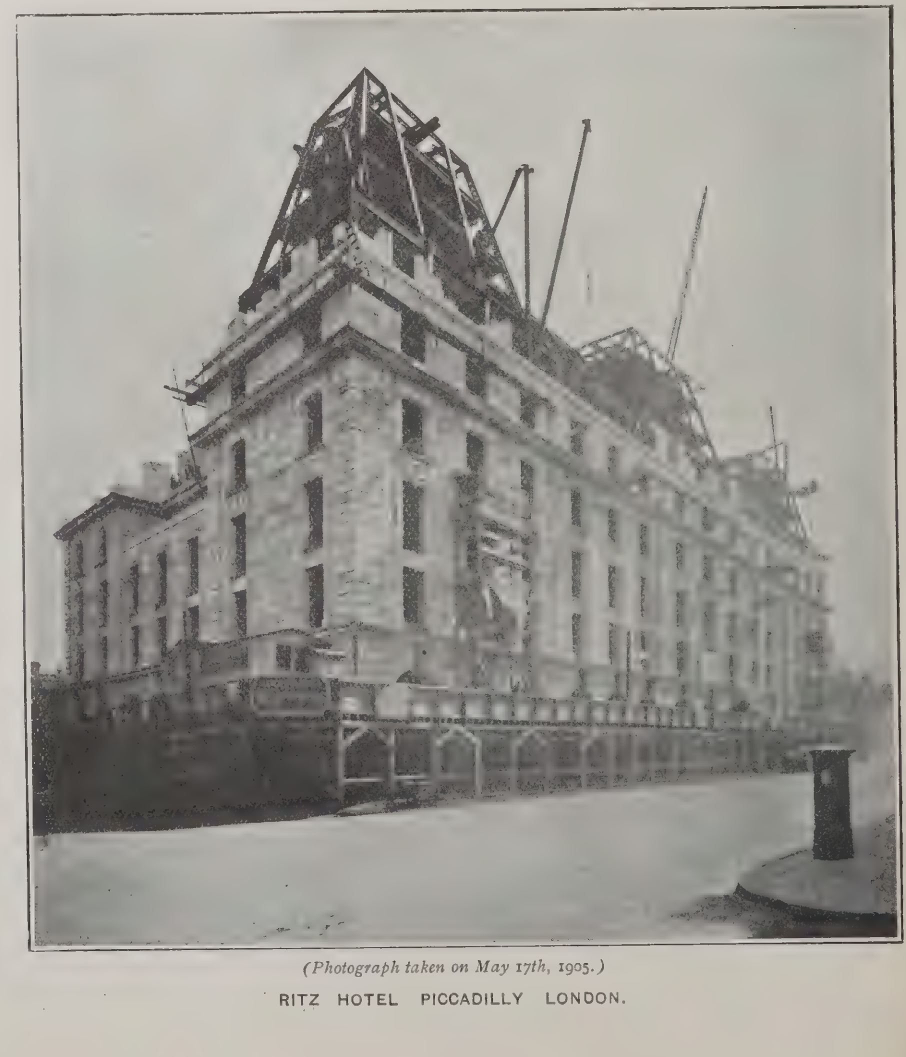
Our grandfathers might tell us how different was the respect accorded to the Barber Surgeons of their day as compared with the respect shown to properly qualified men to-day. Not only had the stamp of man entirely altered, but the immeasurable advance both in medicine and surgery was unquestionable.

It was just twenty years since the first Bill for the Registration of Architects was drafted. "Think for one moment how different would our position be to-day had the Bill been passed. There is now practically unanimity amongst the provincial societies. London is wavering, but even there the active opponents are few and unable to bring forward any valid arguments."

There were two reasons

Why London lagged Behind.

Firstly, just as it was easier to move a cwt. than a ton, so it was easier to convince a small compact community than to convince



(*Photograph taken on May 17th, 1905.*)

RITZ HOTEL PICCADILLY LONDON.

a great and loosely-bound body of men. Secondly, in the provinces the necessity of registration was much more real and apparent than it was in London.

For the ultimate success of the movement it was essential that all future candidates for the profession should serve a certain period of indentures with a registered practitioner or in some recognized architectural college or school, and after that period they would have to pass the qualifying examination, which would have to be conducted under the auspices of the R.I.B.A. None but those who had properly fulfilled these conditions would be entitled to call themselves "architects," nor would they be able to recover their fees as such in a court of law, nor would they be able to issue valid certificates.

The London Architect under the Bill.

In London the individual architect was but one amongst thousands; he had his own particular *clientèle*, and he perhaps spent his life without his existence even becoming known except to a very small section of the great architectural world. His lot would probably not be improved or damaged by statutory qualification, and he did not therefore hold any decided opinion one way or the other.

The Provincial Architect.

In the provinces the architect's position was very different. He was known to all the other practising architects in the town or neighbourhood. The architects, too, were generally well known to the inhabitants, and the status of the architect was more clearly defined.

The standing of the provincial architect, or any architect of education, was distinctly damaged when perhaps an intelligent bricklayer, for instance, who had raised himself to the position of clerk of works, and who, after having served some time in that capacity, suddenly aspired to calling himself an architect. He might not perhaps enjoy a vast amount of confidence or succeed in securing a vast amount of work, but the fact remained that both men called themselves "architects," and as such they became bracketed together in the eyes of the public. By allowing both men to be established on the same footing the professional status of the educated architect was seriously damaged.

That statutory qualification will do much to improve the status of the architect, there could be no doubt.

The Main Points

aimed at in the proposed Bill were as follows:—

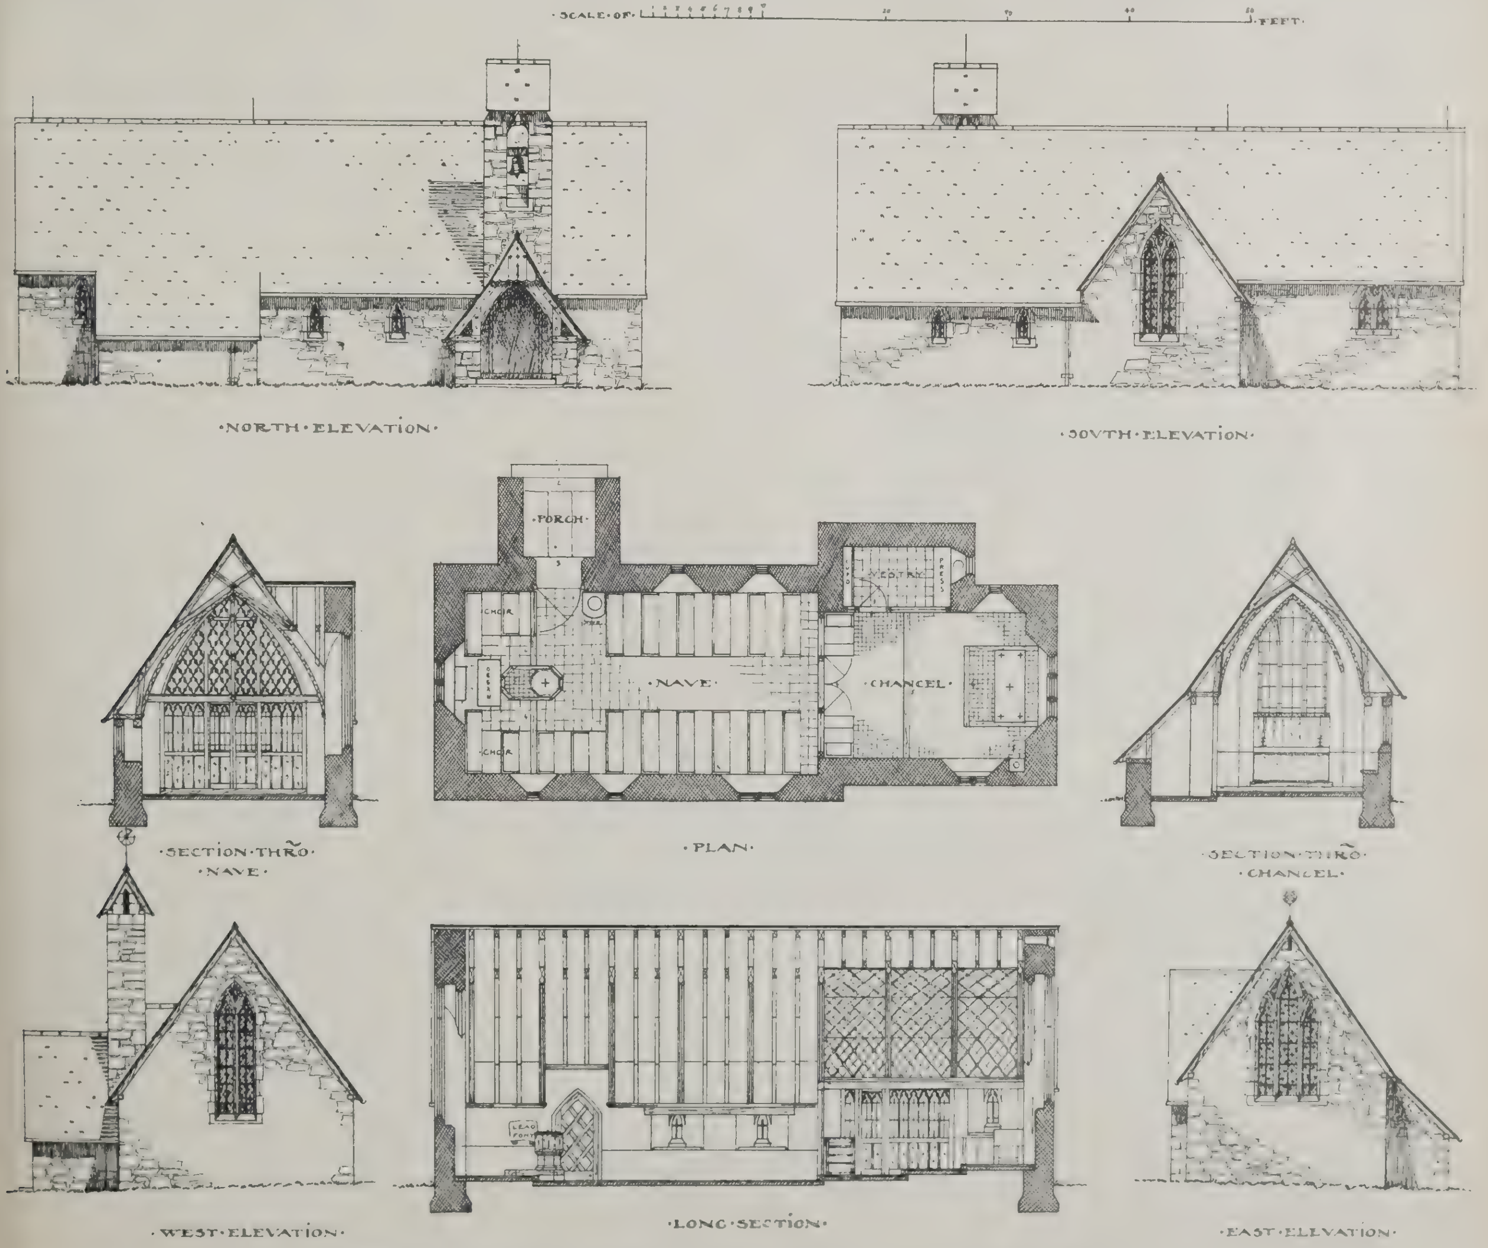
(1) The R.I.B.A. to be recognized head of the profession.
(2) Adequate representation of London and provincial architects on the governing body.
(3) Representatives of the Privy Council on the governing body.
(4) The vested interests of present practising architects to be recognized.
(5) The vested interests of assistants.
(6) A register or roll of architects to be kept.
(7) Compulsory examination for those in the future who wished to practise as architects.
(8) The governing body to have the right of striking any name off the roll or register for malpractice.
(9) The safeguarding of the name "architect" from being used by any except those who were registered.

Mr. Cross's Paper.

Mr. Cross divided his paper under three heads, namely; the present state of architecture and of the profession, the statutory qualification of architects, and the reformed profession.

The present position of architecture was unsatisfactory. Whilst the works of modern architects sometimes displayed a certain amount of creative power or originality, this attribute was very rarely found in combination with architectural scholarship, by which Mr. Cross said he meant an intelligent appreciation of the true principles which formed the foundation of the now popular Italian Renaissance style—principles exemplified in the glorious buildings of ancient Greece and Rome.

Modern architects were rapidly losing the old-time instinct for proportion, harmony, beauty of line and architectural scale, chiefly through their persistent efforts to ruin, by the introduction of grotesque travesties of the Orders, designs which might otherwise pass as fairly successful. Did any sane man contend that the art of architecture was advanced by designing Corinthian or Ionic columns with heights equal to about fifteen times their diameters, or by the happy and decidedly original inspiration of combining,



MISSION CHURCH, NEAR CONWAY NORTH WALES.. H. L. NORTH, ARCHITECT.

say, a Corinthian entablature with a Doric order? Such affectation was merely evidence that many had not mastered the grammar of their profession and that our architectural education was imperfect.

The Past Policy of the Institute.

The favourable reception given to the proposed scheme for registration was due in a large measure to the Institute itself, which had through its successive councils generally favoured a policy little short of one of absolute indifference to the legitimate grievances of its ordinary members, who were now beginning to realize how impossible it was, under existing conditions, to penalize unprincipled or unprofessional conduct, and to recognize the almost insuperable obstacles placed in the way of those desirous of effecting measures of reform in the conduct of architectural competitions. These facts, coupled with the Institute's well-known disinclination to afford assistance to architects who in a private capacity were battling for rights such as those affecting the ownership of drawings—which question, by the way, ought in the general interests of the profession to have been made the cause of a test action or actions fought under the auspices of the Institute itself years and years ago—had had due weight with many architects who would otherwise have withheld their support to the movement in favour of registration.

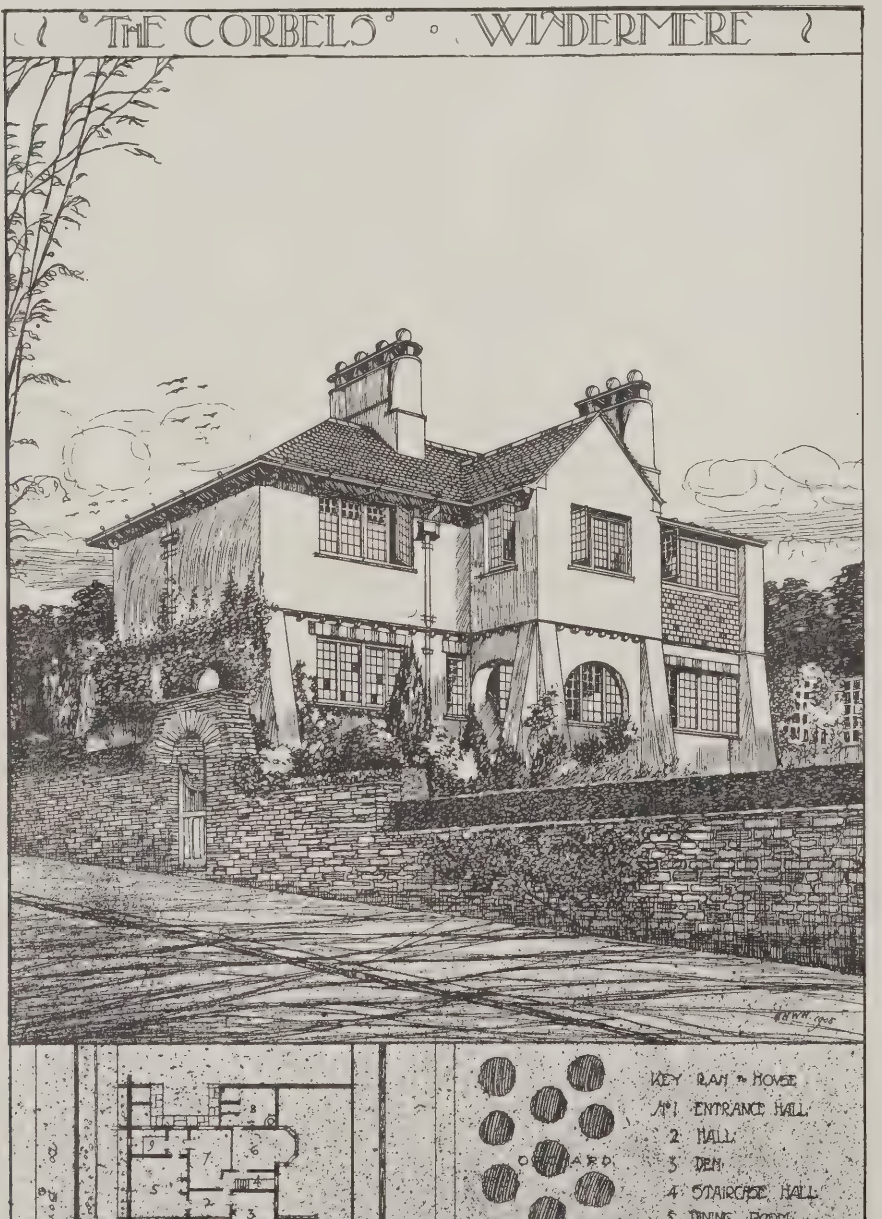
The adoption of a Registration Act

under its auspices would enable the R.I.B.A., if necessary, by a general revision of its by-laws, to severely penalize any member for unprofessional or dishonourable conduct, and to admit of its instituting a thoroughly comprehensive system of architectural training by which men of good general education and culture would be attracted to the profession; and to effect this, steps would probably be taken to enable the R.I.B.A. to enter into negotiations with the governing bodies of all the universities in the United Kingdom with the view of inducing them to appoint professors of architecture at their respective seats of learning.

The Reformed Profession.

And after the Registration Bill had become law, and when through its instrumentality the flow of hordes of illiterate and incompetent men now overwhelming by sheer force of numbers the legitimate practitioners was effectually and finally checked, to what extent would the art of architecture and its exponents benefit?

Well, it would take time, but the final issue of their labours could never be in doubt. Under a wise scheme of registration the average architect of the future should be a man of sound general education and culture and as such he would recognize that he was a member of a great and honourable profession to which he was proud to belong He would know that all unprofessional or dishonest conduct will meet with prompt and exemplary punishment, and owing to his early associations with many of his fellow-practitioners, either at the public school or university, he would be possessed of what was sadly lacking in the profession at present namely, a strong feeling of *esprit de corps* and although his designs might possess little or no great creative power or originality they would be far more likely, on account of their technical scholarship alone, to stand the test of time than those produced by an illiterate and imperfectly trained man o perhaps far greater natural ability.



Discussion.

A vote of thanks was proposed by Mr David Morgan and seconded by Mr. Ellis Marsland. The latter said they had always held the view that the Institute should do this work, but it sometimes happened that reforms in a great body came from outside Registration alone was of course no good It must go with education, and if there was education it was necessary to protect the person educated. Some of the "high art" men, however, declared that education in architecture was not required; hence without a God-given ability one could not be an architect. He, however, regarded architectecture as a science as well as an art, and consequently put education as an essential requirement. As to any diversity of opinion on "registration" or "statutory qualification," it mattered little what they called it nor did it matter whose Bill was adopted so long as the principle of registration was embodied in it. The Society of Architects would be glad to give the Institute its heartiest support.

Mr. G. A. T. Middleton next spoke. He said the papers read that evening recalled those of days gone by, when the reading of such papers meant practical ostracism at the Institute. Now, however, all was changed Registration would not improve the status of the architect, not in the sense of raising him higher in the social scale; nor would it make life easier, because competition among qualified men would be none the less keen but it would improve the training of architects and at least put competition on a fair basis. They might have to wait some time before the scheme was carried at the Institute There had been talk that some of the big men who opposed registration might leave and form a new association of their own: but he predicted that in ten years' time there would be very few men who were not both members of the Institute and ardent supporters of registration.

Mr. Anthony Scott, speaking of the Bill as i would apply in Ireland, referred to the county surveyors there who encroached so much on the architect's province, and pointed out the need for this fact to be taken into account.

Messrs. H. T. Bonner, R. F. Vallance, A H. Salisbury, Adolphus Curry, Cholton James H. H. Richardson and Walter W. Thomas (president) also spoke, and Messrs. Hubbard and Cross replied. Mr. Hubbard mentioned that he had brought before the Institute council the question of directly aiding the allied societies, and a sub-committee had been appointed to work out a scheme. He spoke enthusiastically of what had been done for registration by Mr. Middleton, who had drawn up the first Bill and was a prime mover in the matter.

The following were elected members of the Society of Architects:—J. Bevir (Lymington) E. L. Cotterell (Wolverhampton), S. J Holliday (Birmingham), J. A. Lucas (Exeter) W. H. Robinson (London, W.C.), W. Syme (Kirkcaldy), J. F. Walker (Port Elizabeth S.A.) and G. H. Wenyon (Tipton).

A.A. DINNER.

THE annual dinner of the members of the Architectural Association was held last Thursday evening at the Criterion Restaurant, Piccadilly Circus, London, W. Mr. E. Guy Dawber, president, occupied the chair, and among the large number present (about 120) were Mr. J. S. Gibson, vice-president; Mr. Francis Hooper, hon. treasurer; Messrs. Louis Ambler and Henry Tanner, junr., hon secretaries; Mr. W. J. Locke, secretary of the Royal Institute of British Architects; and Messrs. R. S. Balfour, G. B. Bulmer, Walter Cave, J. D. Crace, Henry T. Hare, Arthur Keen, H. P. G. Maule, John Murray, W. A. Pite, A. N. Prentice, Hugh Stannus, Leonard Stokes and A. Needham Wilson.

After the toast of the King, the Queen and the Royal Family had been proposed from the chair, Mr. E. Guy Dawber proposed the toast of the Royal Institute of British Architects, which he referred to as the parent body of the Association. It had always been very kind to the Association, and especially the council. For many years past they had made an annual grant, and had helped with a donation to the building fund. He coupled with the toast the name of Mr. Henry T. Hare, as a vice-president of that body, in the absence of the president. Mr. Hare, in reply, said the Institute was most closely associated with the Association and regarded it with the greatest sympathy, and wished to give it every support in its power. Its members were very largely recruited from the ranks of the Association. He did not wish on such an occasion to touch on politics, but there was considerable commotion among the architectural profession at the present moment, and it was very doubtful if they would be able to maintain their present position, namely, on the fence. Every member of the Association was an educational enthusiast, and whatever qualification might be imposed in the future upon an architect before he were allowed to practise (and this would be directed against the unworthy), he was sure the members of the Association would be able to regard it with equanimity.

The Social Side of the Association.

Mr. Dawber, in proposing the toast of the Association, said that during the last few years they had embarked upon two large undertakings, namely, the new premises and the day school. These had proved wonderfully successful. They had, however, entailed a large monetary outlay. He had that evening received a letter from a very generous donor who offered £1,000, provided the remainder required to wipe off the debt was collected that year. He appealed to the members to clear the small amount of debt remaining. Now that they had established themselves in the new premises, and with a school of architecture which he was sure was going to do a great deal of good work in the future, he felt they should pay attention to the social side of their work, which had been somewhat neglected. They did not want to feel this was a cramming institution and that the day school was the be-all and end-all of their aims. It should be a sort of large students' club, where they helped forward their fellow-students. He suggested that during the next year they should have some social evenings together and mix much more than they did. One evening they might have an "at-home" at which all the sketches done by members during the holidays might be hung up and freely criticized, while another evening might be spent in giving vent to their grievances. They ought to make their premises more attractive as a club. He coupled with the toast the name of Mr. Walter Cave.

Mr. Cave in reply said the reduction in the debt was due to the efforts of Mr. Dawber. Of equal importance with the social side of the Association's work was that of the schools, which had one of the best courses of instruction and were turning out some of the very best men.

Mr. A. O. Collard proposed the toast of the Visitors, which was responded to by Mr. T. L. Forbes.

Mr. Dawber then proposed the health of the secretary of the Association, Mr. D. G. Driver, observing that no one had worked more than he to further the educational scheme. The toast was given with musical honours, and Mr. Driver replied.

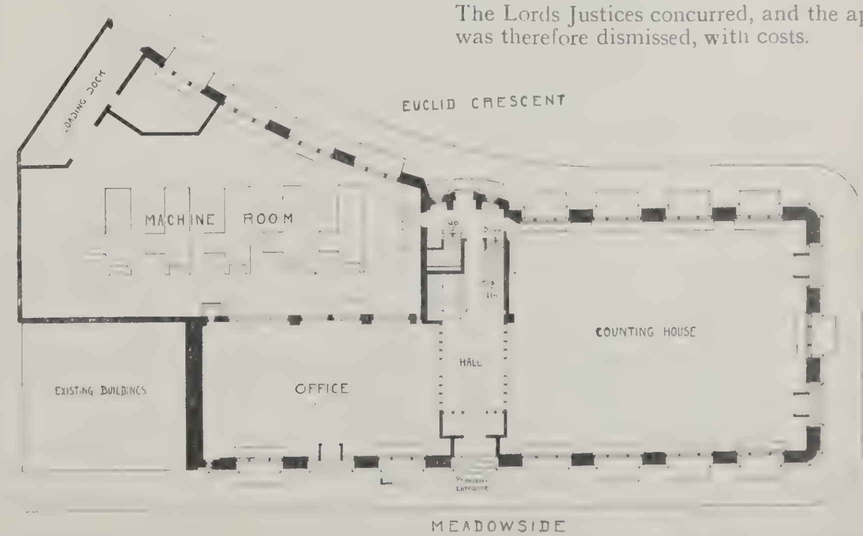
The toasts were interspersed with a very witty and humorous entertainment by Mr. Percy French.

PROTEST AGAINST ELECTIONS TO FELLOWSHIP R.I.B.A.

AT a meeting held on May 15th, at Leeds, the following resolutions were passed by local Associates of the Royal Institute of British Architects:—That this meeting of Associates views with much indignation the present large influx of members to the Royal Institute by direct election to the Fellowship; and in view of the facts (*a*) that many of the candidates are of suitable age to qualify for membership by the special examination provided for such cases, and (*b*) that some of them have not been successful in the examinations but are nevertheless supported by prominent members of the R.I.B.A. council, we protest against this as a lowering of the standard required for membership; as a most unfortunate blow to the cause of professional education they profess to encourage; and as a grave injustice to those who have qualified by examination for membership at much expenditure of both time and money. We urge upon the Associates in London and in all the allied societies to combine in opposing these numerous and unwarranted nominations by demanding a ballot as prescribed in by-law 9, and by all the regular means.

OUR PLATE.

PARTICULARS of the new offices for the "Dundee Courier" were given in our issue for February 22nd last, when a series of photographs showing the reinforced concrete work in the foundations in course of construction was also presented. The drawing in the Academy shows the building complete. The accommodation on the ground floor is indicated by the accompanying plan. The building is of Dumfriesshire red stone, and will be fire-resisting throughout. Messrs. Niven & Wigglesworth, of London, are the architects, and Mr. T. C. Stocks, of Dundee, is the general contractor. The clerk of works is Mr. T. Robertson. Messrs. Richard Moreland & Sons are the contractors for the steel construction.



GROUND-FLOOR PLAN, "COURIER" BUILDING, DUNDEE NIVEN AND WIGGLESWORTH, ARCHITECTS.

Law Cases.

Two Workmen's Compensation Appeals.—Two interesting cases under the Workmen's Compensation Act, 1897, have recently been decided by the Court of Appeal. In the one—that of *Nicholls* v. *Bishop*—a bricklayer claimed compensation from a Birmingham builder for an injury—a crushed finger—sustained whilst the applicant was helping a foreman to move a girder. The judge held that the accident did not arise out of the bricklayer's employment, and the Court of Appeal took the same view, dismissing the case. A report of the case when it came before the Birmingham County Court will be found on p. 59 of our issue for February 1st last.—The second case was that of *Buckingham* v. *Fulham Borough Council.* The latter are the owners and occupiers of a piece of ground known as "Munster Yard," which is bordered on one side by the railway and on another by stables. There was a blacksmith's shop in one corner, and the yard was used as a "dumping" ground, where scrap-iron, old wood-paving blocks and other disused materials were collected and stored. The applicant was employed in shifting a quantity of scrap iron from one part of the yard to another, and in doing so his hand was cut by a rusty bit of iron, and he contracted blood poisoning. It was attempted before the arbitrator to make the respondents liable on the ground that the place where the man was employed was a "warehouse" or "factory" within the meaning of the Act. The deputy county-court judge refused to accept that view, expressing an opinion that a "storehouse" or "warehouse" must be covered in to some extent, at any rate, and that the mere fact that cement and other materials which were affected by rain were placed under railway arches did not alter the character of a yard. He therefore decided in favour of the respondents. For the workman it was now contended that the learned deputy judge had misdirected himself, and that he ought to have held that this dumping ground was a warehouse, or, alternatively, that it was a factory because of the blacksmith's shed which stood in one corner. At the conclusion of the arguments, the Master of the Rolls said that the place where the accident happened was in the ordinary sense of the word a yard, and the opinion he had come to was that the workman's contention that it was a warehouse could not be accepted. The Lords Justices concurred, and the appeal was therefore dismissed, with costs.

Builders' Notes.

The Birmingham Building Trades' Federation is to be dissolved and the balance in hand of £990 distributed.

A Strike at Dunfermline is threatened. The masters insist on a reduction of wages from 9½d. and 9d. The men oppose the reduction.

Employment in the Building Trades continued dull during April, but was, on the whole, slightly better than a month ago. It was worse than a year ago.

Messrs. Sheen & Wells (late Stanley Sheen & Co.), heating and ventilating engineers, of Sheffield, in order to meet the demands of an increasing business, have found it necessary to remove to larger premises. They have therefore purchased the Bath Street Iron Works, Sheffield, which in future will be their address.

Year's Building in Edinburgh. — The annual report on work done in connection with the burgh engineer and master of works' department of Edinburgh states that, nothwithstanding the outcry about the dulness of trade and want of employment, the value of work during the year was £994,940, compared with £825,584 in 1903 Speculative building seems to have suffered no check, the estimated value for that class of work having been £568,900.

Glasgow Masons and the Royal Infirmary. —A special meeting of the Master-Masons' Association of Glasgow and neighbourhood was held last week to protest against the proposal to construct the outer walls of the addition to the Royal Infirmary in terracotta, having regard to the fact that the adjoining building is the ancient cathedral. It was remitted to a committee to exercise whatever powers it possessed to get the frontage of the building constructed of stone.

Competitions.

Children's School, Richmond, Surrey.—1st, Mr. E. J. Milner Allen; 2nd, Mr. C. Harrison Townsend—both of London. The school is to accommodate 500 children, with extension to 1,000.

Wilmslow Cemetery. — First premium (£25), Mr. W. Longworth, Manchester; 2nd (£15), Mr. H. C. Cullock, Manchester; 3rd (£10), Mr. C. T. Taylor, Oldham. (The last has been accepted by the urban district council.) Mr. H. Beswick, county architect for Cheshire, was the assessor.

Buxton Boys' School.—The design of Mr. Charles Swain, of Manchester and Buxton, has been placed first in this competition and is recommended for adoption. The second place was awarded to Messrs. Garlick & Flint, and the third to Mr. W. R. Bryden, F.R.I.B.A.—all of Buxton. Mr. G. H. Widdowes, A.R.I.B.A., was the assessor.

Public Baths, South Shields.—The design of Mr. J. H. Morton, F.R.I.B.A., for new baths and washhouses at South Shields, to replace the present buildings in Derby Street, has been selected out of ten sets submitted. The estimated cost of the building is £12,000. It will comprise a swimming bath 90ft. long by 30ft. wide, 12 slipper baths, 12 douce baths, 4 baths for women and a public washhouse for 50 washers.

Extension of Shirehouse, Norwich.—The Competition Reform Society disapproves of the conditions in this competition because the information to competitors is insufficient (*i.e.*, no block plan or plans of existing buildings will be supplied) and because a contractor's estimate of the cost of the work is required. Architects are requested to abstain from competing unless the conditions are satisfactorily revised.

Secondary School, Preston.—The Preston Education Committee propose to erect a new secondary school for girls and will shortly invite plans in competition. Mr. F. W. Catterall will be the professional assessor.

The King's College Hospital Designs will be on view in the court room of the Carpenters' Hall, London Wall, on May 26th from 12 noon until 5 p.m.; and on the five following days from 10 a.m. until 5 p.m, except on June 1st, when the exhibition will close at 4 p.m. Admission on presentation of visiting card.

Correspondence.

Fibre Stress in Beams.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Although the calculations in my article on p. 218 of your issue for April 26th were checked, I regret to find that the omission of a little squaring figure has vitiated the result. The calculations should read as follows (at fourteen lines from the bottom of the middle column):—To find this position of neutral axis $\frac{1}{2}\ (x\,b\,d) \times 840 \times \frac{2}{3}\ (x\,d) = \frac{1}{2}\ (y\,b\,d) \times 140 \times \frac{2}{3}\ (y\,d)$, or $280\ x^2\,b\,d^2 = 46\frac{2}{3}\ y^2\,b\,d^2$, or $6\,x^2 = y^2$, whence $x = \frac{y}{\sqrt{6}}$. Now x and y being fractions of d, $x\,d + y\,d = d$, or $x + y = 1$, or $y = 1 - x$, therefore $x = \frac{1-x}{\sqrt{6}}$, or $\sqrt{6}\,x + x = 1$, or $2{\cdot}45\,x + x = 1$, whence $x = \frac{1}{3{\cdot}45} = {\cdot}29$, and $y = \frac{2{\cdot}45}{3{\cdot}45} = {\cdot}71$. Then the total resistance $= \frac{1}{2}\,({\cdot}29\,b\,d) \times 840 \times \frac{2}{3}\,({\cdot}29\,d) + \frac{1}{2}\,({\cdot}71\,b\,d) \times 140 \times \frac{2}{3}\,({\cdot}71\,d) = 47\,b\,d^2$. Returning to the fundamental equation, $\frac{wl}{4} = f\,\frac{b\,d^2}{6}$, then $f\,\frac{b\,d^2}{6}$ must equal $47\,b\,d^2$, or $\frac{f}{6} = 47$, whence $f = 282$. But c having been shown to be $= \frac{f}{18}$, therefore $c = \frac{282}{18} = 15\frac{2}{3}$, to be substituted for $13\frac{1}{2}$ in the article in question, and $\frac{x}{y} = \frac{\sqrt{t}}{\sqrt{c}}$, where t and c are the tensile and compressive resistances respectively.

This does not in any way alter the main conclusions, and only slightly affects the magnitude of the differences pointed out. It is interesting in this connection to note that Warr's "Dynamics," p. 261, states: "Barlow found that in a rectangular fir beam the neutral axis was about five-eighths of the depth, as shown by the section of fracture' this is quite accordant with Du Hamel's experiment. Mr. Hodgkinson, experimenting on cast-iron beams, found the neutral line in sudden fractures from one-fifth to one-sixth of the depth; cast-iron, however, might anteriorly be supposed to present a high neutral axis, since its compressive strength is so great."

The argument for the shifting of the neutral axis before rupture takes place may be put shortly as follows:—The ordinary formula for the strength of a beam is, bending moment M = moment of resistance R, that is, for a rectangular beam loaded in the centre $\frac{WL}{4} = Z\,C$, Z being the modulus of section $= \frac{b\,d^2}{6}$. Take the case of a cast-iron beam 12ins. long, 1in. broad and 1in. deep, with a breaking weight of 1 ton in the centre. Then $\frac{1 \times 12}{4} = \frac{1 \times 1^2}{6} \times C$, or C = 18 tons per sq. in. for extreme fibre stress, whereas with the neutral axis in the centre the stresses on the extreme fibres must be equal on both sides of the neutral axis, and we know that the tensile stress cannot exceed 7 tons per sq. in.—Yours truly, HENRY ADAMS

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Norfolk Churches.

EDINBURGH.—STUDENT writes: "Please name a book giving a complete list and description of the principal churches in Norfolk."

There is no book which gives a complete list, but "Antiquities of Norfolk," by John Sell Cotman, and "Murray's Guide" should answer your purpose. L. G. R.

Worm Holes in Oak Dado.

WOODBRIDGE.—PERPLEXED writes: "About twelve months ago I made and fixed some Austrian oak dado, and in a part there has developed a patch of about 6ins. square of worm holes. Which is the best way to stop this trouble?"

You do not state whether the worms have appeared in the framing or the panelling. The remedy, however, in either case is simple. Knock out the stuff and replace the part attacked with entirely fresh oak. It is not at all likely, then, that the mischief will spread. HARRY HEMS.

Size of Principal Rafter in Steel Truss.

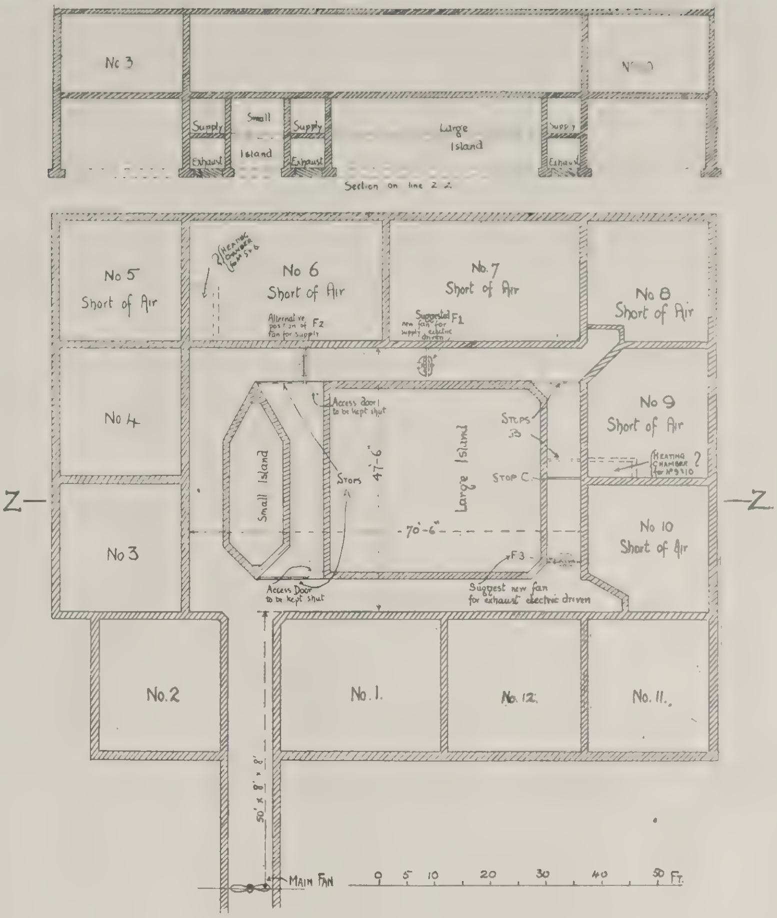
WESTON-SUPER-MARE.—QUID writes: "The accompanying sketch (not reproduced) shows a steel roof-truss of 45ft. effective span. The stress on the part of the principal between A and B is 230 cwts. compression. Which is the best formula to use so as to obtain the size of the section (T-iron) required to resist that stress? I am unable to find out anything definite on this point from any text-books."

This particular truss for the same span will be found worked out completely in "The Practical Designing of Structural Ironwork" (Spon, 8s. 6d.). It is there shown that the principal rafter should be a T-iron $4\frac{1}{2} \times 4\frac{1}{2} \times \frac{5}{8}$, having an area of, say, 5·27 sq. ins. To find the equivalent area in steel, multiply by $\frac{10}{13}$; therefore, $5{\cdot}27 \times \frac{10}{13} = 4{\cdot}06$ sq. ins., or, say, a $4\frac{1}{2} \times 4 \times \frac{1}{2}$ steel T. If calculated by Gordon's formula, the principal rafter is taken as fixed at one end and pivoted at the other. HENRY ADAMS.

Rural By-laws.

A.R.I.B.A. writes: "I am building some houses in a country district, and am having a dispute with the urban council over an unimportant by-law relating to the bearing of some joists. I have put these in contrary to the by-law, though the construction is very much better and the strength greater than if put in according to the by-law: and this the surveyor himself admits, but insists on the letter rather than the spirit of the by-law being enforced. I believe legally they could insist on them being altered, and rather than go to law I should do so. The worst of the matter, however, is that two of the councillors are notorious jerry-builders and are now building and have built within the last few months a number of houses which are glaring infringements of several of the most important by-laws in the book, and this is winked at by the council. I resent this unfair treatment, and therefore objected to making what any competent person would see was an absurd alteration whilst these men did just as they wished. Have I any remedy, and have the Local Government Board any authority in such a case? It appears to be one of those cases, far too common, where some radical alteration in the present law is required."

I think it purely a question of expediency whether you alter your joists to conform to the local by-laws or whether you leave the authority to take proceedings against you if they wish to do so. You have no legal remedy, and the fact that the by-laws are not administered impartially does not affect your case, though of course it might be a telling argument did the case come for trial. As a rule, however, I fear the person who makes the public *exposé* has to pay heavily for the privilege. F S. I.



VENTILATION OF SCHOOL.

Ventilation of School.

X. writes: "The accompanying sketch (re-drawn) shows a system of plenum ventilation carried out at a school. As the classrooms 5, 6, 7, 8, 9, 10 do not get sufficient air to meet the requirements and the extraction is often nil, can you offer any solution of this difficulty? The rooms average 24ft. by 22ft. by 14ft. high. The extraction is at floor-level and the fresh-air inlet is 8ft. 6ins. high. The velocity is not to exceed 5ft. per second, and the quantity to be supplied is 2,000ft. per hour per child. The gas engine is working at 212 revolutions per minute. Is it probable that the fan is sucking some of the air back again? The fan is of 7ft. diameter. The extraction shaft is 76ft. above ground-line, with cast-iron flue-pipe from steam-boiler erected inside it."

The total hourly volume of air needed is 1,200,000 cub. ft.; and the first thing I recommend is that the main fan be tested for its output, and if on its discharge side it is not moving air at this rate it should be replaced by a fan that will. The next thing I recommend is that the passage between the two islands be boarded across at each end, as shown and marked A. This should cause rooms 5 and 6 to work, I think, especially if their heating chamber be as marked, and it may cause rooms 9 and 10 to start also, especially if the stops B are fitted in the far passage. The distance from the main fan of rooms 7, 8 and 9 will, I fear, make a second fan necessary. It should be able to move at least $1\frac{1}{2}$ times as much air as the classrooms need, to overcome the pipe and duct friction, and should be placed about where shown at F, 1; but if the heating chamber for room 6 be there it may be placed where dotted at F, 2. In any case a stop C will be needed at the chamber for No. 10. You do not say where the exhaust shaft is placed, or how the air enters it. The heat from the chimney is not very much for the volume of air that has to be moved, and it is better to make the shaft and chimney independent. If the exhaust shaft is at the opposite end to the supply fan, its pull should make up for the decreased fan-pressure; if it does not, the air entrances must be wrong. If the shaft be near the fan, then another small fan may be needed, as well as that just mentioned for supply; and it should be put in the exhaust duct at F, 3, as shown by dotted lines, and the exhaust passage between the islands must be boarded off like the supply passage. This fan should be able to move all the air from the six defective rooms. Some of the positions I have marked may be unsuitable, owing to flues and heating chambers being near; but you will grasp the main object of the suggestions, which is to get more pressure of air and speed of both currents at the far rooms. If you have to get a new main fan, it may be that the small fan in the exhaust duct will be the only other one needed. O. WHEELER.

Fireclay Partition Slabs.

GLASGOW.—A. B. C. writes: "Is there on the market a wall lining in the form of fireclay slabs of ⊔ shape? The slabs are used for the inside face of external walls, and have the plaster attached to them direct. The slab gives an air-space of about 1in."

We do not know of this exact shape being obtainable out of stock, but the firms who make fireproof terra-cotta partition blocks, such as the Hempstead Patent Brick Co., of

Hemel Hempstead, would be ready to make them to order. Blocks somewhat of the shape desired have recently been placed on the English market by the American National Fireproofing Co., whose European managers are Messrs. James F. Cummings & Co., of 27, Chancery Lane, London, W.C.

Thickness of Walls under L.B.A.

LONDON.—LLAWGNID writes: "In proposed alterations and additions to a warehouse and office block three storeys high, with a basement, some of the external walls around areas are carried on steel girders at the second-floor level, with one end resting on a stanchion and the other end bearing on a brick pier on a party-wall. The district surveyor has intimated that in order to calculate the thickness of these walls it is necessary to assume that they extend unbroken from the ground-floor upwards, or from the basement floor upwards, as the case may be, and not from the top flange of the girders, as the description in the London Building Act would lead one to imagine. Is he correct? Does he not, by assuming that the walls extend from the ground upwards, infringe the by-law regulating the proportion of openings in external walls above the ground-floor storey? In this case, if his contention is correct that the wall technically exists from the ground upwards, the relation of void to solid would be 3 to 1."

I think the answer to this question is found in section 5 of the London Building Act, 1894, which reads: "The expression 'foundation' applied to a wall having footings means the solid ground or artificially-formed support on which the footings of the wall rest, *but in the case of a wall carried by the bressumer means such bressumer*." The next definition also runs: "The expression 'base' applied to a wall means the underside of the course immediately above the footings, if any, or, in the case of a wall carried by a bressumer, *above such bressumer*." Reading these definitions into the sections stating the proper thicknesses for walls of certain heights, one is, I believe, justified in thinking the surveyor has wrongly interpreted the Act. F. S. I.

Strength of Rolled Joists.

BATLEY.—W. R. S. writes: "Please give the formula and method of working out the following problem:—What is the safe load that may be put on a rolled steel joist of 20ft. span, 8ins. by 5ins., and weighing 25 lbs. to the foot run, the weight being placed in the middle? The books I have do not seem to give any formula with a direct bearing on the question."

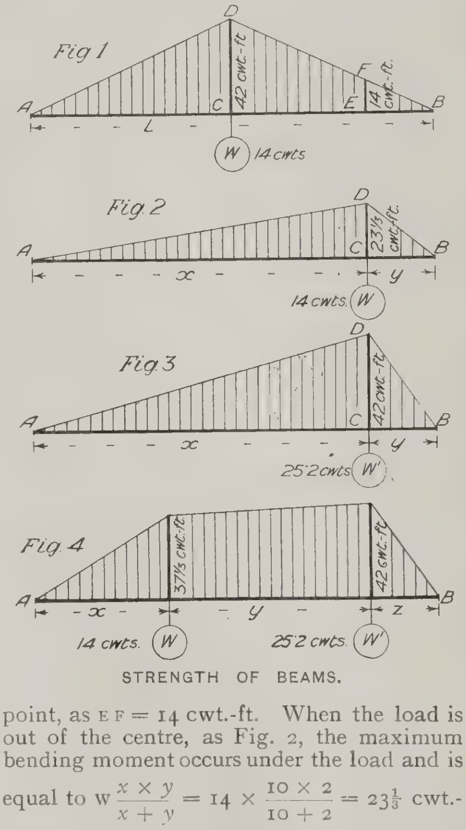
Rolled-joist problems are difficult in an examination because essential facts are generally omitted. In practice what is wanted can be found from a reliable catalogue with the minimum calculation and risk of error. The common formula for the strength of rolled joists is $W = C\frac{ad}{L}$, where W = breaking weight in tons in centre; a = nett area in square inches of one flange + $\frac{1}{6}$ of web (remainder of web assumed to resist shearing only); d = total depth in inches, but for accuracy the mean depth should be taken; L = span in feet; C = constant = 7 for rolled iron joists, 6 for compound girders of ditto with equal flanges, 10 for rolled steel joists, 9 for compound girders of ditto with equal flanges. The area in square inches of one flange of an ordinary joist averages about $\frac{1}{12}$ of the weight in lbs. per foot run, or, including $\frac{1}{6}$ of web, say $\frac{1}{10}$ of weight. Therefore, for a rolled steel joist 8 × 5 × 25 lbs., 20ft. span, we have $W = 10 \times \frac{2{\cdot}5 \times 8}{20} = 10$ tons breaking weight in centre. A span of 20ft. is too great for a free joist 8ins. deep, as the depth in inches should not be less than half the span in feet, or 10ins. in this case. When the joist is less in depth, a higher factor of safety should be used, namely, $\frac{\text{span}}{\text{depth}} \times 0{\cdot}287 = \frac{20 \times 12}{8} \times {\cdot}287 = 8{\cdot}61$, then $\frac{10}{8{\cdot}61} = 1{\cdot}161$ tons or 23·2 cwts. safe load in centre. For comparison of different formulæ for rolled joists and other useful information see "Designing Ironwork," 2nd Series, Part IV. (Spon, 2s.). HENRY ADAMS.

Strength of Beams.

EPSOM.—H. J. W. writes: "The safe central load for a beam 3ins. by 8ins., span 12ft., is 14 cwts. How can I ascertain the safe load if placed 4ft. from centre? Also, how would the safe load be ascertained if the beam were loaded at two different points?"

When the load is central, as on beam AB (Fig. 1), the maximum bending moment is $\frac{WL}{4} = \frac{14 \times 12}{4} = 42$ cwt.-ft., as CD, and the bending moment at any other point is the ordinate to the triangle taken at the required point, as EF = 14 cwt.-ft. When the load is out of the centre, as Fig. 2, the maximum bending moment occurs under the load and is equal to $W\frac{x \times y}{x + y} = 14 \times \frac{10 \times 2}{10 + 2} = 23\tfrac{1}{3}$ cwt.-ft., as shown at CD, where W is the same load as before; but when a new load W' is required to produce the same maximum bending moment, then $\frac{WL}{4} = W'\frac{x \times y}{x + y}$, or $W' = \frac{WL}{4} \times \frac{x + y}{x \times y}$, whence $W' = \frac{WL^2}{4xy} = \frac{14 \times 12^2}{4 \times 10 \times 2} = 25{\cdot}2$ cwts., as shown at CD (Fig. 3). If two loads W and W' are carried as in Fig. 4, the bending moment under W will be $W\frac{x(y + z)}{x + y + z} = 14 \times \frac{4(6 + 2)}{4 + 6 + 2} = 37\tfrac{1}{3}$ cwt.-ft., and the bending moment under W' will be $W'\frac{z(x + y)}{x + y + z} = 25{\cdot}2 \times \frac{2(4 + 6)}{4 + 6 + 2} = 42$ cwt.-ft.

HENRY ADAMS.



STRENGTH OF BEAMS.

Gothic Work to measure in the Peak District and at East Grinstead.

CLAPHAM PARK.—ENQUIRER writes: "Please give particulars of good Gothic work to measure in the Peak district of Derbyshire, making Chapel-en-le-Frith a centre for cycling from; also Gothic work in the neighbourhood of East Grinstead, Sussex."

Churches at Baslow, Castleton, Hathersage, Hope and Tideswell in the Peak district; and Bletchingley, Bolney, Chailey, Fletching, Wivelsfield (Early English); Ardingley and Slaugham (Decorated), and Cuckfield, Uckfield and Withyham (Perpendicular), all within a few miles of East Grinstead, will furnish ample field for measuring. L. G. R.

SOCIETY OF ARCHITECTS.

Coming of Age Dinner.

THE twenty-first annual dinner of the Society of Architects was held at De Keyser's Royal Hotel on Friday evening, the president, Mr. Walter W. Thomas, in the chair. The company numbered about 130. After the royal toasts had been given, the mayor of Marylebone (the Rev. Russell Wakefield, M.A.) proposed the toast of the Houses of Parliament, to which Lord Stanley of Alderley and Mr. C. McArthur, M.P., responded, the latter vouching his support of architects' registration "The London Local Authorities" was the next toast. In proposing this Mr. W. Watson Rutherford, M.P., of Liverpool, said he did not know whether the London County Council would be satisfied with the borough councils; he felt that there would be an awakening on both sides Speaking of by-laws, he observed that while architecture was undoubtedly improving in respect of large buildings, it was deteriorating in regard to common dwelling-houses, and this he ascribed in no small measure to unsatisfactory by-laws, which brought about a uniformity that made for squalidity and general want of comfort. The toast was responded to by Alderman Sir H. Knight (representing the City of London), Mr. J. Jeffery (for the London County Council), the mayor of Kensington—Councillor Percy Gates (for the borough councils) and Sir R. M. Beachcroft (for the Metropolitan Water Board). The mayor of Kensington said that since the borough councils came into existence in 1900 the average rates of the Metropolis had risen from 5s. 2d. to 6s. 3d., but only 1½d. of that increase was due to the local authorities, whose function it was to provide the necessary funds for the spending central bodies! He deprecated the idea of a uniform poor rate and a uniform general rate as being illogical and unfair. Sir R. M. Beachcroft observed that the Metropolitan Water Board had to provide thirty gallons a day each to seven million people, supplying water to a million houses, and while the area under the control of the London County Council was 120 sq. miles that of the Water Board was 620 sq. miles. He also alluded to the growth of London, and conjured up a picture of suburbs extending far into the Midlands on the one hand and down to the Channel on the other.

The toast of "The Society of Architects and Architecture" was given by Mr. L. A. Atherley Jones, K.C., M.P., who regretted that registration had not become law: it was extremely improbable that the Bill would pass this session of Parliament.

The Society's Position in regard to the Registration Bill.

The president (Mr. Walter W. Thomas) and Mr. Cholton James, F.R.I.B.A. (president of the Cardiff, South Wales and Monmouthshire Architects' Society) responded. Mr. Thomas congratulated the members on the position which the Society had attained. Both in finances and membership it was never in a better position to carry on the objects for which it was founded. The chief of these, as they all knew, was the statutory education and registration of architects, and it really seemed as though they were on the eve of realising their desire. It was no longer a question as to whether the profession was in favour of registration or not—the Society of Architects had settled that question by a poll of the profession some years ago—but whether there should be two Bills before Parliament or one Bill promoted by the Institute and unanimously supported by the profession, including the Society. He repeated that the latter was prepared to stand aside in favour of the Institute if that body was prepared either to adopt the present Bill or to substitute another one of a character to satisfy the members of the Society of Architects that the principle which they had so long upheld should be adhered to. The next move was with the Institute. "If they are in earnest we shall be able to approach Parliament with a united front. If, unfortunately, other councils prevail, the lead will be with us again, and we shall not fail to take advantage of it. We are pledged to see the matter through and are quite certain of success in the long run."

Modern Workmen.

The toast of "The Arts and Crafts allied to Architecture" was given by the Lord Mayor of Liverpool (Councillor John Lea, J.P.) and responded to by the mayor of Holborn (Alderman Fitzroy Doll, F.R.I.B.A.). Mr. Doll said that nowadays our sympathies were more with the builder and craftsman than they used to be. The master-builder, however, had become little more than a cashier, and the workmen, he regretted to say, were often unworthy of their hire: he noted, too, what a vast army of foreigners were employed in this country—Belgian, Italian and French asphalt-layers, mosaic workers and plasterers, Swedish and Dutch joiners, and German parquet-floor layers. This state of affairs he laid largely at the door of improperly conducted trades-unionism; and he predicted that unless our technical education was made equal to that on the Continent we should sink still further into the mire.

Mr. A. E. Pridmore proposed the toast of "Our Guests," and Mr. George Hubbard, F.R.I.B.A., responded.

Keystones.

Mr. Arthur E. Sheppard has commenced practice as an architect and surveyor at 39, High Street, Newport, Mon.

An Article on the Development of Architectural Art, by Miss Ethel Charles, A.R.I.B.A., appears in the R.I.B.A. Journal for May 20th.

Mr. Herbert J. Finn has been commanded to wait upon the King with selections of his architectural drawings. Mr. Finn's exhibition at 114, New Bond Street is open till the end of this month.

The Length of London's Roman Wall found in Jewry Street, Aldgate, as reported on p. 281 of our issue for last week, is to be preserved, and the new building adjoining is to be called "Roman House."

Messrs. George Wragge, Ltd., have taken new premises adjoining their showroom in Shaftesbury Avenue, so as to provide accommodation for an increased staff and an increasing business in London. Their numbers in Shaftesbury Avenue are now 209 and 211.

County Asylum Architects.—At the annual meeting of the County Councils Association held last week at Westminster Mr. J. Willis Bund (Worcester) said there was something like a "ring" of architects for the erection of county asylums. Certain architects were well known to the Lunacy Commissioners and knew their wishes and requirements, and unless the work were given to one of these architects life was made a burden. It was decided to call the attention of the Government to the subject.

A Ventilation Contract.—One of the largest contracts of its kind ever given out has just been secured by the Sutcliffe Ventilating and Drying Co., Ltd., of Manchester, for warming and ventilating the new soapery which Messrs. Lever Brothers are building at Port Sunlight. This will be a huge place covering 5 acres of ground. Messrs. William & Segar Owen, of Warrington, are the architects. The building will be warmed and ventilated on the plenum system. Five large steel-plate fans will supply more than 3,000 cub. ft. of fresh air, warmed or cooled as desired, to every person employed in the building.

Manchester Society of Architects.—On May 2nd this Society began its summer programme of visits, about thirty members going to the Church of the Christian Scientists, Victoria Park (Mr. Edgar Wood, architect). The entrance forecourt exhibits picturesque grouping of simple and unusual character, and the interior, when completed to double its present length, will be very satisfactory; the whole design shows considerable individuality and suitability to its purpose. Afterwards the members visited St. Chrysostom's Church to study the effects of the recent fire, finding very complete proofs of the unreliability of stone when exposed to heat and water. On May 6th a visit was paid to Leeds to see the new Roman Catholic Cathedral (Mr. J. H. Eastwood, architect). Under the guidance of the clerk of works considerable time was spent in thoroughly examining the building, and much of interest was found both in detail and in general design. The party then divided, and utilized the little remaining time in making flying visits to Kirkstall Abbey and to Mr. Bodley's fine church at Allerton.

The Buxton Sewage Works were visited recently by M. Bernard Bezault and M. Arthur Vye-Parminter (architect to His Majesty's Embassy at Paris), members of the deputation of eminent French engineers who are in this country inspecting some of the principal sewage purification works on behalf of the French Government. The sewage at Buxton is treated by chemical precipitation and continuous filtration, being distributed over the beds by means of Adams' Cressett revolving distributors. The opinion expressed after the inspection was: "The finest and the cleanest works we have ever been in, and the results achieved are excellent." The works were designed by Mr. W. Hedley Grieves, surveyor and engineer to the Buxton Urban District Council, and were opened on the occasion of the meeting of the Association of Municipal and County Engineers held at Buxton about twelve months ago.

The Marble Baldachino in Westminster Cathedral is to be erected shortly.

Mr. C. B. Fowler, F.R.I.B.A., late of Cardiff and London, has entered into partnership with Mr. W. H. Shute, of "Western Mail" Chambers, Newport, Mon., where they are practising as architects and surveyors. They are agents for several estates, and are carrying out extensive additions, &c., to Llantarnam Abbey, the residence of Mr. Clifford Cory, J.P., High Sheriff of Monmouthshire.

Trade and Craft.

An Illustrated Price-Book.

It will be recollected that a few years ago Messrs. Young & Marten, Ltd., the well-known firm of builders' merchants, of Caledonian Works, Stratford, issued a most elaborate and sumptuously produced catalogue in two volumes which cost them nearly £10,000, creating a reputation for catalogues which they have systematically maintained by the issue of smaller illustrated price-lists. The latest production is their No. 28 Tariff, measuring 12ins. by 10ins. and numbering 460 pp. This is extremely well got up with numerous coloured plates, and is most complete in every detail, with the latest designs. The increasing multitude of little details that enter into modern building operations makes it necessary for everyone concerned, to keep up to date, and it is of the greatest importance to have such a full record as this, with illustrations, sizes, weights, prices, &c. The Tariff enumerates goods regularly kept in stock in large quantities to meet the urgent and increasing demands of the trade for promptitude in supply. In judging the prices in trade catalogues it is well to recollect that the lowest price is not always the cheapest. Messrs. Young & Marten's goods, while they compare well with any on the market for price, are not cheap and nasty—utility is always studied by them, and they have ever striven to supply goods that give satisfaction to all concerned, and consistently eliminate the rubbishy type of goods. It is due to this that their business has grown so rapidly and so uninterruptedly to its present huge dimensions; for their many customers, finding themselves well served, come again. Another advantage the firm offers is that in its showrooms at Stratford the whole of the designs shown in this Tariff are displayed, so that customers can see the goods before buying. The catalogue is a necessity for those who wish to keep themselves in touch with practical construction, and all who are interested should apply for a copy.

Obituary.

Mr. William Horobin, J.P., painter and decorator, of Oldham, died recently in his seventy-ninth year.

Mr. William Crozier, M.I.C.E., late county surveyor, engineer and architect for Durham, died recently in his seventy-sixth year. He reconstructed the assize courts at Durham and the moot hall at Newcastle, and under his direction the Durham Lunatic Asylum was enlarged to accommodate 1,300 patients.

Advertising Notes.

Success is honest reality and worth. Just as surely as the world spots a counterfeit, so surely does it recognise the genuine. Recognition may be a little tardy, but it will come. Be vigorous, bold, and sure, but don't bluff.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

Contracts Open.

RUGBY URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The above Council invite TENDERS for the CONSTRUCTION of a MAIN OUTFALL SURFACE WATER DRAIN about 600 yards in length commencing at the 36 in. Culvert in Mill Road, thence across the Cattle Market and along Wood Street as far as Lodge Road, together with the Manholes and other Works connected therewith, the Plans, Specifications and Conditions of Contract can be seen at the office of the undersigned, where also copies of the Bill of Quantities and form of Tender can be obtained by intending Contractors on and after WEDNESDAY, the 10th inst., on payment of £1, which sum will be returned on the receipt of a bonâ fide tender. Tenders on the Form prescribed endorsed "Main Drain," to be sent to T. M. WRATISLAW, Esq., Clerk to the Council, High Street, Rugby, on or before the 24th inst.

The Council do not bind themselves to accept the lowest or any Tender.

By Order,
D. G. MACDONALD, Assoc. M.Inst. C.E.,
Surveyor to the Council.

Rugby, May 4th, 1905.

COLCHESTER CORPORATION WATERWORKS.

TO CONTRACTORS BUILDERS, AND OTHERS,
NOTICE IS HEREBY GIVEN.

That the Corporation of Colchester are prepared to receive TENDERS for the CONSTRUCTION of an ENGINE HOUSE, BOILER HOUSE, COAL STORE, RECONSTRUCTION of RESERVOIRS, RETAINING WALLS, and other WORKS in connection therewith.

Plans and specifications may be inspected between TEN a.m. and FIVE p.m. on and after 24th MAY inst., at the office of the undersigned.

Copies of the specification, with form of Tender attached, and the quantities of the work may be obtained on depositing one guinea, which will be refunded to each depositor on his making a bonâ-fide Tender and returning the documents entrusted to him when a Contract has been entered into.

It is indispensable that persons tendering shall have had experience in similar work, and be prepared to furnish good and approved security, if required, for the due fulfilment of the Contract.

Tenders must be delivered at the TOWN CLERK'S Office not later than 13th JUNE next, in sealed covers, endorsed "Tender for Engine and Boiler House, etc."

The Corporation do not bind themselves to accept the lowest or any Tender, nor will they pay any expenses in connection with any Tender.

By Order,
C. E. BLAND,
Waterworks Superintendent.

Town Hall, Colchester.
16th May, 1905.

**SUBSCRIPTION, POST FREE,
10/10 PER ANNUM,
or of any Newsagent or Bookstall,
2d. weekly.**

**Subscription Abroad,
17s. 4d. Post Free.**

If you are not already a Subscriber, it will more than repay the small outlay to become one, and thus keep yourself posted in what is doing in the Architectural and Building World.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

**5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.**

Bankruptcies.

STOCKTON STONE AND CONCRETE CO., LTD. Capital: £15,000.

JAMES COSBIE, LTD., builders, and coal and tile merchants, &c., Ballymena, co. Antrim. Capital: £10,000.

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

Sample and Shadecard on application to
Sissons Brothers & Co., Ltd., Hull.
London Office—199B Boro' High Street, S.E.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

May 31, 1905. Vol. 21, No. 538.
6, Great New Street, Fetter Lane, E.C.

Summary.

A serious subsidence has been going on at the east end of Winchester Cathedral, which is now 2ft. out of the perpendicular. (This page.)

An exhibition of photographs and drawings of architectural "refinements"—the collection of Mr. W. M. Goodyear, of Brooklyn—is proposed to be held in Edinburgh during August and September next. (Page 308.)

The Registration Bill of the Society of Architects was introduced again in the House of Commons on May 15th. This provides for the creation of a General Council of Architectural Education and Registration, to whom persons desirous of being registered would need to prove that at the date of the passing of the Act they were fellows or associates of the Institute, members of the Society of Architects, professional members of some architectural society affiliated with the R.I.B.A.; persons practising architecture prior to January 1st, 1895, and still so practising; or persons who had served as apprentices, assistants or practitioners in architecture for twelve years in the aggregate after attaining the age of fifteen years. (Page 303.)

Sixty more cottages are proposed to be built on the L.C.C. Wood Green estate at a cost of £13,919. (Page 308.)

In giving judgment in a light and air case last week, Mr. Justice Farwell pointed out that the dominant owner was never entitled to all the light that came through his windows. The question always was, not whether some light had been taken, but whether so much as to cause a nuisance. (Page 306.)

A small house in Paris has been provided with a foundation consisting of an inverted arch of armoured concrete of 34ft. 4ins. internal radius and 19·6ins. thick extending over the whole site. (Page 309.)

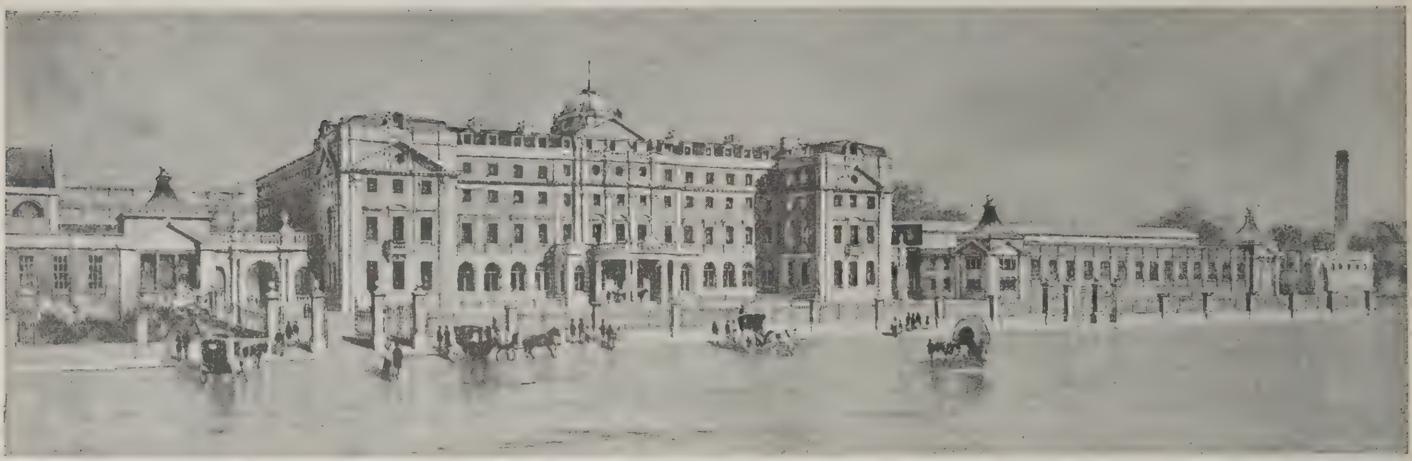
Of the six designs submitted in limited competition for the rebuilding of King's College Hospital at Camberwell, Mr. Edwin T. Hall's is the best plan and Mr. Saxon Snell's the best elevation: the selected design, by Mr. W. A. Pite, suffers from defects respecting light and air. (Page 298.)

An elementary knowledge of chemistry and physics is necessary to a scientific understanding of paints and paintwork. A summary of the principles of these sciences applicable to this subject is given in this issue. (Page 300.)

The L.C.C. Bill for bringing tramways over Blackfriars and Westminster Bridges and along the Embankment has been passed by the Select Committee of the House of Commons. (Page 308.)

Undeveloped Resources. On several occasions we have referred to the wonderful richness of Ireland in minerals, especially granites, building stones and marbles, and have expressed the belief that the development of these resources would confer a great deal of benefit alike on financiers, on purchasers of these materials, and on the poverty-stricken people of Ireland. We have taken every opportunity to draw attention to these resources of Ireland because we consider that much more permanent benefit is likely to be derived from the Government assisting in their development than in spending large sums of money on more or less unprofitable agricultural land. This has been partially recognized, for it will be recollected that we were able to notice in our issue of March 18th, 1903, the opening of an exhibition of Irish minerals and building stones for a period of three months at the Imperial Institute by the Department of Agriculture and Technical Instruction for Ireland. We urged upon the Department the importance of showing the exhibits in a place frequented by architects and builders who could really help the industries, namely, at the Building Trades' Exhibition. This was done, and proved a surprise to many as to the wealth of varieties and the great beauty of Irish marbles and granites. But large orders could not be executed by many of the quarries, which had little or no machinery, and the railway rates and want of transport went against their profitable working; so that they could not compete with foreign and English materials, notwithstanding their unique character, great beauty, superiority and cheap labour. Now we are pleased to chronicle the fact that in one district of Ireland rich in marble and granite a company has been established to work these materials on an adequate scale. This company is the Galway Granite Quarry and Marble Works, Ltd. It has been promoted in a public-spirited way by Colonel A. H. Courtney, C.B., J.P., a local landowner, to acquire and develop the Shantallow Granite Quarry and Miller's Granite and Marble Works at Galway, neither of which had been worked to anything like their full capacity before. Only a small royalty has been reserved by Colonel Courtney, his object being not to make money out of his project but to benefit the district. He has shown us samples of the materials from his quarries. These comprise three varieties of red granite which are very handsome and afford a welcome change from Peterhead. They take a fine polish, are of uniform grain, of delicate mottled pale pink and greenish tint, and as they have plenty of closely aggregated quartz mingled with the various coloured felspars, are very durable. They can be got in very large blocks, free from joints and iron. The marbles consist of the renowned "Irish green" of Connemara—the most beautiful green marble in the world, one of the few greens to resist weather—and a dense black limestone. The former is in two varieties—the rich dark green which hitherto has been found almost impossible to get in any quantity, and the better-known lighter Connemara green. The latter polishes finely and is free from clay, and is therefore eminently suitable for steps and pavements in churches, town halls, &c. The quarries are only about 1¼ miles from the docks, and there is practically unlimited water-power and water-carriage at the very door. Machinery is being put down to polish and work the marble and granite, the best expert advice has been sought, and the cost will compare very favourably with others. The registered offices of the company are 36, College Green, Dublin.

Subsidence at Winchester Cathedral. Within the last week serious reports have been circulated about the stability of Winchester Cathedral, the east end of which has been slowly but surely subsiding. Excavations have been made to ascertain the state of the foundations, which rest on a bed of peaty mould, with a substratum of gravel, and the cathedral authorities, under the advice of their architect, Mr. T. G. Jackson, are endeavouring to check the subsidence at once. It appears that at a depth of about 16ft. there is a stream of water flowing, which may account for the trouble, though it should be pointed out that in the case of St. Paul's, where subsidences on the south side have occurred, the deflection of water-bearing strata by underground tunnelling has been ascribed as the cause. It is generally understood that the east end of Winchester Cathedral was built upon swampy ground, and that the foundations were strengthened by oak piles, which, after the lapse of several centuries, may very possibly be decaying. At any rate, the wall abutting on the Lady Chapel is about 2ft. out of the perpendicular, and a great part of the east end is tilting towards the west exactly to that extent.



ACCEPTED DESIGN FOR THE REBUILDING OF KING'S COLLEGE HOSPITAL AT CAMBERWELL, LONDON, S.E. W. A. PITE, F.R.I.B.A., ARCHITECT

KING'S COLLEGE HOSPITAL COMPETITION.

THE six sets of designs for the new King's College Hospital to be built at Camberwell have been on view since Friday last at Carpenters' Hall. It will be recollected that certain names were put before the Hospital Committee, and as a result the following architects were invited to compete:—Messrs. Edwin T. Hall, W. A. Pite, A. Saxon Snell, Campbell Douglas and A. N. Paterson, William Harvey and J. H. T. Woodd (of Messrs. Woodd & Ainslie).

The Selected Design.

Mr. Pite's design has been placed first by the assessor, Mr. Rowland Plumbe, F.R.I.B.A. We give a perspective and block plan of it herewith. The site has a main frontage to Bessemer Road, and is bordered on one side by Denmark Hill, which causes a fall of about 19ft. from south to north. Mr. Pite, it will be noticed, has grouped his buildings with the administration block in the centre facing Bessemer Road, with the casualty and outpatients' department on one side and the medical school and mortuary on the other, the seven ward blocks being arranged parallel to one another behind, and the isolation block placed at the south-west corner of the site. The administration department provides, on the ground floor of the central block (S), rooms for the resident medical officers and hospital clerks and dressers, with the matron's department on the first floor and servants' bedrooms on the second: the left-hand block (R) comprising nurses' dining-rooms on the ground floor, recreation-rooms on the first floor, and nurses' bedrooms on the second and third floors; the right-hand block (T) comprising sitting-rooms and bedrooms for the resident medical officers on the ground floor and nurses' bedrooms on the floors above; while the central front block (U) provides secretarial and staff rooms on the ground floor, rooms for sisters, matron, &c., on the first, and nurses' bedrooms above. The wards themselves are each 111ft. by 27ft., with a semi-circular private or labour ward, and ward kitchen, &c., opposite, at the entrance, cut off from the rest of the building by a disconnecting corridor. At the opposite end are the usual sanitary annexes.

This plan is carefully-thought-out, but seems to suffer in several respects in regard to light and air. The elevation is rather stale and dull, and the arrangement of the dome and pediment to the administration block is not happy.

The Best Plan.

The best plan in the room is that of design "A" (by Mr. Edwin T. Hall, F.R.I.B.A.). This is very skilfully arranged in every detail, and embodies a very great experience of hospital work. The feature of this plan is that instead of grouping the whole seven ward pavilions side by side at the back of the site, they are arranged alternately north and south of the main corridor, thus securing much better lighting and more air-space around them. The elevations, however, are by no means good, being sadly lacking in proportion, as in the turrets carried up on either side of the pavilions. We understand, too, that the cost of this design is estimated at £400,000; whereas Mr. Pite's works out at £350,000. The administration block is centrally placed facing Bessemer Road, with nurses' home behind, affording pleasant outlooks from the rooms. The eye, ear, throat and skin department and the block for "specials" face Denmark Hill, with the chapel between. Another feature of this plan is the medical school, which is grouped to the right of the administration block and so arranged that students cannot disturb the rest of the hospital.

Mr. Saxon Snell's Design.

So far as general grouping and elevation are concerned, the most pleasing of the designs is that marked (Z), by Mr A. Saxon Snell, F.R.I.B.A. In this the outpatients' department and medical school are kept low on either side of the entrance from Bessemer Road, with casualty and dispensary blocks, chapel and hostel to the left, and medical school, laundry and boiler-house, post-mortem, workshops and isolation block to the right; while the administration building piles up on the higher ground at the rear and forms a fine group. The wards are at the back—three to the left and four to the right of the administration block and nurses' home. Between the outpatients' department and the surgical wards is a block providing ophthalmic wards on the ground floor, a bathing establishment in the basement, and operating rooms on the first floor; and, similarly, on the opposite side of the site is a block of ear and throat wards; while right and left between them are the surgical operating theatre and the medical lecture theatre. The main wards are 109ft. 6ins. by 27ft. The cost of this design is put at £380,000.

Design by Messrs. Douglas and Paterson.

Design "X" is by Messrs. Campbell Douglas and A. N. Paterson. It is accompanied by a large line perspective, presumably done by Mr. Alex. McGibbon. This design, which is estimated to cost £436,079, is somewhat on the lines of Mr. Pite's plan, the administration building occupying a central position facing Bessemer Road, with the outpatients' department on one side and pathological department, post-mortem block, &c., on the other. Most of the ward blocks are behind, though some are brought on to the front side of the main corridor. The medical school faces Denmark Hill.

Designs "B" and "T."

Design "B" has the outpatients' department arranged centrally facing Bessemer Road, with casualty block on one side and resident medical officers' quarters beyond, while on the opposite side are isolation block, laundry, post-mortem and school buildings The ward blocks have an air-space of 86ft. between each (in one case 115ft. 6ins.). Each ward is 116ft. by 27ft. and accommodates twenty-four beds—1,755 cub. ft. of space per bed. The elevation of this design is dignified, and is rendered by a fine black-and-white perspective.

Design "T" has the administration block on the Denmark Hill frontage, with the outpatients' department on one side and the nurses' home on the other. Extending across the site are two long corridors, closed at the further end by the pathological block and mortuary. The medical school, detached, is close to the latter. There are six ward blocks and an isolation block at one side, where also are laundry, boiler-house and workshops. The wards are 101ft. 6ins by 27ft. 9ins.

Reviewing the competition as a whole, it may be said that all the designs exhibit much skill, but that Mr. Hall's is the best plan and Mr. Snell's the best elevation.

"THE TUFTON STREET TATLER."

THE first spasm of "The Tufton Street Tatler or The Purple Patch," issued by the wits of the Architectural Association, is a production of various merit. In part it is laborious humour glibly written, in part it savours of the music-hall "funny-man," and some of it borders on personalities which a discreet editor would avoid; but there are many clever things in its pages, and as the architectural profession is not so delightfully humorous as to be above such aids, we welcome this effort and wish it every success.

Below are some of the best extracts from the first issue:—

THE DAY'S WORK.

I got to the office at half-past ten,
And sat on my stool and sighed;
Poor Jim grew sleek on a pound a week
In this way till he died.

I drew a moulding about a door,
And figured it two by three;
Then feeling weak, I went to seek
A neighbouring A.B.C.

When I came back in the afternoon
That moulding looked too small;
After earnest thought, I felt I ought
To rub out door and all.

Just as I finished, the clock struck five,
And I thought, with a weary sigh,
"It's hard for you to earn your screw
In this way till you die."

Moral.

Do as little as ever you can,
But do it extremely well,
And then, you know, to Heaven you'll go,
Unless you go to H—ll.

He thought he saw an architrave
And eke a pannelled door,
He looked again and saw it was
A ferro-concrete floor.
"These arty men *do* draw," he said,
"As none have drawn before."

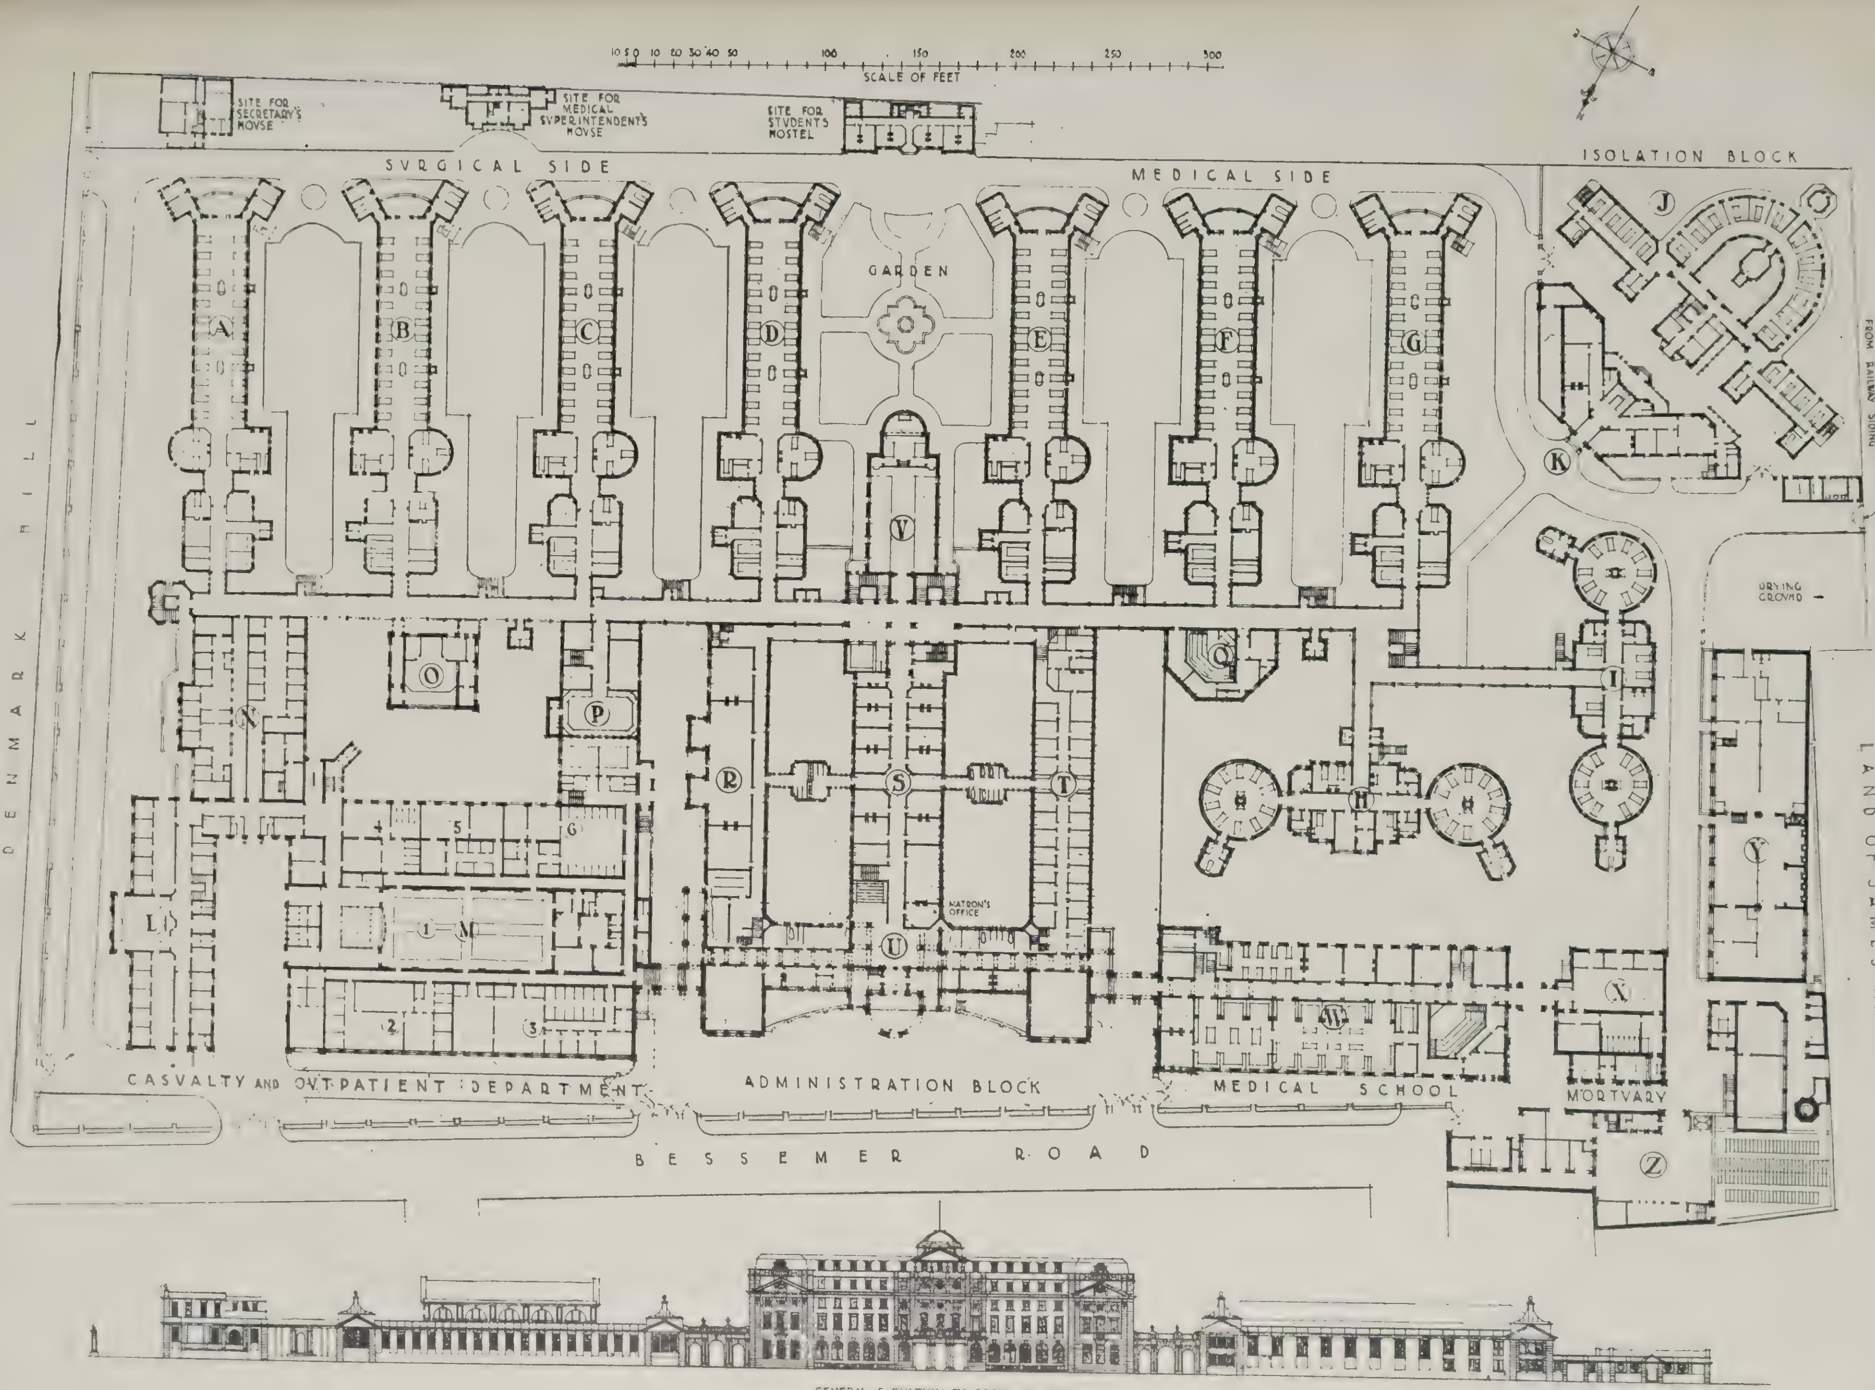
Answers to Correspondents.

W. H. & E. T. H.—Nothing is known about ventilation.

A. M.—Yes, one postcard is quite sufficient both for specification and perspective.

TRY RANCHESTER & LICKARD'S RO-COCOA.—[ADVT.]

The second issue of "The Tufton Street Tatler" will be in September. The price is 6d.



GENERAL ELEVATION TO BESSEMER ROAD

SELECTED DESIGN FOR THE REBUILDING OF KING'S COLLEGE HOSPITAL AT CAMBERWELL, LONDON, S.E. W. A. PITE, F.R.I.B.A., ARCHITECT.

A, B, C, D, E, F, G, ward blocks. H, eye, ear, throat and skin. I, extension. J, isolation. K, administration building for isolation block, and nurses' home. L, casualty. M, outpatients. N, bathing, with electrical section over. O, three operating theatres. P, dispensary with theatres over. Q, medical clinical theatre. R, S, T, U, administration block, with kitchens, stores and servants' living-rooms in basement. V, linen, with future chapel over. W, pathological, medical school buildings and students' club. X, post-mortem. Y, laundry. Z, outbuildings.

HOUSES·AT·WALTON·ON·THAMES· NIVEN·AND·WIGGLESWORTH·ARCHTS

PAINTS AND PAINT-WORK.—III.

(Continued from p. 259, No. 535.)

CHEMISTRY AND PHYSICS.

BEFORE proceeding to a detailed investigation of paints and the conditions to which they are subject we feel it necessary to give a general outline of chemical and physical theory in relation to our particular subject. Though what we say here may not seem to some to be very closely related to the subject we have in hand, nor to go very thoroughly into the chemistry and physics of colour manufacture, it should be explained that this is only intended to be an introduction to what will follow, when the principles here touched on will be elaborated and extended in connection with the exemplary pigments, vehicles, &c.

Modern Science

may be stated to be based upon the dual doctrine of the indestructibility of matter and of energy. Conjointly with this we have the ideas of the convertibility of energy into various kinds, and of matter being composed of elementary substances which can combine with each other.

The sciences included under the heading of physics, we may say, deal with energy, while chemistry deals with the elementary substances and their combination. But seeing that the operations of chemistry both require energy for their action, and develop energy, the connection between the two is so close that no exact division can be made, and we have, perforce, in this article to treat the two branches together. Indeed, it is one of the conceptions of modern science that matter is but a manifestation of energy: which view everything seems to tend to establish.

As the result of experimental work a number of laws or generalisations have been determined which are used as standard instruments of research. They have been tested and put to the proof so often that they seem almost incontrovertible; and their observance enables us to judge with certainty the results of most actions, and to predict with all probability what will be the effect of many new factors. Chemistry is an exact science, and if the circumstances are exactly repeated the same result will always be arrived at. This fact is expressed as the cardinal principle of chemical action—the law of constant and multiple proportions.

The Atomic Theory,

first conceived by Dalton, but considerably modified, has been found a workable hypothesis, and modern chemistry is based upon it. This theory is as follows:—It is assumed that every kind of matter is built up of one or more elementary bodies, which are simple in form and cannot be split up into any others. These elements are found to combine with each other in definite proportions, and it is assumed that every substance is compounded of a number of small atoms (*i.e.*, the smallest particles that can enter into chemical combination). These in different elements are not of the same weight, but bear the same proportion as their combining weights. Thus, 81 parts of zinc oxide (zinc white or Chinese white) is composed of 65 parts of zinc by weight to 16 parts of oxygen, and the theory assumes that in the compound zinc oxide the number of atoms of oxygen is equal to the number of atoms of zinc, but as their proportionate or equivalent combining weights are as 16 and 65, the atom of zinc is assumed to be just over four times as heavy as the oxygen.

Atoms are not considered to exist in their free state, but to be the smallest portions of a body that can enter into a chemical change. In the free state bodies are assumed to exist only as molecules; that is, they are the smallest portions which can exist in that state. Molecules, when in the gaseous state, are almost invariably compounded of two atoms. The atom being the smallest portion of any element which can enter into any combination, the smallest proportionate amount in which it will combine with any other element is taken as its equivalent weight, and in other combinations where the proportion is larger it is assumed that more than one atom is combined with the other constituent or constituents. Some elements will take to themselves one, two, three, up to eight atoms of another, and this power is called valency, atomicity, or quantivalence.

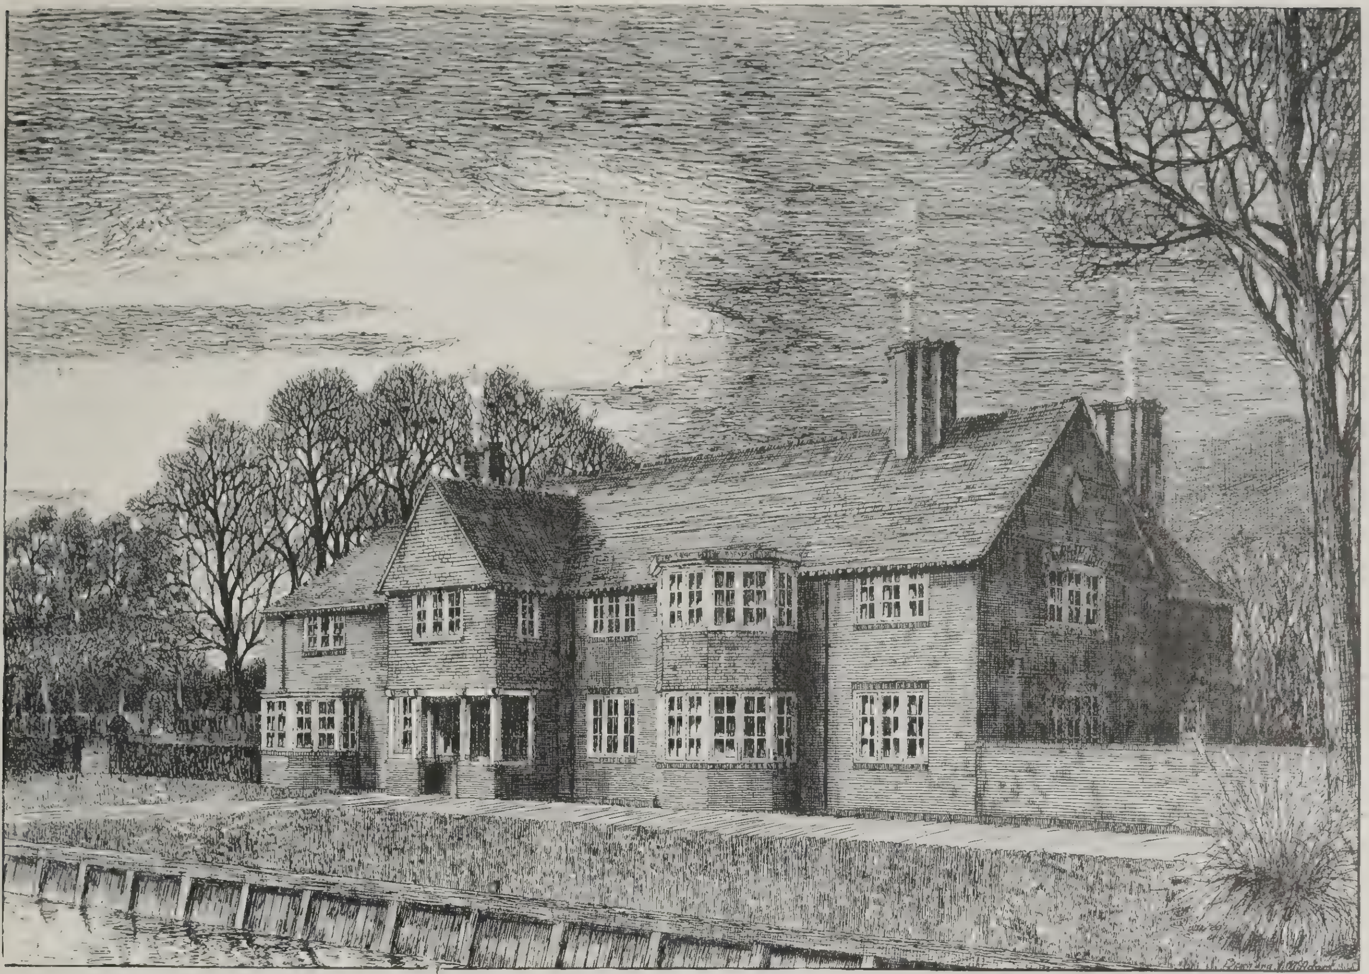
Valency.

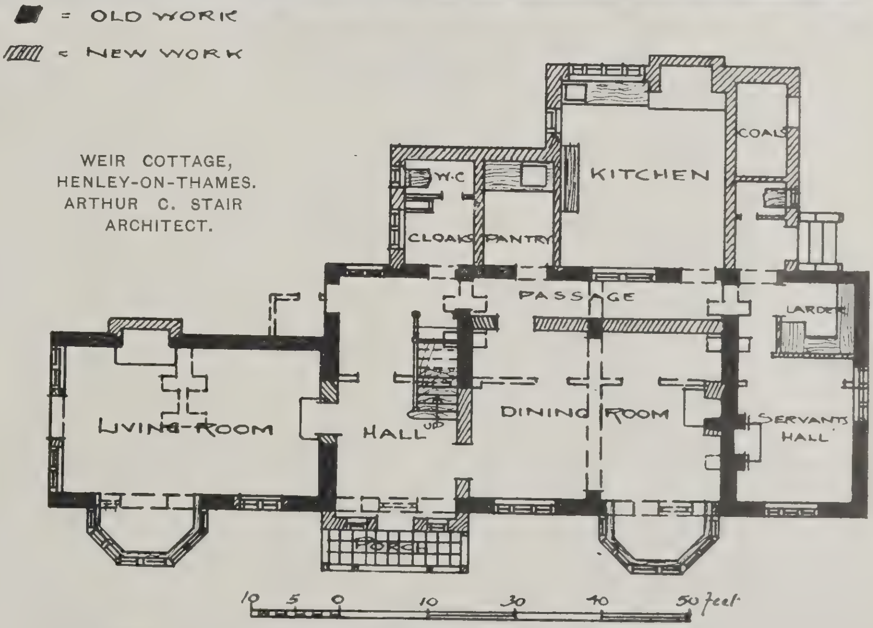
Valency may popularly be compared to the exchangeable value of coins; thus as compared with a farthing a penny is four valued, and as compared with a penny a sixpence is six valued. It is a disputed matter whether the valency is variable or always remains the same, for most of the elements are found to act as though their valency were variable. It seems probable, however, that the valency is invariable, and the apparent variability is due to their being able to satisfy some of their powers for

(*a*) (*b*) (*c*)

COTTAGES AT CAMPDEN, GLOS. C. R. ASHBEE, ARCHITECT.

These cottages are built of Cotswold stone with Cotswold stone slates: (*a*) was built for the Earl of Gainsborough on the ruins of what was once a labourer's cottage; there is a steep fall of 10ft. from back to front, which accounts for the two doors, the lower one to the road being the cellar for coals and storage. (*b*) and (*c*) are for Mr. William Nathon Izod; (*b*) looks out on the High Street; (*c*) shows the back view with its garden.





This house occupies a most important site on the Thames. It formerly consisted of four workmen's cottages, and it has now been converted into a riverside house, the external walls, the principal internal walls (as shown on plan) and the old roof being retained. For the back addition and bays old bricks and tiles have been used to give a uniform appearance. The two principal rooms have square-framed panelling, the dining-room in oak and the living-room in deal painted white. The builders were Messrs. Walden & Cox, of Henley-on-Thames, and the architect was Mr. Arthur C. Stair, of 9, Queen Victoria Street, E.C.

taking up atoms by combining with themselves.

It has been discovered that the quantity of heat an elementary substance will absorb (*i.e.*, its specific heat) is inversely proportionate to its equivalent weight, which is expressed by the law that—the atoms of elementary matter have the same capacity for heat. Again, equal volumes of gases generally contain the same number of molecules when compared at the same temperature and pressure (Avagadro's law); from which it follows that the ratio of the weights of equal volumes of two gases compared at the same temperature and pressure must represent the relative weights of the free molecules of the two bodies. It should be particularly noticed that this gives the molecular weight, not the atomic, though the latter can often be inferred.

Name of Element.	Symbol.	Atomic Weight.
Aluminium - - - - - -	Al^{iv}	27·3
Antimony (Stibium) - - - - -	Sb^{v}	120·0
Arsenic - - - - - -	As^{v}	75·0

Zinc - - - - - - -	Zn	65·0

Atomic Weights.

It is by such methods as these that the atomic weights of elements are determined. Herewith is given a list of elements with which we have to deal, giving their equivalent or atomic weights as compared with hydrogen as the unit. There are a number of others, but they are out of our present province. The list gives the valency or power of combining to its atom one or more monad atoms (that is, those whose powers are unity can only take to each of their atoms one atom of another monad element); this power is shown by the small figures at the right-hand side of the symbols, which last are used as a kind of shorthand sign for each element for the sake of convenience.

A Formula

is a short expression in symbols of the proportion and arrangement of the atoms of the elements in a compound. Thus, ZnO, zinc

NICHOLL'S YARD,
FARNHAM.
DRAWN BY
HAROLD FALKNER.

oxide or zinc white, shows that one atom of zinc (Zn) is combined with one atom of oxygen (O). Again, $Zn(OH)_2$ is the formula for hydroxide of zinc. The small figure $_2$ below the line outside the bracket means that the atoms within the bracket are each doubled, namely, the compound consists of one atom of zinc, two of hydrogen and two of oxygen. The bracket serves to show the arrangement of the atoms in so far that OH is a particular combination of atoms known as a radicle, which enters into the molecule as a distinctive and separate body. If a large figure is placed before a formula, as $2Zn(OH)_2$, it means that each part is repeated, that is, there are two of the molecules of zinc hydroxide; thus there are two atoms of zinc, four of oxygen and four of hydrogen.

We can at this juncture explain the meaning of a chemical equation. If to the zinc oxide is added sulphuric acid, water and zinc sulphate are formed. This is expressed by the following equation:—

$$ZnO + H_2SO_4 = ZnSO_4 + H_2O.$$

Now, what does this express? Zn is the symbol for zinc, O for oxygen, H for hydrogen and S for sulphur. ZnO, of course, is zinc oxide, and as zinc has an atomic weight of 65 and oxygen 16, we see that the value of this compound in the reaction is 81. Similarly, the H_2SO_4, standing for the sulphuric acid, has a value of 98, and the products zinc sulphate, $ZnSO_4$, and water, H_2O, have the values 161 and 18 respectively. This shows us that if 98 ozs. of sulphuric acid are added to 81 ozs. of zinc oxide, 161 ozs. of zinc sulphate and 18 ozs. of water are produced. So that this chemical shorthand expresses not only the qualitative but also the quantitative composition of a compound.

A Chemical Compound,

it should be especially noticed, is not a mere mixture which could be separated by mechanical means, but has undergone an entire change of properties by reason of chemical combination, and the constituents can only be separated again by chemical action.

The elements can be divided roughly into two classes, metals and non-metals. The latter given in the table are arsenic, boron, bromine, carbon, chlorine, fluorine, hydrogen, nitrogen, oxygen, phosphorus, silicon and sulphur. The metals have the characteristic metallic lustre, and conduct heat and electricity. The molecular structure of a metal is entirely different from that of a non-metal.

A common division of chemical compounds is into acids, alkalis and salts. All the acids contain hydrogen, which is displaced by a metal in the formation of salts. The acids containing one atom of replaceable hydrogen are known as monobasic acids; those containing two, three or four, dibasic, tribasic and tetrabasic acids respectively. Generally it may be said monobasic acids are the only members of the class which do not form acid salts.

Liquids in Paints.

Matter appears in three states of aggregation, namely, the gaseous, the liquid and the solid state. The two last we have to deal with in paints.

Molecules have an attractive force for each other, and also a moving force tending to separate them. It is the mutual relation of these forces which determines the molecular state of a body, whether it be solid, liquid or gaseous. Molecular attraction is only exerted at infinitely small distances; it is designated by the terms cohesion, affinity or adhesion Cohesion is the force which unites adjacent molecules of the same kind; it is strongly exerted in solids, less strongly in liquids, and hardly at all in gases. Its strength decreases as the temperature rises because the moving force of the molecules increases. Hence solid bodies become first liquid and then gaseous as they are heated. Chemical affinity or chemical attraction is the force which is exerted between molecules not of the same kind. Adhesion is the molecular attraction exerted between the surfaces of bodies in contact.

Matter in a liquid state has a relatively easy mobility of its particles. The fluidity of a liquid is not perfect, the particles always adhering to each other. This property is called viscosity. Liquids have a characteristic property of dissolving solids to form solutions. The term also applies to the mixture of two liquids.

Specific gravity of substances is usually determined with liquids. The specific gravity is the comparative weight of a unit volume of the body to the weight of the same volume of distilled water at a temperature of 4 degs. C.

Solids in Paints.

We are just as much concerned with matter in the solid state of aggregation in paints as with liquids. An elastic body is one which, when deformed under the application of an external force, will recover its original dimensions when the deforming force has been removed. A plastic body is one which will not.

A characteristic property of solid bodies is crystallization. A crystal may be defined as a homogeneous body in which the different physical properties conduct themselves differently in the different directions radiating from one of its points. Minerals are defined and determined by the study of two properties which they possess, namely, chemical composition and crystalline form. The properties of crystals may be divided under the heads of general (such as density, specific heat, temperature of fusion and chemical composition), and directional (such as cohesion, elasticity, and numerous optical, thermal, electric and magnetic properties, and, as well, the crystalline form). If a mineral has all its directional properties in the same direction, it is said to be amorphous, and when some of them vary with the direction they are said to be crystallized. An amorphous material has no characteristic shape (such as a powder or glass), but every crystallized material has one, a body exhibiting its characteristic shape being called "a crystal." The form of a crystal is supposed to be due to the orderly arrangement of the particles, whereas in solution and in the liquid or gaseous condition the particles are free to move in all directions.

A.A. Camera and Cycling Club: Whitsuntide Excursion to Belgium.—The Architectural Association Camera and Cycling Club have arranged an excursion to Belgium for Whitsuntide, leaving Charing Cross Station on Friday, June 9th, by the 9 p.m. train. Bruges will be the headquarters. All communications should be addressed to Mr. Gilbert H. Lovegrove, 18, Foxgrove Road, Beckenham.

IN PARLIAMENT.

(By Our Press Gallery Representative.)

ON May 15th Mr. Atherley Jones introduced the

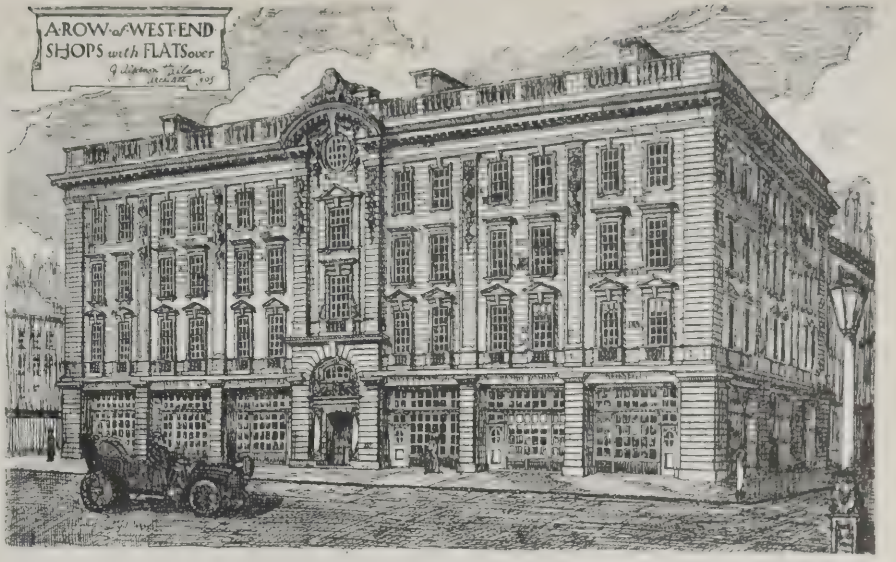
Architects' Registration Bill.

This consists of forty-four clauses, and provides first of all for the creation of a General Council of Architectural Education and Registration of the United Kingdom, with branch councils for England, Scotland and Ireland. Five members of the General Council are to be nominated by the Crown (three of them for England and Wales and one each for Scotland and Ireland). Five architects are to be chosen as members by the Royal Institute of British Architects (three for England and Wales and one each for Scotland and Ireland); one by the Royal Academy of Arts; one by the Royal Institute of the Architects of Ireland; two by the Society of Architects; five by members of provincial societies qualified to register (three for England and Wales and one each for Scotland and Ireland); and nine by registered practitioners (five for England and Wales and two each for Scotland and Ireland). The members shall be chosen and nominated for a period not exceeding five years, and the president shall be elected for a period not exceeding three years.

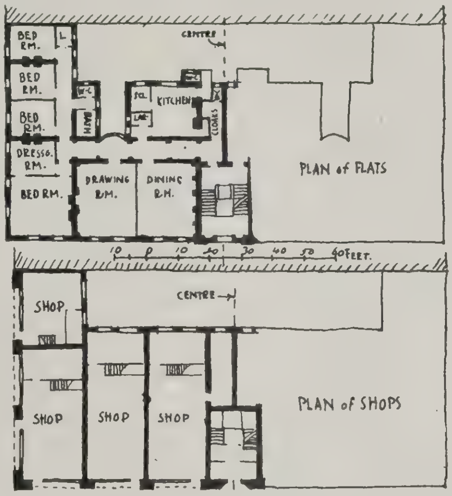
The Privy Council shall appoint the place of the first meeting. An elaborate set of clauses provides the machinery for election. The charters of the Royal Institute of British Architects are to remain in force, and provision is made for the appointment by the General Council and branch councils of a registrar and other officers. Removal of names from the register may be done at the request of the person whose name is to be removed; where a name has been incorrectly or fraudulently entered; where a person registered has, after the passing of the Act, been convicted of an offence which if committed in England would be a misdemeanour or higher offence; or where a person registered is shown to have been guilty after his registration of any conduct infamous in a professional respect A name may be restored by resolution of the General Council.

The Qualified.

Those qualified to be registered are—persons who at the date of the passing of the Act are fellows or associates of the Royal Institute of British Architects, members of the Society of Architects, professional members of any architectural society affiliated with the Royal Institute of British Architects; persons proving to the satisfaction of the General Council that they were practising architecture prior to January 1st, 1895, and are still so practising; or who have served as apprentices, assistants or practitioners in architecture for twelve years in the aggregate after attaining the age of fifteen years. An applicant for admission after the passing of the Act must be over twenty-one years of age, must have served as apprentice for not less than three years with a registered practitioner, and must have passed such examinations as the General Council shall authorize. Registered practitioners shall pay in advance an annual renewal fee of 20s., but there are fees of £5 and £3 payable on registration by different classes of persons qualified at the date of the passing of the Act. Other clauses deal with the penalty on unregistered persons using the title of architect or any title implying that he is registered, the machinery for holding examinations, the registration of branch registers, evidence of qualification, publication of the register and other matters. None but registered persons are to be entitled to recover charges or hold public appointments unless they already hold them. Colonial and foreign practitioners with recognized diplomas are to be allowed to register, their names being kept on a separate list. The Bill is backed by Sir William Coddington, Mr. Wallace and Sir Christopher Furness.



The idea in planning this design was to get as many shops as possible into the main frontage, which is 140ft. As will be seen from the sketch plan, there are six shops on the front and one shop in each side street, the entrance to the flats being in the centre of the main front. The flats are planned to get two suites on each of the three floors, the rooms being of good size and not cramped and ill-lighted; the w.c. and bath having a little disconnecting lobby. The caretaker's quarters are in the roof. The elevations are intended to be in Portland stone, the building to present a homogeneous appearance, with an absence of any of the restless detail usually seen in buildings of this class.



New Government Buildings.

Mr. Cohen asked Lord Balcarres whether there had been any cessation in the external work of the Government buildings at the south end of Parliament Street.

Lord Balcarres said the answer to the first part of the question was in the negative. The scaffolding would probably be ready for removal in about a year's time.

Irish Slates.

Mr. Field asked the Chief Secretary for Ireland whether he was aware that the Commissioners of National Education in Ireland were inviting tenders for the erection of buildings at Glasnevin, and that a supply of Westmoreland slates was specified; and seeing that Irish slates of first-class quality could be supplied at a much lower cost, whether arrangements would be made to allow of competition between Irish and English slates.

Mr. Long replied that the fact was as stated in the first enquiry, but the Commissioners informed him that their architect would be instructed to allow any contractor who so desired to submit an alternative tender for the supply of Irish slates. The Commissioners would further consider the matter when selecting a contractor for the works.

STRENGTH OF CONCRETE STEEL BEAM.

By Henry Adams, M.I.C.E.

TAKING a 12 × 6 concrete beam with $\frac{1}{60}$ of the area in steel reinforcement, 2ins. from the bottom, the strength by the Kahn formula will be found as follows:—

Let E_s = modulus of elasticity of steel = 30,000,000.

E_c = modulus of elasticity of concrete = 2,000,000.

F = ultimate tensile strength of steel = 64,000.

f_t = ultimate tensile strength of concrete = 200.

f_c = ultimate compressive strength of concrete = 3,000.

a = area of metal, b = breadth of beam.

d = depth of beam to centre of reinforcement.

y = distance from centre of reinforcement to neutral axis.

Then $y = \frac{15a + bd^2}{30a + 2bd}$, and moment of resistance $= \left\{\frac{5}{8}(d - y) + y\right\}aF + \frac{f_t b y^2}{3}$. Breadth of beam not less than $\frac{aF}{1800(d - y)}$. Safe load one-fourth or one-fifth. Then $a = \frac{12 \times 6}{60} = 1{\cdot}2$ sq. ins.,

$$y = \frac{15 \times 1{\cdot}2 + 6 \times 10^2}{30 \times 1{\cdot}2 + 2 \times 6 \times 10} = \frac{18 + 600}{36 + 120} = \frac{618}{156} = 3{\cdot}96 \text{ ins.}$$

Ultimate moment of resistance $= \left\{\frac{5}{8}(10 - 3{\cdot}96) + 3{\cdot}96\right\}1{\cdot}2 \times 64{,}000 + \frac{200 \times 6 \times 3{\cdot}96^2}{3} = 600{,}320{\cdot}64$. Taking a span of 12ft. and the load W uniformly distributed, the beam being simply supported at the ends, $\frac{WL}{8} = 600{,}320{\cdot}64$, whence

$$W = \frac{600{,}320{\cdot}64 \times 8}{12 \times 12} = 33{,}351 \text{ lbs.} = 300 \text{ cwts.}$$

breaking load. Allowing a factor of safety of 6, the safe load will thus be $\frac{300}{6} = 50$ cwts

By another method, $M = f\frac{I}{y} = 500\,\frac{864}{6} =$ 72,000 lb.-ins. resistance of concrete. For steel $f = 15{,}000$ lbs. per sq. in.; then $15{,}000 \times 1{\cdot}2 \times 4 = 72{,}000$ lb.-ins. Then $\frac{WL}{8} = 72{,}000 + 72{,}000$, whence for 12ft. span $W = \frac{8(72{,}000 + 72{,}000)}{12 \times 12} = 8{,}000$ lbs. $= 71{\cdot}4$ cwts. safe load.

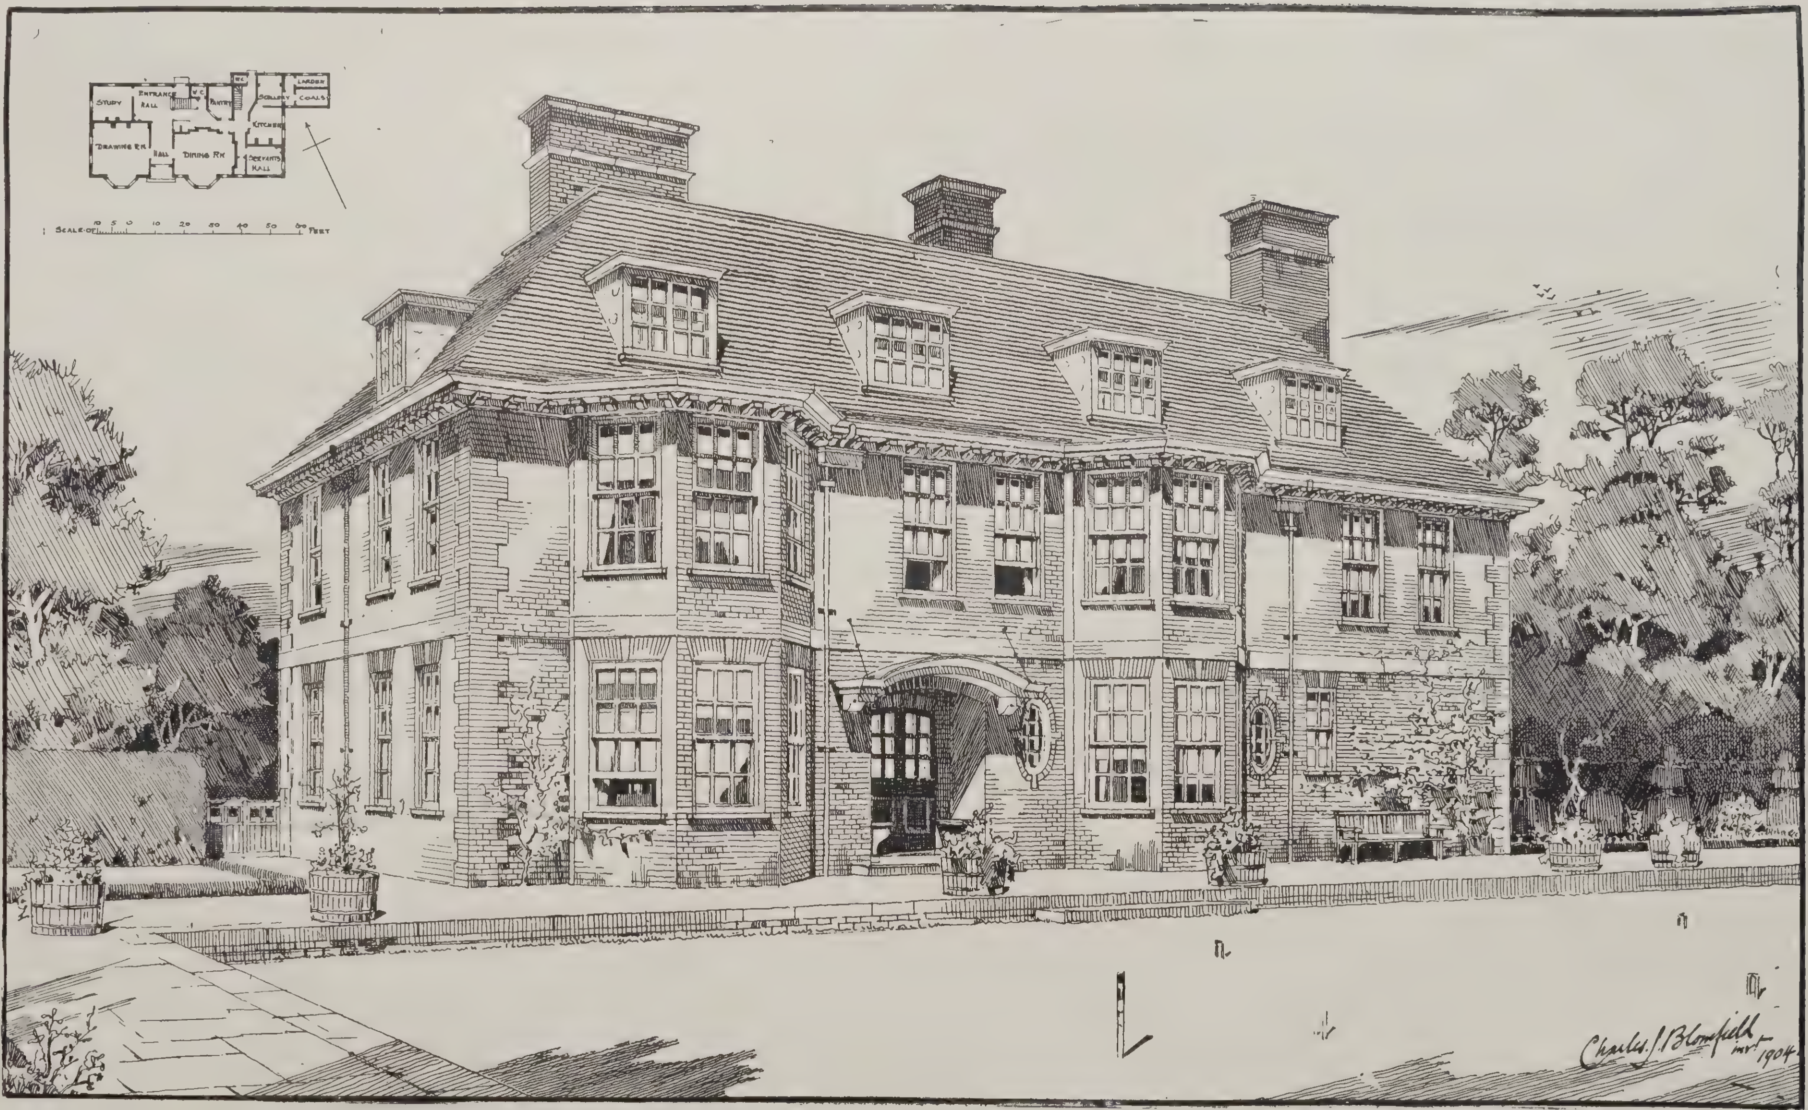
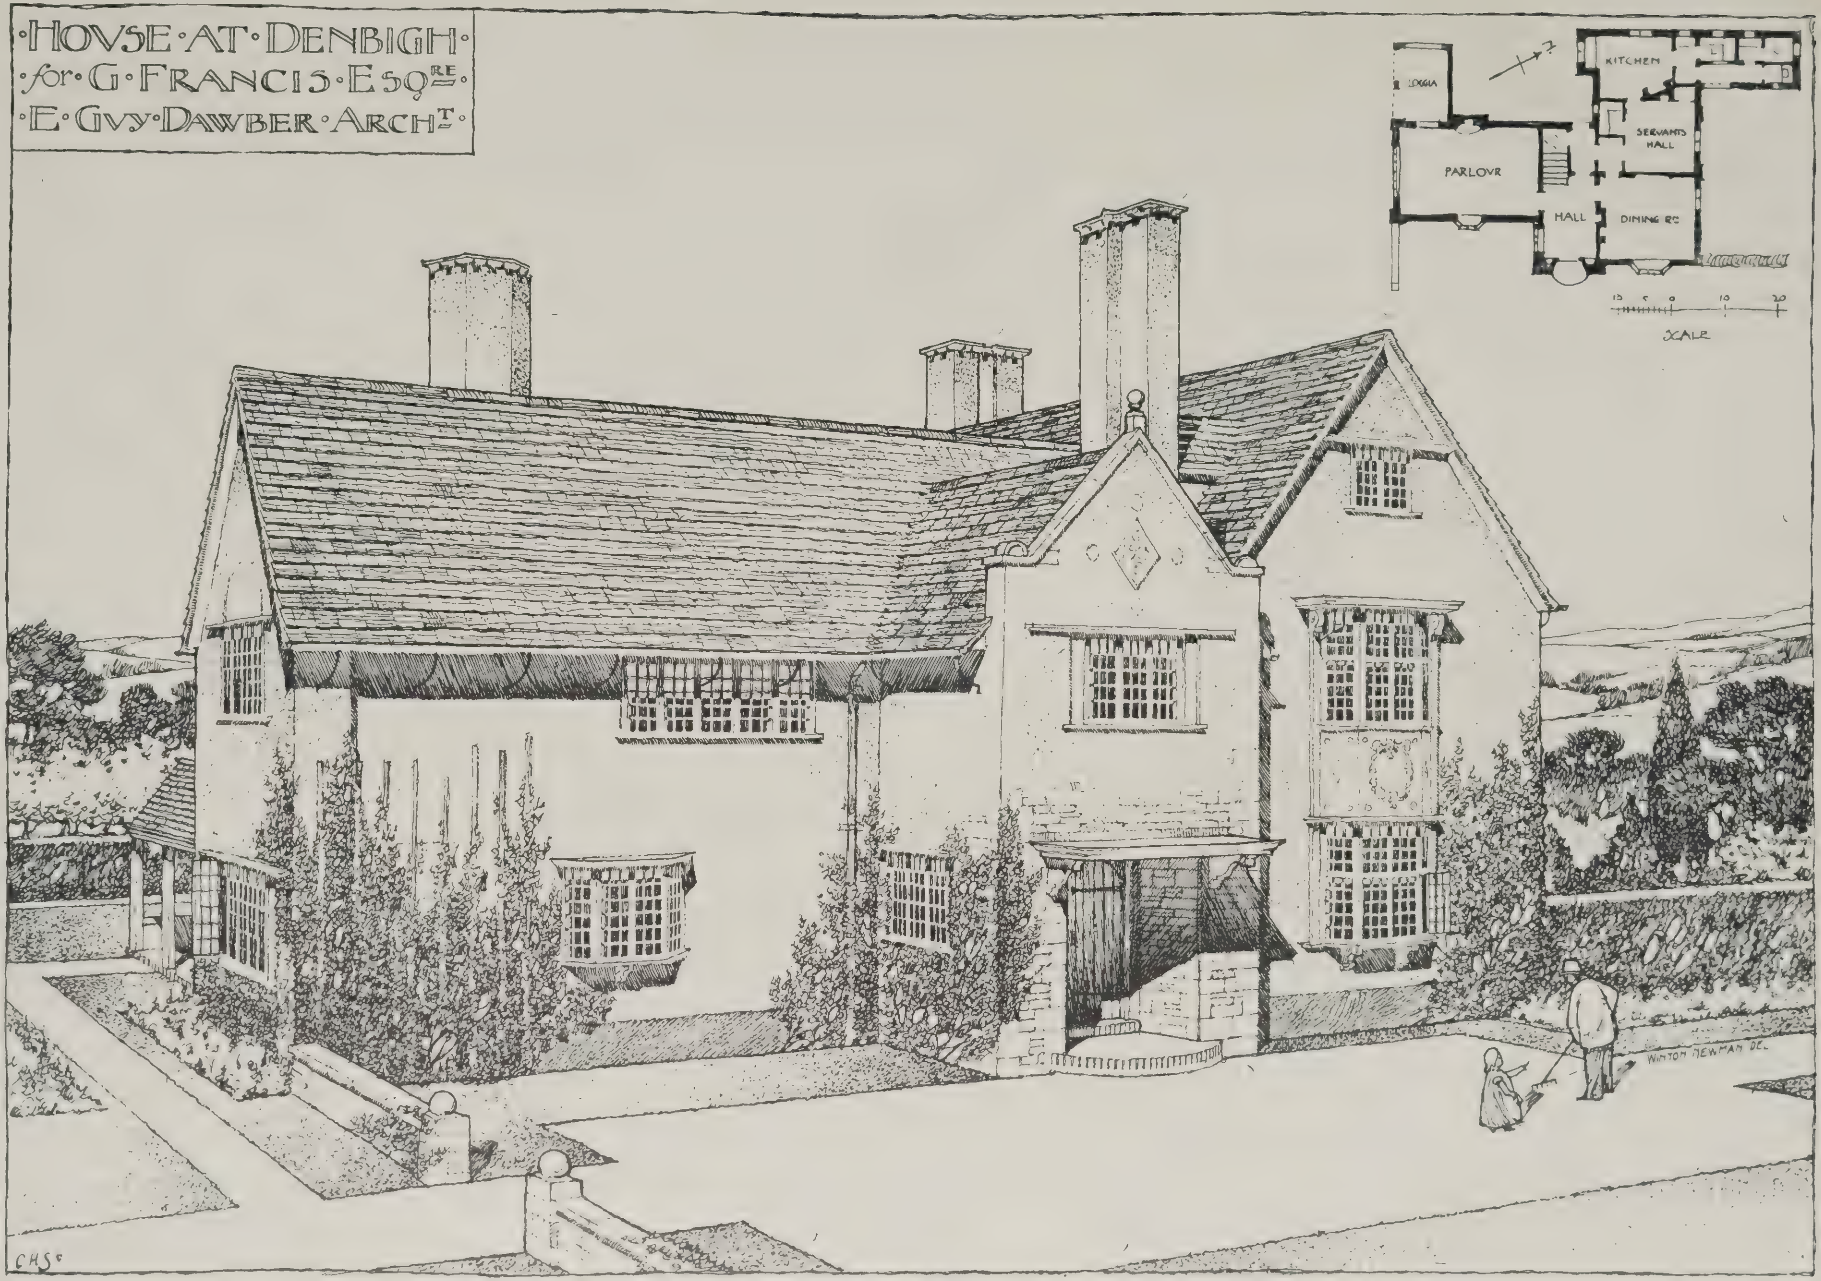
Wednesday, May 31st, 1905.



HOUSE AT STANSTED, ESSEX. CHARLES J. BLOMFIELD, F.R.I.B.A., ARCHITECT. *(Royal Academy Exhibition, 1905.)*

This house is now in course of erection for Mr. Harry Chester. The walls are built of Fletton bricks, faced with red bricks from Sible Hedingham. The roof will be covered with red tiles. The accommodation, other than that shown on the ground-floor plan, consists on the first floor of four bedrooms, dressing-room, bathroom, w.c., linen closet, housemaid's closet, and day and night nursery; on the attic floor a schoolroom, four bedrooms, housemaid's closet, w.c. and cisterns. The work is being carried out by Mr. Daniel Robinson, junr., builder, of Stansted.

Supplement to
The Builders' Journal and Architectural Record.
Wednesday, May 31st, 1905.



(Royal Academy Exhibition, 1905.)

This house is rough-casted, with green Welsh slates on the roof and old stone in the entrance gable.

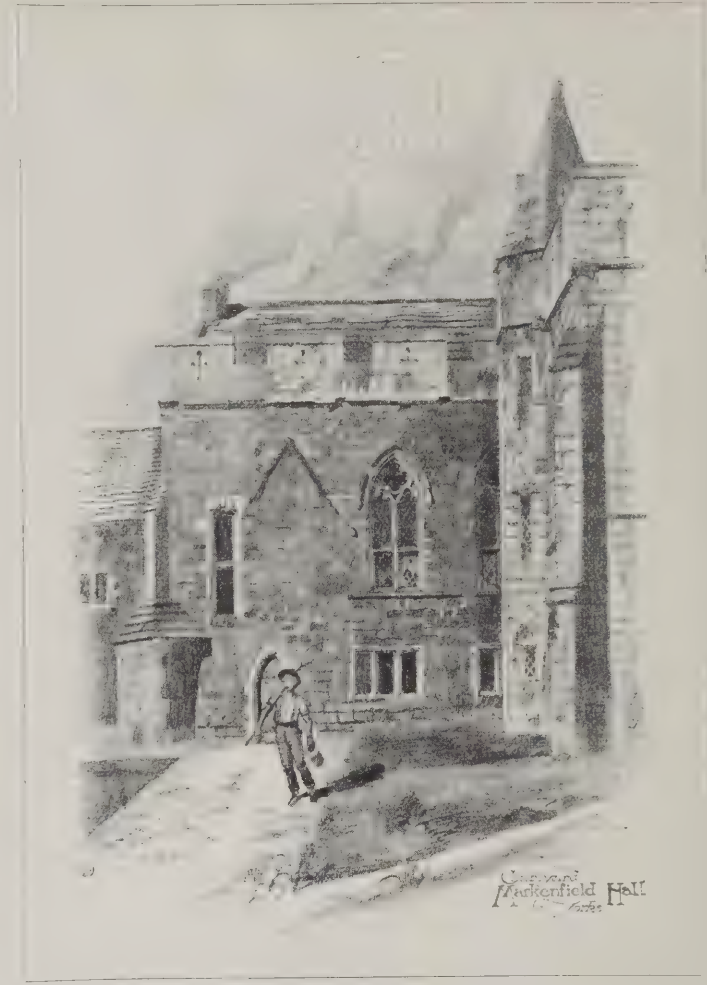
HOME ARTS AND CRAFTS.

THE Home Arts and Industries annual exhibition was opened at the Royal Albert Hall, S.W., by Princess Henry of Battenberg last Wednesday. For the first time the great floor of the Royal Albert Hall had been used for the purpose. 125 classes exhibited, sending work from all parts of the British Islands.

Many of the Home Art classes exhibited several kinds of work; 47 exhibited woodwork (carved for the most part), 9 inlaid woodwork, 24 metal (chiefly repoussé brass and copper, some wrought-iron and a little enamel), 4 pottery, and others lace, embroidery, carpets, silks, &c.

One of the chief features of the exhibition was the stand of the Compton class, promoted by the late G. F. Watts; most of the beautiful terra-cotta and pottery work was to the special designs of Mrs. Watts. Other noteworthy exhibits were by Mr. Frank Rosier, a woodcarver of Sussex, the Birkenhead Della Robbia pottery, and the Ruskin pottery from Birmingham. The aim of the Association is to encourage the practice of handicrafts and revive old ones, more especially in villages and country-places out of touch with the organizations for art and technical instruction enjoyed by large towns. The classes commence usually by purely voluntary effort on the part of those who have the welfare of country dwellers or working people at heart A class may in time develop into an industry doing work sufficiently well to attract regular custom and thus to become self-supporting. It is then known as a "Developed Industry."

The Association assists classes by the loan of designs, models and leaflets of elementary instruction, and gives assistance generally. Architects would do well to seek the aid of these crafts classes in the execution of work to their designs.



DRAWN BY EDWARD WALKER.

Law Cases.

Light and Air Case.—On Friday last in the Chancery Division of the High Court of Justice judgment was given in the important light and air case of *Higgins* v. *Betts*. This concerned the erection of a warehouse and an addition to some premises in Cowcross Street, E.C., which, it was alleged, obstructed the ancient lights of the "Red Lion" public-house opposite. Mr. Justice Farwell, in delivering judgment, said he had taken into account the House of Lords decision in *Colls* v. *Home and Colonial Stores*, and also the recent cases of *Kine* v. *Jolly* and *Ambler* v. *Gordon*. He said that, apart from express contract or grant, the owner of a house had no right to any access of light to the windows over his neighbour's land until he had acquired it by prescription or under the Act. When he had so acquired it, he had a house with an easement of light attached to it, and any substantial interference with his comfortable use and enjoyment of his house, according to the usages of ordinary persons in that locality, was actionable as a nuisance at common law. But the dominant owner was never entitled to all the light that came through his windows. It was not enough to show that some light had been taken, but the question always was whether so much had been taken as to cause a nuisance. With regard to the present case, his Lordship said it was clear that the plaintiff's saloon bar was materially affected, with serious results to the business carried on there, and that the dining-room on the first floor was extremely affected. In that room the plaintiff was left only 32 degs. of light out of a former 67 degs. The pot-house was also affected, and the staircase and scullery on the first floor to some extent. As the result, he found as a fact that there was a substantial privation of light sufficient to render the occupation of the house uncomfortable and to prevent the plaintiff from carrying on his accustomed business as beneficially as he had formerly done. He granted an injunction in the *Yates* v. *Jack* form, with the addition of the words "so as to be a nuisance" and with qualifications counsel had agreed on.

Correspondence.

Stalls.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In Mr. H. L. North's plan for a mission church near Conway, North Wales, given on p. 287 of your issue for last week, the stalls are shown to the rear (north and south) of the font, and are situated at the extreme west end; and they all face due east. This is entirely at variance with English precedent and tradition. The plan gives plenty of room for them in the chancel, in which a couple of priests' seats and desks are placed, all alone in their glory.

In Germany the Lutheran churches very generally ignore stalls, *i.e.*, in the position where—according to our accepted notions—stalls ought to occur. This is the case, for instance, in the very disappointing new cathedral at Berlin. Further, in the United States I have seen the choirs (mixed) stuck up at the western end—but why such a course should be adopted for a new mission church in this country is not at all clear.

Perhaps Mr. North has good reasons for thrusting the choirmen and singing boys behind everyone else—thus leaving the chancel practically empty. If so, it will be interesting, and possibly instructive, to learn why so unusual a course has been adopted.—Yours truly, HARRY HEMS.

Worm Holes in Oak Dado.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the query by "Perplexed" on p. 293 of your issue for last week, we beg to point out that "Powellized" wood will effectually resist the attacks of worms and the further encroachment of these pests in wood which is partially decayed. This process should appeal forcibly to owners of valuable furniture, and for wall-panelling and dadoes. We should be pleased to furnish details of the process to any reader on application.—Yours truly,

THE POWELL WOOD-PROCESS SYNDICATE, LTD.
28, FLEET STREET, E.C.

Obituary.

The late Col. Bird died worth £12,000. He bequeathed £200 to the Timber Trades' Benevolent Society.

Mr. John Tweedale, F.R.I.B.A., for twenty-six years a partner in the firm of Smith & Tweedale, architects, of Leeds, died recently in his fifty-second year.

Mr. William Drew, head of the firm of William Drew & Sons, architects, of Swindon, died on May 15th, aged 67. He did a considerable amount of school work, and was the architect of the Clarence Street Schools, Swindon.

Mr. W. W. Freeman, a well-known Chester builder and contractor, died recently, aged 63. He was associated with the building of Chester Town Hall, and when a portion of the building was destroyed by fire a few years ago Mr. Freeman restored it. He also built the Chester isolation hospital and the public baths.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

An Arbitration Case.

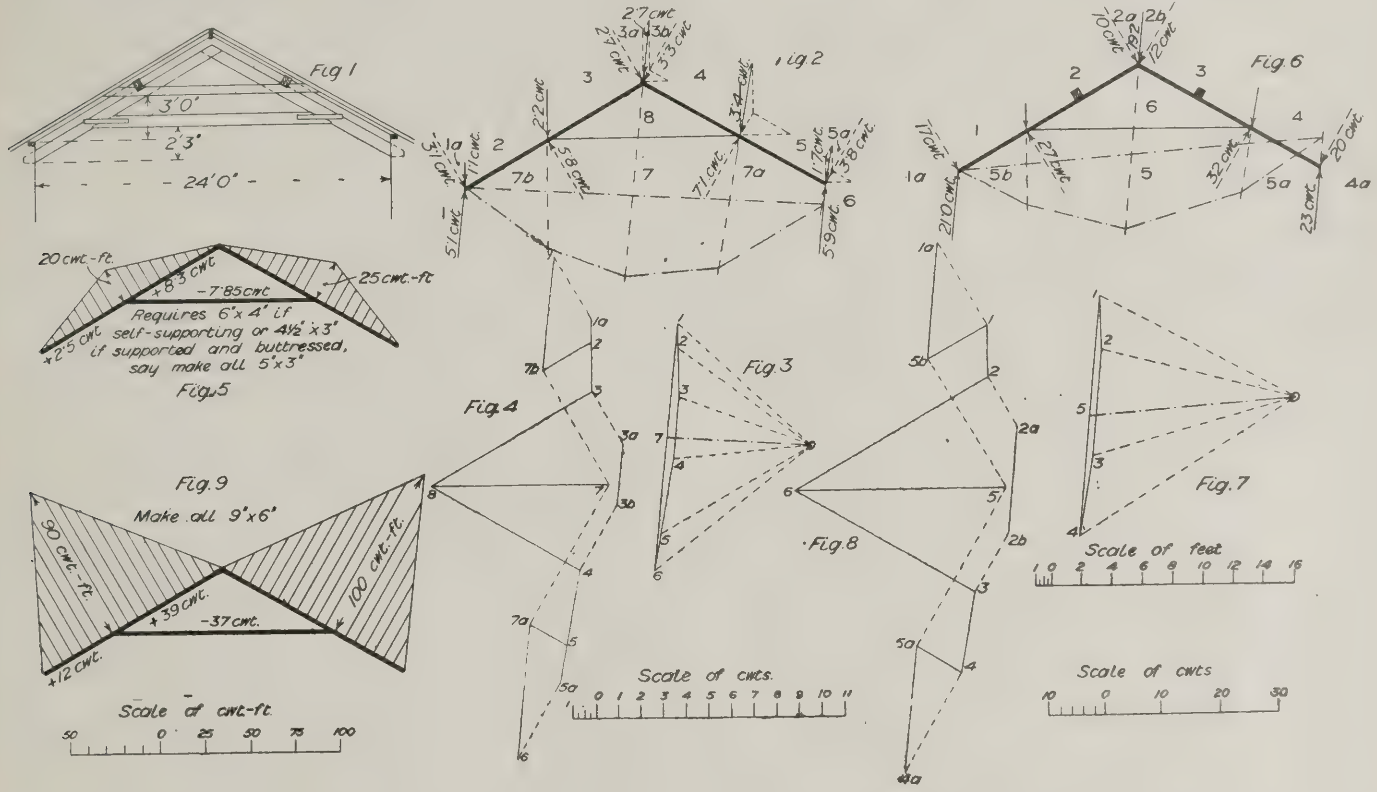
X. writes: "I have lately been connected with an arbitration case which is proceeding in Scotland. Two points have arisen upon which I am greatly in doubt. What I want to know is how far the production of private letters can be insisted on by the arbiter, and also whether 'provisions' in a contract are to be treated as extras or not when measuring up. The facts of the case are briefly these: – The building owner (an electricity company) is being sued by a builder for the amount of a contract and extras. A chimney stalk erected (partially) had to be pulled down by the building owner and rebuilt by the builder. The resident engineer for the building owner was named in the contract to act as clerk of works to the architect, but he also of course at times practically acted as client to the architect A call was made for the letters from the clerk of works to the architect. This was resisted by the building owner because most of the letters are between the resident engineer and the architect, and practically amount to letters between client and architect. Are not these privileged? They certainly contain a lot of private information between the client and architect, and are not letters that would pass between an architect and clerk of works. The call was also resisted because of alleged libels on the builder in the letters. However, the arbiter would not recognize this, and said he would edit the letters to avoid any libel action. Can the arbiter force production? Also, many extras were done without written order. The building owner is resisting these, hoping to save at least some of the costs of the arbitration. The contract is a lump-sum contract. The quantities are part of the contract."

The questions raised by this enquiry are exceptionally complicated, especially as the facts as given are not full enough to permit of a confident opinion being expressed. With regard, firstly, to the correspondence which passed between the clerk of works and the building owner, I think that this should be produced. If the building owner refuses, then a *subpœna duces tecum* should issue against the person in whose custody the correspondence is (see Arbitration Act, 1889, section 18). If the clerk of works has been so negligent as to mix up his correspondence, as is suggested, he and his employer must take the consequences of this negligence. But of course if no letter passed between the clerk of works (*qua* clerk of works) and building owner there is nothing to produce. As it was expressly agreed that "extras were to have written orders," there is nothing due, strictly speaking, for any extras not so ordered. As to the "provisions," I do not quite appreciate the exact meaning of this term, but if the building owner provides for a payment of £30 6s. 7d. for work which has been done it is certainly due to the builder, although the difference between £30 6s. 7d. and £50 4s. 9d. appears to be an "extra" and so not recoverable. At the same time the clause for £50 for contingencies might include extras (not ordered in writing) up to that figure: it depends on the wording of the clause. Let the intention of the parties as expressed or implied by custom be your guide as far as possible. As to cases, I might refer you to Mew's "Digest of Case Law" under the headings of Building Contracts and Arbitration, &c. S. P. J. MERLIN.

Scantlings for Collar-Beam Roof.

WIMBLEDON. — COLLAR writes: "I am unable to find in the text-books the proper method of calculating the scantlings for a collar-beam or 'A' roof principal. Please give the working-out of an example – say 24ft. span, pitch 30 degs., with covering of slate, timber northern pine, trusses 10ft. centre to centre."

The roof shown, of which Fig. 1 is an outline, is a rather peculiar double-truss, compounded of two separate collar-beam trusses – one composed of the pair of common rafters and ceiling joist, and the other of the principal rafters and collar. The dead load on the former trusses may be taken at 28lbs. per ft. super. acting vertically, and the wind force 28lbs. per ft. super. acting horizontally; and assuming the rafters to be 15ins. centre to centre, and none of the load transmitted to the purlins, the frame diagram will be as Fig. 2, reaction diagram as Fig. 3 and the stress diagram as Fig. 4. The maximum stresses and scantlings would then be as marked on Fig. 5. Assuming that the purlins transmit half the load to the lower trusses, and that the walls are not buttressed, the frame diagram will be as Fig. 6, reaction diagram as Fig. 7, the stress diagram Fig. 8, the maximum stresses and scantling as Fig. 9. The details of the method of working were given in "Building World," Nos. 486 and 496 (Cassell & Co., 3d.). HENRY ADAMS.



COLLAR-BEAM ROOF.

Buildings to Measure near Ipswich.

IPSWICH. — STUDENT writes: "Are there any buildings suitable to measure for the R.I.B.A. intermediate examination in the neighbourhood of Ipswich?"

Perpendicular churches at Hadleigh, Boxford, East Bergholt, Stratford St. Mary and Letheringham should furnish you with ample work for the R.I.B.A. intermediate examination. L. G. R.

Cycling Tours.

DARLASTON. — E. G. D. writes: "Which is the best cycling route (architecturally) and the buildings of interest thereon: (*a*) Cirencester to Wells *via* Bath; (*b*) Wells to Salisbury; (*c*) Chichester to Canterbury?"

Cirencester to Wells via Bath. — Leaving Cirencester, proceed along Akeman Street to Marshfield (church) and Cold Ashton (church) to Bath, where Prior Park, the work of John Wood, should be visited. Between Bath and Wells there is nothing of any architectural interest, but Glastonbury Abbey, a few miles south of Wells, is a good example of a Cistercian monastery, and if a sketching permit is required it should be obtained in advance. *Wells to Salisbury.* — From Wells take the road through Shepton Mallet (church) to Frome (church); then branch off to Longleaf Park, where a fine Jacobean residence is to be seen; then on to Warminster (church). From here follow the railway to Salisbury, passing through the following places, all of which contain interesting churches — Heytesbury, Codford St. Peter, Fisherton de la Mere, Stapleford, South Newton. Wilton House deserves notice; it is near the main road. *Chichester to Canterbury.*—There are many routes that might be taken through Sussex, but perhaps the most direct is through Petworth (church), Billinghurst (church), Horsham (church), East Grinstead, Penhurst, Chiddingstone (church), Hadlow Castle, Yalding (church), Maidstone (church), Lydd (church), Lenham (church), Chilham, Chantham (church), Canterbury. L. G. R.

Reductions in Brickwork.

Oldham.—Zaandam writes: "A specification states that '*all* brickwork, including hollows, has been reduced to one brick (9ins.) thick, unless otherwise stated.' Would this apply to the facing bricks? Bill sent."

The "hollows" referred to are presumably "openings" such as are taken in the "Northern" system of measuring. The description as to measurement of brickwork leaves the "facing" a doubtful item both as regards the facing itself and the hollows. Only the person preparing the bill could answer your question definitely.

W. E. D.

OUR PLATES.

SOLOM'S COURT, Surrey, is built of grey bricks, rough-cast, and tiled roof. Particulars of the houses at Stansted and Denbigh are given under the illustrations.

Competitions.

Worthing Public Library and School.—The awards in this competition are as follows:—1st, Mr. H. A. Crouch; 2nd, Messrs. Lanchester & Rickards; 3rd, Messrs. S. B. Russell & T. Edwin Cooper—all of London.

Radcliffe Public Free Library, Manchester.—For this building, which is to be erected in Stand Lane, forty-eight sets of drawings have been received from architects in open competition. The committee have appointed Mr. G. H. Willoughby, F.R.I.B.A., of Manchester, to act as assessor.

Keystones.

Four large new Spinning Mills are to be built at Manchester.

New Washhouses for Dundee are to be erected in Miller's Wynd at a cost of between £6,000 and £7,000.

Wooler Parish Church, Newcastle-on-Tyne, is proposed to be re-modelled from designs by Mr. C. R. Baker King, A.R.I.B.A., of London.

The new Public Library at King's Lynn, opened recently by Mr. Andrew Carnegie, was designed by Herbert J. Green, architect and diocesan surveyor, of Norwich, King's Lynn and Lowestoft.

A new Wesleyan Chapel and Schools at Leeds is being erected in Dewsbury Road, at a total estimated cost of £10,500, from designs by Messrs. Danby & Simpson, architects, of Leeds. The chief contractors are Messrs. W. H. Dews & Co. and Messrs. W. Airey & Son.

Architectural Association of Ireland.—The last general meeting of the session was held on May 23rd. Mr. H. Allberry, A.R.I.B.A., was elected president for the ensuing year, and Messrs. F. Hayes and G. F. Beckett were elected vice-presidents. Committee: Messrs. C. H. Ashworth, F. G. Hicks, J. H. Webb, A. G. C. Millar, C. H. Mitchell, G. P. Sheridan, R. M. Butler, C. J. M'Carthy and J. Holloway. Mr. J. H. Webb, the retiring president, delivered his valedictory address, in which the growth of the Association and the increasing enthusiasm of the members were referred to.

The new Secretary of the Surveyors' Institution is Mr. Alexander Goddard, who succeeds Mr. Julian C. Rogers, retired.

Tribunal of Appeal, L.B.A.—Each member of this tribunal receives three guineas for the first hour of every case and two guineas for every subsequent hour at each day's sitting.

The Rule was too Short.—An Irish bricklayer who was told to measure a length of foundation said, "Altogither 'twas as long as me rule, me arm an' two bricks."

"Furniture Styles."—A second edition of this book, by Mr. Herbert E. Binstead, editor of the "Furniture Record," is to be issued by Mr. A. H. Botwright, 14, City Road, E.C., price 5s.

The North British Station Hotel, Glasgow, was opened last Thursday under the railway company's own management. The building has been reconstructed under the direction of Messrs. Baird & Thomson, architects, of Glasgow.

Hampton Court Palace.—For the convenience of the public the Office of Works have had tablets erected giving the names of the various courts at Hampton Court Palace, and at the east and west fronts large framed coloured plans of the building and grounds are displayed.

New Station at Tilbury.—An embankment 100ft. long and 45ft. wide is to be constructed at Tilbury Pier, and a triangular stage on piles at the lower side of the embankment. This is part of an enormous scheme for the improvement of the station and docks. The scheme will cost £250,000, and will take three years to complete.

Lightning Conductors.—A paper on "Modern Lightning Conductors" was read before the Society of Arts last week by Mr. Killingworth Hedges, M.I.C.E., hon. secretary of the Lightning Research Committee. It is printed in full, with illustrations, in the Journal of the Society for May 26th. Many of the recommendations made have already been noted in our columns in connection with the recent report of the Lightning Research Committee, such as the use of a tubular earth and the advantages of iron conductors.

A Poorhouse at Omoa for the parishes of Cambusnethan, Bothwell and Shotts, Lanarkshire, has been erected from designs by Mr. Alexander Cullen, F.R.I.B.A. There are ten blocks of buildings, providing accommodation for 203 inmates under the following classification:—Receiving or probationary block, 10; four ordinary pavilions, two storeys in height, divided into day rooms and dormitories for 70 males, 48 females and 24 children; hospital block, 24 males and 18 females; and a ward of five beds for maternity cases—this block also providing accommodation for nurses and the doctor. The outer walls are of stone, lined with brick, with a space between. The cost of the whole undertaking will be about £175 per bed.

Sixty More Cottages on the L.C.C. Wood Green Estate are proposed to be built at a cost of £13,919. Tenders have been invited, and the prices obtained are much lower than any before presented to the Council, namely, £228 for a first-class cottage, or £235 for each corner cottage; second-class cottage, £183; and third class cottage, £153 10s. "On the lines now suggested," says the Housing of the Working Classes Committee, "we feel sure that the Council will be safe in proceeding with further blocks of cottages, whereas to allow the estate to remain undeveloped because of a few initial difficulties would be impolitic and would delay the return for the capital outlay incurred, which can only be realized by proceeding with reasonable care to carry out a well-matured scheme of development."

A new Post-office at Crewe has been erected at a cost of £10,000.

Change of Address.—Mr. J. Peebles, quantity surveyor, has removed from 28, John Street to 7, Southampton Street, Bloomsbury Square, W.C.

A Branch Library is to be erected in the Lea Bridge Road by the Leyton Urban District Council from designs by Mr. William Jacques, of 2, Fen Court, Fenchurch Street, E.C.

A part of the Gothic Church of All Hallows in the Wall is now exposed in New Broad Street, where a row of nine eighteenth-century houses is being demolished to make way for new offices.

Royal Exchange Fresco by Mr. Yeames, R.A.—The fresco panel by Mr. Yeames, R.A., in the Royal Exchange, depicting the foundation of St. Paul's School by Dean Colet, was unveiled yesterday.

The new Church of All Saints, Burton-on-Trent, built by Mr. William Bass at a cost of nearly £30,000, was consecrated last week. It is designed in the Late Decorated style and has a tower 120ft. high.

A new Town Hall at Sutton Coldfield is being erected from designs by Mr. Arthur R. Mayston, of London, at an estimated cost of £10,000. The builder is Mr. T. Elvins, of Birmingham. The foundation-stone was laid last week.

The new Middlesex County Asylum which will shortly be opened at St. Albans will have cost £500,000. The estimated cost per bed, without equipment, was £316, but this has been much exceeded. Accommodation is provided (on the Scotch system) for 1,150 patients in pavilions. Of this number there will be 100 paying patients. An unusual feature is a large entertainment hall. The site cost £40,000, and the Midland Railway Co. are constructing a station adjoining it. The contract price for the buildings was £276,375.

Tramways over the Bridges.—The London County Council's Bill proposing to bring tramways over Blackfriars and Westminster Bridges and along the Embankment has at last been approved by the Select Committee of the House of Commons, who have decided that the widening of Blackfriars Bridge is imperative. They have authorized the construction of a subway from the Strand end of Waterloo Bridge to join the subway at Aldwych, but declined to sanction a tramway connection between the Embankment and the shallow tramway under Kingsway. With regard to the widening of Blackfriars Bridge, it is roughly estimated that this will cost about £40,000.

Architectural Refinements.—The exhibition in Rome of drawings and photographs of architectural "refinements," part of the research work of Mr. W. M. Goodyear, of Brooklyn, suggested to the Edinburgh Architectural Association the idea of securing the loan of the exhibits, and the Association has now not only succeeded in obtaining these, but also the whole extensive collection of the trustees of the Brooklyn Institute of Arts and Sciences, to which Mr. Goodyear proposes to add many valuable drawings which are his own property. A complete representation of the work so far achieved would thus be obtained. The exhibition is proposed to be held in Edinburgh during August and September next. As, however, the expenses of freight, insurance, &c., are greater than the Association can meet alone, an appeal is made to those interested in architecture, archæology and education to assist in raising a fund of about £200. Cheques may be made payable to Mr. Colin B. Cownie, hon. secretary of the Association, 17, York Place, Edinburgh.

DESIGN FOR £150 COTTAGES.

Views and Reviews.

A Directory for Builders and Architects.

Architects, builders and others will find this directory very useful, for it gives a full list of contractors for waterworks, gasworks, roads, drainage works and contractors' plant and materials, as well as lists of architects, builders, surveyors and engineers throughout the Kingdom, and, at the end, reports of important legal cases relating to contractors' work, Bills in Parliament, works under construction &c. The present edition is the twelfth. It has been thoroughly revised and brought up-to-date, and is therefore a very handy book of reference, but it is not a very cheap book at 15s.

"The Directory of Contractors and Public Works Annual, 1905," edited and compiled by William Biggar. London: "The Contractors' Chronicle," 13, Victoria Street, S.W., price 15s.

The Country Gentlemen's Estate Book for 1905.

In this edition there are more articles than hitherto, and several of them are of the greatest interest to architects and builders, such as "The Rural Housing Question," by Mr. H. Lemmoin-Cannon; "Cheap Country Cottages," by Mr. Charles Carter; "The Small Country House," by Mr. Alfred H. Hart, F.R.I.B.A.; and "The Common Brick," by Mr. S. G. N. Mann. A number of illustrations of cottages, with plans, are given in the volume. In his article on the manufacture of bricks Mr. Mann says that, taking the rental of the field at 6d. per 1,000 bricks turned out, combined with a royalty of 2s. 6d. per 1,000 sold, and the cost of moulding at 5s. per 1,000, the actual cost is usually below 20s. per 1,000: while the cost of machinery (clay and chalk wash-mills and pug-mill) and tools for a yard, with one moulding stool, may be taken at £80.

The accompanying design for £150 cottages illustrates Mr. Hotchkiss's excellent, though short, article on the subject. One of its features is the very steep roof, which saves walls and so reduces cost. The sizes of the rooms would be:—Kitchen, 14ft. by 10ft.; parlour, 12ft. by 10ft.; scullery, 9ft. by 7ft.; larder, 9ft. by 3ft.; bedrooms, 10ft. by 11ft., 10ft. by 10ft. and 9ft. by 11ft. Mr. Hotchkiss says that these cottages have actually been built for £151 each, including fences, drainage, water-supply and carting. They were passed by a rather careful district council, were finished in a first-class manner, the bricks cost more than 30s. per 1,000, and the cottages are dry and comfortable. A detailed cost of labour and materials in building these cottages is given, which is very useful and suggestive.

The book is excellently produced and full of useful information.

"The Country Gentlemen's Estate Book, 1905," edited and compiled by W. Broomhall. London: The Country Gentlemen's Association, Ltd., 2, Waterloo Place, S.W., price 10s. 6d.

Builders' Notes.

Sunderland Building Trade.—The Sunderland operative stonemasons have agreed to accept a reduction of ½d. per hour, with a working day of 8½ hours instead of eight hours.

Armoured Concrete Foundations.—In consequence of the treacherous nature of the clay soil, a small house recently erected from the designs of M. Cappé in Paris has been provided with a foundation consisting of an inverted arch of armoured concrete having an internal radius of 34ft. 4ins., being 19·6ins. thick, and extending over the whole length of the site, which is 61ft. 3ins., with a span of 26ft. 8ins. The ground was carefully excavated to the form of the extrados of the arch, which was then carried out in concrete of the requisite thickness, with abutments at each side, in which longitudinal flat-iron bars 1½ins. by ⅝in. were anchored, with occasional upright anchor bars. The internal space in the hollow of the arch was then filled with damp river sand, well rammed in shallow layers and finished with a perfectly level surface at the springing line of the arch. On this a layer of concrete 3·93ins. thick was laid with bars of hoop-iron embedded at intervals, strained across and hooked over the anchor bars in the abutments, so as to form a continuous tie, and to counteract any tendency in the concrete arch to spread. Full details of the construction are given in the "Nouvelles Annales de la Construction" for May.

A Scottish Quarry Combine.—It is understood that a combine of different quarry-owning firms has taken place under the title of The Lothians Quarry Co. The combine includes twelve quarries in West and Mid-Lothian, and it is expected that prices will have a firmer tendency. The Pardovan quarry, near Linlithgow, which was recently shut down, has been taken on lease by an Edinburgh company of quarry-masters.

Hopton Wood Stone.—The old-established businesses of Killer Brothers, Ltd., and the Hopton Wood Stone Co., Ltd., have been amalgamated, and they will in future be carried on as the Hopton Wood Stone Firms, Ltd. Messrs. J. Hodson & Son, Ltd., of Nottingham, who have acted as sole agents for the first-named firm for some years past, will continue as agents for the combined businesses. They have in course of preparation a new illustrated booklet containing special information about Hopton Wood stone, and they will be pleased to send a copy on application.

Bricks v. Stone.—The master-masons in Glasgow and Edinburgh are very much exercised over the recent decision of the Glasgow Corporation to rebuild the Royal Infirmary with terra cotta blocks instead of stone. It is stated by the Corporation officials that in the construction of the Dennistown and Bridgeton new libraries, although the work is not yet completed, the stone is showing signs of deterioration, and instructions have been given the contractor to appy Zerelemy liquid to the stone as a preservative. It is claimed also that brick-built hospitals are not so damp as stone, and are in other ways better suited for the object for which they were designed.

Contracts Open.

TOTTENHAM URBAN DISTRICT COUNCIL.

TO TAR AND ASPHALTE PAVING CONTRACTORS.

The Council invite TENDERS for REPAIR of the TAR and ASPHALTE PAVING throughout their District.

Specifications and forms of Tender can be obtained on application to Mr. W. H. PRESCOTT, A.M.Inst.C.E., Engineer to the Council, at their Offices, Coombes Croft House, 712, High Road, Tottenham, any day during office hours.

Persons Tendering will be required to deposit with the clerk, when handing in their Tenders, in a Bank of England note or cash, the sum of £5, which will be forfeited by the person whose Tender is accepted if the contract be not executed within seven days from the date he is informed it is ready for signature.

This deposit will be repaid to the parties Tendering who are unsuccessful.

The contractor will be required to pay all workmen on the Council's work the recognised Trade Union rate of wages.

A Schedule of such wages will be inserted in the contract, and the copy of the Schedule must be exhibited on the Pay Office at the Works.

Sealed Tenders on the form supplied, endorsed "Tender for Tar and Asphalte Paving Repairs," to be delivered to me by TWELVE o'clock NOON, on TUESDAY, the 6th JUNE, 1905.

No other form of Tender will be received.

Security will be required for the due performance of the Contract. The Council will not be bound to accept the lowest or any Tender.

By Order,
EDWARD CROWNE,
Clerk of the Council.
Tottenham,
26th May, 1905.

URBAN DISTRICT OF ACTON.

NEW PUBLIC OFFICES AND TOWN HALL.

The Council invite APPLICATIONS from firms of contractors desirous of tendering for the ERECTION of the proposed new PUBLIC OFFICES and TOWN HALL at Acton, in accordance with the plans prepared by and under the superintendence of the Architect, Mr. WILLIAM G. HUNT, of 17A, Vicarage Gate, London, W. A limited number of firms of repute will be selected from such applications to Tender in competition for such work from bills of quantities prepared by Mr. F. T. W. MILLER, of No. 2, Dartmouth Street, Westminster, S.W.

The firm whose Tender is successful will, if the work is proceeded with, be required to enter into a Contract and a bond with two approved sureties for the due performance of such Contract.

The Council do not bind themselves to accept the lowest or any Tender for the work.

Applications, with references giving particulars of the principal works executed, and endorsed "New Town Hall," to be addressed to me, the undersigned, and delivered on or before the TWELFTH day of June, 1905.

By Order,
WM. HODSON,
Clerk to the Council.
Council Offices,
242, High Street, Acton, W.
12th May, 1905.

HENDON UNION.

TO BUILDERS AND OTHERS.

The Guardians of the above Union are prepared to receive TENDERS for PAINTING and sundry REPAIRS at their Workhouse, near Edgware, in accordance with the specification prepared by their Architect, Mr. E. P. THOMPSON, A.R.I.B.A., 25, Finsbury Square, E.C., a copy of which can be seen at my Office between the hours of TEN a.m. and FOUR p.m.

Sealed Tenders, endorsed "Tender for Painting and Repairs," to be delivered to me not later than WEDNESDAY, the 7th JUNE next.

The Guardians do not bind themselves to accept the lowest or any Tender.

By Order of the Board,
F. J. SEABROOK,
Clerk to the Guardians.
Union Offices,
Edgware,
18th May, 1905.

To Contributors.

THE EDITOR will be pleased to consider any articles illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.
2. The charge of one penny will be made for each additional word.
3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.
4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.
5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.
2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.
3. Correspondents are particularly requested to be as brief as possible.
4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.
2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

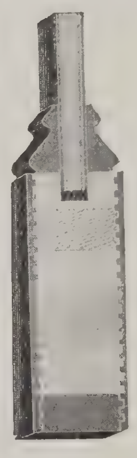
"PRINTERS' PIE," 1905.

ON June 1st will be published the 1905 issue of "Printers' Pie," the annual founded by Mr. W. Hugh Spottiswoode, with the assistance of Mr. Arthur Croxton, to benefit the funds of the Printers' Pension, Almshouse and Orphan Asylum Corporation, whose president this year is Mr. C. Arthur Pearson. Last year's "Printers' Pie" was completely sold out, and the success of the work has encouraged Mr. Spottiswoode to produce a much larger edition for 1905. The forthcoming issue will contain contributions from the Duke of Argyll, W. L. Alden, F. Anstey, G. B. Burgin, Lieut.-Col. Newnham Davis, General French, Tom Gallon, C. L. Graves, J. K. Jerome, E. V. Lucas, H. W. Lucy, Barry Pain, Major-General Baden Powell, C. Arthur Pearson, Mostyn Pigott, William Le Queux, W. Pett Ridge, Adrian Ross, Lord Stanley, G. R. Sims, Katharine Tynan, I. Zangwill, &c., and reproductions of drawings, including seven coloured plates, by Cecil Aldin, C. A. Buchel, E. Miriam Croxton, C. Dana Gibson, Dudley Hardy, John Hassall, L. Raven Hill, Gunning King, Phil May, Will Owen, Charles Pears, F. Pegram, L. Thackeray, David Wilson, F. H. Townsend, Lawson Wood, Starr Wood, &c.

Messrs. W. H. Smith & Sons have again generously placed their facilities at Mr. Spottiswoode's disposal; and in recognition of the efforts of the booksellers and newsagents of the country a contribution will be made from the proceeds of the forthcoming issue to the funds of the Booksellers' Provident Institution and the Newsvendors' Benevolent and Provident Institution. "Printers' Pie," 1905, will be published, as before, by the Proprietors of the "Sphere" and "Tatler," price 1s. nett.

THE GILMOUR DOOR Co LTD.
Factories Trenton Canada
53 BERNERS STREET LONDON



All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece

HARDWOOD
In Various Designs

From 35/- to £10.
DOORS

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Showrooms of the various agents, or at 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE. A book of designs, prices, &c., will be sent on application to "Dept. B," 53, Berners Street, London.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

June 7, 1905. Vol. 21, No 539.

6, Great New Street, Fetter Lane, E.C

Summary.

The Professional Associateship examination of the Surveyors' Institution will in future be called the Intermediate examination, and the Fellowship examination the Final examination. Three £80 scholarships for students have been arranged in connection with Cambridge University, and others elsewhere are suggested. (Page 317.)

The Sieges Allée, or Avenue of Victory, in Berlin, is adorned with thirty-two monuments, each having the statue of a Prussian ruler in the centre, flanked by the busts of two great men of his time. (Page 316.)

At St. Mary's, Great Warley, some beautiful church work has been designed and executed by Mr. Reynolds-Stephens. Metal has been extensively used for the interior, the chancel screen being of brass, the apse roof lined with aluminium, the pulpit of copper, bronze and marble, and the reredos of metal and marble. (Page 313.)

The masons and joiners on Tyneside have accepted a reduction in their wages, but the bricklayers and plasterers still hold out. (Page 323.)

Messrs. Spencer, Santo & Co. declare a dividend of 15 per cent. on their ordinary shares, carrying forward £1,193. They have acquired a large West End site on which to build business premises. (Page 323.)

Napsbury Asylum, opened on Saturday last, has cost £385,000. It accommodates 1,150 patients and the main corridor is about one quarter of a mile long. Mr. Rowland Plumbe was the architect. (Page 314.)

Mr. Reginald Blomfield writes to the "Times" criticizing Signor Manfredi's proposals for restoration work at St. Mark's, Venice. He protests against the rebuilding of the vaults, the removal of mosaics, and the proposed levelling of the floor, and calls to mind the recent restoration work at San Vitale, Ravenna, where expression has been given to the deadly theory that the facsimile is just as good as the original. (Page 313.)

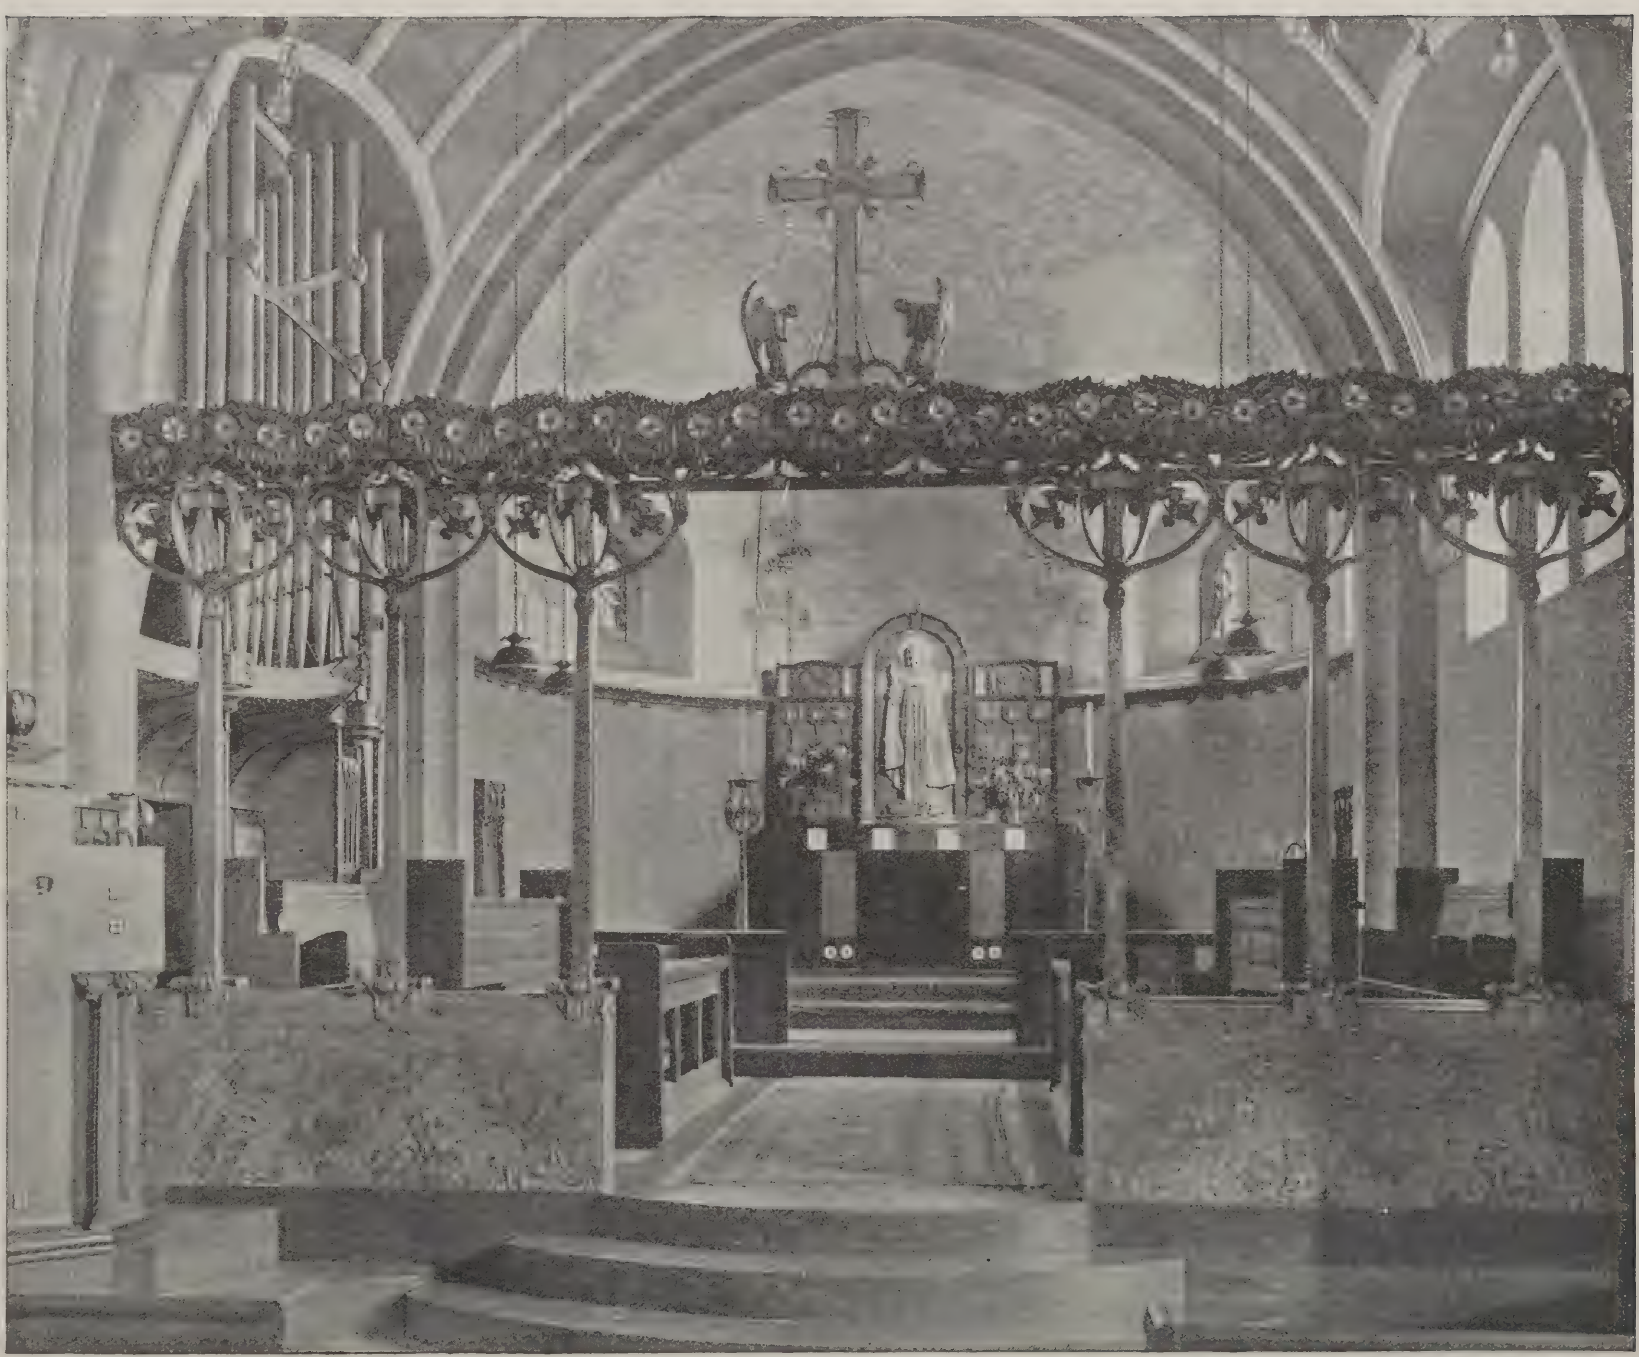
It is not likely that the London Building Acts Amendment Bill will be introduced in the next session of Parliament. (Page 323.)

There has been little change in the London wood trade during May. It has continued to be characterized by a small consumption, a moderate importation and a low level of prices. Until the dock deliveries show more improvement there cannot be much hope of a rise in prices. When they do, if the importation continues small, as there is every prospect that it will at present, the effect on the existing level of price should be immediate. (Page 322.)

The annual elections for the Council of the Royal Institute of British Architects resulted in the defeat of all but three of the candidates pledged to support the statutory registration of architects. (Page 320.)

Terra-cotta v. Stone. We have already announced the decision of the Board of Managers of the Glasgow Royal Infirmary to use terra-cotta for the outer walls of their new building, on the ground that stone decays in the Glasgow atmosphere. This decision, as reported in our columns, has evoked considerable opposition from the local stonemasons, who say it will displace 200 or 300 of them for several years. With the economics of the argument that money should be spent for the benefit of local labour we will not concern ourselves, but merely with the discussion that has taken place as to the suitability of the materials for their positions. Of course, the conditions of Glasgow are hardly different to those in most large towns, and the advocacy of terra-cotta as being superior to stone is but an echo of the controversy that raged some years ago when terra-cotta was generally boomed as the material of the future. Like everything else, however, terra-cotta has failed to prove the remedy for all ills, and it has had to be relegated to its proper place. Terra-cotta opposes to the destructive forces of the atmosphere a more or less vitreous skin, nearly but not quite impervious to moisture, but it should not be forgotten that in burning in the kiln this skin keeps the fire from the inside, and when weather does get to work on the latter, as it will in time with an acid air such as exists in seaside or manufacturing towns (or more quickly if the glaze is chipped), then disintegration is all the quicker. The temptation to workmen to chip it is great because of the unevenness in form that results from the twisting and warping in the firing. Another common fault, through no inherent defect of the material, is the colouring of the clay or the forming of a surface by the imposition of a skin of superior clay. Among the defects of terra-cotta are the impossibility of getting true planes and lines from block to block, the impossibility of alterations, and the weakness that results from a block being hollow, even when filled with concrete. It has its advantages, however, in the elaborate detail which is permissible (though this often leads to excesses), the richness of colour, and its cleanliness (more especially when glazed) and its low cost, all of which advantages furnish a reason for its use in particular circumstances. But stone still holds its place for strength, exactness of line and surface and carving, while as to weathering it only depends on choosing a good weathering stone or treating with a preservative solution. In this connection it is to be noted that an impervious surface is not always so advantageous as one which wears away slowly, for it will have been noticed that a stone like Portland decays just sufficient to remove the greasy soot and keep a clean white appearance without rapid disintegration, whereas terra-cotta or glazed ware gets a greasy skin that looks dirty.

The Weight of a Crowd. The fact that structural collapses are few and far between, and that they are generally due to extraordinary circumstances, such as fire or decay, does not allow us to neglect to be still more on the safe side if we can show that current practice is theoretically deficient. That few disasters occur is no doubt due to the adoption of a large factor of safety; this, however, should not be used to cover excessive loading, but only to guard against defective materials and workmanship. It will be recollected how a few years ago we were all startled by the collapse of a football stand at Glasgow, causing several deaths and severe injuries. The general conclusion drawn from this was that the consideration of the effects of a moving load, or of periodic vibrations produced by stamping or clapping, had not been taken into account by the constructors. The result has been that of recent years in all large centres where an event of importance takes place leading to the erection of stands for spectators, these and balconies, &c., are tested by the police by loading the stands with a body of men, who jump or stamp to give the effect of possible actual conditions. This guards against serious failure, but the result has often been to disclose great weaknesses in design, and where stands do pass the test we generally feel this must be due to the wasteful use of material and labour rather than to efficient design. It is well to use a large factor of safety, but the stresses should be properly gauged and then the members designed to carry these stresses. It would appear from some experiments carried out at Harvard that designers have generally under-estimated the weight of a crowd. It is usually assumed that the weight is about 45lbs. to 50lbs. per sq. ft. But the experiments to which we allude, and which were carried out by Prof. L. J. Johnson with the aid of undergraduates, show that football stands, bridges and platforms may have to sustain a considerably greater weight than that. Professor Johnson built a box 6ft. square and placed varying numbers of men in it. Eleven men weighing on the average 11 stone each were easily placed in it. That gave a load of over 47lbs. per sq. ft. But eleven men carefully placed only occupied places round three sides of the box; no fewer than forty men could be packed into the box if they were all made to face the same way. The average weight of these undergraduates was 11 stone 9lbs., and this would give a pressure per sq. ft. of 181lbs., which is nearly four times as much as constructors allow for. Yet at a football match, where all the spectators face one way, the crowding would be little less than in these experiments.



BRASS CHANCEL SCREEN IN THE CHURCH OF ST. MARY THE VIRGIN, GREAT WARLEY, ESSEX. DESIGNED AND EXECUTED BY W. REYNOLDS-STEPHENS.
C. HARRISON TOWNSEND, F.R.I.B.A., ARCHITECT.

THE USE OF METAL IN CHURCH WORK.

BY arrangement with the editor of the "Art Journal," and with the permission of the artist, we are able to give the accompanying three photographic illustrations of the chancel screen and altar rail in the church of St. Mary the Virgin, Great Warley, Essex, designed and executed by Mr. W. Reynolds-Stephens, with whom Mr. C. Harrison Townsend, F.R.I.B.A., was associated as architect of the building.

Mr. Reynolds-Stephens's scheme of decoration embraces the whole church, and is worked out in iron, brass, bronze and copper, with mouldings in plaster covered with aluminium; carved walnut panels and seats; and various coloured marbles. The woodwork, where not walnut, is painted a quiet green. The general effect is one of richness, harmony, beauty of design and correlation of colour. On entering the church from the west, the eye is led past the highly decorated ribs of the wagon roof, onward through the wonderfully rich metal screen, to the semicircular apse, the walls of which are covered with magnificent slabs of grey-green marble, and the roof entirely with aluminium. The roof is divided into five spaces by vine-branches treated architecturally, which unite and form a broad band of trellis two-thirds of the way up; the bunches of grapes and leaves are slightly tinted. The apse windows are arranged to throw light on the aluminium surface, producing a very beautiful effect. The figure of Christ, which forms the centre of the reredos, is (with the exception of the head) of metal, and stands on a great serpent of black oxidized copper, gleaming here and there with blue mother-of-pearl. The panels on either side are of marble, divided by three metal uprights, each of which ends in a rose surrounded by a crown of its own leaves. Two small upper compartments contain exquisite metal bas-reliefs of the Nativity and the Entombment.

The altar rails consist of dark-green marble upright slabs, rising from a broad base of marble, and enclosing in each panel a circular crown of thorns in brass, glorified by internal floreation, with three large single roses—a decorative note seen in every part of the church.

The chancel screen is perhaps the richest and most elaborate of all the decorations. It is formed of three flowering fruit-trees in brass, on each side of the central opening, which spring from a marble base or wall, as "founded upon a rock." Each tree bears an angel looking down the church, and representing respectively Joy, Peace, Long-suffering, Meekness, Faith and Temperance. "The greatest of these," Love, is placed on the cross which crowns the centre of this beautiful screen, and on either side of it are adoring angels, representing Gentleness and Goodness. The tree-tops form a long and thick wreath of mother-of-pearl roses and leaves in metal.

There is a corresponding screen separating a side-chapel from the nave; it is of walnut and pewter, and the design is based on the conventionalized form of the Oriental poppy, to symbolize Sleep and Death, in harmony with a beautiful memorial tablet over the main entrance.

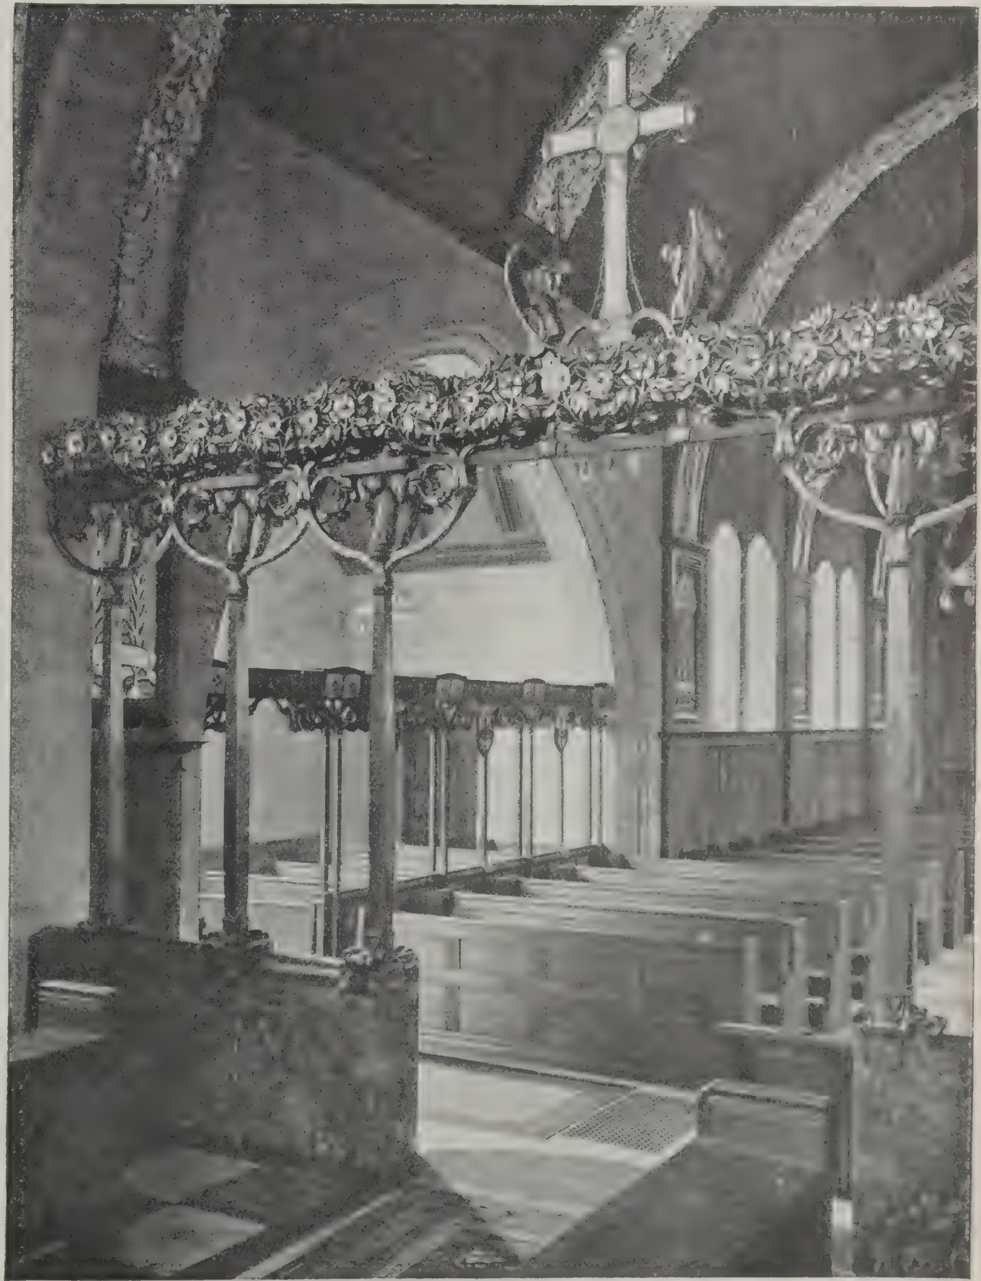
Of the other features of the church we may mention the decorated ribs of the nave roof, which spring from wooden pilasters and are coated with aluminium leaf; the pulpit, which consists of three broad copper crosses, joined at right angles at the transverse bars, backed by marble, and supported by bronze trees with floreation; the bishop's chair in the chancel; the altar frontal, displaying an enviable freedom from conventionality; the electric-light fittings; and the windows, which, with the exception of a few small ones of gem-like richness, are all light. Opposite the entrance are the angels of worship and praise, by Mr. Heywood Sumner, and near the font are child-figures by Mr. Louis Davis.

For further particulars and illustrations of this interesting church we would refer our readers to the "Art Journal" for March, to which we are indebted for the foregoing description.

THE REPAIR AND RESTORATION OF ST. MARK'S, VENICE.

A Criticism by Mr. Reginald Blomfield.

MR. REGINALD BLOMFIELD, A.R.A., writes to the "Times" in reference to St. Mark's, Venice. He says that no proposal has been made to do away with the iron ties which secure the interior of the building, as was first reported. Signor Manfredi proposes to remove the iron cramps on the exterior of the building and replace them with copper, a work probably of absolute necessity. "This so far is reassuring, but there are other points in the architect's proposals which are not so. . . . The serious structural failures are those of the two west bays of the nave, with the resulting injuries to the cupola above it and to the west window, and the settlements of the north-west angle and of the piers under the central cupola. . . . In regard to the two west bays Signor Manfredi proposes to construct detachable centering with all the parts fitted and numbered, which can be kept permanently in the workshops of St. Mark's and put up at once on the first sign of further failure. He further proposes to relieve the crowns of the vaults of all superincumbent pressure from the framing of the cupola, to renew the iron girdle fixed round the drum by Zendrini in 1723, and to reinforce it by another girdle around the base of the drum, and other structurally necessary works. So far the most staunch conservative would acquiesce in his methods, but it is painfully apparent that this ingenious centering, and the rest, are only a stepping-stone to the demolition and reconstruction of the vaults as soon as the funds permit. The failure in the west window is, Signor Manfredi maintains, due to the distortion of the vaults, and can only be adequately met by their reconstruction; but his own report makes it clear that this depression has been there for a long time. Zendrini drew attention to it in 1721 and dealt with it at the time. Some ill-advised alterations were carried out in the last century, but there is no evidence to show that the mischief has increased since that date or is now active.



VIEW FROM CHANCEL.

"Signor Manfredi himself could doubtless find other means of checking it than that of rebuilding So long as it is possible to provide against the effect of the distortion on the statics of the building in any other way, it is surely a piece of gratuitous vandalism to rebuild these vaults, with all that it involves to the interior of the building, because they are out of shape and offend an unfortunate passion for neatness.

"In the case of the angle of S. Alipio it may be necessary to rebuild . . . . There is probably no alternative to Signor Manfredi's general proposals in this case; but it is impossible to follow him in his suggested treatment of the four 'Tribunes.' He proposes to remove the mosaics, tie the piers round with metal bars, and replace the mosaics. Here, if anywhere, one would imagine underpinning to be the only effectual course. Signor Manfredi himself admits that the real evil is below the ground, and yet for unexplained reasons proposes to confine his labours to work above it. An ominous hint is suggested by his opinion that the mosaics are in a deplorable state and that the mosaicists should be ready to follow on the repairs to the walls. Is it possible that the *causa causans* for these recommendations is not so much the condition of the piers as the fancied shabbiness of the mosaics? If metal ties are all that is necessary, why remove the mosaics at all? Why not leave the mosaics alone—show the metal ties for what they are, and give up definitely the vicious attempt to convert a priceless old building into a new one? This, if one may without discourtesy suggest it, seems to be the real danger in Signor Manfredi's proposals. It appears frankly in his list of decorative restorations. His proposal to replace the external iron cramps with copper is, no doubt, necessary, but why "restore" the capitals of the gallery—that is, substitute mechanical reproductions for these weather-worn stones that have faced the salt winds of Venice for nearly 900 years? Why restore the bronze doors or the great pulpit, the "bigonzo," beyond what is necessary to hold them together? Why, last of all, take up the floor of the church and level it? . . .

"The levelling and renewal of the floor would not add one iota of strength to the building, but it would destroy the romance of centuries. The proposal raises the whole issue of 'restoration' in such cases—cases, that is, not of necessary public improvement, but of the conservation of historical monuments of great age and inestimable value. That Signor Manfredi and his colleagues are sincerely anxious to do what is best, one does not doubt for an instant; but it is the point of view from which they approach their task that is open to question. Recent works of restoration in Italy, such as those now being executed in San Vitale at Ravenna, reveal the deadly theory that the facsimile is just as good as the original, if only it is a sufficiently good imitation; but we are more the creatures of sentiment than we readily admit. The fact that for centuries people have wondered at these mosaics and knelt on this billowy floor is one not to be measured in terms, but it is a fact that will always have to be reckoned with, and one of a kind that justifies the genuine dislike and suspicion of restorations entertained by most sensitive people. We in England are hardly in a position to throw stones in this matter, but we are at least becoming conscious of our own iniquities, and on this ground may appeal to Signor Manfredi and the authorities of St. Mark's to stay their hand in all that is not absolutely necessary to the safety of the fabric."

Lambeth Bridge Unsafe for Heavy Traffic.—In consequence of the defective condition of Lambeth Bridge no vehicles of more than $2\frac{1}{2}$ tons will be allowed to cross, and all traffic will be required to proceed at a walking pace.

NAPSBURY ASYLUM.

THE Middlesex County Asylum at Napsbury, near St. Albans, was opened on Saturday. Mr. Rowland Plumbe, F.R.I.B.A., is the architect.

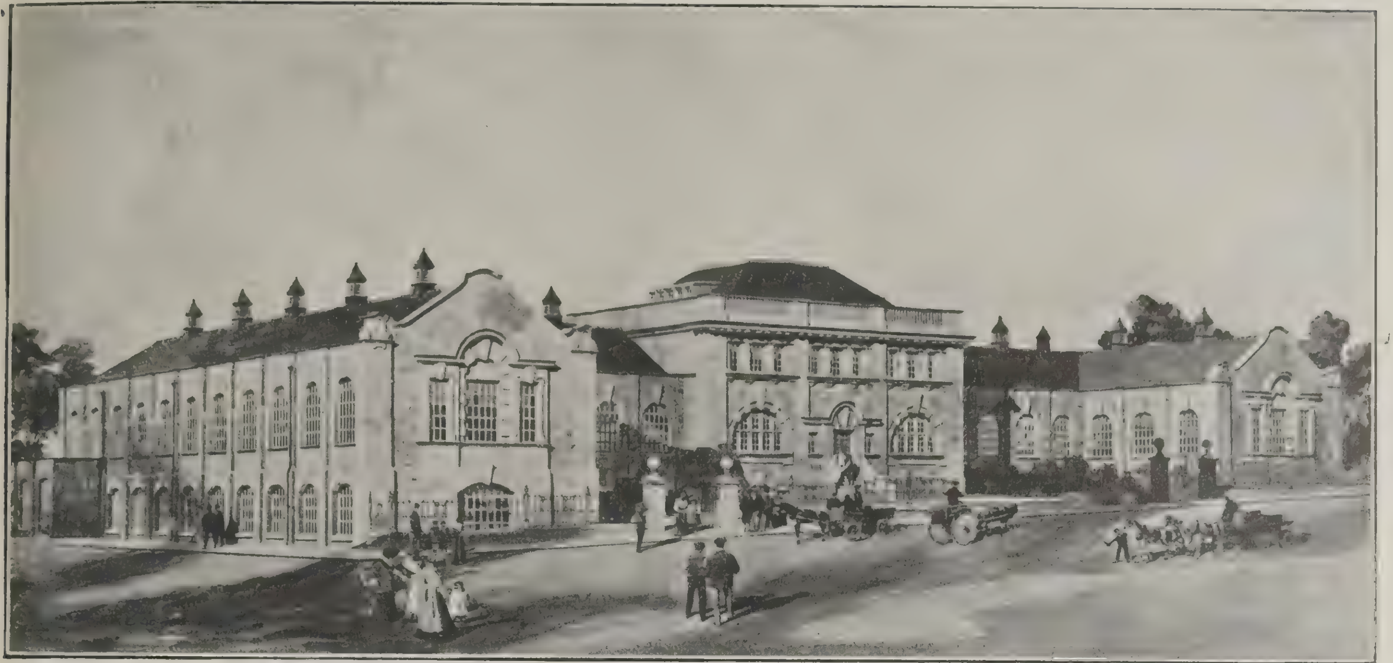
The principal entrance faces the main road from London to St. Albans, just beyond the village of London Colney. On entering, the corridors to the left lead to the "hospital" (*i.e.*, the portion of the building to which lunatics will be first conveyed, and from which, not very long after, many will emerge practically restored to normal health), while to the right are the reception-rooms, medical superintendent's and clerk's offices, and the committee-room.

The hospital comprises an entire block of buildings, and is complete in itself, with patients' and nurses' night and day accommodation, dining- and recreation-rooms. The cells are light, airy and of fair size. There are, of course, the usual padded rooms for violent cases. The corridors are wide, and afford space in some parts for indoor recreation, such as bowls or skittles. Owing to its general dimensions and freedom, the main corridor—which is about a quarter of a mile in length—has been nick-named the "bicycle track." Other detached blocks, which are built some distance away from the main building, are to be devoted to the reception of paying patients.

The Main Building.

The main building is, of course, for the accommodation of those patients whose stay in the asylum will necessarily be of longer duration. On either side of the corridors are the sleeping and sitting-rooms of the inmates, nurses' apartments and recreation-rooms. The dining hall is on the ground floor, spacious and lofty, and designed to accommodate about 600 persons. Immediately above is the concert hall, or theatre, which will accommodate an audience of over 800; there is a gallery at one end. The stage

ALTAR RAIL IN THE CHURCH OF ST. MARY THE VIRGIN, GREAT WARLEY, ESSEX. DESIGNED AND EXECUTED BY W. REYNOLDS-STEPHENS.



SILVERSMITH'S WORKS, HALIFAX. JOSEPH F. WALSH AND GRAHAM NICHOLAS, ARCHITECTS.

(fitted with fireproof curtain, &c.) is as large as that of an average London theatre, and every facility will be provided for the production of elaborate entertainments.

From the windows of both these rooms patients will be able to watch the out-door sports. There is a magnificent stretch of level greensward for cricket, quite as spacious as Kennington Oval.

The wards are arranged *en echelon* and are two-storeys high.

The Stores Department.

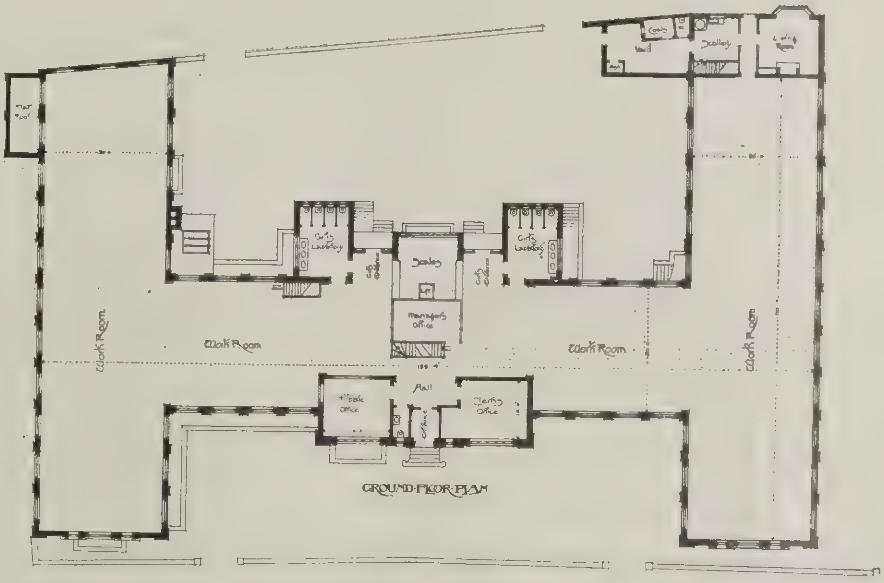
A very interesting portion of the main building is the stores department, which comprises granary, coal and other cellars, bakery, laundry, kitchens—all fitted with the most up-to-date machinery and appliances—steam engines and dynamos for operating the water and electric-light plants. Gas is also laid on both for lighting (chiefly as a reserve illuminant) and for cooking. There is a private siding from the Midland Railway, by means of which coal and other stores are delivered on the spot. It may also be added that a railway station is to be built adjoining the grounds, for the convenience of visitors to the asylum.

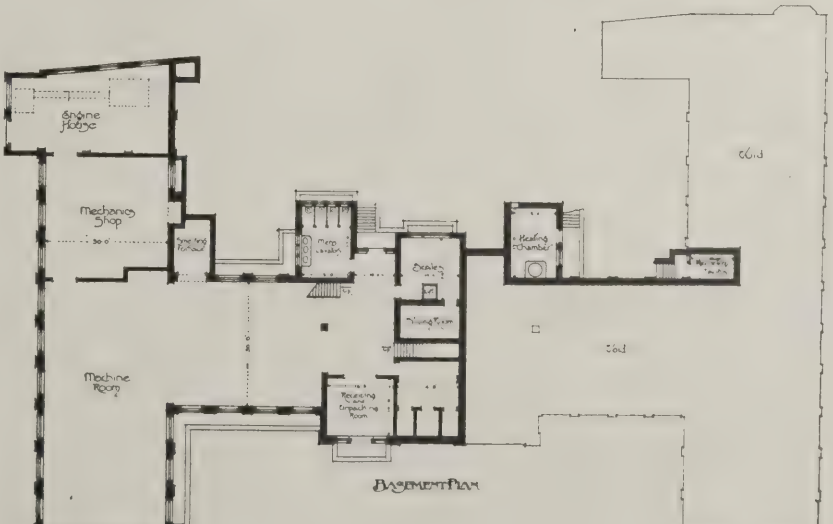
An interesting experiment (which has worked well) has been the laying-out of grounds and making of roads and paths by means of direct labour, employed under the superintendence of the Asylum officials, a course of procedure which was adopted in consequence of contractors' tenders very largely exceeding the estimate of the architect. In this way a relative saving has been effected, amounting to several thousands of pounds, by reason of the original apportionment for roads being adhered to.

The planting of shrubberies and flower beds has been carried out under the direction of Mr. Goldring, the well-known landscape gardener.

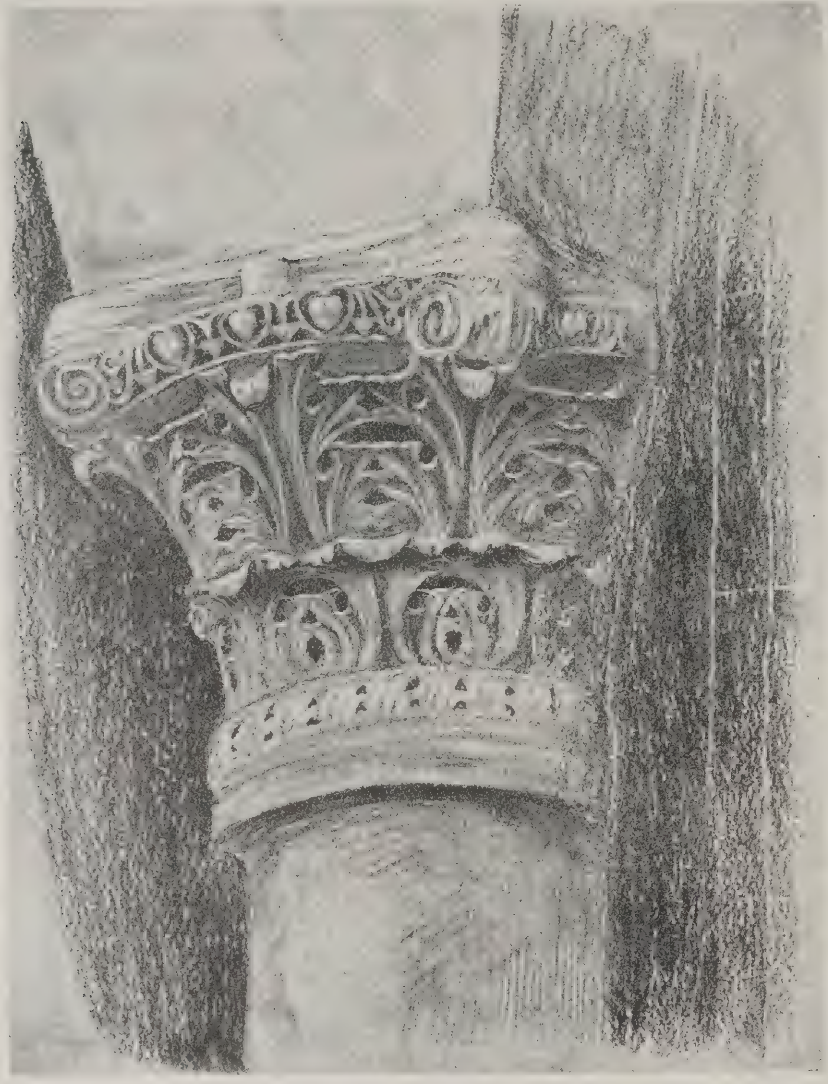
A visit to Napsbury would not be complete without inspecting the farm, which is admirably planned and stocked; the dairy too, is a model. All this is essential to an up-to-date asylum, not only for the raising of its own food and provisions, but on account of the beneficial occupation which the cultivation of the land affords to those patients who are suitable to undertake it.

The estate acquired for this asylum is about 416 acres and has cost £45,000, while the buildings, to accommodate 1,150 patients, have cost £387,000. Messrs. Charles Wall, Ltd., of Chelsea, were the builders.





These buildings, designed by Messrs. Joseph F. Walsh and Graham Nicholas, architects, of Halifax, have been erected for Mr. Charles Horner. The walls are of local sandstone grit, and the roofs are of blue slates. Inside, the walls are lined with a dado of salt-glazed bricks and moulded bricks, the floors being of maple blocks and terrazzo. The accompanying plans, together with the view above, fully illustrate the arrangements in a building erected for the manufacture of jewellery on a large scale.



BYZANTINE CAPITAL FROM THE MOSQUE OF DAMASCUS. DRAWN BY W. R. LETHABY.

Views and Reviews.

An Excellent Book on Mediaeval Art.

Professor W. R. Lethaby's great ability in the demonstration of the conditions which produced ancient art are well known, and in this work he has again sustained his reputation for adequately and succinctly criticizing that wide field of artistic activity—mediæval art in Europe. He traces the streams of influence which produced many phases of Gothic and Romanesque art, dealing with Rome and its relation to the East in the age of Constantine, and of the schools at Constantinople and Ravenna, to Romanesque in Italy, Germany, France and England, and thence to Gothic in France, England Spain, Switzerland, Germany and Italy. With Mr. Lethaby art is man's thought expressed in his hand-work. He shows clearly how "there is much more of the East in Gothic, in its structure and fibre, than is outwardly visible. To account for Gothic we have to account for its historic basis, and for the whole atmosphere of mysticism, chivalry and work-enthusiasm, with all the institutions, monastic, romantic, and social, which formed its environment." It is impossible to summarize in a short review the useful suggestive character of the book, and the many points touched upon by Professor Lethaby, but we advise everyone interested in the art of architecture to read it and draw their own conclusions. The book is well reproduced, and profusely illustrated with many photographs and numerous drawings by the author, one of which is here given as an example of beautiful draughtsmanship.

"Mediæval Art, from the Peace of the Church to the Eve of the Renaissance, 312-1350," by W. R. Lethaby. London: Messrs. Duckworth & Co., price 8s. 6d. nett.

THE NEW BERLIN.

Berlin has been practically rebuilt during the last twenty years and affords a good object-lesson in civic embellishment.

Some of the more important buildings and monuments erected in the last few years are: The Damm-muhlen buildings, a castellated reproduction of the royal mills, 1893; Luther Monument, 1895; Marein Kirche, rebuilt in 1894; new district courts with lofty rococo towers, recently completed; the enormous police headquarters, 1890; Church of St. George, 1898; Pius Kirche, 1894; statue of Senefelder (inventor of lithography), 1892; Museum of Natural History, 1889; Gnaden Kirche (a Romanesque church erected in honour of Empress Augusta), 1894; German Colonial Museum, 1899; the Reichstag buildings, 1894; National Monument to Bismarck, 1901; Sieges Allée, or Avenue of Victory, 1901; Emperor Frederick Memorial Church, 1895; Lessing Monument, 1890; Wagner Monument, 1903; statue of Queen Louisa, 1880; Potsdam and Victoria Bridge, with fine bronze statues, 1898; Teltow Courthouse, 1891; Hofman Haus, 1900; the new cathedral, 1903; National Monument to Emperor William the First, 1897; the Schloss Brunnen, monumental fountain in front of the palace, 1891; royal stable and carriage house, 1900.

The Sieges Allée, or Avenue of Victory, runs from the Königsplatz through the Tier Garten; this fine avenue, completed in 1901, is adorned with thirty-two monuments. Each monument is a marble hemicycle, in the centre of which rises the statue of a Prussian ruler, flanked by the busts of two great men of his time. These thirty-two statues are of unequal merit, but interesting.

TIME WASTED IN WATCHING CONSTRUCTION.

Someone with a statistical turn of mind has called attention through one of our American contemporaries to the time wasted by citizens who stop to watch the construction of "skyscrapers," with their steel and hollow-tile and terra-cotta, brick or stone veneer walls.

As an average, fifty persons are taken as the number for the eight working hours as looking on at the work of dismantling the old building through a period of thirty days. This work is interesting enough, but fewer people look on at it for the reason that there is dirt and dust, and perhaps a fence shuts off much of the early part of the work.

Modern methods of excavating for foundations become more interesting, and an empty wagon suspended in air 30ft. up, and lowered into the basement level by a steam crane, is a sight for almost anyone.

1,500 Spectators.

By all odds, however, the steel construction makes the mazes of congestion in the streets. With its necessary choking of traffic, the interest on the part of the individual pedestrian is multiplied until at the noon hour on a bright day 1,500 people may be lined north and south and east and west watching the great girders rising 150ft. into the air to the sputterings of the donkey engine, regulated by the boatswain's whistle which pipes somewhere unseen in the skeleton of the structure.

The Human Spider.

As the steel construction grows in height, this street interest also increases. It exacts greater exertion on the part of the spectator, but he gets more out of it. Perhaps as one of these girders rises to some particularly troublesome point in the spidery heights of the structure a workman may be poised upon it, signalling, and looking like a human spider in his web of steel. At such a time business comes more nearly stopping in the sight of the picture than it might were a fire ranging there. The chance of the man's fall—the dizziness of the height—the diminutiveness of man as compared to his work—all have the allurements that appeal to the man with the least flexible of necks.

Next in order of interest is the elevation of the granite blocks of a building, the stones weighing tons in some instances and yet going up with all the ease of the old oaken bucket that hung in the well. Men showing as black dots in the upper structure; the chatterings of the pneumatic riveting machines sounding like giant woodpeckers at work in a forest of steel; the roar of the work of the builders, mingling with the roars of traffic in the streets—all cause waste of time in watching.

The Delays Caused.

Every type of man, boy, woman and girl is represented in the spectators looking upon the work of the builders or elbowing through the congestions in the streets

The messenger boy with the expected note or package has stopped to look, and the minutes are going beyond his count.

The street car is delayed and maledictions are cast upon the company and the crew alike when the skyscraper is to blame. Trains are missed by passengers. The nervous one is shocked when he suddenly finds himself under 5 tons of skeleton steel rising 100ft. up, while the pedestrian with the spirit of hurry goading him plunges at the lines of congested onlookers, anathematizing as he goes.

From the windows of buildings around the new skyscraper there are complaints of the losses that come to those employing help. Looking down upon the work of the builders, no less than looking up at it, has its fascinations, and there are months of lost working days to be credited to the office employees looking down, in addition to the years that are lost in the aggregate by the pedestrians in the streets looking up

SURVEYORS' INSTITUTION EXAMINATIONS.

AFTER much consideration, the Council of the Surveyors' Institution have decided to change the names by which the Professional examinations have hitherto been known. The Professional Associateship examination will in future be called the Intermediate examination, and the Fellowship examination the Final examination, thus getting rid of some ambiguity as regards the claims of candidates to immediate admission to the classes of membership which have hitherto been associated with these particular examinations.

Misapprehension about Fellowship.

As regards the Fellowship, it is a misapprehension to suppose that a candidate who has passed what has hitherto been known as the Fellowship examination is entitled, on reaching the minimum age prescribed by the by-laws, to be transferred to the highest class of membership. It is apparently not clearly understood that the candidate for transfer must fully satisfy the Council that he has had such experience in practical and responsible work as the public are entitled to look for in a person describing himself as a Fellow of the Institution. Subject to the rules, it is open to anyone to enter for the Final examination at the time most convenient to himself, but before the Council will transfer him to the Fellowship he must satisfy them that he has had five years' experience as a surveyor in circumstances satisfactory to the Council, either—

(*a*) As a principal in an established business as defined by the by-laws.

(*b*) As responsible manager of an established business as defined by the by-laws.

(*c*) As head of a department in the office of a public body, reporting direct to his Board or Council.

The New Scholarships.

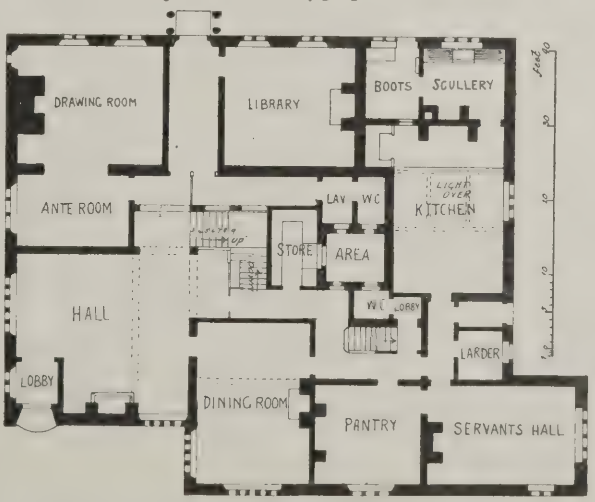
The council of the Institution have been occupied during the past year with the consideration of schemes for extending the scope and raising the standard of professional education by bringing the advantages of university training within the reach of such students as are desirous of acquiring systematic training in some of the scientific subjects cognate to their profession, and a scheme has been agreed on between the council and the Senate of Cambridge University with regard to scholarships open to students of the Institution. There are to be three scholarships, of £80, one awarded every year and tenable for three years.

Somewhat similar offers have been made to the Universities of North Wales and Durham, in the interests of students from the northern and western districts of the kingdom.

The council had hoped to open the competition for these scholarships to Fellows and Professional Associates as well as to students, but to do so would infringe specific provisions in the charter and by-laws, and they have, in consequence, been compelled to limit their offer to students.

It may be mentioned in this connection that by way of still further linking the Institution examinations with the teaching universities, the council have agreed to accept the Bachelor of Science degree in the department of agriculture in the University of Edinburgh as qualifying candidates for the professional examinations of the Institution.

Mr. Charles Bidwell is the new president of the Institution, succeeding Mr. H. T. Steward.



"MINSTED," MIDHURST SUSSEX: GROUND-FLOOR PLAN.

Keystones.

New Grammar School, Lincoln.—The Board of Education has passed the plans of this school by Mr. Leonard Stokes, F.R.I.B.A.

The Mall.—The King particularly desires that the historic name of "The Mall," leading from the Queen Victoria Memorial to the Admiralty, shall not be replaced by the term "Processional Road."

Plans for new Council Schools at Middlewich, Cheshire, for 800 mixed scholars, prepared by Mr. Joseph Cawley, M.S.A., of Northwich, have been approved by the Board of Education and the Cheshire County Council.

Mr. Sydney Mitchell, of Edinburgh, who has designed many churches in Scotland, has been appointed architect and professional adviser to the Managing Board of St. Giles's Cathedral Edinburgh.

Edinburgh University Union.—A block of buildings to cost £8,500 is to be added to the Edinburgh University Union. It will be partly three and partly four storeys high, and will contain a spacious library, a writing room on the second storey, and five rooms for office and committee work. There will be a large new kitchen with servants' hall on the top storey.

Collapse of a new Bridge.—On Saturday a new suspension bridge which had just been erected over the River Irvine near Dean Castle, at Kilmarnock, gave way. After the formal ceremony of opening had been gone through, a rush of people was made to cross the bridge, and the structure collapsed and fell into the river. It was a wire-rope suspension bridge with iron columns set on concrete piers, and was designed to bear 20 tons. It is alleged that there was a latent defect in a link of one of the anchor chains, and that this caused the chain to give way, thus throwing the whole strain on one side and pulling one of the wire ropes through the socket of the fastening block.

The Simplex Steel Conduit Co., Ltd., have found it necessary to build new factories at Garrison Lane and Maxstoke Street, Birmingham, in order to meet the greatly increased demand for their conduits and fittings. The works are equipped with the most up-to-date machinery and labour-saving appliances. Special arrangements and facilities have been made to maintain quick delivery, a large and representative stock being held, so that all demands may be met immediately.

A Discussion on Sanatoria for Consumption, their design and location, will take place at the meeting of the Royal Sanitary Institute to be held at the Parkes Museum on Friday, June 16th, at 4.30 p.m. The discussion will be opened by Mr. Edwin T. Hall, to be followed by Messrs. H. Percy Adams, T. W. Aldwinckle, T. W. Cutler, Dr. C. Reinhardt, A. C. Scovell (chairman of the Metropolitan Asylums Board), Dr. J. E. Squire, Dr. F. R. Walters and Dr. C. Theodore Williams. Tickets for the admission of visitors may be had on application to the secretary of the Institute, Mr. E. White Wallis. On the following day a visit will be paid to the Heatherside Sanatorium at Frimley.

Ruskin.—Mr. George Allen announces in a pamphlet some new editions of Ruskin in the 2s. 6d. series. Those of them, however, which include the original illustrations will be 3s. 6d.

£337,000 Street Improvement. — The Hammersmith Borough Council has approved a scheme for the widening of King Street, from the Broadway to Waterloo Street, at an estimated cost of £337,000. This is part of the main thoroughfare leading from Piccadilly to the western districts of London.

Hatchett's Restaurant.—The kitchen department at this well-known Piccadilly restaurant has been entirely reconstructed and enlarged and fitted with modern cooking appliances by Messrs. Benham & Sons, Ltd., of Wigmore Street, W. The sculleries and plate and glass rooms have been provided with new dressers, plate and pot racks, &c. New hot and cold water and gas supplies have been installed (including services to the new bar and ladies' lavatory), and new larders and cool rooms have been constructed.

A new Wing to St. Peter's School, York, was opened on Thursday last. It contains sitting-rooms, bedrooms and breakfast-room for three resident masters, study accommodation for twenty senior boys, two large preparation rooms for juniors, each accommodating eighteen, dormitory accommodation for fifty-five boys and sanitary arrangements. The work has been carried out at a cost of about £6,000 by Mr. T. S. Ullathorne, of Selby, from the designs and under the supervision of Mr. Walter H. Brierley, architect, of York.

Obituary.

Mr. R. P. Whellock, A.R.I.B.A., of London, died recently, aged 70.

Alderman W. H. Dunn, architect, of Gateshead, died recently, aged 62. He was a past-president of the Northern Architectural Association.

Mr. Robert Laing, well known in the building trade of Dundee and district, died last week, aged 69. He was the builder of the Esplanade at Dundee.

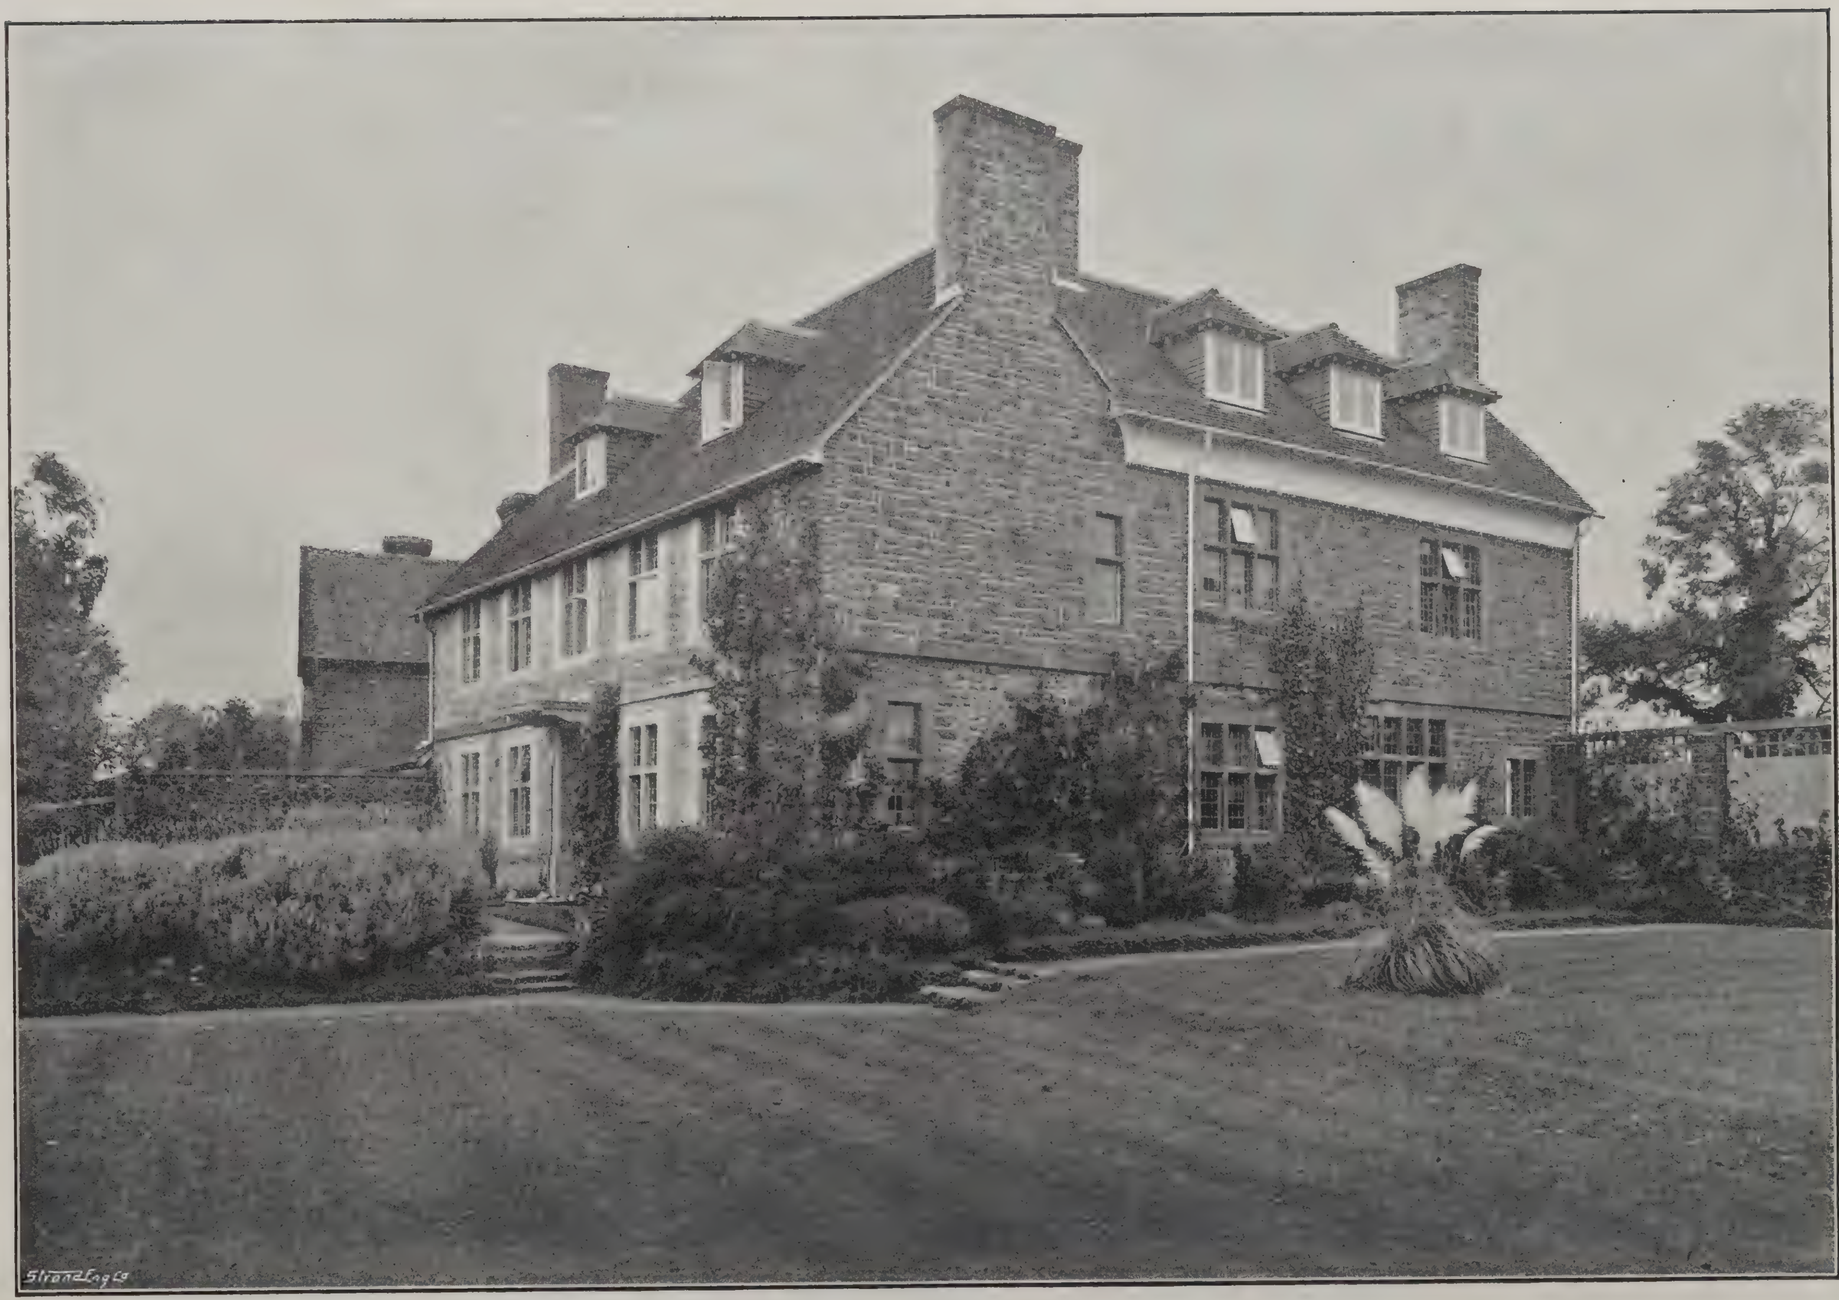
Competitions.

The King's College Hospital Competition Drawings are on view at the Art Galleries, Camberwell, till Monday next.

Coventry and Warwickshire Hospital Extension.—The design of Messrs. A. Hessell Tiltman, of London, and Mr. H. W. Chattaway, of Coventry, has been adopted. It is estimated to cost £35,000. Four sets of designs were submitted.

A SUSSEX HOUSE.

"MINSTED," Midhurst, Sussex, designed by Mr. Mervyn Macartney, is situated at the base of The Downs, and is built of stone from the Cowdray estate. The floors and staircase are of oak, the hall and dining-room being panelled in the same material. In the dining-room is a plaster frieze by Mr. George Jack. The contractors for the house were Messrs. Maides & Harper, of Croydon.



" MINSTED " MIDHURST SUSSEX: FROM THE GARDEN. MERVYN MACARTNEY, ARCHITECT.

Correspondence.

A Village Chapel.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I think some explanation is necessary to my design for the interior of a village chapel hung in this year's Academy, and illustrated on p. 292 of your issue for May 24th. The interior is that of a small Congregational church erected in the delightful golfing village of Hestbank on Morecambe Bay, near Lancaster, at which place I have a summer cottage. Nearly three years ago, acting on my advice, the building committee of the Centenary Congregational Church, Lancaster, employed Mr. Dan Gibson, architect, of Windermere, to prepare plans, which were in every way suitable and most ably designed, but, as so often happens, the designs "in committee" were reduced to something less than barren necessity. It was in this state that I found the church, which I had hoped would mark the beginning of better days for village free church architecture (a wide field, let me add, entirely untouched by either reverent designers or craftsmen); and my work, which has been purely a work of love, and so far has been carried on without encroaching on the funds of the church, has been to give a little colour and interest to the bald and bare interior. As always happens, this work is now costing more than was saved by the reduction of the architect's design, but I have had the sympathy of a few enthusiasts like myself, and the financial help of many onlookers, including Colonel Sandys, M.P., Mr. George White, M.P., Mr. W. H. Lever, Mr. S. J. Waring and many others, whilst Mr. Carnegie has offered to give the second half towards a new organ, the case of which I have designed; but to complete the scheme many more helpers are still required. Behind the screen shown in the drawing there are curtains hung. The screen reduces the size of the church by one-fourth for the greater comfort of the small winter congregation. The seating capacity inside the screen is seventy-two. The four centre panels fold back, allowing seating accommodation for an additional twenty-four. The carving for the screen and pulpit is being executed by Mr. Arthur Simpson, of Kendal; the stencil decoration on roof will, I am afraid, have to wait for some time, as the other work will exhaust the funds in hand.

In conclusion I ought to add that whilst this work has been personal and honorary, the architect responsible for the building has been consulted and has generously advised on many matters for the completion of what has been to me a very interesting piece of work.—Yours very truly,

THOMAS W. MAWSON, Hon. A.R.I.B.A.

P.S.—"The Corbels," illustrated in your issue for May 24th, is my own residence when at Windermere.

Law Cases.

A Question of Light.—The case of *Mellody* v. *Howarth* recently came before Judge Coventry at the Blackburn County Court. This concerned the erection of an addition to the wall dividing the yards of the plaintiff's and defendant's houses, by which it was alleged the light to the plaintiff's kitchen had been interfered with. The original height of the wall was 5ft. 9ins. and the addition was 6ft., making a total of 11ft. 9ins. His Honour said that the whole case was whether the obstruction caused substantial inconvenience in the ordinary use of the room of a house like this. He was of the opinion that if an extremely fine photographic test were applied it might be found that an infinitesimally longer exposure might be needed now, but for the ordinary uses of a house it would practically make no difference. Verdict for defendant, with costs.

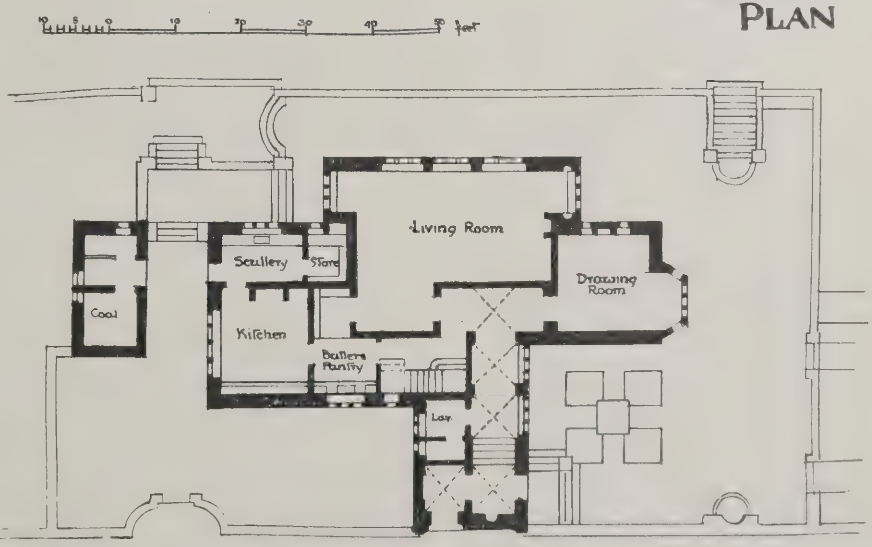
BEDROOM
PLAN



This house is proposed to be built with walls of local stone and the roof covered with light green slates: woodwork of oak in living-room and staircase.

R.I.B.A.

The New Council: The Registrationists Defeated.

A BUSINESS MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. John Belcher, A.R.A.

After the minutes had been read, the report of the elections was announced. The total votes recorded were 1,081. The figures after each name represent the votes given. Only three members of the Council are known to be registrationists, and thus it means that the candidates pledged to support the statutory registration of architects have been unsuccessful—a complete reversal of last year's result.

(*a*) signifies that candidate was pledged against registration.

(*r*) signifies candidate pledged to support registration. Those not marked were non-party candidates.

The result was as follows:—

President.

John Belcher, A.R.A.

Vice-Presidents.

ELECTED.

H. T. Hare (*a*)	840	E. T. Hall (*a*)	641
Leonard Stokes (*a*)	674	Sir John Taylor (*a*)	611

NOT ELECTED.

Alfred Darbyshire (*r*)	472	Butler Wilson (*r*)	351
S. Perkins Pick (*r*)	408		

Council.

Fellows.

ELECTED.

T. E. Collcutt (*a*)	575	E. A. Gruning (*a*)	376
Ernest George (*a*)	509	G. H. Fellowes Prynne (*a*)	368
John Slater (*a*)	452	J. W. Simpson (*a*)	360
Beresford Pite (*a*)	423	J. S. Gibson (*r*)	317
E. W. Mountford (*a*)	417	C. Harrison Townsend (*a*)	303
J. A. Gotch (*a*)	416	A. W. S. Cross (*r*)	305
Paul Waterhouse (*a*)	402	W. H. Atkin Berry (*a*)	288
W. D. Caröe (*a*)	401	E. Woodthorpe (*r*)	276
A. N. Prentice (*a*)	393		
J. J. Burnet (*a*)	386		

NOT ELECTED.

E. Wimperis (*a*)	274	E. M. Gibbs (*r*)	214
F. T. Baggallay (*a*)	271	W. H. Seth-Smith	209
John Bilson (*a*)	265	Herbert Davis (*r*)	198
George Hubbard (*r*)	260	R. F. Vallance (*r*)	178
J. W. Beaumont (*r*)	254	C. E. Mallows	172
W. Gilbee Scott (*r*)	245	J. D. Matthews	163
Max Clarke (*r*)	243	W. A. Pite	147
W. Flockhart	238	H. D. Searles-Wood	127
Lewis Solomon (*r*)	235	S. B. Russell	107
John Murray (*r*)	232	H. H. Wigglesworth	98
F. R. Farrow (*r*)	223	R. Stephen Ayling	42
Maurice B. Adams	214		

Associates.

ELECTED.

R. S. Balfour (*a*)	702	H. V. Lanchester	492
W. A. Forsyth (*a*)	509	H. A. Crouch (*a*)	476

NOT ELECTED.

T. E. Pryce (*a*)	422	G. A. T. Middleton (*r*)	247
H. W. Wills (*r*)	377	H. H. Langston	164
C. E. Hutchinson (*r*)	369	E. A. Young	143

Representatives of Allied Societies.

ELECTED.

A. W. Brewill
G. B. Bulmer
Thomas Cooper
H. L. Goddard
John Keppie
W. M. Mitchell
G. H. Oatley
P. C. Thicknesse
J. H. Woodhouse

NOT ELECTED.

J. T. Cackett
J. H. Phillips
B. Priestley Shires
H. O. Tarbolton

Representative of the Architectural Association.

E. Guy Dawber.

Hon. Secretary.

Alexander Graham.

New Fellows and Associates.

The following were elected (of London where not otherwise stated):—

Fellows.

S. D. Adshead
R. Frank Atkinson
H. Beswick (county architect for Cheshire)
J. Priestley Briggs
G. T. Brown (Sunderland)
R. T. Conder (Buenos Aires)
F. L. Conder (Buenos Aires)
H. C. Corlette
Alfred Cox
J. B. Dunn (Edinburgh)
R. Evans, junr. (Nottingham)
W. J. Gilliland (president, Ulster Society of Architects)
F. T. W. Goldsmith
E. J. Gosling
A. E. Heazell (Nottingham)
O. C. Hills
J. Hudson
J. Hunt
A. T. Hussell (Ilfracombe)
R. M. Lucas (Southampton)
F. W. Marks
J. H. Martindale (Carlisle)
Glendinning Moxham (Swansea)
Sir C. A. Nicholson
F. W. Peel
J. C. Perkin
W. Pywell
C. H. Rew (Great Berkhamsted)
E. J. Sadgrove
T. A. Sladdin (Cape Town).
F. A. Smith
Prof. R. Elsey Smith
H. Teather (Cardiff)
F. Wallen
W. Williamson (Kirkcaldy)
W. Woodward
A. B. Yeates

Associate.

C. T. Palmer.

Hon. Associates.

E. A. Abbey, R.A.
W. Goscombe John, A.R.A.

Hon. Corresponding Members.

Don José Urioste y Velada (Madrid).
H. Paul Nénot (Paris).

Discussion on Competitions.

The discussion was resumed on the Institute paper on the conduct of architectural competitions as revised by the Competitions Committee (see p. 255 of our issue for May 10th). Mr. C. E. Hutchinson had proposed that the Council should be associated with the president in advising promoters as to their appointment of assessors, and Mr. George Hubbard had moved an amendment that the matter be referred back to the Competitions Committee. Both these amendments were negatived. Mr. Horace T. Bonner brought forward the following motion:—"That in the event of the president or council being applied to by promoters of competitions to nominate competing architects, notice of such application shall be published in the Institute Journal, and members of the R.I.B.A. who are willing to take part in such competitions be invited to send in their names for selection by ballot as competitors." This was not carried.

IN THE REIGN OF KING BEL-CHAW.

The Fribites, the Aribites and the Other Ites.

[*The following document in reference to the elections has been circulated during the past week.*]

NOW it came to pass, in the first year of King Bel-Chaw's reign, that there was great dissension amongst the Fribites and Aribites, who together formed the tribe of Ribites, concerning a new doctrine.

These leaders did not fight themselves and besought others not to fight, counselling moderation, as the old are wont to do.

But behind them were younger men, with hotter blood, who said, "We *will* fight; we are the salt of the earth; we are valiant and to be trusted; we can blow trumpets."

And they called themselves the "Edukatites," and did carry blue books and wear a blue ribbon.

And the other side did call themselves the "Registratites." They carried no books, only a long roll on which to inscribe names.

They had no leaders, only a "Kommittee"; although who did make them a Kommittee none did know.

And they had a Sekkretary, a Scot named Gilbey, famous for his whines.

And an Under-Sekkretary.

And there were yet others, who did sit on a fence and fear greatly lest they should fall down on either side.

And them men called "Hedgites."

Some of them did write circulars, and did post them, which must have caused them great expense.

And the small but powerful neighbouring tribe, the "Memorialites" (who will not eat or intermarry with the Ribites), did laugh in their sleeve, saying, "We did tell you so"—which is their motto.

And the cloud that had been no larger than "the mere handful"—for by such name was called the small tribe of "Societites" owing to its insignificance—grew and grew, and hung heavy on the minds of all the people, like unto a huge Komppy-tition: although some did find self-advertisement in it, and did derive strange pleasure from writing to the papers and seeing their words printed therein.

Such men read not one another's letters, only each, his own.

And the wives read their husbands' letters, but not those of the husbands of other wives.

And the Inland Revenue (stamp department) alone benefited.

Now in the twelfth month of the first year of King Bel-Chaw's reign came the great festival of the tribe known as "The Elekktion."

For by the laws of the Ribites it is ordained that if any dispute shall arise amongst them, such dispute shall be settled not by recourse to arms, nor by verbal warfare in the arena, but by votes.

And each member of the tribe, Aribite as well as Fribite, has a vote, which he must not sell, but must give away.

And as many of the Ribites live in far-off lands, because of the great expense and loss of time which journey to the chief city would entail—to say nothing of the difficulties which some of the Provincialites, as they are called, experience in making themselves understood in the chief city, owing to the strange language they do speak—it is further ordained that each Ribite, whether he live in the chief city or in the country, must send his vote by post, not by hand, neither must he give it by word of mouth.

And because many of the Ribites cannot write, no man must write anything on the voting paper, but must merely put his mark; although he, or his assistant, must write his name on the envelope containing such paper.

On the fifth day of the month, which is the day of election, the Great Kouncil Chamber was filléd.

And the Skrutineers—men chosen to count the votes, because of their great great skill in Arithmetick—stood before the King, and did bow their heads to him.

And when the people saw the Skrutineers, and the sealéd paper which they did offer to the King, there fell upon them a great silence, so that a drawing-pin could have been heard to fall.

The rest of the document contains merely the names of those elected, and is without interest. (TRANSLATOR.)

IN PARLIAMENT.

(By Our Press Gallery Representative.)

THE following are some of the enquiries addressed to ministers in the House of Commons during the last few days.

The New Mall.

Sir Henry Fowler asked Lord Balcarres when the new Mall would be opened through to Charing Cross.

Lord Balcarres replied that the First Commissioner of Works regretted that he was unable to fix any date for the opening of the Mall into Charing Cross. It must entirely depend upon the completion of the buildings at that end of the Mall.

Statues in Westminster Hall.

Mr. Lyall asked Lord Balcarres when the statues now in Westminster Hall were erected, and whether in view of the historic associations of the building some more suitable site for them would be found.

Lord Balcarres replied that the statues were erected between 1866 and 1871 under circumstances explained in the House of Commons Sessional Papers of 1868. The First Commissioner feared that he could not give any pledge to find another site for them, but he would consider the matter.

Select Committee on Fires in Factories.

Sir A. Acland-Hood stated in reply to a question by Mr. Tennant that he hoped to be able to set up the Select Committee to enquire into the means of prevention of and escape from fire in factories, workshops, shops, warehouses and composite buildings, prior to the Whitsuntide adjournment.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Fire Clause in L.B.A. Amendment Bill.

CATFORD.—T. E. S. writes: "Please explain the exact meaning of the appended clause from the London Building Acts Amendment Bill:—

'Where an imaginary line 30ft. drawn from any point in the plane of any existing opening in any external wall of any building, and in the direction of any intended window in any external wall of a building of a warehouse class (being a new building), and inclined to the aforesaid plane at any angle not exceeding 135 degs., would touch or intersect the plane of such intended window at any point therein, such window shall be glazed with fire-resisting glazing and be set in frames of fire-resisting material, and shall be so constructed that some portion of such window will afford easy access for firemen into the building in which the window is constructed.'"

The wording of the clause is most involved. Apparently what is meant is that a warehouse window must be rendered fire-resisting if it is within 30ft. of any existing opening, the distance being measured in any direction within an angle of 135 degs.

R.I.B.A. Examinations.

WALLINGTON.—G. H. writes: "I shall be glad of any information with regard to the R.I.B.A. examination. Is it necessary to be articled? I have had a good deal to do with architectural work, and would like if possible to qualify."

It is not necessary to be articled in order to become an Associate of the Royal Institute of British Architects. The only tests are the examinations. Full particulars of conditions can be obtained from the R.I.B.A. Kalendar, published at No. 9, Conduit Street, London, W.

Houses on Building Plots.

WALTON-ON-THAMES.—CONSTANT READER writes: "I have been selling plots of land for building, and have stipulated that houses are to be built of not less value than £225 nett and that bay windows are not to project more than 3ft. 6ins. from the face. Can shops be built under this condition? I did not say they were not to build shops. I mentioned only houses and bays. Are the houses shops or not?"

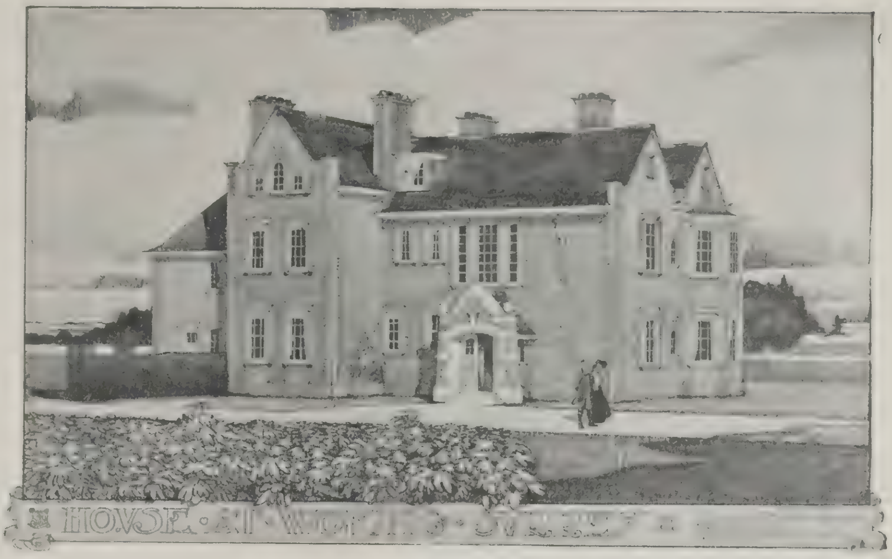
If you have clearly and distinctly embodied in the conveyance or sale contract the fact that houses *only* are to be built upon the plots, you are quite within your rights in insisting that a shop shall not be erected. A "shop" is *not* a "house." You should at once consult your solicitor upon the matter, giving him your copy of the contract and all details germane to the particular case.

F. S. I.

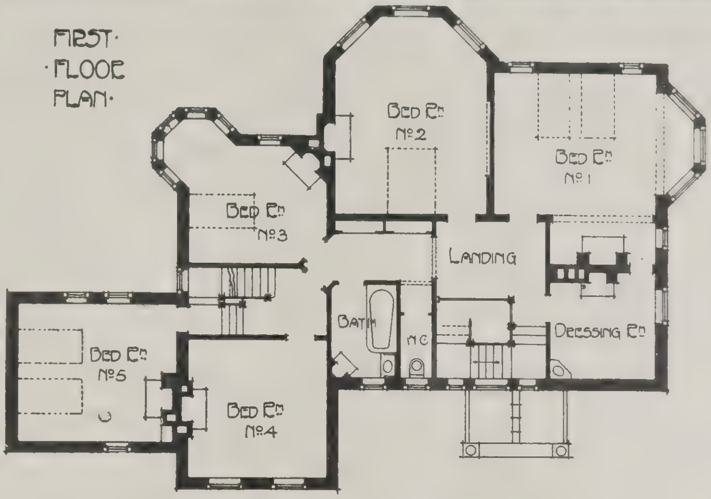
Drainage of Site.

LONDON.—M. N. writes: "Which is the best way to drain the site of a house which consists of very fine sand with water only 3ft. from the surface? Will field pipes (unglazed) with collars admit the water and at the same time keep out the sand, or will they rapidly choke?"

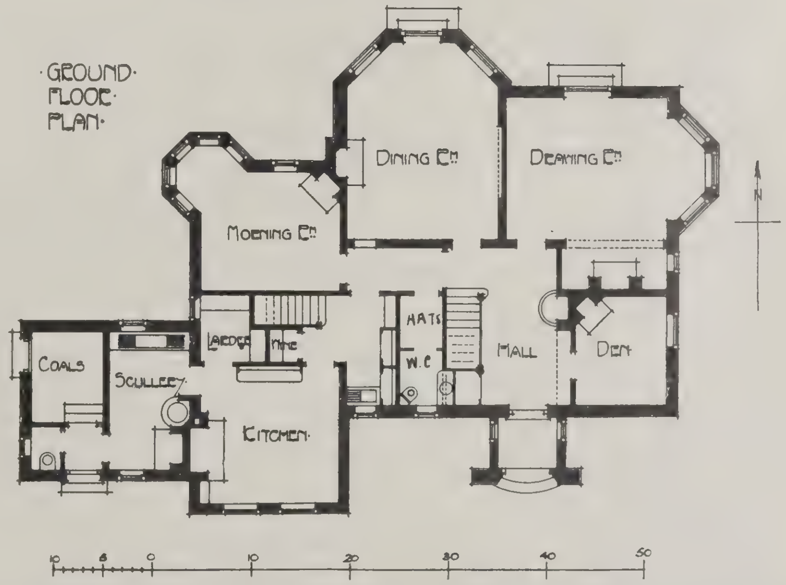
The enquiry hardly gives sufficient data to state an opinion. No general particulars are given whether the site lies high or low, on a slope, on the top of a hill, or in a valley; whether there is a convenient ditch or water-course to drain into; whether there are springs; the nature of the subsoil, &c., &c. It might be necessary to cut trenches round the site 4ft. or 5ft. deep, to lower the water level. We can only give general advice. Lay 4in. collar field pipes from 8ft. to 15ft. apart, with a slight fall and at a depth of 4ft.; these to discharge into a 6in. main drain emptying into some convenient water-course, the outfall pipe to be of iron, set at a height above the possibility of choking by floods, held up by a concrete wall, and either fitted with a flap valve or a cage to prevent the ingress of birds or vermin. The covering of the pipes will need careful attention – a first thick layer of straw or fine heather, covered with 18ins. of pea gravel of even size (not large and small stones), or a covering of sods, is advisable. As the effect of draining watery soils is to lower the ground, it might be necessary to make the minor drains a little deeper than 4ft. The subsoil drains in all cases should be put in at least a few weeks before the foundations. In addition we should advise 4ins. of Portland-cement concrete all over the site. These precautions might be excessive if we knew the site better; but without that knowledge we could not advise less.



FIRST· ·FLOOR PLAN·



·GROUND· FLOOR· PLAN·



This house is placed at the extreme northern end of the site, so that the reception-rooms may face due south and have the full advantage of the garden, with a fine view of country. The materials used are Crowborough purple brick facings with red brick and stone dressings for the walls, and red tiles for the roof. The architects were Messrs. Thomson & Pomeroy, of 49, Hill Road, Wimbledon, and the contractors Messrs. Harris & Son, of High Street, Woking.

THE TIMBER TRADE.

London Market in May.

MESSRS. CHURCHILL & SIM report that there has been little change in the London wood trade during May. It has continued to be characterized by a small consumption, a moderate importation and a low level of prices. About 500 standards more have been delivered from the docks in the month than was the case in May last year, but the Whitsuntide holidays fell in May in 1904, and will have to be this year deducted from the consuming power of the month. Until these dock deliveries show more improvement than this there cannot be much hope of a rise in prices. When they do, if the importation continues small, as there is every prospect that it will at present, the effect on the existing level of price should be immediate. In the foreign markets prices for summer supplies have varied little in May. Russian shippers have done no wholesale business, and for the small sales effected have reduced their rates only slightly, so that they are still above the corresponding quotations of their Swedish competitors. Swedish shippers accordingly are more inclined to hold, here and there, for something over the lowest rates that have been accepted earlier; but they too have done only small business in the month. Freights continue cheap and plentiful enough, but if anything, the rates have tended slightly to harden since April.

Messrs. Denny, Mott & Dickson, Ltd., state that if there was no great improvement in the demand during May, the consumption was consistently steady, and business was of a soundly satisfactory character in all departments of the timber trade. Prices for fresh stocks continue to harden, and even last year's stocks are ceasing to be a further source of anxiety to holders, as they have assumed moderate proportions and been sufficiently written down to promise some profit—now that the signs of gradually improving general trade are becoming unmistakable, whilst the clearing of the political atmosphere by the just assured Japanese naval dominancy in the East should increase general confidence and lead to a peace which will make for good trade.

The abstract of stock, consumption, &c., for May, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on May 31st was:—

	Pieces.
Foreign deals and ends	858,000
Do. battens	1,459,000
Pine deals and battens	905,000
Spruce do. do.	624,000
Boards, rough	2,545,000
Do. prepared	6,021,000

Totalling 12,412,000 pieces, as compared with 14,333,000 in 1904, 14,254,000 in 1903, and 13,330,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs	172 pieces.
Do oak timber	594 loads.
Do. fir timber	169 do.
Do. Oregon pine, &c., spars and masts	4,107 do.
Colonial oak timber	1,346 loads.
Do. birch timber and planks	1,363 do.
Do. elm and ash timber	552 do.
Do. yellow pine	252 do.
Do red pine	177 do.
United States pitch-pine timber	14,952 do.
Do. do. deals	50,000 pieces.
East India teak	7,921 loads.

The deliveries for the first five months

have been of—

	Pieces.
Foreign deals and ends	1,391,000
Do. battens	2,610,000
Pine deals and battens	477,000
Spruce do. do.	687,000
Boards, rough	2,590,000
Do. prepared	6,541,000

Totalling 14,296,000 pieces, as compared with 15,584,000 in 1904, 16,600,000 in 1903, and 17,289,000 in 1902.

The deliveries for May

were as follows:—

	Pieces.
Foreign deals and ends	280,000
Do. battens	575,000
Pine deals and battens	102,000
Spruce do do	157,000
Boards, rough	440,000
Do. prepared	1,566,000

Totalling 3,120,000 pieces, as compared with 2,970,000 in 1904, 3,100,000 in 1903, and 3,403,000 in 1902.

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for the first five months of the year have been:—

	1905.	1904.	1903.	1902.
	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	16,038	15,486	21,526	14,104
Boards	5,985	4,832	7,267	6,776
Total	22,023	20,318	28,793	20,880

and for May—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	7,920	7,829	13,229	7,757
Boards	2,221	1,567	2,922	1,390
Total	10,141	9,396	16,151	9,147

Soft Woods.

Swedish Wood.—Messrs. Churchill & Sim report that the importation for May has been slightly in excess of that for May last year, but nevertheless on a small scale. Both deals and battens, old stock principally, have been sold at rates which compared not unfavourably with those current here in April, but the demand has been of a very retail nature. Prices for flooring have drooped during the month, even below those submitted to in April, again from lack of power in the demand.

Norwegian Boards.—The arrivals of prepared boards from the Norwegian ports during May have been very scanty; not much more than half those of May, 1904 They have, however, amply supplied the feeble wants of the market, and prices are certainly no better than they were a month ago.

Russian Deals and Battens.—The market has cleared up a fair quantity of last year's importation during May, and prices for deals, and still more so for battens, have tended to firmness in the absence of any considerable break in free-on-board quotations for further shipments.

Finnish Battens.—There has been a tendency towards improvement in the prices for all small Finnish battens in the London market during May. Probabilities still point to a light supply, and with any improvement in the consumption this tendency should be easily maintained.

Prussian Timber.—The fresh supply of fir timber has been a very light one, and the dock stock appears to amount to the magnificent total of 169 loads, so that there can be no London market price, Of oak also the supply has been inadequate even for a retail consumption, and prices are firmer.

Canadian Timber.—Prices for pine deals continue weak in London, at perhaps a point below those to which they were reduced in April. The demand has slacked off again. For spruce there is no change in the London market. The St. Lawrence shipments continue to be sold for arrival in small quantity at moderate prices, while from the Lower Ports it is becoming more, rather than less, difficult to make forward sales at the comparatively high rates asked, rates to which the London market has never made any attempt to respond. In hardwoods the demand for oak and birch timber has been quite unsatisfactory. There is no change in the quotations for elm and ash, or for yellow pine timber.

The fresh supplies of sawn timber in the month are almost nil, and the effect of a good consumption is shown in a plentiful reduction of the dock stock. This has not, however, had any particular effect on prices, which so far cannot be said to be more than a point better than in April. Of pitch-pine deals the supply has been quite nil during the month, and these stocks also show free reduction. The effect on prices, moreover, has in this case been more marked, and there is a distinct rebound from the excessive depression of the earlier months of the year.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., report that the landings in the docks in London during May consisted of 1,320 loads of logs and 145 loads of planks and scantlings, or a total of 1,465 loads, as against 1,107 loads for the corresponding month of last year. The deliveries into consumption were 301 loads of logs and 260 loads of planks and scantlings—together 561 loads, as against 383 loads for May, 1904. The difficulties of getting supplies continue, and although a Moulmein cargo of logs has been a welcome addition to the depleted stocks, it consisted entirely of short logs, and a considerable portion of these were sold to consumers long before arrival, so that the increase in the dock figures is transient. Very long prices are required for such stocks as may still remain at the shipping ports, and large supplies are quite unobtainable. Prices, therefore, are reaching a figure quite unprecedented; and although this is to be regretted, it must be recognized that shippers have had to suffer in the volume of their trade by the scarcity of the outget from the forests, and have naturally found compensation in marketing such supplies as they have at high prices.

Mahogany.—This market has been very lifeless. The lack of volume in the demand has counteracted the effect of the moderate supplies from Honduras, the season for this description of wood having practically closed.

Odessa Oak.—The shipments of logs which have recently come forward have been of a very prime character, and given great satisfaction to large consumers who find such wood most economical for high-class constructive work. As the market continues to widen out, prices have tended upwards; but the chief shippers of this wood are wisely content with getting a small return on the actual cost of production, so that their product may continue to be comparatively cheap as against other descriptions of oak.

Builders' Notes.

London Building Act Amendment Bill.—It was originally decided that the Corporation, he Metropolitan boroughs and the various rofessional and other authorities concerned hould submit their observations on the Bill y June 10th. An extension of time, to uly 10th, has now been granted. In hese circumstances it is not likely the Bill vill be introduced in the next session of arliament.

Cheap Houses.—The Local Government oard has granted permission to the Staines ural Council to pass the following by-laws vith respect to the erection of cheap dwellngs:—

(1) All rooms in buildings to be used as shops or dwellngs to be 8ft. high, with the exception of rooms contructed wholly or partially in the roof, which should ave a height of 5ft. from the floor at the sides and 8ft. ver one-half of the floor.

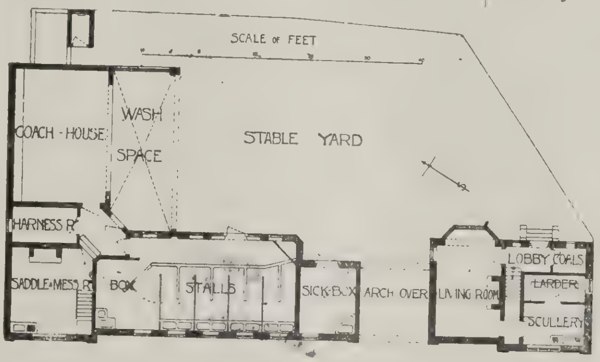
(2) Any building comprising not more than one storey o be constructed of, or wholly covered with, galvanized orrugated or other sheet iron, and the interior to be overed with fireproof lining.

Tyneside Building Trade Dispute: Joiners ccept a Reduction.—The joiners employed n the building trade on Tyneside, following he lead given by the operative masons, have ccepted a reduction in their wages of ½d. er hour, making the rate 9½d., with minor lterations in their working rules. The brickayers and plasterers still appear to be firm n their determination not to begin work xcept at previous rates of pay, but it is nticipated that a settlement will be effected vith the labourers on the basis of ¼d. per our reduction.

Spencer, Santo & Co.—The report for 1904 ates that the nett income, including the mount brought forward, was £20,966. It is roposed to pay a dividend at the rate of 5 per cent. per annum on the ordinary ares, making 10 per cent. for the year, arrying forward £1,193. This distribution at the same rate as last year. The directors onsider it satisfactory that, in spite of the eneral depression in the building trade, the ompany is in a position to maintain its dividend. Continued satisfactory progress has been made with the new public offices at Westminster. The company has just secured a large building site in an important thoroughfare in the West End, whereon it is proposed to erect business premises. The directors confidently anticipate that this venture will prove a highly remunerative one.

The Transporter Bridge across the Mersey, between the towns of Widnes and Runcorn, was opened last week by Sir John Brunner.

Irish Slates.—Referring to the use of Irish or Westmorland slates at school buildings at Glasnevin for the Commissioners of National Education in Ireland—a question in regard to which was asked recently in the House of Commons (as reported on p. 303 of our issue for last week)—a correspondent of the "Freeman's Journal," Dublin, says: "I have before me a price-list of a Westmorland slate company, and I compute that the slates which are commonly used here by builders would cost about 50s. per square of 100ft. super. landed at the North Wall, and the cost of fixing these on the roof would be about 12s. per square. I have also a price-list of an Irish quarry before me, and the price per square works out at about 35s. on rail, Dublin, and the price of fixing at about 6s. The difference between the two is 21s. per square in favour of the home article."



THE STABLES.

RED HOUSE, CHAPEL ALLERTON.

In the design of this house, near Leeds, of which we give plans and photographs herewith, a large hall with top-light was required, suitable for the display of a collection of prints upon the walls, with a number of small sitting-rooms opening off the hall. A gallery runs round the hall at first-floor level, but care has been taken to avoid making any of the bedroom doors to open direct from this gallery. Externally the house is built of axe-faced Hopton Wood stone for the plinth, and above with 1¾in. Woodville sand-faced bricks supplied by Messrs. Ellis, Partridge & Co., of Leicester, with Ancaster stone dressings. The cornice is of wood, painted white, while the roof is slated with "Arfon" American red slates, supplied by Messrs. Pearson Brothers & Campbell, of Liverpool. The columns of the portico are also of Hopton Wood stone treated with a "pecked" face, and the hall mantelpiece is made of various-coloured Derbyshire marbles from Messrs. Killer Brothers' quarries. The contractors were:—W. Thompson & Sons, mason and bricklayer; Banks Mawson, joiner; J. Lindley, plumber; T. Moore, plasterer; Watson & Worsnop, slater; and Roylance & Horsman, painters. The stable fittings were supplied by the St. Pancras Ironwork Co., Ltd. Messrs. F. W. Bedford and Sydney D. Kitson were the architects.

OUR PLATES.

The rood screens at Aldenham Church, Herts, and Swaffham Prior Church, Cambs, have been recently erected (in oak) from designs by Mr. Charles J. Blomfield, F.R.I.B.A. In both cases the ancient approach and doorway to the rood lofts are in existence. The screen for Aldenham Church was carried out by Messrs. J. Thompson & Co., of Peterborough, and that for Swaffham Prior Church by Messrs. Cornish & Gaymer, of North Walsham.

* Accepted subject to amendment.

Midsomer Norton (Somerset).—For alterations to the Wilts and Dorset Bank, for the Wilts and Dorset Banking Co. Mr. William F. Bird, architect, Midsomer Norton :—

J. H. Tovey, Midsomer Norton	£397 15 0
J. Bird,* Radstock	380 0 0

* Accepted.

Midsomer Norton (Somerset).—For the erection of two small villas in North Road, for Mr. Mark Matthews. Mr. William F. Bird, architect, Midsomer Norton :—

W. & A. Edgell, Westfield	£968 0 0
J. H. Tovey, Midsomer Norton	765 0 0
William Tovey,* Midsomer Norton	747 10 0

* Accepted subject to amendment.

Oulton.—Accepted for the enlargement of the Oulton Council school buildings, for the East Suffolk County Education Committee. Mr. F. W. Richards, architect, 14, Stanley Street, Lowestoft :—

Mobbs Brothers, 57, Maidstone Road, Lowestoft	£2,000

Redruth.—For additions and improvements to the Druids' Hall, for the Public Rooms Co., Ltd. Mr. H. W. Collins, architect, Clinton Road, Redruth :—

Hodge & Opie	£1,596
A. Carkeek,* Redruth	1,580

* Accepted.

Reigate.—For the erection of a residence in Blackhorse Lane, for Mr. J. Henderson. Mr. C. E. Salmon, architect, Bell Street, Reigate :—

W. Bagaley & Son	£6,490 0 0
R. Killick	6,315 13 6
J. King & Son	6,080 0 0
W. Wickman*	5,595 0 0

* Accepted.

Roydon (Essex).—For the erection of an eight-roomed house, for Mr. C. F. Steel. Messrs. Barrett & Driver, architects and surveyors, 23, York Place, Baker Street, London, W. :—

C. S. Foster & Son, Loughton, Essex	£420 0 0
Robert Archer, Cheshunt, Herts	390 0 0
C. King, Nazeing, Essex	360 0 0
A. M. Byott, Hoddesden, Herts	337 7 0
G. Chester, Great Purnden	310 0 0
W. E. Clarke,* Hoddesden, Herts	298 10 0

* Accepted.

Southend-on-Sea.—Accepted for the erection of a public library in Victoria Avenue, for the Corporation :—

F. & E. Davey, Ltd., Southend-on-Sea	£7,576

Swanley Junction.—For the erection of an addition to the factory of the Kent Jam Co., Ltd. Mr. W. S. Skinner, architect, Bristol. Quantities by the architect :—

H. L. Holloway	£3,282
F. & H. F. Higgs	3,225
W. Johnson & Co.	3,095
W. F. Blay	2,846
J. Lonsdale,* Swanley Junction, Kent	2,748

* Accepted.

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

Sample and Shadecard on application to Sissons Brothers & Co., Ltd., Hull. London Office —199B Boro' High Street, S.E.

CAUTION – See the name Hall's Distemper on all tins; refuse imitations, which are inferior.

ROOFING SLATES:

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 8.
June, 1905.

FIRE-PREVENTIVE REQUIREMENTS IN TORONTO.

WE have already dealt with the conflagration at Toronto of last year, and it is naturally of considerable interest to observe the lines upon which the conflagration area is to be rebuilt. This rebuilding is controlled by the new building regulations of Toronto, which were passed in July and December of last year, and under which all new structures are being put up. Seeing that in the Metropolis we are now in the throes of discussion regarding building legislation, we have selected some of the more interesting points regarding the building requirements in Toronto with a view of showing what these Canadian requirements are as based upon the sad experience of last year.

Toronto's new building law, passed July 6th, 1904, and amended December 27th, defines the term "fireproof construction" as follows:—

The term "fireproof construction" shall apply to all buildings in which all parts that carry weights or resist strains are constructed wholly of stone, burnt clay, iron, steel or concrete, and in which the roof and all stairs and also elevator enclosures are made entirely of incombustible material, and all metallic structural members are protected against the effects of fire by coverings of an entirely incombustible material, and which must also be a slow heat conductor. In buildings of this type all door or window mullions, whether vertical or horizontal, shall be faced with cast-iron, terra-cotta or other incombustible material of equal fire-resisting values.

The materials which shall be considered as fulfilling the conditions of fireproof coverings are: first, brick; second, hollow tiles of burnt clay, applied to the metal in a bed of mortar and constructed in such manner that there shall be two air-spaces of at least three-fourths of an inch each by the width of the metal surface to be covered within the said clay; third, porous terra-cotta, which shall be at least 2ins. thick and shall also be applied directly to the metal in a bed of mortar.

The requirements of the new law as to style of buildings are in part:—

(1) All buildings hereafter erected or altered in the city of Toronto so as to exceed 70ft. in height, except churches and grain elevators, shall be of first-class and fireproof construction throughout, and churches containing a seating capacity of 1,200 or more people must be of fireproof construction up to and including the main or auditorium floor.

(2) All buildings intended to be used as an apartment or tenement house, lodging-house or hotel, exceeding 55ft. in height, must be of the first class.

(3) All buildings exceeding 50ft. in height and intended to be used as a college or public school, hospital, asylum or an institution for the care or treatment of persons, and all theatres and opera houses with a seating capacity of more than 1,000 persons, and boiler, engine and dynamo rooms in all buildings, must be of the first class.

(4) Buildings other than the above referred to may be erected in mill, slow burning, ordinary or frame construction, in the several limits hereinafter described.

(7) No buildings shall exceed in height the following times its least dimension at the base:—

For buildings with skeleton frame, 5 times; with masonry walls, only 4 times; for buildings of mill construction, 3 times; with ordinary construction, $2\frac{1}{2}$ times, and frame buildings $1\frac{1}{2}$ times. This also applies to wings of buildings whose length exceeds $2\frac{1}{2}$ times their width, providing no building shall exceed the maximum height established for its respective class.

The following provisions relating to the protection of outside windows are understood to apply to fireproof office buildings, &c.:—

All warehouses, workshops or buildings used for factory purposes which are two storeys or more in height above the sidewalk or curb level shall have doors or shutters made of fireproof material on every window and entrance when the same does not open on the street, the whole to be sufficient to prevent fire from entering the building by such window or entrance, and to be submitted to the Chief of the Fire Department.

(1) When the doors or shutters cannot be put on outside of a building they shall be put on the inside, and in any case shall be hung independent of the woodwork of the window.

(2) Every such door or shutter shall be closed upon the completion of business of the day by the occupant having the use or control of the same, and all fireproof shutters above the ground floor must be so constructed that they can be closed and opened from the outside.

(3) Where fireproof doors or shutters are put on the inside of a building the door and window frames are either to be made of or covered with incombustible material, and the sashes are to be glazed with wired glass.

(4) All windows not provided with fireproof shutters shall have frames covered with incombustible material, and metallic sashes glazed with heavy wired glass, or in lieu thereof shall have automatic sprinklers over them on the outside, or a perforated pipe not less than 2ins. in diameter may be substituted for the sprinklers, in buildings of fireproof construction, or having inside sprinklers. In either case proper and sufficient supply pipes and all necessary valves and fittings are to be furnished, the whole to be made and fixed in such a way as to ensure the proper working of either appliance in case of emergency.

A MUSEUM IN DANGER.

THE Dublin Science and Art Museum is, according to the Board of Visitors, in constant and imminent peril of destruction by fire. In the last annual report attention is again called to the necessity for removing the workshops to a site where an accidental fire would not cause imminent risk of destruction of the museum. The visitors declare that they have discharged the duty cast upon them, and responsibility must rest upon those who neglect their warning.

There have been previous complaints as to the safety of our national collections generally. It would be well if Mr. Spielmann, who succeeded in improving the fire risk of the National Gallery, could be induced to again energetically pursue this question.

A SMALL FIRE AT WHITELEY'S.

THE small fire which occurred at Messrs. William Whiteley's has a point of interest somewhat uncommon to fires generally, namely, to one relating to the accumulation of noxious gases in badly-ventilated compartments.

The chemical department of the London County Council, in a report on a fire which occurred in the Westbourne Grove premises, at which several firemen were partially suffocated and rendered unconscious, draws attention to a serious danger to which firemen are exposed. It states as follows, namely:—

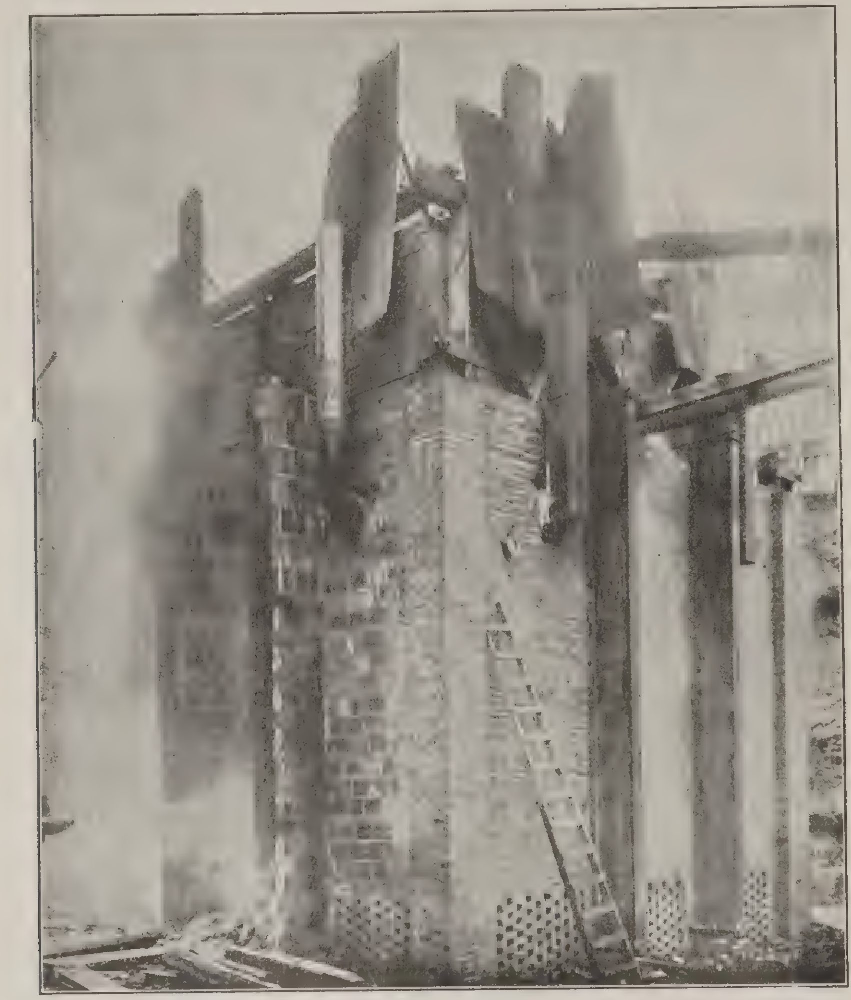
"From the enquiries made and the general appearance of the place, I am of opinion that the loss of consciousness by the firemen was caused by inhaling the mixed gases produced by imperfect combustion, the effect being intensified by the confined space in which the fire occurred.

"The fire seems to have taken place in a long, corridor-like room, where there was practically no ventilation. The want of ventilation probably prevented an extensive fire, as there was not a sufficient current of air to support rapid combustion. In fact, it appears that the wood had undergone to a large extent destructive distillation rather than ordinary combustion.

"This incomplete combustion would not only probably largely remove the oxygen of the air, but might also introduce gases of a distinctly poisonous nature, and this would largely hasten the production of unconsciousness in the men breathing the atmosphere.

"It is probable that the firemen were deceived by the comparative absence of smoke, which may have been removed by the working of the automatic sprinkler, and they may therefore have entered the premises without taking the usual precautions which are adopted when inhaling a dangerous atmosphere.

"I think that it would be desirable if you could arrange that firemen entering premises of this character should use respirators or be furnished with an independent air-supply, as in all probability if such precautions had been adopted on this occasion the bad effect on the men would have been greatly reduced if not prevented."



THE PITTSBURG TEST IN OPERATION SHOWING APPLICATION OF WATER.

SOME MODERN AMERICAN WAREHOUSES.

The Pittsburg Terminal Warehouse.

THE enormous warehouse scheme that is just about to be carried out at Pittsburg, U.S.A., for the Terminal Warehouse and Transfer Co. calls for special attention in this supplement, for several reasons.

First of all, we have here an instance of an American warehouse company systematically going to work with a view of obtaining a fire-resisting building upon which they hope to be able to obtain a very low insurance rate, both for structure and contents. Secondly, we here have an example of what American practice apparently considers to be the right kind of construction to adopt for buildings of this class. Next we have a warehouse company making careful investigations as to the fire-resistance of the system of construction they are about to adopt, and going so far as to call in Professor Woolson of the Columbia University, New York, to undertake some fire tests with the work they propose using; and lastly, we have, by the courtesy of Professor Woolson, received a copy of the official report of these fire tests, which were conducted on similar lines, although not on identical lines, to those of the official New York fire tests, with which his name is primarily associated.

It is always pleasing to see a warehouse corporation systematically taking up the fire aspect of the scheme of building, and it would be well if our own great Harbour Boards and Dock Companies paid greater attention to this aspect of warehouse construction than heretofore.

It is eminently interesting, further, to observe that the up-to-date system of construction adopted by the Terminal Warehouse Co. is not what we had believed would be the probable system, namely, that of flat hard terra-cotta bays, but that the system adopted is a combination of porous arched terra-cotta with cement-concrete. As to the idea of the warehouse companies having a bay of the floor and a section of the partition they propose using put up and tested under conditions not dissimilar to those required at New York, we would only say we trust our own great corporations will in time learn the wisdom of regularly having such tests executed in the same way as, we assume, they generally have their cement tested or their steelwork tested in the question of stresses and strains.

The Warehouses.

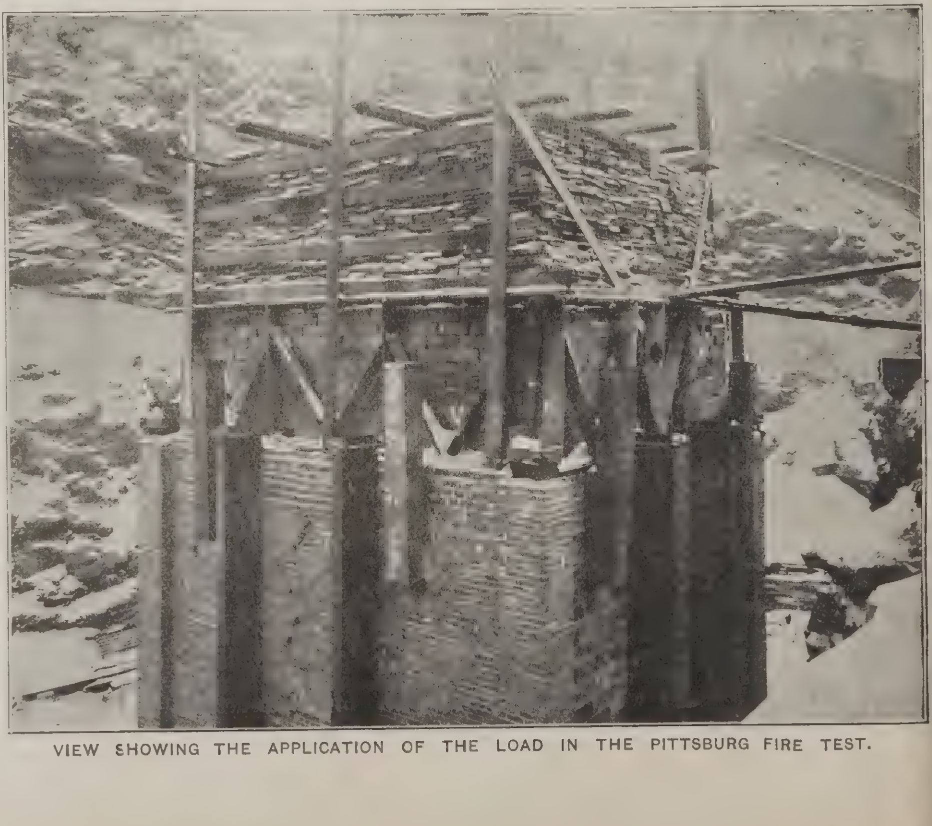
The warehouses, which are located along the Monongahela river, will have first-class wharf and switching facilities for the transfer of all kinds of merchandize by rail and water, and will cost about £400,000. They are designed to represent the highest type of fire-resisting construction, nothing but the latest and the most improved materials being used. The insurance rates, it is said, will be the lowest ever given on any buildings of this class in the States.

The buildings cover an area of 370ft. by 390ft., with basement below first-floor level and six storeys above. The four upper storeys are divided longitudinally by a roadway 45ft. wide leading from Carson Street and extending from the front to the rear of the building. The exterior walls are to be of brick, 13ins. between pilasters. No stone will be used in the construction of the exterior walls, and all sills will be of terra-cotta. The total height of the buildings from the railroad track to the top of the parapet wall is 90ft.

The first floor is arranged for a terminal station with six tracks entering the building; wide platforms are provided on each side of the tracks for receiving and distributing freight consigned to the different warehouses. Elevators are provided for each warehouse, enabling tenants to receive goods directly in their respective warehouses, with equal facilities provided for shipping goods to outside points.

In designing the building, skeleton construction has been employed, and consists of "Z" steel built-up columns beginning at the base and continuing to the top of the roof, connected horizontally at the floor levels with steel beams and girders, each floor being of sufficient strength to bear safely upon every superficial foot of its surface 350 lbs. with a factor of safety of 4. The soil is of such a nature that it was deemed advisable to use concrete piles. Upon this foundation concrete piers were erected, forming the bases of the steel columns.

The buildings are intended to be fire-resisting throughout. The floor and each



VIEW SHOWING THE APPLICATION OF THE LOAD IN THE PITTSBURG FIRE TEST.

bay will consist of four porous terra-cotta arches extending across the bay diagonally and at right angles to each other; 8in. I-beams cambered to conform to the rise of arches will be placed at right angles to the girders and beams, intersecting exactly in the centre of the bays. By this method of construction it will be impossible for one entire bay or floor space to collapse in the event of some heavy object striking the arch. The floor arches are to be levelled with cement-concrete, and topped with a cement finish 2ins. thick.

The arch proper will be made of hollow, porous terra-cotta material in blocks 6ins. deep, 8ins. wide and not over 12ins. long, set with broken joints, the shells averaging ⅞in. thick. The arches will spring from the bottom flanges of the corner beams, thus diverting the loads direct to the columns, and have a rise in the centre of 18ins. above the flange.

The roof is on what is known as the "Johnson system of construction"—a wire mesh laid over the centering, this mesh to be embedded in cement-mortar not less than ¾in. thick in the proportion of 1 part of cement and 2½ parts of sand, the tile laid in same and grouted in position. All beams are to be covered with terra-cotta, the covering of the bottom flanges of the beams to be not less than 2ins. thick. The top is to be levelled off with cement-mortar and made smooth ready for the roof-covering, which will be 4-ply roof gravel.

All floors will be solid without openings, except the stairways and elevators, and will be inclined toward the division wall away from the side in which the floor openings occur, and at an inclination of 1in. in 20ft. Gutters will be formed of cement, with a 4in. pipe passing through walls on each floor-level, with light swinging cap attached to the pipe.

The Combined Floor and Partition Test.

The following is a summary of the report of the official fire test with the porous terra-cotta flooring system carried out by Professor Woolson. Test started 11 a.m.; water applied 3.16 p.m.; age of floor when tested twenty-four days:—

Method of Construction.—The test building was of steel frame construction 20ft. by 22ft. with corner posts and I-beam girders between. The longer girders were 24ins. deep, and the shorter ones 18ins. deep. This frame was encased by a 13in. brick wall on two sides and by a 9in. combination tile and cement wall on the other two sides, the object being to study the relative merits of the two types of walls as fire barriers

The floor to be tested constituted the roof of the test building. It was constructed by forming a groined arch of 6in. hollow tile between the girders, with a rise of 17ins. at the crown. Above the tile was a concrete filling of about 4ins. over the crown and 18ins. at the haunches. The arches were sprung from the corners of the rectangular floor-space instead of the sides, thus throwing the greatest thrust to the corners where the framework could best resist the load.

For the purpose of reinforcement, two 8in. I-beams were put in between each pair of girders at the middle and meeting in the centre of the floor span. These beams were cambered to the curvature of the arch and divided the test floor into four equal parts. They were encased by the floor tile.

The construction was practically a reproduction of one unit of the floor system to be used in the new Pittsburg Terminal Warehouse and Transfer Co., in which there are to be 800,000 sq. ft. of floor space all divided into spans 20ft. by 22ft. the same as this.

Full details of the construction are shown in the accompanying drawings and photographs.

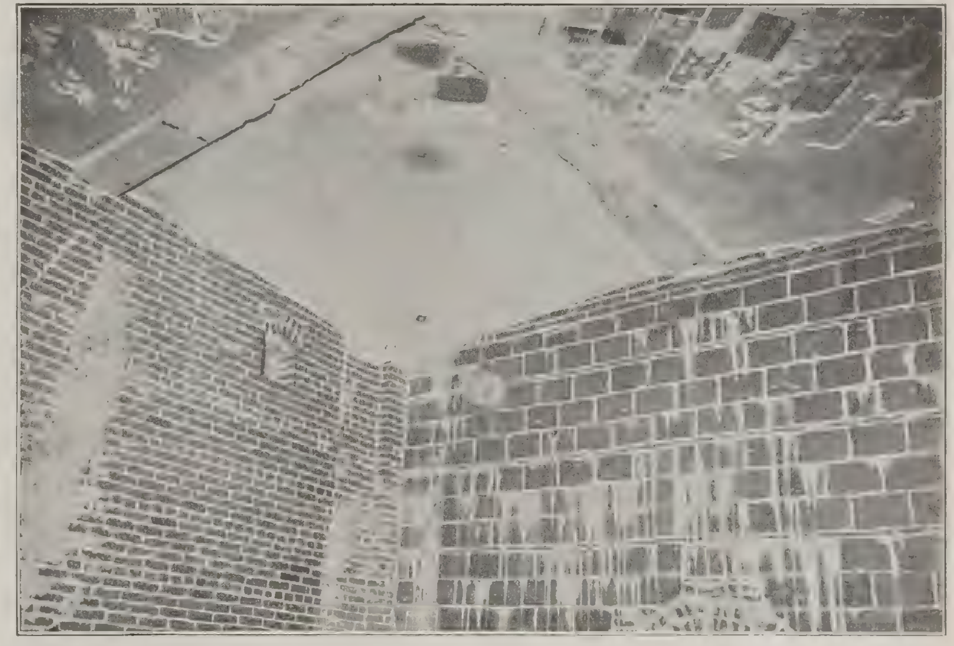
The floor proper of the test building was formed of an open chequerwork of brick, the same as a kiln floor, and upon this the fire was built. The ceiling was 15ft. 4ins. above the floor. Suitable draft openings, smoke flues and firing-door were provided.

The concrete "fill" was mixed in the proportions of 1 vulcanite Portland cement, 3 river sand and 6 gravel. The tile ceiling was given a protective coating of 1in. of cement.

Purpose of the Test.—The purpose of the test was to determine the effect of a continuous fire below the floor for four hours at an average temperature of 1,700 degs. F., the floor carrying at the same time a distributed load of 270 lbs. per sq. ft.; at the end of the four hours the underside of the floor (or ceiling) while still red hot to be subjected to a ⅛in. stream of cold water at short range under 60 lbs. pressure for ten minutes. Deflection of floor to be measured continuously during the test

Temperatures.—The temperatures of the fire were obtained by two electric pyrometer couples suspended through the floor from above and hanging about 6ins. below the ceiling. One couple was near the crown of the arch, and the other in a corner, distant about 3ft. from each wall.

Readings were made upon each couple every three minutes. The fuel used was dry refuse-wood, the frequency of firing being determined by the temperature of the test chamber.



VIEW OF FLOOR AND PARTITION AFTER THE PITTSBURG TEST.

Deflections.—The deflection which occurred at various stages of the test were measured by a Y-level reading upon a rod located upon the middle of the floor slab. The deflections were read by Mr. Bailey, an engineer detailed from the Pittsburg Testing Laboratory.

Water.—The water was applied by city firemen with a steamer. The nozzle pressure was well above 60 lbs. The firemen estimated it at 75 lbs. to 80 lbs.

In applying the water the stream was thrown back and forth over the whole ceiling as much as possible and not allowed to strike continuously in one place. As it was not practicable to flood the roof, as is customary in tests of this character, the stream was played on the ceiling continuously for ten minutes at full pressure.

Results of the Test.—Owing to the very large size of the test chamber and an insufficient flue area for the volume of fire, together with the fact that the fuel supply in the early part of the test was not suitable to feed a fire of such magnitude, it was impossible to get high temperatures during the first half of the test.

The quality of the fuel was changed during the latter part of the test, and the building having become thoroughly heated it became easy to maintain high temperatures.

Because the temperatures in the early part of the test were low, which resulted in lowering the average, it was decided to ignore the first fifteen minutes of the test, and make it up by extending the time fifteen minutes over the four hours.

The cement coating on the ceiling began to blow off about ten minutes after the fire started, and a considerable portion of it fell before the expiration of the test. The roof was covered with a load of hollow tile several feet deep, making it impossible to ascertain whether any cracks developed there or not. As the roof was in compression in all parts, and the deflections recorded were very small, it is not likely that cracks did occur there.

After application of the water, it was found that the cement coating was gone and the tile exposed where the water struck the ceiling, but the tile appeared to be in perfect condition with no cracks or broken parts. At least, none were apparent under a hasty inspection by torch immediately after the test.

The maximum deflection recorded during the test was a trifle under ½in., and the average temperature at the middle of the ceiling was 1,725 degs. F.

The report of this test is naturally one of great interest, but we think we should immediately say that there were two important elements whereby the results shown would probably have not been quite so good in New York, and certainly not in this country.

The first is that the severity of the fire was certainly not that to which we are used to in London. In looking through a detailed record of the temperatures we find that practically two hours had elapsed before the temperature of 1,600 degs. Fahr. was reached, or in other words the temperature during the first half of the test did not exceed that which in this country we apply to ordinary wire glass or electro-glazing of ¼in. thickness. During the second half of the test, it is true, the temperatures rose, but here again the impingement of the flame could have been nothing compared with the impingement in this country, having regard to the fact that only an ordinary wood fire was applied as distinct from a fire produced with the aid of gas. By the aid of gas the actual conditions of a fire are assimilated, *i.e.*, flame and heat are applied in that force which is common wherever there is a draught during a fire.

CONSTRUCTIONAL DETAILS AND TEMPERATURE CHART OF THE PITTSBURG FIRE TEST.

Besides this, we consider that the height of the floor above the actual bed of the floor was too high, and certainly higher than it would have been permissible either in New York or in this country. As far as we can see, the floor was 15ft. above the bed of the fire, or nearly twice as high above the bed of the fire as would be the case during an official test in this country.

The floor and partitions were constructed by the National Fireproofing Co. of the U.S.A., who have also recently applied for tests under London conditions, so that comparative results should be shortly obtainable.

WINDOW AND DOOR OPENINGS.

THE following are extracts from an important report presented by the special committee of the full meeting of the National Fire Protection Association of the United States at their meeting of May 23rd and May 25th, with a copy of which we have been favoured. The lengthy document is supplemented by numerous rules.

While considerable progress has recently been made in the development of various methods of protecting openings in walls against fire, these developments have been mainly along the line of improvements in existing practice, and the Committee cannot but feel that far greater advancement must be made to place this engineering problem abreast with the times. Methods and materials are still being commonly used and approved which are unsuited for the purposes for which they are intended.

Recent tests and investigations indicate that for openings of ordinary size the so-called standard tin-clad door and shutter, all things considered, furnishes the most reliable protection, particularly when the exposures are severe. The superiority of this type is very largely due to its efficiency as a non-conductor of heat. This offsets in a large measure inherent defects in other respects.

It is only fair to say that recent tests have shown that certain forms of doors have superior fire-retardant qualities to the tin-clad, wood-filled fire door, but their practicability in other respects has not as yet been fully demonstrated. Doors and shutters having the desired fire-retardant qualities, a more acceptable appearance and in which no inflammable materials are used are urgently needed. The standard vault door and the iron shutter would seem to take second place as fire-retardants for general use, their mosto bjectionable feature being the transmission of heat.

Wired glass properly framed is classified as third on the list of retardants now in common use. Like thin iron shutters, its most objectionable feature is due to the fact that when severely exposed the passage of heat through the glass is extreme. There is a vast field for the intelligent use of this material, but its limitations should be recognized. A continuation of many of the present practices in its use will undoubtedly result in disaster and possibly in the discredit of its real value. Wired glass mounted in frames which are so poorly designed and constructed that they will hardly hold together until installed in the wall, and in frames which when heated are unable to withstand even the smaller jets from fire stream, will hardly prove of sufficient value to warrant the consideration with which they are now so commonly favoured. The use of inflammable putty in which the glass is almost always set in itself constitutes a danger under many conditions of service.

Polished plate and prism glass in units not exceeding 4ins. square, electro-glazed and properly framed, should, in our opinion, be classed with wired glass as a fire-retardant.

Although at present not very generally used or recognized as a fire-retardant, the steel rolling door and shutter undoubtedly fills a valuable place in the list of retardants. Its greatest defect is due to radiation.

FIRE PREVENTION AND THE L.C.C. BILL.

THE London County Council are now busy considering an Amendment Bill for the London Building Act, to be put forward for the session of 1906. In order to make their views clear they have taken the wise step of having the clauses of their proposed Bill of 1905 embodied in a copy of the existing Act and issued with explanatory notes as to the bearing of the proposed amendments. It is only regrettable that this had not been done before, as we believe it would have prevented much of the opposition. Besides this valuable document, a memorandum has been issued by the chairman of the Building Act Committee which, in precise language, explains the objects and reasons for the proposed amendments. The part that deals with the subject under review in this supplement we give verbatim, and we think the chairman of the London Building Act Committee should be congratulated upon the lucidity with which he has put forward the Council's case regarding the provisions in respect to danger from fire.

There is one point, however, which although not primarily mentioned under the heading of "Danger from Fire," very materially affects this problem. This is the removal of a restriction which has so far had a most beneficial effect on the reduction of fire loss. It has up to the present only been possible (and then only with the permission of the London County Council) to erect buildings of a cubical content of 450,000 cub. ft. It is now proposed to leave the cubical contents to the discretion of the County Council. This, we think, is a retrograde movement as far as fire-protection is concerned, and should not be encouraged by those who have the interests of fire-protection at heart. It will also no doubt be opposed by the insurance companies who have a vested interest in this question.

It is advisable that there should be greater facility for considering units of buildings of considerable cubical dimensions in which the division is horizontal and not necessarily vertical, but to allow units of quite discretionary cubic content in the Metropolitan area would mean the advent of an additional conflagration hazard, the terrible results of which have been so visible in the great fires of the Americal cities, where to a very great extent the conflagrations have been due to the large contents of the first building affected by fire.

Present Position.

This Bill was set down for second reading in the House of Commons on 14th March, 1905, and by an arrangement between the members of Parliament in charge of the Bill and of the City of London (Escape from Fire) Bill it was agreed to drop all parts of the Council's Bill with the exception of Part VIII. (Means of escape from Fire, &c.). Part VIII. of the Bill then passed the second reading without opposition. The withdrawal of the other parts of the Bill affords the Council an opportunity of ascertaining the views of the local authorities and the various professional and other associations concerned on the proposals contained in the Bill, and on 4th April, 1905, the Council decided to take advantage of this opportunity and to send the Bill, with the amendments to the existing Acts clearly shown, to all the authorities concerned, with a request that they would acquaint the Council at as early a date as possible with their views as to the amendments that should be made in the London Building Acts. The Bill will thus afford a basis for discussion by all the authorities concerned, and it is hoped that in this way it will be possible to arrive at some degree of unanimity as to the principles that should govern the amendments to be sought in a new Bill. The question is one of some difficulty to those who have not made a study of the Building Acts, and this memorandum has therefore been drawn up with the object of conveying in as simple a form as possible some idea, not only of the scope of the proposals contained in the Council's Bill, but of the reasons which actuated the Council in promoting the Bill. Although Part VIII. of the Bill has passed the second reading in the House of Commons, it is thought undesirable to omit reference to it at present.

Legislation prior to 1894.

Prior to 1894 the Acts relating to streets and buildings in London were thirteen in number. The London Building Act, 1894, consolidated and amended the enactments relative to streets and buildings contained in these thirteen Acts, and it may be useful to state briefly the facts relating to the passing of the 1894 Act.

In 1890, the Council being of opinion that the building law, both constructional and sanitary, should be strengthened and then consolidated, certain provisions for effecting that object were included in the Council's General Powers Bill of that session. These provisions met with considerable opposition and criticism before Select Committees of both Houses. On 23rd December, 1891, the Council, having learned that it was the intention of the Government to introduce a Bill to consolidate the Metropolitan Building Acts, authorized the Building Act Committee to lay the amendments suggested by them before the President of the Local Government Board and to confer with him as to any other amendments which might appear desirable during the progress of the Bill. As no Bill dealing with the suggested amendments was introduced by the Government during 1893, the Council decided to introduce a Bill. This was accordingly done, and the Bill was read a second time in the House of Commons and referred to a hybrid committee. Forty-seven petitions were lodged against the Bill, which occupied the Committee for twenty-two days, and during this time was considerably altered. After passing the House of Commons, the Bill was for four days before a Committee of the House of Lords, but it passed the Upper House without substantial alteration, and as the London Building Act, 1894, received the Royal Assent on 25th August, 1894.

Necessity for Amendment.

In 1898 a short amending Act was passed, but this affected only four out of the 218 sections contained in the principal Act, and the building law of London may practically be regarded as comprised in one Act at the present time. As might be expected in an Act dealing with a subject of such magnitude as the building law of the greatest city in the world, cases have from time to time come to the notice of the Council which clearly illustrate the need for an amendment of the law; in some cases in the direction of making the existing provisions more stringent, in others in the direction of affording greater facilities for building operations. The rapidity with which building has proceeded of late years, with the consequent covering over of open spaces, has rendered it imperative to make some provisions for future needs as regards light and ventilation by requiring a greater width for new streets. The serious number of fatal and destructive fires has demonstrated beyond doubt the inadequacy of the existing provision for securing means of escape in case of fire and for preventing the spread of fire. On the other hand, the changes which have taken place in industrial conditions render an alteration in the law necessary in order to enable buildings to be erected of large size without the restrictions which the present law imposes, and which have the effect of seriously hampering trade and manufacture in the county of London. Moreover, the tendency of the age is to accentuate the importance and the necessity of the adoption of time-saving methods in every branch of industry, and in building the need for rapidity has led to a stronger demand for greater facilities being given for the use of iron and steel construction.

Amendment Bills 1903 and 1905.

While the Council was collecting material for an amendment of the Act of 1894, there occurred on 9th June, 1902, at No. 67, Queen Victoria Street, a fire in which ten lives were lost. In August, 1902, the Home Secretary wrote to the Council stating that, in view of the facts disclosed at the inquest on the Queen Victoria Street fire, he thought that the question of further legislation on the subject of safety from fire in high buildings required early consideration; that in his opinion the matter could not be adequately dealt with by a mere extension of the powers of the Council under the Factory and Workshop Act, 1901, and he was therefore disposed to think that any new legislation should take the form of an amendment of the London Building Act, 1894; and as this Act was a local Act any amendment of its provisions would naturally be by a private Bill promoted by the Council, and that, so far as it might be possible for him to do so, he would be glad to assist in any proposal that might be made for that purpose. The Home Secretary subsequently informed the Council that he would have no objection to the extension, under proper conditions and in suitable cases, to existing buildings of provisions with respect to means of escape from fire, provided adequate provision were made for allowing the owners or occupiers of existing buildings an appeal to an arbitrator or to some other tribunal. When the first letter from the Home Secretary was received in August, 1902, there was not sufficient time to make it possible to introduce in the then next session of Parliament a Bill to secure all the amendments which were known to be necessary in the Act of 1894. It was, however, felt that the Council ought to avail itself of the support promised by the Home Secretary, and at once prepare a Bill to amend the provisions of the Act dealing with fire-prevention and the means of escape from fire. This was accordingly done, and on 10th November, 1902, the Home Secretary wrote stating that the Council's proposals with regard to the provision of means of escape appeared to him to be such as, in principle, might properly be submitted to Parliament and dealt with on their merits by Select Committees of the two Houses after a full consideration of the various interests involved; that there were points of detail which in his opinion might require further consideration, but that these could be better dealt with by the Select Committees, who would not only hear the Council and consider any suggestions that might be made by Government departments, but would also give a full hearing to all persons who might be affected by the proposed legislation.

With a view to affording time for consideration of the views put forward by the representatives of the various interests affected by the Bill, and in the hope of securing the harmonious co-operation of all concerned in the amendment of the Act, the Council decided not to proceed with the Bill. The Building Act Committee were subsequently instructed to prepare proposals for securing the necessary amendments to the London Building Act, 1894, and letters inviting suggestions as to the amendment of the Act were sent by the Committee in June and again in November, 1903, to the Corporation of the City of London and to the Metropolitan Borough Councils and also to professional and other authorities concerned.

The Bill of 1905 was the outcome of the Committee's work, and was drafted after careful consideration of the suggestions made by many of the Metropolitan Borough Councils, by the Royal Institute of British Architects, the Surveyors' Institution, the British Fire Prevention Committee, the District Surveyors' Association and many other bodies. The provisions with regard to means of escape in case of fire were based upon the proposals which were included in the 1903 Bill, and which, as stated above, were considered by the Home Secretary to be such as, in principle, might properly be submitted to Parliament.

Danger from Fire.

The necessity of further legislation on the subject of safety from fire was, as has been already stated, the subject of correspondence between the Home Secretary and the Council in 1902, and has been generally admitted, even by the persons and authorities who are most averse to any amendment of the building law in other directions. Should any evidence be needed, however, it is afforded by the following particulars of recent fires:—

Situation of premises.	Date of fire.	Lives lost.	Remarks.
339–343, Wandsworth Road, S.W.	4th March, 1902.	3	The Fire Brigade Committee reported to the Council that they were of opinion that in cases where shops are built on the forecourts of houses, adequate means of escape should be provided for the occupants of such premises.
Barbican, E.C. (fire originated in Nos. 10 and 11).	21st April, 1902.	None	The fire resulted in the almost total destruction of Nos. 8 to 14, Barbican (south side), part of No. 74, Aldersgate Street, Nos. 60, 61, 62 and 63, Barbican (north side), and Nos. 2 to 9, New Zealand Avenue. Other premises in Barbican were more or less damaged by fire, as were also certain premises at the north end of New Zealand Avenue, which is a *cul-de-sac*. The coroner's jury deprecated the use of matchboarding for walls and ceilings.
Queen Victoria Street, E.C. (fire originated in No. 67).	9th June, 1902.	10	The coroner's jury recommended that the London Building Act, 1894, be made retrospective as regards the provision of means of escape from high buildings.
Messrs. Dixon & Haynes' furniture repository, Harrow Road.	11th Sept., 1902.	None	Considerable difficulty was experienced in attacking the fire from the rear of the building, as there were no back entrances or means of placing ladders in position at close quarters.
Ben Jonson Road, Stepney -	29th Dec., 1902.	6	The fire originated in the front projecting shop, and the deaths occurred on the second floor.
Brownlow Street, Holborn -	18th Jan., 1903.	3	The building was one of five floors about 40ft. by 30ft., used as stores and dwelling-house. The fire occurred in the basement and the upper part of the building was filled with dense smoke.
Hackney Road, N.E. - -	19th Oct., 1903.	3	Descent to the ground floor was rendered impossible by the dense smoke rolling up the staircase.
Duke's Head Passage, E.C.	25th Feb., 1904.	7	The coroner's jury recommended that the authorities should have full power to inspect all buildings and compel the owners to supply proper means of exit to the roof by means of fixed ladders or other means of escape.
Judd Street, Brunswick Square, W.C.	19th Oct., 1904.	6	The fire originated on the first floor, and the deaths occurred on the second and third floors.
Westminster Bridge Road, S.E.	2nd Nov., 1904.	1	The coroner's jury at the inquest held on the fire expressed the opinion that greater power should be given to the district surveyors to enter and examine dilapidated buildings with a view to greater security from fire.
City Mill building, 1, Upper Thames Street, E.C.	17th Jan., 1905.	None	The coroner's jury expressed the opinion that the building was not of suitable construction for the business carried on therein, and that ample and adequate means of exit should be immediately provided for the safety of the persons employed there, as the building was a most dangerous place in case of fire.

The principal fire provisions are briefly as follows:—

(*a*) That every building (both new and existing) of more than one storey above the ground storey, or of one storey only above the ground storey, but exceeding 25ft. in height shall, unless the Council otherwise allow, be provided with means of access to the roof, and with a parapet or guard rail, where necessary, to prevent persons slipping off the roof. Under the existing law means of access to the roof is required in certain cases.

(*b*) That in every building of which the floor of any storey exceeds 50ft. in height above the street level sufficient means of escape and precautions against the spread of fire are to be provided and maintained. Under the existing law means of escape can be required from the storeys above 60ft. in height.

(*c*) To require means of escape in case of fire from—

(1) Buildings in which sleeping accommodation is provided for more than twenty persons, or in which more than twenty persons are employed.

(2) Buildings used partly for shop purposes and partly for dwelling, where the shop portion projects more than 5ft. beyond the building.

(*d*) To apply the above provisions (*b*) and (*c*) to existing buildings; and to provide for referring disputed matters to arbitration, and for an equitable division of the cost of the alterations between the freeholders and leaseholders.

(*e*) To require the provision of means of escape from new buildings having any storeys above the ground storey and exceeding ten squares in area, and used partly for trade and partly as a dwelling-house.

(*f*) To prohibit the use as living-rooms or workshops of rooms above, or directly communicating with, oil shops without (1) the provision of adequate safeguards to prevent the spread of fire from the oil shop to other parts of the premises, and (2) the provision of means of escape from such premises.

(*g*) To regulate (1) the use of matched-boarding and panelling as an internal finishing to ceilings, walls, &c., and (2) the enclosing of lifts in buildings; and to protect in new buildings of the warehouse class windows within a dangerous distance of openings in other premises.

No more dangerous policy can be advocated than that of providing for escape from buildings in case of fire solely by means of access to the roof. A means of access from the top floor of a building to the roof cannot be relied upon as affording an escape from the floors below the top floor, and, as regards even the top floor, it can only be considered valuable when there are means of escape from the roof of the building to adjoining premises. For efficient means of escape from any large building it is essential that there shall be alternative means of egress of some kind from each floor, so that wherever a fire may occur persons may not be cut off by flame and smoke from the only means of escape.

SOME RECENT PARTITION TESTS.

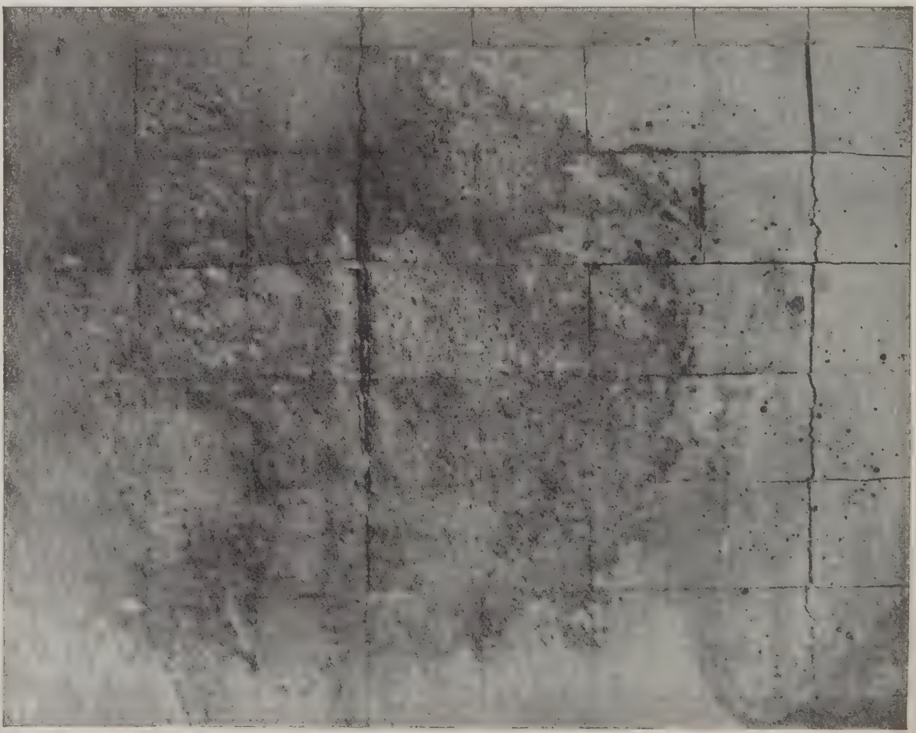
TWO reports (Nos. 92 and 93) have been issued by the British Fire Prevention Committee regarding fire tests with Mantada partitions, constructed by the Adamant Co., of Birmingham and London.

In both tests the manufacturers desired to attain classification in the fully protective class for partitions of 2½ins. thickness and under, such classification being obtainable if the partition withstood successfully a fire test of 2½ hours, followed by the application of water from a steam fire engine for a period of two minutes.

In their first test the manufacturers put forward a partition 2½ins. thick. This partition withstood the fire test, but part of it fell on the application of water.

At the second trial the partition put forward was of 2½ins. thickness. In this case the fire was let through the partition after about an hour and forty minutes, through a vertical crack, but the partition did not fall, as was the case with the former partition, on the application of water.

The moral of these two tests is a very obvious one: the Mantada slabs are certainly very good slabs from the fire point of view, but their application is not yet satisfactory. It is to be hoped that more care and forethought will be applied by the manufacturers in respect to the question of erecting partitions of their material, so that not only the material but the actual partition will stand up against the fire and water test in the manner they would no doubt wish, which would give them the record for thin partitions of 2½ins. and under.



THE SECOND (2½-INCH) PARTITION (FROM INSIDE) AFTER THE FIRE AND WATER TEST

As far as we can see, in the first test the partition collapsed because the jointing was not of such a character as to make the partition a rigid one when a stream of water touched it.

In the second test the makers have apparently tried to remedy this by inserting metal rods, but they went to the other extreme and put in too much metal rod work, with the result that one of these rods, probably expanded, caused the crack, and let the fire through.

What is required in partitions of this kind is quite a small thin dowel to supplement a good system of jointing. As in the case of other tests, we give the "object of test," which was identical in both cases, and the two summaries of tests. We supplement these by an illustration of the second test, showing the crack where the fire got through, but showing how the partition stood up after the water had been applied.

Object of Tests.

To record the effect of a fire of 2½ hours' duration at a temperature gradually increasing to 1,800 degs. Fahr. (982·20 degs. C.), and not to exceed 2,000 degs. Fahr. (1,093·3 degs. C.), followed by the application of water for two minutes on the fire side with the view of being classified as affording "full protection" (Class A).

Summary of Test I.

During the fire test the partition buckled outwards ¾in. (·019 m.). No fire or smoke passed through the partition. The recorded temperature in the passage on the outside face of the partition at no time exceeded 220 degs. Fahr. (104·4 degs. C.). On the application of water about 20ft. super. (1·8 sq. m.) of the partition fell.

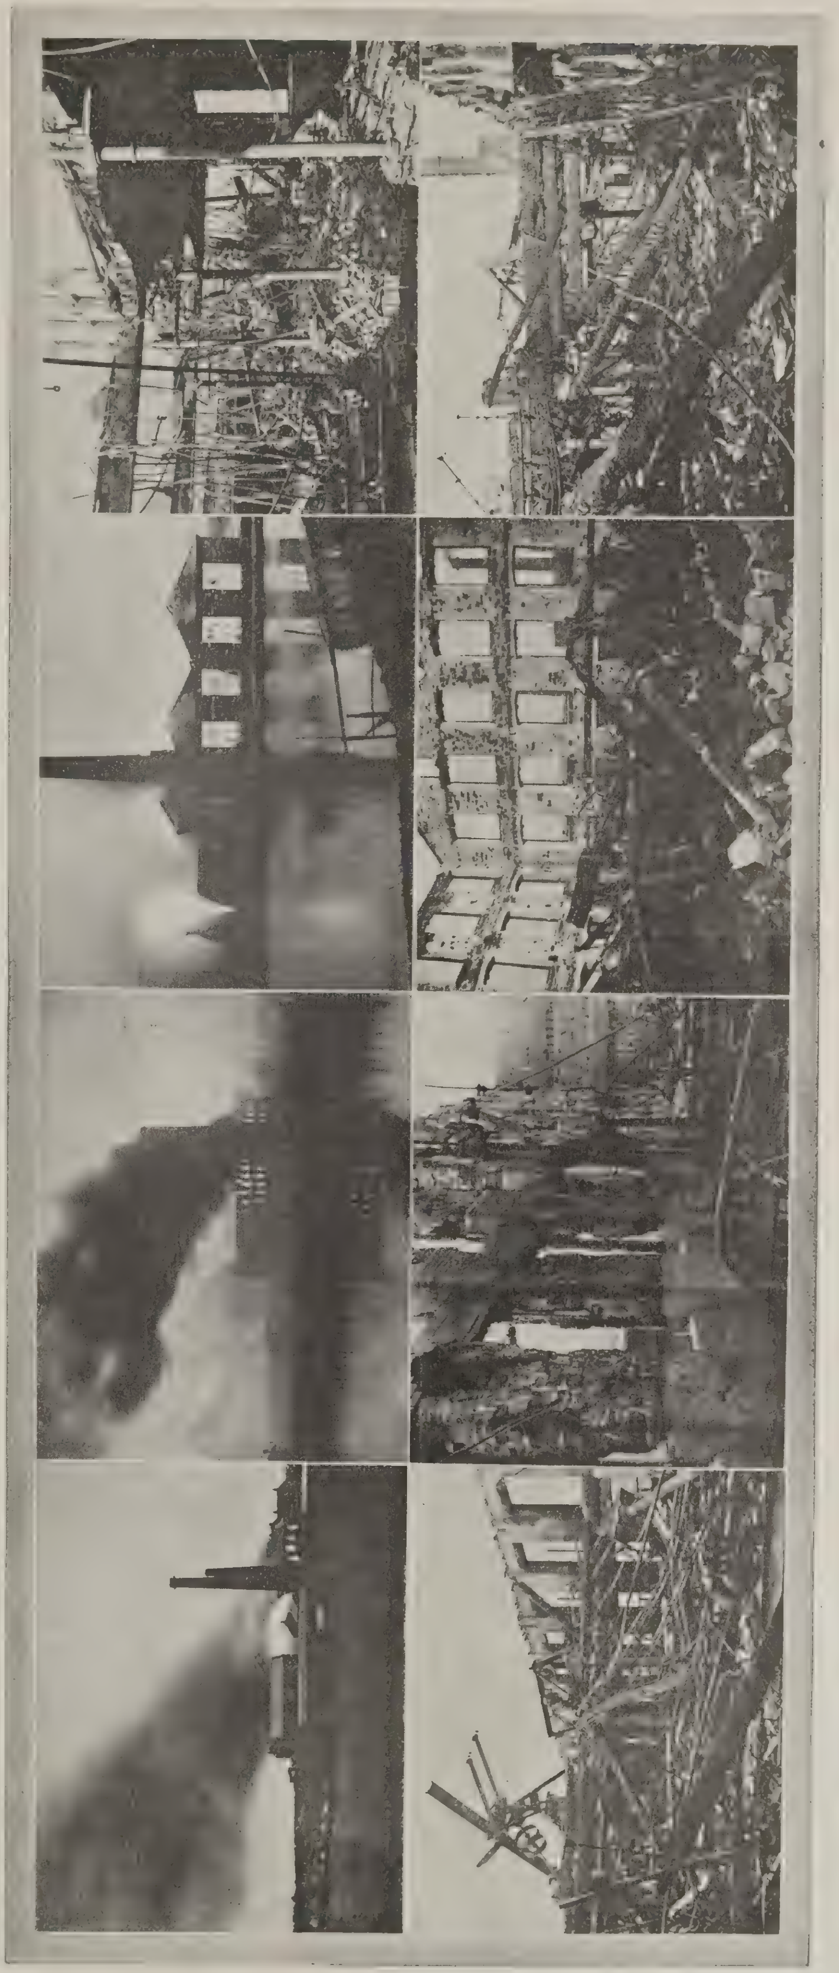
Summary of Test II.

After 53 minutes the partition commenced to bulge inwards, and continued to do so to the end of the test. The maximum deflection was 4⅜ins. (·111 m.). After 100 minutes a vertical crack appeared in the centre of a slab in the 6th course 4ft. (1,219 m.) from the north end of passage, and gradually extended upwards to the 8th course and downwards to the 3rd course. This crack gradually increased in width, and eventually fire and smoke passed through. On water being applied on the inside it came through the various open joints on the passage side. The partition remained in position at the conclusion of the test.

A LANCASHIRE MILL FIRE.

We are enabled, by the courtesy of "The Engineering Times," to reproduce several photographs of a fire at a Lancashire cotton mill. The following is an extract of an interesting article by Mr. J. H. Crabtree, H.M. Inspector of Factories, that accompanied them:—

Factories in the cotton county are noted the wild world over for their large dimensions, and specimens of five-storey mills are not rare in which we may count thirty-five windows in the length and twenty-five in the breadth thereof. Each floor represents few rooms, not more than two or three at the most; the ground floor is occupied by the machinery for carding and spinning the cotton fibre in its initial stages of treatment. This machinery is known as the "preparation" department. From the ground floor the partially spun cotton is carried on bobbins to the mule-spinning rooms above, generally styled "first," "second," and "third" spinning rooms, where the cotton is spun and attenuated into threads of various "counts" or degrees of fineness. Each of these upper floors is usually divided by the entrance stairway into a large and a small mule-room, the former having twenty to forty mule-frames or machines and the latter having six to twelve frames.



The outbreak of fire.

Flame through windows.

Bursting through roof.

Fireproof floors give way.

Girders held in mid-air.

Stone walls remain firm.

Machinery several feet deep.

Scorched wooden beams.

PHOTOGRAPHS OF A FIRE IN A LANCASHIRE COTTON MILL.

One of the smaller rooms on an upper floor is known as the cotton chamber and is used for breaking up the cotton bales, and mixing the different classes of the fleecy-looking material. The upper rooms are heated to temperatures of from 80° to 100° Fahr., and the wooden floors contain oily and greasy matter which must be used to overcome excessive friction in the moving parts of the machinery.

When, therefore, once a fire does break out there is ample opportunity, unless it should be very smartly subdued, of making very rapid, aye, even lightning, progress, and of sweeping with its lambent flames through one of these large rooms so full of inflammable material, in the space of a few seconds. A minute is sometimes quite long enough to imperil a whole room of 12,000 cub. yds.

The starting-point is generally in one of the upper mule-rooms, and at a spot well-known to the workers for its occasional treachery in throwing out sparks where they are most dangerous. This locality is in the headstock of the mule. The motions of some of the parts of this headstock are extremely rapid, the pulleys making 750 r.p.m. and having rim velocities of 12 yds. per second. It is not to be wondered, then, that when a speck of dirt or hard, flinty material hinders this rapid motion the instantaneous friction thus set up immediately produces a spark. This spark touches the nearest fibre or thread, then several fibres and threads become involved and soon the room falls a prey to the greedy, devouring flames. Buckets of water are provided; fire-hose is there; extinguishing appliances are near at hand; but it too often happens that the fierce rapidity and voracity of the flame baffles all efforts and cannot be quenched.

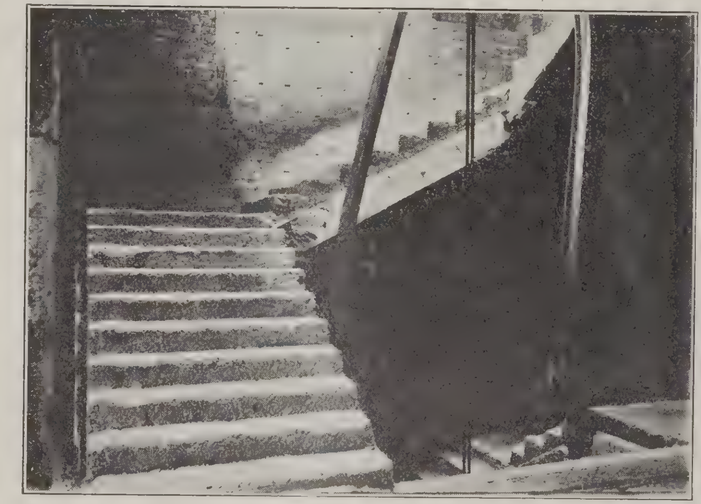
TELEPHONE FIRES.

We have from time to time referred to the serious hazard of fire at the offices of the telephone companies, and illustrated fires both in London and Glasgow, and of course we would add that, apart from the hazard to employees, there must necessarily be a risk to consumers, and above this also the possible inconvenience through fires that requires consideration. Having regard to what we said previously, we think it advisable to here give the summing up of Dr. Waldo and the verdict of the jury regarding the recent telephone fire.

The London Fire Inquest Act has been a boon to the Metropolis as far as fires in the City area are concerned, and it is only regrettable that the Inquest Act does not apply to the London County Council's areas and, as a matter of fact, to the United Kingdom generally. What a simple Act of this kind can do if administered by so able a coroner as Dr. Waldo is obvious, and, apart from any question of fire-prevention, there can be no doubt that the possibility of fire inquests being held in connection with any fire occurring in the City area must do much to reduce the possibility of incendiarism.

Summing up at the Inquest.

Dr. Waldo, in summing up, said that, for convenience sake, the two inquests might be taken together, although the premises were some distance apart. It was not disputed that both fires arose simultaneously from the same cause. Two important points were involved in the enquiry—the structural safety or otherwise of the premises as regards the risk of fire and the escape of occupants, and the special electrical conditions that gave rise to the fire, and the lack of powers to regulate the telephone service with a view to preventing the danger to property and life arising from similar accidents in the future. Being of comparatively modern introduction, telephone systems appeared to have remained hitherto outside any official control. The facts of the fires were simple. Early on the morning of February 28th a fire was discovered at Mansion House Chambers—at about five minutes to 2 a.m. The facts of the fire in Oxford Court, Cannon Street, were somewhat more complicated, as there was some danger to life, and there were several defects. The fire was discovered at 2 a.m. by the housekeeper and his wife, who heard crackling in an adjoining room, known as the distributing room. The husband gave the alarm, but, owing to some confusion between the two fires, there was some delay in the arrival of the fire brigade. The fire, however, was confined to the upper storey and the cables and the derrick on the roof above. The distributing room was lined with matchboarding, and the floor was of wood. The distributing room was full of electrical cables, and it was for the jury to say whether it was desirable to have appliances of that kind in a room with wooden walls and floors. In both fires the place of origin was clear; nor was there any doubt that the cause of the fire was an accidental contact of the telephone cables laid along the tunnel of the District Railway at Westminster Bridge.



A CONCRETE STAIRCASE AFTER A FIRE.

The electrification of the line required that the cables should be protected from possible contact with the railway current by being lodged in troughs. That work was handed over to the District Railway Company. The cables had been removed from their former position, and were to be placed permanently along the front of the platform, where they would be covered in. At the time of the fire the cables were lying on the ground, and a metallic cover, such as was used for covering the cables, appeared to have established a contact between the cables and the conducting rail of the line. Subsequently, when in the course of certain experiments made by the railway engineers a current of 550 volts was sent through the railway system, it formed an arc with the cables which carried 24 volts only, and more or less of the 550 volts were transferred to the National Telephone Company's system, with the result that parts of the connecting and conducting apparatus fused at the premises in Mansion House Chambers and at Oxford Court. The fire in Oxford Court revealed structural defects that might lead to loss of life in the case of a fire in the daytime. The position was rendered more perilous by the fact that the sleeping room was separated merely by wooden partitions from the large collection of electrical cable passing through the distributing room. That state of affairs was beyond the control of the London Building Act, 1894, which was not retrospective. The Act came into force on January 1st, 1895, some time after the Oxford Court premises were built. There were no means, therefore, of compelling the owner or owners to provide safety exits in the event of fire. The fire furnished another illustration of the urgent need of additional legislation such as that contained in the City of London (Means of Escape from Fire) Bill before Parliament. The question naturally arose whether the passage of a high-tension current of such great strength as that derivable from contact with the current of 550 volts might not be dangerous to anyone using the telephone at the time. Mr. Clay said that there was no danger because the wires would be at once fused, and so the current would be stopped. Mr. Alfred Bennett (telephone engineer to the corporations of Glasgow, Hull, Portsmouth and Brighton, and the States of Guernsey) had said that, in his opinion, operating should cease during thunderstorms, and that the Exchange should be fitted with the safety devices. Obviously, it would be unwise to subject persons who used the telephone to powerful currents, to say nothing of the risk of fire from fusion of wires.

The Jury's Verdict.

The jury found that the fires originated at the National Telephone Company's premises at about two o'clock on the morning of February 28th. The fires were caused by the contact of the company's cables with the conductor rail of the District Railway Co. at Westminster. There was not sufficient evidence to show whether the cause was accidental or due to negligence. Telephone wires should not be allowed near high-tension currents unless properly protected. Contact of a telephone wire with a high-tension current was not likely to be dangerous when properly protected, and with the same proviso there was not likely to be fire, or shock to subscribers. They considered that the construction of the test and distributing rooms showed great room for improvement. Greater use should be made of non-combustible material. Safety devices should be fitted in all exchanges. Special powers were required to regulate all structural and other powers connected with the telephone service. The jury saw no necessity for a Government enquiry into telephone risks and needs. They did not think the Oxford Court premises were satisfactorily provided with means of escape from fire.

CONCRETE FOR STAIRCASES.

We dealt in a previous supplement at length with the interesting fire at Glasgow, in Messrs. Wylie, Hill & Co.'s premises. We have now obtained a photograph, by the courtesy of Mr. Ellis Marsland, of the concrete staircase in that building as it appeared after the fire. Considering that the building had its entire contents burnt out, and that the contents were of a highly inflammable character such as is generally met with in a drapery stores, the photograph we present is certainly a remarkable one, as showing how concrete construction will withstand a great volume of flame up a staircase shaft, the staircase being stripped of its wood treads and risers, but otherwise remaining intact.

The Association of Professional Fire Brigade Officers held its annual meeting at Bradford last week, when C.O. Scott of that city was elected president for the year.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

June 14, 1905. Vol. 21, No. 540. 6, Great New Street, Fetter Lane, E.C.

Summary.

From the business and commercial point of view, the modern system of division of labour has a good deal to recommend it; but each worker becomes a mere "segment," his whole life and thought cut up into parts: he becomes mechanically perfect in his part, but its relation to all other equally important parts is ignored. (Page 331.)

The extensive restoration of the Chateau of Saint-Germain-en-Laye, near Paris, is now being completed. The object has been to give it its original sixteenth-century appearance, as it was left by François I. (Page 328.)

The most effective screen for purifying and humidifying the incoming air in the plenum system is the mist screen, which consists of a brick chamber wherein water is fed on to a revolving copper fan, which distributes it as mist. (Page 337.)

The great east window of St. Margaret's, Westminster, is to be restored by Mr. Kempe, and the east wall advanced a little, at an estimated cost of £3,000. (Page 336.)

There is a marked contrast in the methods of burning gypsum abroad. Most of the American rock is calcined in kettles by direct heat. The French plaster manufacturers have invented a variety of kilns and methods. (Page 335.)

The Birmingham Builders' Exchange is to opened on June 29th. A collection of catalogues of all the leading firms connected with the building trade is being made. (Page 334.)

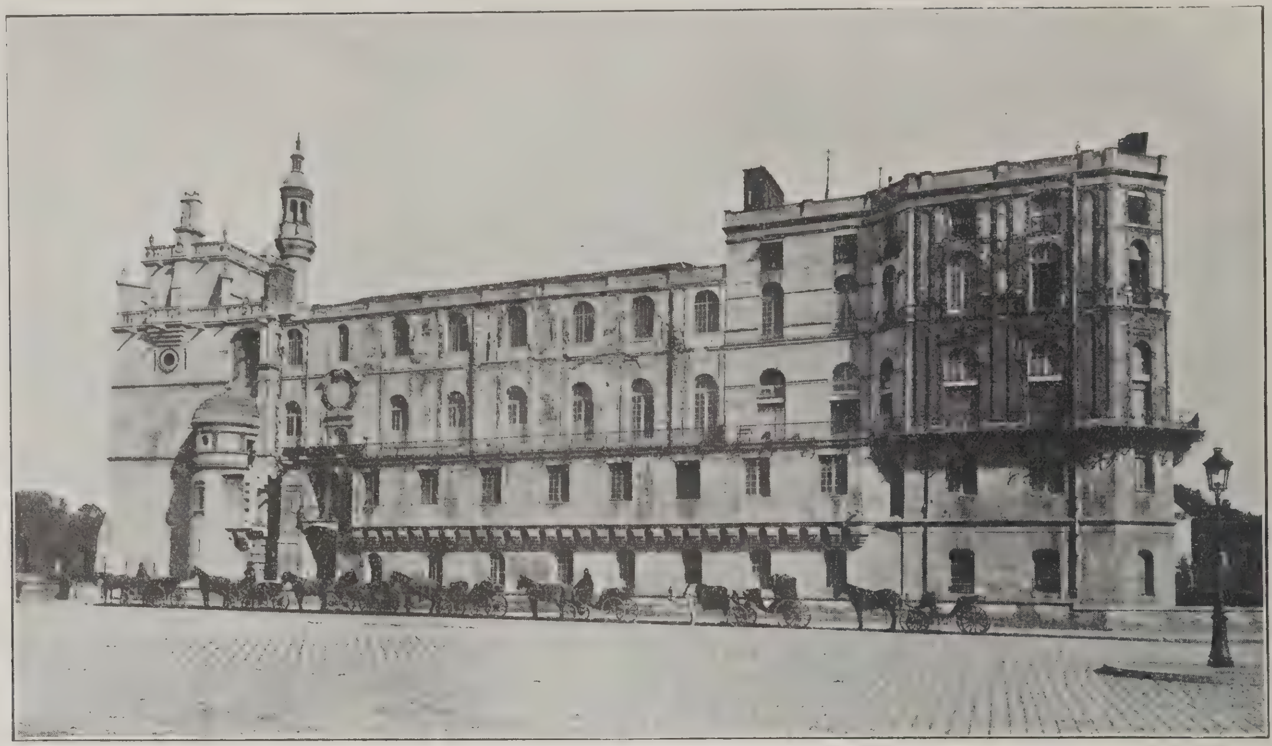
Messrs. Lanchester & Rickards have been selected for the Wesleyan Church House to be built on the site of the Westminster Aquarium. The estimated cost is £140,000. (Page 338.)

The proportions of concrete adopted in American practice for use in the tallest skyscrapers are 1 part Portland cement, 3 parts sand and 6 parts broken stone. (Page 336.)

Messrs. Holloway Brothers' contract for the third extension of the Admiralty buildings is to be completed by May 1st next year. The penalty for delay is £100 per week. (Page 338.)

The Charge against Mr. Bodley. In our issue of April 19th last a correspondent called attention to the restoration proposals of Mr. G. F. Bodley, R.A., at York Minster, and the charges have just been repeated in the "Times" by Mr. Thackeray Turner, secretary of the Society for the Protection of Ancient Buildings. Objection is made to the erection of new flying buttresses on the north side of the nave, and Mr. Turner calls attention to the fact that the nave is vaulted over with wood groining in imitation of stone, which, he says, "gives practically no outward thrust upon the walls, but it is clear that the original builders contemplated putting up the vaulting in stone, because they made provision for flying buttresses. It is these contemplated buttresses which the authorities are proposing to build. Much mischievous renewal has gone on at York Minster for many years past. Now, however, the restorer is not cutting away ancient work and putting new in its place, but putting up new work on the supposition that it was once there. As there is no stone vaulting, the weight of these new flying buttresses will thrust the walls together, and we gather that to meet this thrust it is intended to brace the walls so as to make them capable of withstanding the pressure of the new flying buttresses." Mr. Bodley's reply to criticism is contained in a letter to the Dean of York, in which he says: "Flying buttresses are for the strengthening of the walls of the clearstory. Though at the Minster there is no vaulting, yet a roof of so wide a span has a thrusting influence outwards. Flying buttresses, steadied by the weight of pinnacles pressing down, resist thrust and keep the walls in order. That is the use of flying buttresses. They strengthen and resist outward pressure. Mr. Green reports that the thrust of the roof is telling very distinctly on the clearstory walls, which are already out of the perpendicular. The great height of these walls renders them weak and makes the addition of the flying buttresses most desirable." The question is somewhat difficult of solution, because the builders intended to use stone vaulting but feared to do so and put up instead a sham in wood, which was renewed about the middle of the last century after a fire. If it were possible to erect a stone vault this would be the best thing to do, but apparently it is not. If, as Mr. Bodley states, the walls of the clearstory are being thrust outwards they must be buttressed. The buttresses, if proportioned to this thrust, would only be light, but if this were done they would not be similar to the others on the building and being proportioned by a sham would look wrong. The interior roof is a sham, and it seems that it must lead to further deception. The moral is obvious. It would have been better to have frankly admitted the weak building originally and have used a simple open-timber roof.

Competitors' Estimates. In view of the fact that building committees are as a rule so dominated by questions of expense, it can hardly be considered that the usual method of asking competitors to state the cost of their designs is satisfactory. Every one is familiar with those "cooked" estimates which work out the cost of the building so nicely, just about the figure stipulated by the promoters, and everyone also knows how in many cases the actual cost of the building far exceeds the competitive architect's estimate. This is especially the case in complex designs, such as those for municipal buildings, where fittings comparatively insignificant in themselves total up a very large item; in which case it is especially noticeable how the competitor with little or no experience of the actual carrying-out of a design such as he submits clearly shows his ignorance of what the real cost of the work is likely to be. It would often be a better plan if the conditions required competitors to state, not the estimated cost of their design, but only the cubical contents and general finishing. The assessor could then determine what price per foot cube to put it at, instead of each competitor doing this for himself, with the result that the total cost which is very satisfactory when worked out at 7d. is an utterly false estimate when the actual price might be 9d. per ft. cube. The question of cost has a far more important bearing on the standing of the architectural profession than seems to be imagined. When the estimated cost is so generally exceeded and extras on the contract ate so frequent, is it surprising that architects are distrusted and that local bodies get their surveyors to design and carry out buildings? It is useless to call on individuals, but assessors are independent and could counteract some of the mischief.



CHATEAU OF ST. GERMAIN: THE UNRESTORED WEST FRONT.

THE CHATEAU OF SAINT-GERMAIN-EN-LAYE.

By F. H. CHEETHAM.

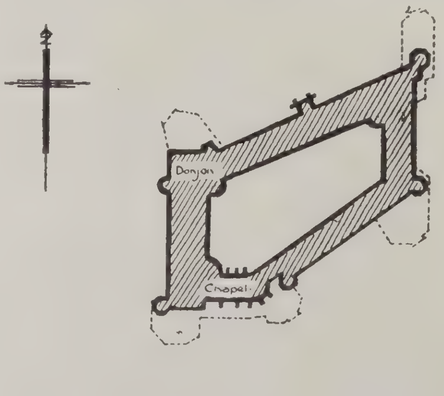
SINCE 1862 the château of Saint-Germain-en-Laye has been undergoing a restoration, or rebuilding, of that thorough type with which we are familiar in France. The work is not yet complete, though within measurable distance of the end, the last portion being now in the hands of the builders.

The condition of the château before the work was decided upon was such as justified a very drastic treatment, the original edifice of François I. having been disfigured in the seventeenth century by the addition of huge ugly blocks of brick and stone at the angles of the building, which entirely robbed it of its real character and hid many of its most conspicuous merits. The usages also to which the château had been put during the time of the Revolution and in the subsequent years of Empire and Monarchy had left the interior in a sad state of repair. The decision, then, to turn the château into a museum necessitated a thorough reconstruction within and without.

The architect charged with the restoration in 1862 was M. Eugène Millet, a pupil of Labrouste and Viollet-le-Duc. He is known also as the designer of the church of Paray-le-Monial and the Chapelle Saint-Gilles, at Troyes. But his greatest work is the restoration of the château of Saint-Germain. Unfortunately, M. Millet did not live to see the completion of the work, dying in 1879. His drawings for the complete restoration will be found in Sauvageot, and his designs have been more or less faithfully followed. M. Millet was succeeded by M. Paul Lafollye, and since 1896 the architect in charge of the rebuilding has been M. Daumet, Inspecteur Général Honoraire des Bâtiments Civils. The object of the reconstruction has been to restore to the château its original sixteenth-century appearance, as it was left by François I., and this has been most admirably done. It is, of course, very largely new work, but it is frankly so. The additions made by Louis XIV. have been swept away and their materials scattered. The present writer on visiting Saint-Germain came across an advertisement of a sale by auction which had been held in October, 1902, of "Materiaux de demolition provenant du Château National de Saint-Germain-en-Laye," and these were announced to consist of "beams, joists, rafters, firewood, joinery, doors, casements, shutters, casings, panels, faïence, marbles, etc."

The château of Saint-Germain was built by François I. on the foundations of an older building, from the designs of Pierre Chambiges. Of this older building the chapel and the donjon were retained and skilfully incorporated in the château. The plan therefore follows the lines of the Gothic fortress or castle, and something of the sternness of a mediæval building found expression in the outer elevations. Du Cerceau, speaking of the irregular plan of Saint-Germain, says of the courtyard that it is of "assez sauvage quadrature."

Robert the Pious is said to have erected a monastery in the forest of Laye in the eleventh century in honour of Saint Germain, bishop of Paris. About a hundred years later, in a donation of Louis VI. to the monastery, there is mention for the first time of a royal château. This presumably stood on the site of the present building, and was probably built by Louis himself. It is stated to have possessed a donjon, chapel, moat and enceinte. Philippe-Auguste resided here on several occasions between the years 1189 and 1222. Louis IX. also frequently came to Saint-Germain, and to him we owe the chapel. Viollet-le-Duc speaks of this as "one of the most characteristic examples of the art of the thirteenth century at the moment of its splendour," and Sauvageot calls it "one of the joys of Gothic architecture."



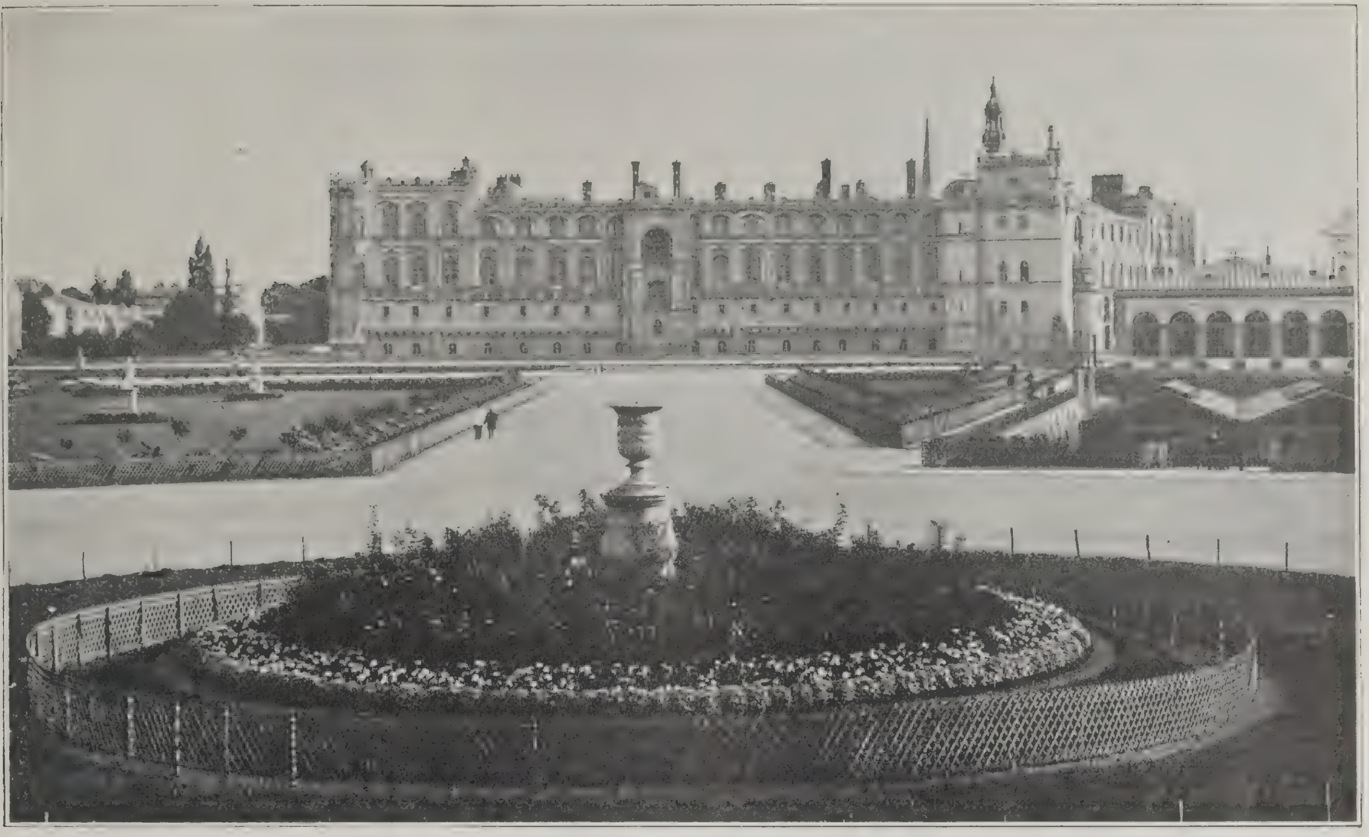
· Dotted lines show additions in 17th Century (now demolished)

In 1346 the château of Saint-Germain was burnt by the English at the beginning of the Hundred Years' War, but the chapel escaped. Twenty years later, in 1366, Charles V. commenced the rebuilding of the château, but of the nature of this rebuilding little is known, the donjon at the north-west angle of the building being all that was left of it in the reconstruction of François I.

François I. may be considered as the real creator of the château of Saint-Germain. "Finding the situation pleasant," says Du Cerceau, "François pulled down the old building, without, however, touching the foundations, and rebuilt the whole as we now see it." The work was commenced in 1539 by Pierre Chambiges, and advanced so rapidly that at the death of the architect in 1544 nearly the whole of the building was at the roof level. Chambiges was succeeded by his son-in-law, Guillaume Guillain, who carried out Chambiges' design and finished the work in 1548. These are the dates given by M. Léon Palustre. At the time Sauvageot wrote (1865) it was still thought that Saint-Germain was the work of Italian architects, and M. Millet in his report of 1862, while stating the opinion of Félibien that Serlio was the architect of Saint-Germain, qualifies the statement with his own remark that "we do not know whether there is any foundation for such an assertion, for very often in France Italians are given the credit of magnificent works which were the product of French artists." Still, he admits that "it would be difficult to deny the influence at Saint-Germain of foreign artists."

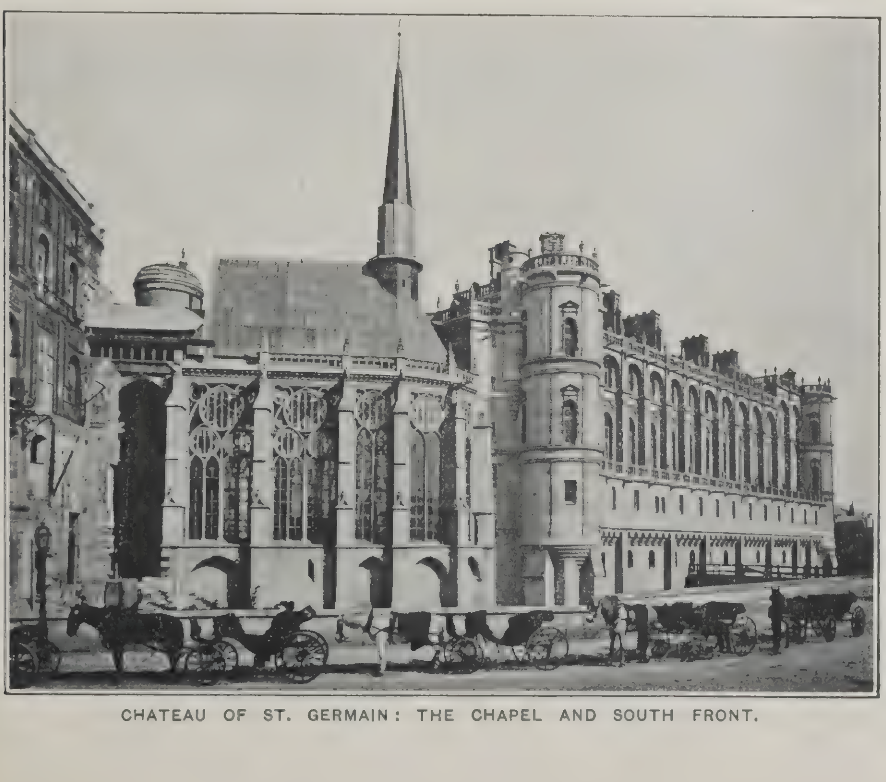
"Modern discoveries," writes M. Léon Palustre, however, "have not been favourable to those who were pleased to see everywhere the hand of the Italian. Where even some uncertainty was permissible, the balance has been found to be on the side of the native artist. The place that Fra Giocondo, Primataccio, and so many other unduly occupied in our history, has been given up to the victorious French artists. On this point there is not to-day, and can no longer be, any disagreement."

Francois I. died in 1547, and therefore did



CHATEAU OF ST. GERMAIN: THE NORTH FRONT.

not live to see the château completed. Henri II., finding it too much like a fortress and wishing for a more luxurious residence, commenced the new château, a vast palace which occupied the site of part of the existing terrace. The new château was finished by Henri IV., and all that remains of it is the pavilion that now bears his name. Louis XIII. resided at the new château during a long portion of his reign; there he died, and there his son Lóuis XIV. was born. Louis XIV., however, took back the court to the old château, deserting the new palace, which had been built too quickly and was already showing signs of instability. Louis XIV. added the five great projecting pavilions at the angles of the château which did so much to destroy its original character, and the last of which has only quite recently been demolished. Sauvageot tells us, however, that Louis XIII. had already made some modifications "assez graves" in the building, and by additions and suppressions had altered the Gothic character of the chapel. The additions of Louis XIV., which were the work of Jules Hardouin Mansart, and which Sauvageot characterizes as "truly deplorable," were commenced in 1682, just about the time Louis finally quitted Saint-Germain for Versailles. To Louis XIV., however, we owe the construction of the magnificent terrace and the parterre to the north of the château, both the work of Le Notre.

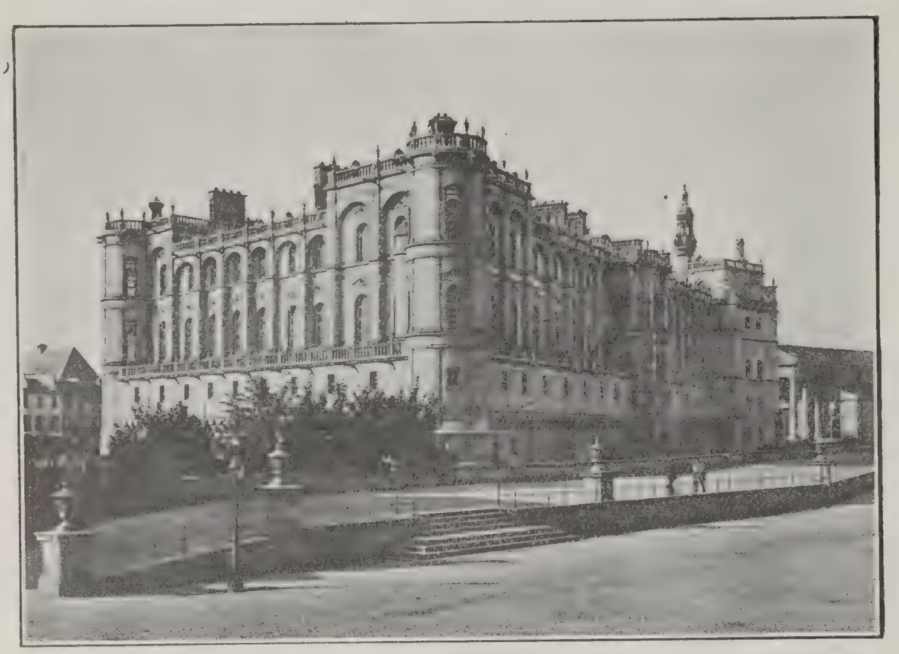


CHATEAU OF ST. GERMAIN: THE CHAPEL AND SOUTH FRONT.

After the departure of Louis the château became the residence of James II. of England, who died there in 1701. During the greater part of the eighteenth century Saint-Germain continued to serve as a place of asylum for the friends and companions of the exiled Stuarts. The Revolution turned the building into a prison; the Empire used it as a cavalry school; the Restoration as a barrack; and from 1836 to 1855 it served as military penitentiary. Napoleon III. resolved to restore the château, and by a decree of November 8th, 1862, established there a museum of Celtic and Gallo-Roman antiquities.

It will be seen, then, that the present building comprises the ancient foundations, the chapel of Saint Louis, the donjon of Charles V., and the palace of François I. Its irregularity will be observed in the block plan on the opposite page. The great terrace of Saint-Germain lies at some distance to the east of the château, which has Le Notre's garden on the north, and the streets of the town on the west and south.

Saint-Germain has not the outward characteristics of a French château of the Renaissance. We seek in vain for the high pointed roofs and the graceful detail of ornament to which our eyes are accustomed. Something of its Gothic origin has been preserved in its exterior elevations. The lower of the three storeys, rising from the moat, is built entirely in stone and has a massive appearance. A line of corbels forming machicolations supports a projecting passage around the whole of the building at the level of the entresol. The wall finishes above in a balustrade and balcony at the level of the first-floor windows. The upper part of the château is built in brick and stone, the walls terminating in an open balustrade with vases. The roofs, a series of flat terraces in lias, are not seen. "It is interesting to trace the same peculiarities in all Chambiges' work," says Miss Rose Kingsley, "the use of brick for ornament, while the *massifs* of the wall are in stucco or stone. We see it in his portion of Fontainebleau, the cour du Cheval Blanc. At Saint-



CHATEAU OF ST. GERMAIN, FROM THE NORTH-EAST.

Germain it is used not only on the exterior but in the interior. This inversion of the use of stone and brick is a mark of all the châteaux built by Chambiges, Fontainebleau, Saint-Germain, La Muette, Challuau." The long monotonous lines of the front are broken by the corner pavilions, but these have very little projection, the idea apparently having been to afford as wide a view as possible from all parts of the château of the magnificent panorama around Saint-Germain. The absence of high roofs may be due to the same cause, the desire to obtain a promenade at the highest point of all from which the view could be best enjoyed. These roof terraces, as they were called, were supported by brick vaulting on the second floor, and the use of iron ties in the construction was one of the causes which led to the adoption of the theory of the Italian origin of Saint-Germain. "It is easy to see, however," says M. Palustre, "that allowing for the height at which the vaults are placed, the width of the building (12 metres), the enormous weight of the terraces, and the impossibility of finding a point of support outside, the method adopted was the only one to pursue."

The interior elevations to the courtyard are less severe and perhaps more original. The brick pilasters become, by their greater projection, something approaching "sturdy buttresses" (Sauvageot). These divide the whole of the courtyard elevations into so many bays, the buttresses being connected at two levels by brick arches. A balustrade runs round the courtyard at the level of the first floor and above the entresol, and another balustrade crowns the walls as on the outer elevations. Three of the angles of the court are occupied by circular staircase towers terminating in domed roofs of stone.

The south-west corner of the courtyard is occupied by the chapel of Saint Louis. On this side a storey has been added to the wall of the chapel above the eaves of the roof, to make it "harmonize" with the sixteenth-century work on either side. The chapel consists of four bays and an apse. The windows occupy the whole space between the buttresses, and are thus square-headed. The tracery, however, takes the form of a pointed arch, the spandrels being filled in with trefoils. "The chapel of Saint-Germain," says Viollet-le-Duc," is peculiar in this: its style is not that of the Royal Domaine, but is derived from the schools of Champagne and Burgundy."

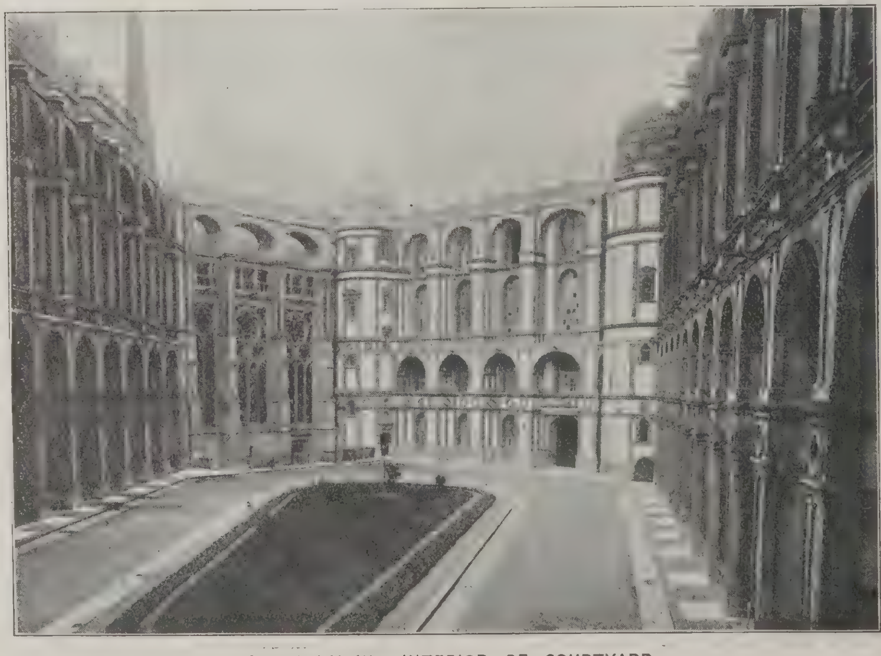
"The five pavilions added by Louis XIV.," says M. Millet, "deranged all the harmony of the old dwelling. They have not the monumental character of the buildings of François I." The immense projection of the pavilions entirely spoiled the magnificent views from the windows of the château, and their great shadows darkened its walls. The buildings themselves seem never to have been properly completed; there were floors without staircases, access to which was obtained only by very steep steps like ladders, of unmistakable temporary character. The building of these new pavilions caused much damage to the old work of Charles V. and François I., to which they were attached. Even the chapel, as will be seen by the dotted line on the block plan, was hidden on the south side (the side now facing the Rue du Château Neuf) by the erections of Mansart. There was, therefore, nothing to regret in the disappearance of this seventeenth-century work.

The restoration of the chapel is now completed. The floor, which had been raised to the level of the ground in the courtyard (thus destroying the proportion of the interior), has been lowered to its original level, and the chapel itself is now used as part of the museum. The "restoration" is thorough, and at present is rather too new to please.

Saint-Germain has been described as a happy mixture of brick and stone. The ornamental use of brick is as conspicuous a feature inside as out, and has been made the most of in the restoration. There are many good brick fireplaces besides the great one in the Salle des Fêtes. The bricks in most of these fireplaces measure 8¾ins. by 2¼ins., and the joints are ⅜in. wide. Throughout the building the Fleur de Lys, the salamander (badge of François I.) and the initial F are freely used. The lock-plates of the doors take the form of a crowned F, the keyhole being in the lower member. The top storey of the château is vaulted in brick, with stone ribs, the members of which are picked out in red. On the balcony in the projecting block of the grand staircase have been placed two admirable equestrian bronzes by Fremiet, representing a Gaulish chief and a Roman horseman, in reference to the character of the museum. As to the museum itself, few archæological collections can compare with it for interest and value—a value much enhanced by its possessing a very excellent "catalogue raisonné," prepared by M. Salomon Reinach.

There are seventeen plates descriptive of the château of Saint-Germain in the second volume of Sauvageot's "Palais, Châteaux, Hôtels, etc., de France," and sixteen illustrations in the text. Many of these plates form the "projets de restoration" of M. Millet and represent the château pretty much as it is now.

The town of Saint-Germain-en-Laye lies thirteen miles west of Paris and is built on a hill on the left bank of the Seine, nearly 200ft. above the river. The view from the well-known terrace has often been described and is extremely fine. The terrace is nearly a mile and a half long and 100ft. wide, and is planted with limes and horse-chestnuts. The Château Neuf, of which the Pavillon Henri IV. is the only remnant, stood overlooking the river, with gardens stepping down the hillside in a succession of terraces. This insecure position, together with its hasty building, gave it but a short lease of life. Before Louis XIV. quitted it we hear of "peu de solidité" in the building. It began to fall to pieces, and, coming into the hands of the Comte d'Artois in 1776, he ordered it to be destroyed—a work which, however, only seems to have been completed by the Revolution.



ST. GERMAIN: INTERIOR OF COURTYARD.

SPECIALISM.

By R. H. T.

MANYSIDEDNESS is not always a mark of intellectual power, and is a characteristic rather of successful business men than of artists. The architect is called upon to exercise his skill in a variety of subjects. The modern building problems alone are sufficient to occupy the attention of any professional man if he wishes to be quite abreast of the day. He must know a little of various kinds of buildings—houses for the rich and poor, hospitals, asylums, schools, civic buildings, libraries, technical schools and laboratories. In addition, he has to be acquainted with many kinds of construction, comprising iron and steel, concrete or reinforced construction applied to various purposes, in addition to the traditional trades of the mason, bricklayer, carpenter, &c.; and the requirements of modern civilized life have compelled him to possess a knowledge of electricity in its many applications to building, for motive power, heating and lighting, and also of hygiene and sanitary science. He must also have a knowledge of building fittings and apparatus, such as those necessary for schools and laboratories, to enable him to apply his architectural skill economically in planning buildings. Mechanical cal plant is another thing about which he is supposed to know something if he is to design factories, engine-houses, central power stations and the like.

A Source of Weakness and Strength.

Now, this manysidedness of architecture has been a source at once of weakness as well as of strength: of weakness, because it has tended to divide the faculties and energies of the professional man and to divert them into different channels; and of strength, because we are shown the possibilities of modern architecture and how these various forces can be combined.

One of the main results of this multiform activity has been to divide the profession, and subdivision of labour is now one of the great economical forces of our time. It is the backbone and main factor in all the leading industries of the day; but how far the same principle is an advantage to an art is a question of importance.

In a large miscellaneous practice made up of building and architectural work, with branches of surveying, subdivision can be resorted to with good results, as one member of the firm can be engaged in the designing of buildings, other members of the staff in making engineering details, such as steelwork, and others on supervision, quantities and valuations; or in some large firms one member transacts the office routine and sees clients, while the other members supervize and conduct special branches.

Such a division facilitates business, just as in manufactures it is found economical. It may not be an ideal one for an architectural purpose, but it certainly enables better results to be achieved.

Architecture a Livelihood.

It is a matter of necessity nowadays that architecture be practised mainly as a means of gaining a livelihood—the man must "live to work"; it has to be practised as a business chiefly, as an art secondly. In America the custom of employing experts in the offices of large firms is common. These experts are engaged in designing constructional steelwork, special factories and plants. They are, in fact, designing engineers. The chief work is undertaken by specialists. The contractor is often a practical engineer who supplies all the details and supervision, or employs an engineer to look after the work. There the large financial load carried by the contractor has much modified the condition of things. Formerly the contractor could and would know about all that went on in the building. Nowadays he cannot execute his work single-handed; he sublets it, and the sub-contractors also sublet their obligations.

This house, for Mr. E. P. Musmann, is faced with Luton bricks, the balconies and porch being of Portland stone. In execution, extra rooms required led to variations of the tower, which is shown on the drawing as originally designed by the architect, Mr. George Hornblower, F.R.I.B.A.

Crumbs of Men.

But this division has not been productive of the best art work nor of the best architecture. Ruskin in his "Stones of Venice" says: "We have much studied and much perfected the great civilized invention of the division of labour; only we give it a false name. It is not, truly speaking, the labour that is divided, but the men—divided into mere segments of men—broken into small fragments and crumbs of life, so that all the little piece of intelligence that is left in a man is not enough to make a pin or a nail, but exhausts itself in making the point of a pin or the head of a nail."

Workers Apart.

If we look at the professional aspect of architecture, we shall see that it is composed of several different things, and those engaged in producing a building are divided men—that is, their interests and aims are very one-sided or restricted. Thus there is the man who designs the building, perhaps only a "ghost," and architecture which consists only of designing can hardly be called by that name; then there is the builder or engineer who carries out the construction—his interest and responsibility lie in making a profit, and therefore of taking a very partial view of the construction; then we have decorative craftsmen, who only work in their restricted ways, and are equally divided in their thoughts and sympathies. None of these divided men can produce architecture, for each of them is only working in his own narrow groove—only employing one of his faculties, while his eyes are closed to all others.

"Farming Out."

From the business and commercial point of view, then, the modern system of division of labour has a good deal to recommend it; but at the same time the personal factor is suppressed. The worker becomes a mere "segment"; his whole life and thought is cut up into parts, and he only uses one of those parts in his work. He becomes mechanically perfect in his part; but its relation to all other equally important parts is ignored. There is a want of sympathy between the several portions of the work, simply because each craftsman has only done his best in his own way without considering his brother-craftsmen's part. And this discordance of aim is often seen in a building designed by one man, contracted for by another, and executed by several different craftsmen or sub-contractors.

As long as the modern contract system lasts in which there is a nominal designer who is paid a percentage on the cost, and a contractor who has to "farm out" the work to several separate tradesmen who have no personal interest in or responsibility for the work, we can hardly expect anything better. The whole is no more than a business transaction, in which the large professional firm makes a profit.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Books on Building Construction and Quantities.

CHESTER.—G. M. writes: "Please name a good book on the first stages of building construction and builders' quantity surveying as a preliminary to attending a technical school during the winter months for these subjects, and also with a view to making myself efficient as a builder's quantity surveyor on a small scale."

Longman's "Notes on Building Construction" Vol. I. (9s.), "Specification No. 8" (3s. 3d.), and Davis's "Quantities and Quantity Taking" (4s.). These books can be obtained post free from our offices for the prices stated.

Tenterden Church, Kent.

LEYTONSTONE.—STUDENT writes: "Is Tenterden Church, Kent, a suitable subject to measure? Also, are there any architectural examples worth sketching in the surrounding district?"

Tenterden Church has rather a shabby external appearance. Most of the original tracery of the aisle windows has disappeared, though now restored. The church has a beautiful lofty fifteenth-century tower. The aisles to the chancel have curvilinear windows, some being especially fine. Other churches in the district are Bevenden, Biddenden, Frittenden, Cranbrook, Sandhurst, Rolvenden, Headcorn and Hawkhurst, the last possessing a very fine five-light curvilinear window in the east end. L. G. R.

Churches to Measure in the Lake District.

HUDDERSFIELD. — PROBATIONER writes: "Please name a few churches in the Lake District suitable to measure for the R.I.B.A. intermediate examination."

Crosthwaite, Bolton Gate, Distington and Wythburn, all Perpendicular churches, would supply material for one of your measured drawings, but as far as can be ascertained in London there are no thirteenth- or fourteenth-century churches in this district. L. G. R.

Brickwork Pointing.

JOINTER writes: "A large house is erected in an exposed position by a builder, with red bricks of fair quality supplied by the building owner, who desires them to be tuck-pointed, with a white joint. The brickwork is washed down in the usual way with Venetian red colouring containing copperas, stopped and tuck-pointed, the joint being ironed in the stopping. The front of the house, which faces the exposed side (south-west), after having been built six months, looks very poor, owing to the rain having washed the colouring out of the bricks and quite discoloured the white putty joint, although the joint is still intact. The three remaining sides look well. Can the builder be compelled to repoint the front in consequence, or do you consider the discoloration will stop and the white joint show better in course of time?"

The work has not been properly done, and it is doubtful whether the white joint would show better in time; in any case it would take a considerable period to do so. The mistake was in not using a binding material with the red pigment. Green copperas is used for colouring stock brickwork, decomposing on exposure to the air into yellowish-brown hydrated iron-oxide; it is washed away by rain to a certain extent, only being retained by the absorption of the brick, but it has no real binding action. It would be better to use a dilute solution of water glass as the binding agent, or one of the washable distempers (these have casein, linseed oil and lime as their binders).

Contract Drawings.

HALIFAX. — WILLIAMSON writes: "Are signed finished coloured plans in pencil binding as contract drawings? When time has been limited I have allowed this."

Yes.

The Glasgow Exhibition.

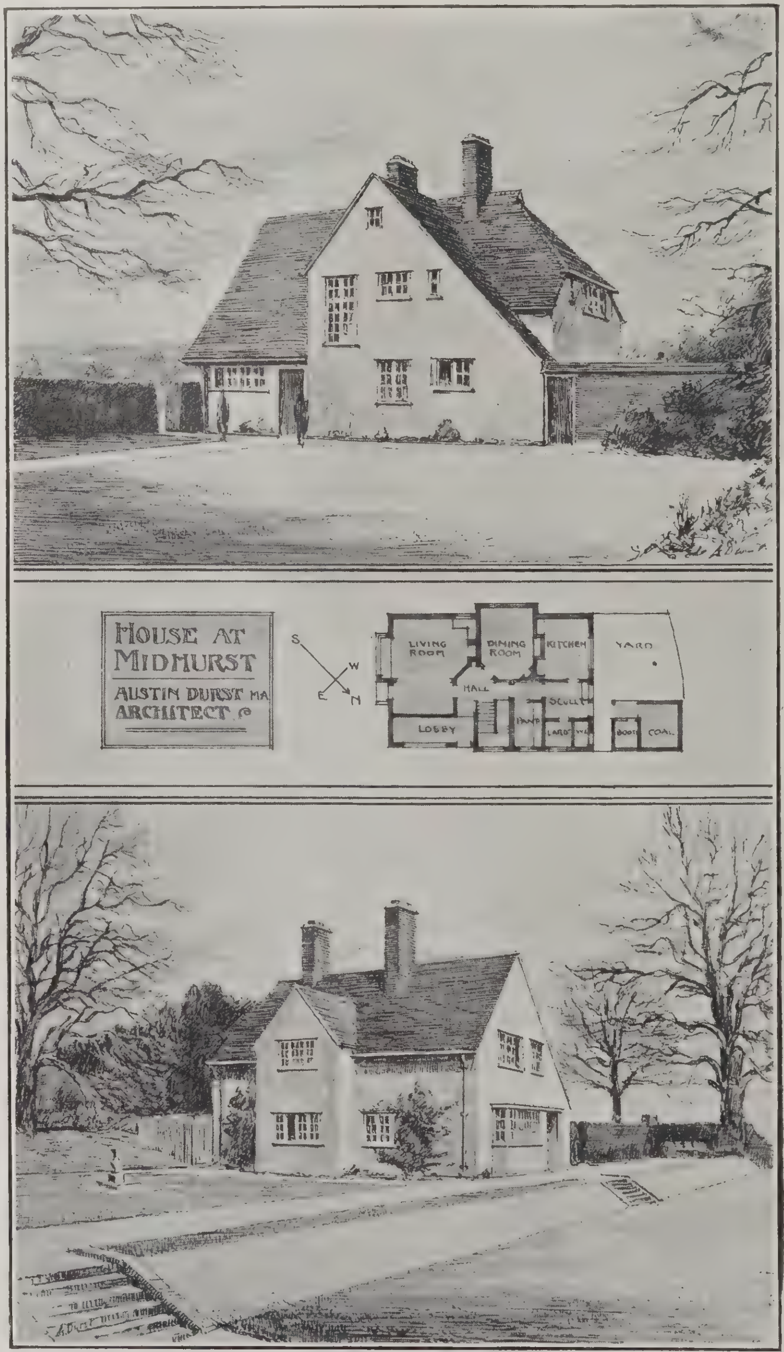
EDINBURGH.—ARCHITECT writes: "Where can I find illustrations of the architectural work in connection with the Glasgow Exhibition of 1901?"

See our issues for May 22nd and 29th, 1901, and the "Architectural Review" for June and August, 1901.

Water-supply to House.

M. S. writes: "We have taken a house on a three years' agreement, commencing from December last, on the understanding that the water would be laid on from the main about the beginning of February; but this has not been done yet. In March the agent said it would be done in a day or two; the landlord also said it would be done shortly. As there are still no signs of it being laid on, we have written to the district council and have received an answer to the effect that the plans and estimates are in London awaiting the sanction of the Local Government Board, without which the work cannot proceed. We have a flushing drain, and no water on the premises. Can we be compelled to stay under these insanitary conditions? We have a rainwater tank, but get very little from it, and all water has to be fetched from the agent, who is a neighbour."

If you can prove the facts you state, we



This house was built at a cost of about £1,000, with 11in. hollow walls of local Sussex bricks, cement rough-cast. The tiles are hand-made and also local. The dining-room is panelled in sequoia, with mother-of-pearl inlay. On the ground floor the boards, treated with "Carbolineum," are laid direct on the concrete. The garden was planned with the house to suit the site, and had the advantage of some fine oaks on the northern boundaries. The work was carried out by Mr. H. C. Deane, builder, of Midhurst.

think you need have no fear in leaving, only you might have to establish in a court of law the fact that one of the conditions of agreement was that water should be laid on.

Mounting Drawings.

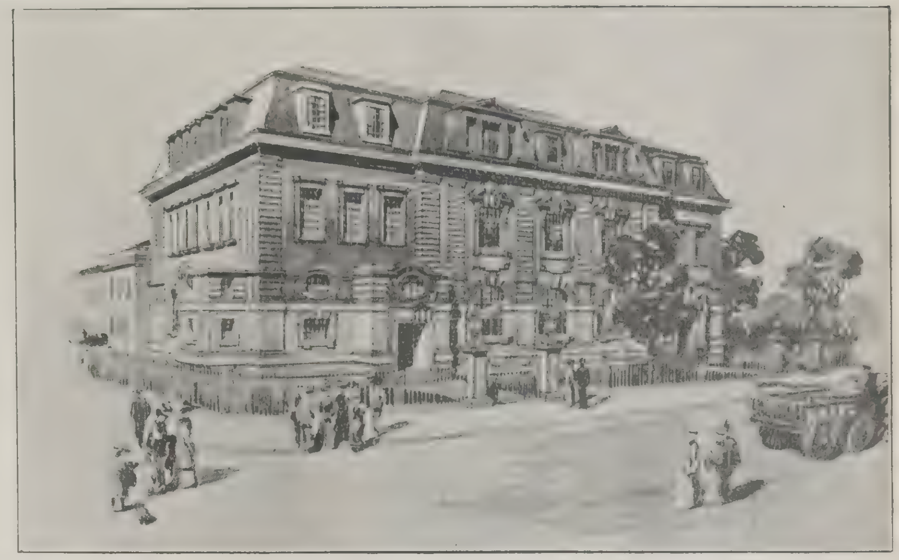
HOLMFIELD.—AMATEUR writes: "Please give a recipe for making a strong paste for mounting drawings which is not liable to go mouldy or be eaten by mice and other vermin."

Use rye flour, and prevent decomposition by the addition of 20 drops of oil of cloves to every half-pailful.

Roofing Tiles.

SURREY.—C. E. S. writes: "Are there any makers of the original old rich-red tiles for roofing?—I mean the sort that get covered with lichen in parts, whilst other portions always remain the delightful rich-red one sees on old buildings only. A well-known maker of roofing tiles told me recently that such tiles are very porous and do not keep out the weather, and if he made any for me he was sure I should not use them. Is this so? I have often used the hand-made sand-faced tile, but this soon goes a dark-brown colour and the red colour is quite lost."

The colour depends on the composition of a clay and the temperature of firing. Very light red is usually indicative of under-burning. The modern manufacturer is very keen on producing a non-porous tile, but it is doubtful if it is such a desideratum, for, if porous, vegetation soon grows on the surface, closes up the pores and throws the water off. To resist the weather, however, a tile must be vitrified throughout, and this requires a high temperature. In the past tiles were burnt with a wood fire and the difference may be due to this, wood giving a clean fierce flame that raises the temperature quickly, thus enabling the greatest temperature to be obtained (as it should be) at the end of the burning, so as not to deleteriously affect the surface while vitrifying the tile throughout. Probably the same result could be obtained by turning producer gas into the kiln or injecting powdered coal. Many modern tiles have only the outer skin vitrified (and almost glazed), while the inside is unburnt, and consequently frost destroys them. When tiles are machine-moulded from dry or semi-plastic clay they are often laminated, and then added facility is given for destruction by frost. To overcome both defects hard firing is indulged in, and this gives dark colours and a semi-glazed surface that are not very pleasing, and being so hard and non-absorbent do not allow the weather to colour them except with greasy dirt in smoky towns. There are few makers of old hand-moulded sanded tiles, especially wood fired, but the "Wrotham red" tiles made by Messrs. Thomas Pascall & Sons, of High Street, South Norwood, have a high reputation.



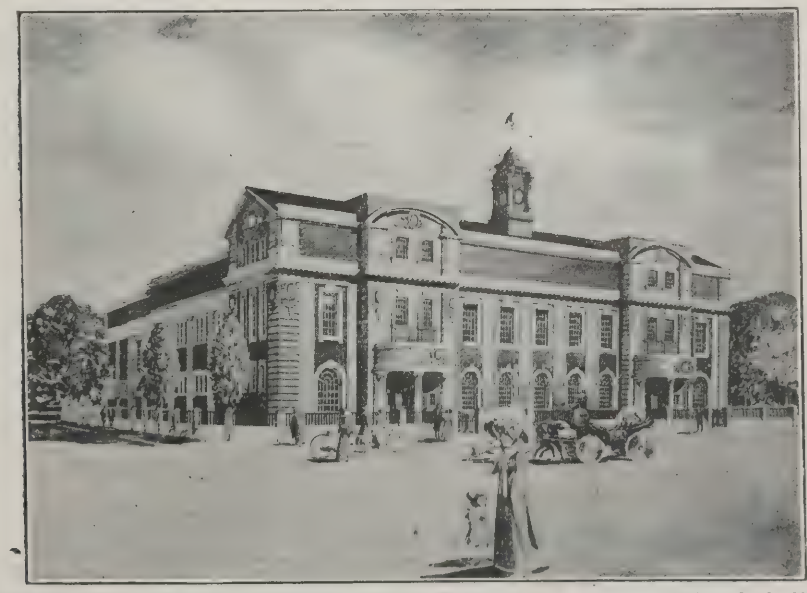
WORTHING FREE LIBRARY, TECHNICAL AND ART SCHOOL: SECOND-PREMIATED DESIGN BY LANCHESTER AND RICKARDS.

WORTHING LIBRARY COMPETITION.

ON a corner site at Worthing it is intended to erect a free library, technical and art school, with the addition of a museum later. A limited competition among fourteen selected architects was held and, as announced in our issue for May 31st, the design of Mr. H. A. Crouch, A.R.I.B.A., of London, was placed first by the assessor (Mr. John Belcher, A.R.A.); those of Messrs. Lanchester & Rickards, Russell & Cooper, and J. O. Gibson being placed second, third and fourth. These designs were submitted for the consideration of Mr. Carnegie, who is providing the funds. The first three premiums were £50, £25 and £15 respectively. It was one of the conditions that the library was to cost not less than £5,000 and the total cost not to exceed £15,000. As we publish Mr. Crouch's design in this issue there is no need to describe its arrangements in detail, which are best studied from the plans. It will be noticed that the library department is kept towards the back of the site and is very compactly arranged, while the technical school occupies the front on ground and first floors, the art school being disposed on the second floor. The central portion of the building consists of a good-sized assembly hall, well treated inside and extending up two storeys.

Messrs. Lanchester & Rickards' plan is almost square, with a central area, the technical school entrance being placed to the left on the main front and the library entrance to the right. The newsroom, 61ft. by 28ft. 6ins., extends along the main front, on the ground floor, with magazine room (45ft. by 17ft. 6ins.) to the right, book store (48ft. by 38ft.) in the centre, staff rooms behind, and reference room (34ft. by 26ft.) at the rear right-hand corner. The assembly hall is 59ft. by 34ft. On the first floor are the technical classrooms, with the art school above. The elevation is rather ill-proportioned and dumpy-looking.

The design by Messrs. Russell & Cooper has the library entrance to the left and the technical school entrance to the right. The assembly hall and the lending library and book store are both 70ft. by 30ft. The elevation of this design is very pleasing.



WORTHING FREE LIBRARY, TECHNICAL AND ART SCHOOL: THIRD-PREMIATED DESIGN BY S. B. RUSSELL AND T. EDWIN COOPER.

New Flats at Wimbledon.—At the corner of Belvedere Grove and Courthope Road, Wimbledon Hill, a block of high-class residential flats, called "Clifford House," is to be erected from designs by Messrs. Palgrave & Co. Messrs. R. Ward & Son, of Battersea, are the contractors.

Society of Architects' Visit to Liverpool.—Thirty-six members of the Society of Architects, from London and provincial centres, visited Liverpool on June 3rd. First the new Dock Board offices, of which Messrs. F. H. Hobbs and Arnold Thornely are the architects, were inspected, then a tour of the docks was made, after which Hatton Garden fire-station, St. George's Hall and the Town Hall were seen.

The Regent Hotel, Royal Leamington Spa, has been entirely remodelled, re-decorated and re-furnished under the direction of Mr. Ernest R. Barrow, A.R.I.B.A., of the firm of Brown & Barrow, 12, Norfolk Street, London. The builder was Mr. R. Cleaver, of Northampton; Mr. C. Ridley Shield acted as clerk of works; Messrs. Flavel, of Leamington, have fitted the kitchen and offices, and Messrs. Braithwaite, of Kendal, the laundry; while Messrs. Brown & Parsons, of Leamington, have executed the whole of the electric lighting, the Easton Lift Co. the passenger and service lifts, the Art Pavements and Decorations, Ltd., all faïence, wall-tiling and mosaic work, and Messrs. Shanks the sanitary fittings.

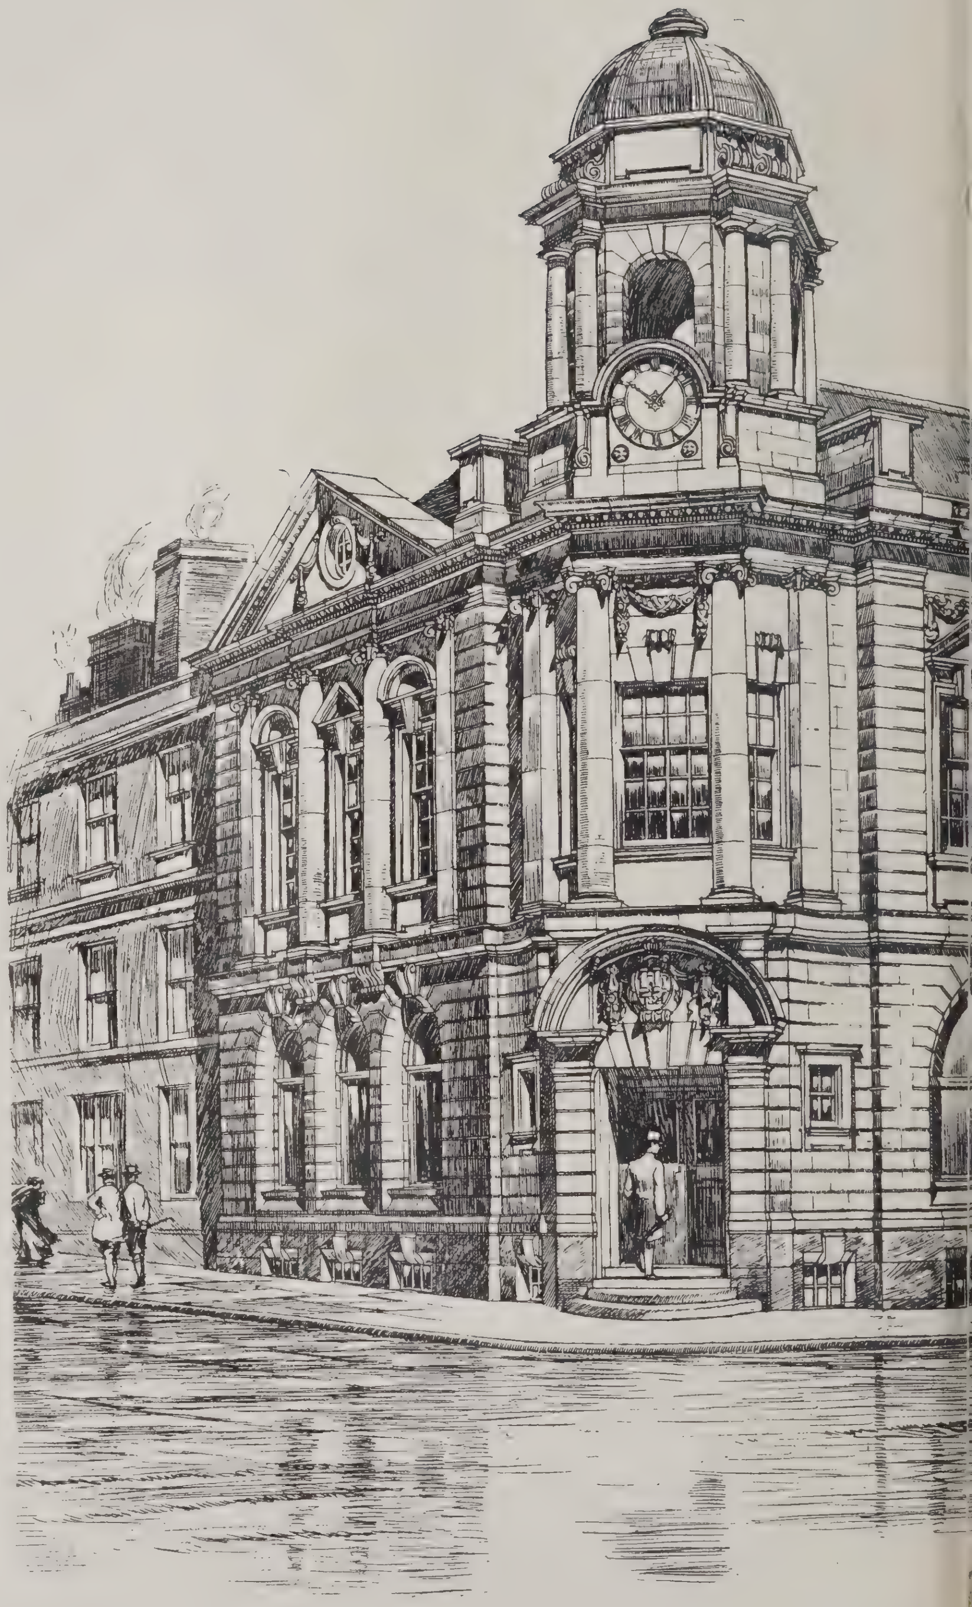
Builders' Notes.

South Wales Building Trade Employers' Federation.—At the annual meeting held last week in Swansea Mr. W. T. Morgan (Cardiff) was elected president and Mr. W. A. Linton (Newport) and Mr. W. O. Jenkins (Swansea) were elected vice-presidents.

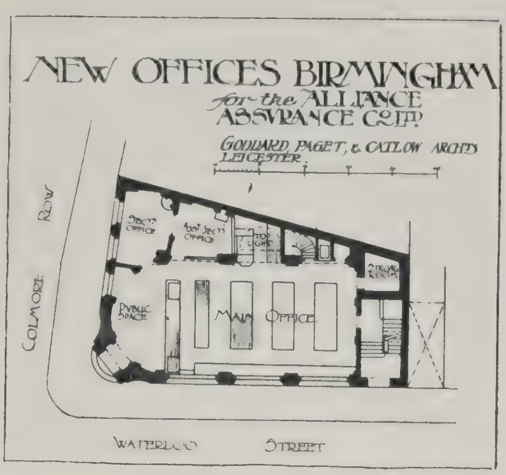
Newcastle Building Trade Dispute. — A conference between representatives of the Master-Builders' Association and the Bricklayers' Society was held last week at the office of Messrs. Oliver, Leeson & Wood, architects, Newcastle, in order, if possible, to arrive at a settlement of the dispute resulting from the demand for a reduction in wages and alteration of working rules. The proceedings lasted over three hours, without any arrangement being agreed upon.

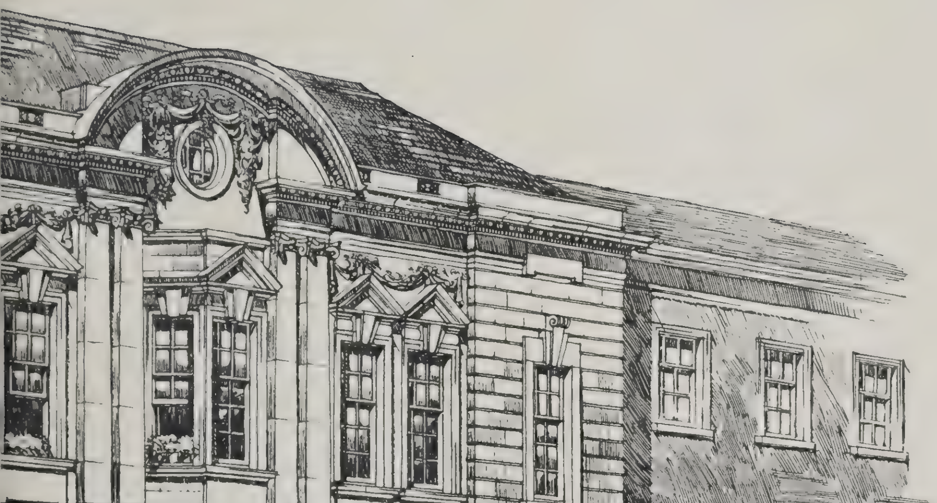
The Birmingham Builders' Exchange and Exhibition is to be opened on June 29th. The following are among the firms who are exhibiting:—Messrs. Mellowes & Co., Ltd., Sheffield; the Wood Carving Co., Ltd., Birmingham; Hambletts Blue Brick Co., Ltd., West Bromwich; Phillips & Sons, Birmingham; the Cannon Iron Co., Deepfields; the Perfector Window Co., Ltd., Nottingham; English Brothers, Ltd., Wisbech; the Haunchwood Brick & Tile Co., Ltd., Nuneaton; Yarrow & Co., Ltd., Bolton; Albert J. Shingleton, London; the Fire-Resisting Corporation, Ltd., London; Kenrick & Jeffereson, Ltd., West Bromwich; Kodak, Ltd., London; Maw & Co., Ltd., Jackfield; Kaye & Co., Ltd., Rugby; the Cloisonne Glass Co., Ltd., London; Samuel Platt, Ltd., Wednesbury; George Farmiloe, Ltd., London. A most complete system has been inaugurated whereby immediate reference may be made to the most important catalogues of the leading firms concerned in the erection and equipment of buildings, and a plan has been adopted to keep the library replete with all the newest publications. A most encouraging feature is the number of applications for membership of the Exchange, thus evincing a desire on the part of architects, builders and manufacturers to avail themselves of the facilities which such an institution offers for co-operation.

The Welsh Slate Industry. — A correspondent writes:—The following figures very eloquently illustrate the present crisis in the slate trade and point conclusively to the fact that free trade is ruining the slate and slab industry of Wales. France and America are the keenest competitors, and whilst they are sending slates and prepared chimneypieces into these islands free of duty, a heavy tax is placed on Welsh slates. The Britisher cannot get to his own market, owing to the competition in rates, and sell at the same price. Much less can he go to the Continent. In connection with this it should be remembered that in America, which is a protected country, workmen are paid better wages, yet they can, owing to free trade, beat us on our own market and by heavy taxes stop our goods going to their markets. At present the price quoted in North Wales quarries for 1,000 permanent blue slates 24ins. by 14ins. is £14 10s., and for slates 24ins. by 12ins. £13 12s. 6d. In addition, the purchaser would have to pay a rate of 10s. per ton to get the slates to Aberystwyth. In a letter to an Aberystwyth firm a French quarry company offer to deliver 1,000 slates of the same quality and size in Aberystwyth itself for £12 6s. and £11 respectively. The fact that these slates are probably sold as Welsh slates at Welsh prices accounts for the depression. In respect to chimney-pieces, America will deliver these goods in this country cheaper than they can be produced here, owing principally to the cheap freights.



These premises have been erected at the corner of Colmore Row and Waterloo Street, Birmingham. On the grou
In the basement are the surveyors' and typists' rooms, stationery store, strong-rooms and lavatory accommodation. The
Portland stone walls, and the roof covered with Westmorland slates. Internally the ground-floor offices are panelled in
the ceiling being of modelled plaster. The building is from the designs and under the superintendence of Messrs. Godda
stonecarving is by Mr. J. Crosland M'Clure, of Leicester, the modelled plasterwork by Mr. G. P. Bankart, and the marble





is the main office, with accommodation for about forty clerks, private offices being provided for the secretaries. oors are arranged for offices and caretaker. The materials used externally are grey polished granite for base, ny to a height of about 4ft., and above this the walls are lined with Brescia del Fomo and Pavonazzo marbles, ., FF.R.I.B.A., of Leicester. The general contractors were Messrs. John Bowen & Sons, of Birmingham. The decoration by Messrs. Fenning & Co., of London.

HOW PLASTER-OF-PARIS IS MADE.

THERE is a marked contrast in the methods of burning gypsum abroad. Most of the American rock is calcined in kettles by direct heat, and even where rotary cylindrical kilns are used the heat is direct. The French plaster manufacturers have invented a variety of kilns and methods which are held in high favour by the companies using them.

The Common Kiln.

One of the common types of kiln is a much simpler arrangement than the kettle, and would seem to represent a more crude method. A series of arches are constructed out of gypsum blocks and supported on piers of the same material. These arches are about 1ft. 8ins. wide and 2ft. 4ins. high. On these are placed large blocks of gypsum, then smaller and smaller blocks until the kiln is filled to a height of about 13ft. The whole kiln is covered by a shed roof, and spaces are left between the blocks to give a draught. The arches are filled with wood, and a hot fire maintained until the lower blocks begin to grow red-hot, which requires about ten hours. Then a slow fire is kept for ten or twelve hours. The lower rock over the arches is overburned and the upper rock underburned, but a mixture of the whole gives a fairly uniform plaster. Such a kiln holds 70 tons to 75 tons of rock, and the plaster is removed in from two to three days. It requires 1,200 faggots of wood, which now cost 1s. 8d. a hundred. Many kilns use part coal in the form of briquettes.

The Brisson Kiln.

The kiln just described is used more commonly than any other, but a number of plasterworks are now using improved kilns where the heat is usually indirect. The Brisson kiln used at Pantin is analogous to a gas furnace in construction. It has eight retorts, each holding six hectoliters of gypsum, heated by a single fire, attended by a single workman and yielding a very white plaster. The plaster made in the rough kilns previously described is usually grey. For a long time any process making white plaster was looked upon with suspicion in France, as the grey plaster was considered superior in quality.

The Dumesnil Kiln.

Another variety of kiln held in high favour in France is the Dumesnil kiln. This has a central fire-pit with a fire chamber above, which is connected with radiating flues constructed of the larger fragments of the gypsum rock. Above these flues the stone is arranged in layers, containing smaller and still smaller fragments towards the top. In the arch forming the top of the kiln are flues controlled by dampers. The gypsum is charged through an opening in the rock and removed through a door at the side. The kiln is 20ft. in diameter and 13ft. in height to the top of the arch. It will hold 1,200 cub. ft., and is burned in twelve hours with a fire of faggots and in a little less time with coal. The method is said to be economical and the plaster uniform in quality.

German Methods.

In the Hartz Mountain district of Germany the gypsum is ground on mill-stones. The plaster is calcined in iron kettles set in masonry and the material is kept in motion by revolving stirrers. At Osterode one mill uses a round iron-vessel as a muffle kiln for burning the plaster.

In Ellrich and Walkenried some double shaft ovens 13ft. high and 5ft. in diameter are used. The fuel and gypsum are placed in these shafts in alternate layers and covered with a shed roof. As soon as the plaster is completely calcined it is drawn out from below and more material added to the top.

In some of the primitive mills the rock is broken in stamp mills. The stamps are made of maple or oak, with an iron shoe at the bottom giving a length of over 9ft. These fall in a trough of wood with an iron-grate bottom. It is ground finer in a roller machine in which heavy rollers move over a pan somewhat like a mortar-mill. In some mills a jaw-crusher is used, and the fine grinding is there accomplished by means of mill-stones.

AMERICAN CONCRETE FLOOR PRACTICE.

THE following notes on some of the more general methods of constructing concrete paving and flooring *in situ* will be of interest, and are suggestive in regard to specification clauses, which as usually written by architects are very loosely drawn:—

Excavation.

The depth of the excavation depends largely on the soil. For outside work excavate to the depth of 16ins. to 24ins.; if paving is bounded by soil on each side excavations should extend at least 1ft. on each side of the wall. Thoroughly ram the soil and fill the excavation with clean cinders, clinker, slag, gravel and broken stone. Dampen this and ram it well into place. The excavation should be filled to the height where the concrete is to be deposited. Keep well and thoroughly compacted.

The Concrete.

The thickness of the concrete should be 3ins. to 6ins, according to the strength required and the size of the slab. Proportions: One barrel of good Portland cement, two and a half barrels of clean, sharp, coarse sand, free from loam or clay, and five barrels of clean coarse gravel or broken stone not exceeding $1\frac{1}{2}$ins. in size, screened (as is usual) of sizes below $\frac{1}{4}$in., and free from dust. If the gravel or broken stone contain much of the size of sand the proportion of added sand should be correspondingly decreased. The cement and sand must be thoroughly and uniformly mixed in the dry state, then the water added and the mortar turned until the water is thoroughly incorporated; the broken stone or gravel, previously wetted, is then added and turned thoroughly several times. Uniformity of concrete mixing is very necessary. Deposit immediately before set, and tamp well before water rises to surface.

The Top Coat.

Thickness 1in. to $1\frac{1}{2}$ins., according to strength required. Proportions: 1 part of good Portland cement and 2 parts of clean, coarse, sharp sand or coarsely-ground trap rock, ground limestone or sand free from dust, any size up to $\frac{1}{16}$in. or $\frac{1}{8}$in., and never exceeding $\frac{1}{4}$in. Mix dry until uniform, and then add the proper quantity of water. The top coat must always be laid before the concrete has begun to set, and the water used must be clean, free from mud, sewage, alkalies and acids. Cold water retards setting and warm water accelerates it.

The Dryer.

It is often found advisable to take equal parts of the cement and fine sand obtained by screening sand, or equivalent, which is used in the top coat, and to spread it uniformly over the surface, in all cases being careful to get it well trowelled in before setting has begun in the top coat.

Slabs.

Pavements or floors should never be laid in continuous sheets or cut into slabs. Where the slabs are 4ft. by 4ft. or 5ft. by 5ft. a total thickness of 4ins. or 5ins. is required, and if slabs 6ft. by 6ft. the thickness should be from 5ins. to 6ins., and for several purposes, such as floors which must bear heavy traffic, the thickness should be increased to 7ins. or 8ins., according to good judgment of the requirements.

Joints.

The concrete should be cut entirely through, and the top coat should be cut nearly through, forming a **V**-shape groove with round edges on a bevel, and the blocks should be laid off in alternate rows. Tarred paper or clay paste can be used between joints to prevent adhesion. Between the lap joints also use clay paste, as this makes the joints more impervious. Expansion joints, to take up expansion due to changes of temperature, should be laid wherever necessary. For instance, in long walks expansion joints of white pine $\frac{1}{4}$in. in width should be laid for 20ft. or 40ft. The expansion of cement-concrete under changes of temperature is approximately the same as that in steel rails.

Colouring Matter.

Where colours are employed other than the natural sand and whitish-yellow cement, it must be borne in mind that colouring matters containing grease or acids are to be avoided, as, for instance, lampblack, graphite and the like, which are very injurious to the cement. Care should be taken in the selection of the colouring material, which should be secured from a reliable maker, stating the purpose for which it is to be used.

The Setting.

The finished surface should be protected from dirt, too rapid evaporation, hot air, the rays of the sun, currents of air, showers and frost, and from any mechanical injury during the process of hardening. If the evaporation should be too rapid, the cement will be deprived of water necessary for setting and hardening. All this work should be done by competent workmen, experienced in the laying of cement pavements, in every case where it is possible to obtain skilled labour.

Concrete Proportions.

Below are proportions for the making of concrete, which come from an authoritative source, and are the exact proportions for some of the most extensive and successful operations that have been executed in the United States recently.

To mix the strongest concrete for the construction of steps, arches or the like, it is necessary to use 1 part of Portland cement, 2 parts of sand and 4 parts of broken stone.

To make a very strong concrete suitable for foundations of pavements, engine foundations or piers, 1 part of Portland cement, $2\frac{1}{2}$ parts sand and 5 parts broken stone.

Strong concrete suitable for construction of the tallest skyscraper should have 1 part of Portland cement, 3 parts of sand and 6 parts of broken stone.

For concrete suitable for almost all ordinary purposes, 1 part of Portland cement, 4 parts of sand and 8 parts of broken stone.

ST. MARGARET'S, WESTMINSTER.

Restoration of the East Window.

THE great east window of St. Margaret's Church, Westminster, is proposed to be restored. It is said to have been designed for Henry VII.'s Chapel, and refused admission by Henry VIII.; then, having passed from one owner to another, the munificence of Parliament caused it to find its abiding home at St. Margaret's in 1758, after more than 250 years of wandering.

It is stated that the window needs to be taken out and releaded, and that, unless the work is undertaken without delay, the glass will suffer. At present the window is awkwardly placed inside the frame of a much larger window removed to make room for it in 1758. At the time there was erected a sham Gothic apse which concealed this circumstance, but, now that the sham apse has been very properly swept away, it is manifest to everybody that the window ought to be placed higher in the wall. Moreover, the existing wall is in a bad state. It is, however, destitute of historic interest, for the east end of the church has been frequently rebuilt since the Reformation.

In view of these facts it has been decided to undertake the renovation of the east end of St. Margaret's. With this object a representative committee has been formed, and it has been decided to entrust the work to Mr. C. E. Kempe. The Restoration Committee will acquire from His Majesty's Office of Woods possession of the narrow strip of ground which separates the wall of the church from the railings, and the new east wall will be built a little eastwards of the present wall, giving a slightly greater length to the chancel and breaking the squalid flatness of the Georgian exterior.

The cost of the whole work is estimated at £3,000.

Obituary.

Mr. W. J. Taylor, architect and surveyor, of Sheffield, died recently from blood-poisoning, caused by an accident while visiting some property at Dore. He was in his forty-seventh year.

A new Convalescent Home has been built at Bexhill from designs by Messrs. Rowland Plumbe & Harvey. It is Georgian in style, carried out in purple bricks, with red dressings, and red tiles on the roof. Accommodation is provided for 71 patients, but when two more wings have been added there will be accommodation for 118.

Correspondence.

Stalls.

To the Editor of The Builders' Journal.

Sir,—In reply to Mr. Harry Hems I would submit the following facts:—At Conway and Llanrwst, where the old rood screens remain intact, the choir and musicians used to be accommodated in the rood loft till about fifty years ago. This was undoubtedly the mediæval arrangement. Where rood lofts were demolished the materials and parapet fronts were often used to form western galleries for the singers, who had been deprived of the rood loft. Where the church was too low for a gallery a slightly raised platform was made at the west end. The chancel in my design is very small, 16ft. by 12ft., and could not contain a choir, and the church is too low for a rood loft or western gallery, so I did the most traditional thing that could be done and placed them on a step at the west end, which is a good position practically also.

The best authorities seem to agree that surplice choirs as we term them never existed in our parish churches in mediæval times. Mixed choirs in chancels are an exhibition of Sunday hats not to be tolerated at any period till recently. The last thing I should wish to do would be to introduce any foreign traditions.—Yours truly,

Conway. HERBERT L. NORTH.

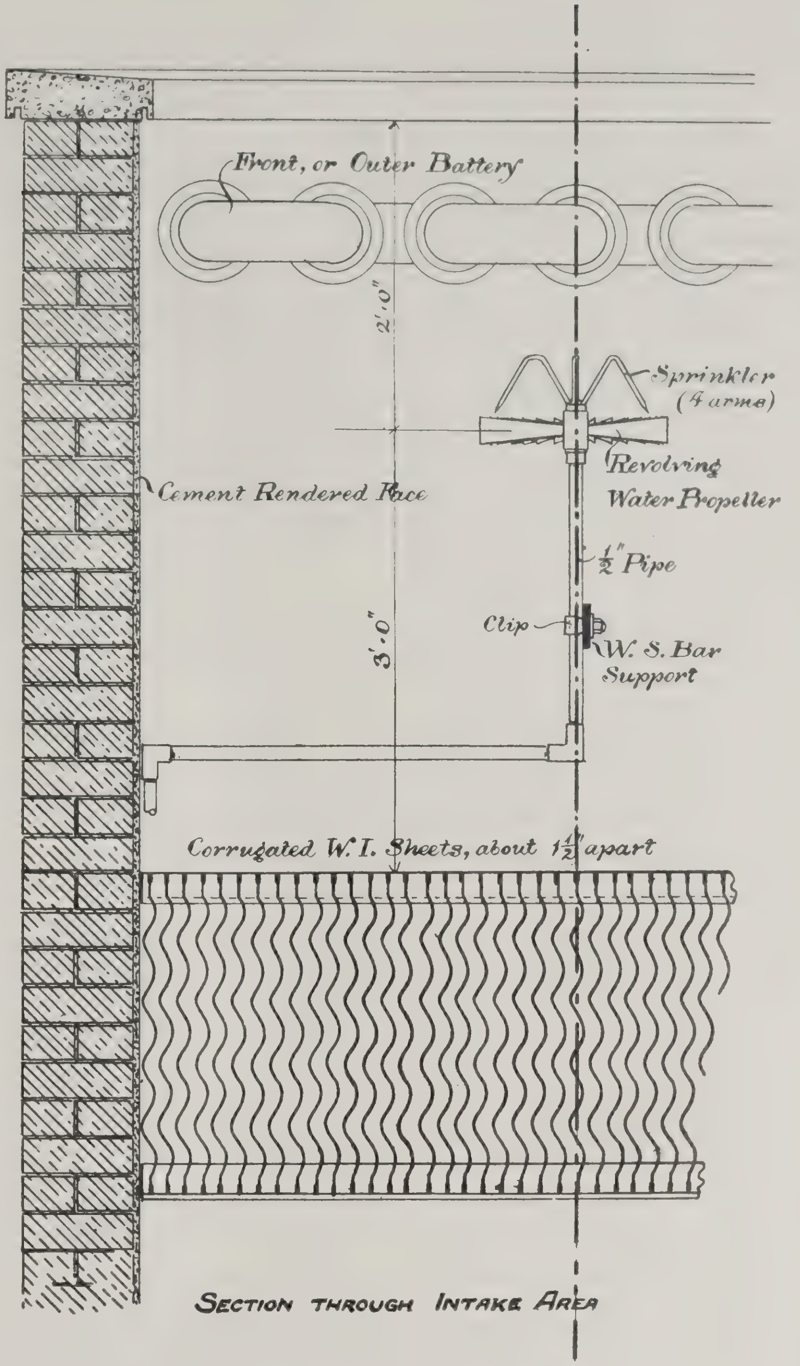
Views and Reviews.

The Plenum System of Ventilation.

This is a very practical and useful book on the plenum system. There are no lengthy definitions of what ventilation really is, nor elaborate analyses of air, its constituents, &c., as usual to the introduction of this much-debated subject. The author has quite another object in view, namely, to give the architect sufficient information to enable him, if not to design a propulsion system, at least to intelligently criticize a scheme and to superintend the structural part of the work. In an introductory chapter Mr. Griffiths comes down on the advocates of "natural" ventilation. As he observes, the quantity of air admitted under this system is only partially under control—that is to say, the entrance of fresh air can be regulated by the opening or closing of windows, or by other means; "but, as the entrance of fresh air is due to the amount of wind-pressure, and its direction, this cannot be regulated. In other words, if the wind be directed against the openings, and, should its velocity be such as to supply more air than is required, windows, &c., can be closed or partially closed, and the ventilation regulated to the required degree; but, should the velocity of the wind be too low, or in such a direction as not to be against the openings, then it is clear that no opening of the windows will induce the air to enter the apartment required to be ventilated, and ventilation, as such, ceases."

By the plenum or propulsion system the amount of air admitted can be controlled absolutely, and, moreover, it can be warmed, cooled and washed as desired.

For driving the fans, steam, gas and electric power are used, but the last-named is by far the best. The qualities of each are discussed in the third chapter of this book. As to the fans themselves, the author rightly draws attention to the fact that many are faultily designed, causing a churning rather than a propulsion of the air. From 250 to 280 revolutions per minute should be the maximum velocity, except when silence is not a necessity, as in the case of drying-rooms. At higher speeds there is a perceptible buzz.



THE MIST SCREEN FOR PURIFYING AIR.

A most interesting chapter is that on air purifiers and humidifiers. There are six kinds of screens generally employed for cleaning the incoming air. These are—the canvas screen, the coke screen, the fixed fibre screen, the revolving fibre screen, the cylindrical revolving screen and the mist screen. The author considers that the canvas screen is neither very durable nor efficacious; the coke screen unsatisfactory because it is likely to be packed either too tightly or too loosely; the fixed fibre screen also unsatisfactory because it accumulates soot, &c., when water is not running over it; the revolving fibre screen considerably better, though, being of double thickness, it puts more work on the engine and, by continually revolving, it tears; and the cylindrical revolving screen the most cleanly of the fibre screens; but the best of all is the mist screen, of which we give a diagram on this page. This consists of a copper sprinkler fixed within about 2ft. of the top of the brick-built intake shaft, and having below it a revolving propeller which throws off the water in the form of a very fine mist, through which the air has to be drawn. About 3ft. below the sprinkler are galvanized corrugated iron sheets, spaced about 1½ins. apart, between which the mist falls, so that the air is doubly purified. Below is a shallow tray connected to the drain, into which all water and impurities are conducted.

In the chapter on ducts and flues the author points out that these should be formed of brick, with floors laid to falls to gulleys, and rendered throughout in Portland cement, finished with a trowelled face. He does not favour double ducts. As to heating batteries, the best method is to fix these immediately against the bottom of the vertical flues and to heat them with steam. All details are discussed by the author, and in succeeding chapters he deals with dust, changes of air, tests and comparative cost. In reference to the last, a detailed bill is given of the costs of maintenance (1) with hot-water apparatus, (2) open fireplaces and (3) plenum system, by which it is shown "that the luxury of a propulsion installation for a building containing about 250,000 cub. ft. will entail a total annual cost of about £229 per annum in excess of hot-water apparatus, and about £166 per annum in excess of open fires; but it must not be forgotten that for this additional annual outlay something like

5,572,800,000 cub. ft., or about 186,589 tons, of filtered, humidified and warmed air would be thrown in as a *quid pro quo.*"

The book is thoroughly practical, being full of useful information, and as such should be of much service to architects.

"The Plenum or Propulsion System of Heating and Ventilation," by Harold Griffiths, A.R.I.B.A., F.R.San.I., A.M.I.C.E. London: Simpkin, Marshall, 4, Stationers' Hall Court, E.C., price 4s. 6d. nett, post free.

Law of Sewers and Drains.

Mr. MacMorran, K.C., has long been known as an authority on the law of sewers and drains, and the work written by him, in conjunction with Mr. W. Addington Willis, constitutes a much needed and authoritative text-book on a difficult and complicated subject. That such a prodigious work of 580 pages, with an index extending to another 125 pages, should be necessary to explain the legal points involved in such an everyday question is something of a disgrace to our legislative system. Doubtless, however well a measure is draughted, some ingenious people will be able to evade or to pick holes in its provisions, and it has often seemed to us that there should be a standing legal committee in Parliament who should, at the request of one or both Houses, consider the various decisions given in litigation under any Act that has been in force for a certain period, and re-draught any clauses or interpolate fresh clauses which would enable mistakes to be rectified and new points to be met, and would ensure the enforcement of the laws in the spirit in which they were conceived or required. Such a committee would provide for the gradual and continual rectification of laws which had proved defective in working. Needless to say, the Public Health Act, 1875, and allied Acts are most urgently in need of overhauling. As the authors observe in their preface, "It would be mere presumption to suggest that any work, however carefully prepared, could make the subject simple; and all that the authors of this book can or wish to claim is its completeness as a digest of this branch of law."

"The Law relating to Sewers and Drains," by Alexander MacMorran, M.A., K.C., and W. Addington Willis, LL.B., price 25s. nett. London: Butterworth & Co, 12, Bell Yard, Temple Bar, E.C; Shaw and Sons, 7 and 8, Fetter Lane, E.C.

Sanitary Law and Practice.

This is a handbook for students, dealing with the work of the medical officer of health and sanitary inspector, and the various matters are dealt with from that point of view. The matters are multifarious, and it is not surprising that the book extends to 760 pages. The book is most valuable and complete, and the inclusion of a summary in each section of the laws affecting that branch of the work is not the least useful part of the book.

"Sanitary Law and Practice: A Handbook for Students," by W. Robertson, M.D. (Glas.), D.P.H., and C. Porter, M.D., B.Sc. (Public Health), M.R.C.P. Edin., price 10s. 6d. nett. London: Sanitary Publishing Co., Ltd., 5, Fetter Lane, E.C.

Municipal Matters.

The various branches of municipal engineering are now becoming so complex that some kind of summary or introductory treatise to them is needed for the benefit of the councillor and student, and of recent years a number of cheap handbooks have appeared which seem to have been designed with this end in view. Of this class of text-book may be mentioned two little works just issued from "The Local Government Journal" office, 27A, Farringdon Street, E.C. The first—"Electric Traction on Street Tramways," by C. Biggs, A.I.E.E., price 6d.—sets forth the merits of the overhead, conduit, contact and other systems of tramway traction, with notes on the machinery required, &c. In twenty-six pages it need hardly be said that the subject is no more than outlined; but the information is clearly and concisely written, and should find a ready sale among those who want to grasp a difficult and complicated subject. The second work—"The Water Supply of Villages and Small Towns," by H. C. H. Shenton, M.S.E., price 6d.—a more ambitious work, extending to some fifty odd pages, gives very succinctly in paragraph form the various sources of supply, the measuring and gauging of supplies, with notes on wells and well-boring, rams, wind-power pumps, water-wheels, pumps of various classes, reservoirs, as well as short notes on the construction of dams, reservoirs and the laying of the mains. From these notes a very good idea of the work involved in water-supply can be obtained, and they form a fitting prelude to further study.

From the same office comes an expert criticism of the Valuation Bill, 1904, price 6d., which deprecates the value of this measure either for securing uniformity of taxation or better facilities for proper assessment.

Competitions.

New Technical Institute, Rochester.—One hundred and thirty-one designs have been submitted in this competition.

Competition for Free Library, Hove.—The Competition Reform Society disapprove of the conditions of this competition because there is no professional assessor, and no undertaking is given that the successful competitor will be employed. Architects are requested to abstain from competing unless the conditions are satisfactorily revised.

Primitive Methodist Orphanage, Harrogate.—Thirty-six designs were submitted for this institution, comprising ten pairs of homes, with master's house and entrance lodge. The first premium (£25) has been awarded to Messrs. Oldham & Hill, of Manchester, and the second (£15) to Messrs. Boyd & Groves, of Newcastle-on-Tyne. Mr. F. W. Dixon was the assessor.

Hammersmith Baths and Washhouses.—The design by Mr. J. E. Franck, A.R.I.B.A., of London, has been selected in a limited competition of six, subject to its being found possible to carry out the work for the stipulated sum of £45,000. The other competitors were Messrs. A. W. S. Cross, J. M. Ross, Maurice B. Adams, Spalding & Spalding, and E. Harding Payne.

Southend Schools Competition. — Fifteen sets of plans (by thirteen architects) have been sent in for the competition for new schools in Bournemouth Park Road, Southend-on-Sea. The committee have awarded the first place to Messrs. Greenhalgh & Brockbank, of Southend; the second to Mr. G. E. Clare (of Messrs. Clare & Ross), of Southend and London; and the third to Mr. D. H. Smith, of Southend.

Wesleyan Church House, Westminster.—The trustees of the new Wesleyan Church House at Westminster, having selected nine designs from the 132 originally submitted by architects, have, acting upon the advice of Sir Aston Webb, their professional assessor, finally accepted the design of Messrs. Lanchester & Rickards, of London, W.C. It is thought that the cost of the building (which has a large dome and will be loftier than either the Westminster Hospital or the Westminster Palace Hotel) will amount to £140,000. The style of architecture chosen is the Renaissance. In working out the design its proportions and massing have been allowed to develop from the necessities of the case, the form of the large hall being naturally the dominating influence, while the expressed desire for a building of monumental character has been an important factor in determining the treatment of the detail. Applied ornament and sculpture have been sparingly used and figure-work has been almost wholly avoided, as unsuited to the purposes of the building. In the basement there will be a tea room to seat 550, and another to seat 450. The mezzanine at ground level will comprise thirteen offices, two strong-rooms and a lavatory. The ground floor will comprise a conference hall to seat 300, reading-room, library, small hall, four committee rooms, librarian's room, vestry and two lavatories. The mezzanine above the ground floor will contain twelve offices and two lavatories. On the first floor will be the assembly hall, seating 1,401 on the floor, cloak-rooms and lavatories, two vestries, a reception-room and eleven offices; on the second floor, galleries accommodating 1,155, making a total seating accommodation for the assembly hall of over 2,500. The librarian's house will be on the third and fourth floors.

Keystones.

A new Wing to St. Edmund's College, Ware, has been erected from designs by Mr. F. A. Walters, F.S.A.

New Station at Peebles.—A commencement has been made with the new station on the North British Railway at Peebles. The cost will be nearly £5,000.

Red House, Chapel Allerton.—Messrs. J. Hodson & Son, Ltd., of Nottingham, request us to state that the Hopton Wood stone for this house, illustrated in our issue for last week, was supplied by them.

Change of Address.—Messrs. Leaning & Tanner, quantity surveyors, have moved from 28, John Street, Bedford Row, W.C., to No. 7, Southampton Street, Bloomsbury Square, W.C.

London Squares. — The Parliamentary Committee of the London County Council is to prepare a Bill for introduction into Parliament in the session of 1906 with a view to securing that the garden squares and enclosures in London should remain unbuilt upon.

A Nurses' Home and Laundry at the North-Eastern Hospital are proposed to be built. This is part of a scheme of enlargement including an isolation block, new out-patients' department, post-mortem room and probably a milk dispensary, estimated to cost £30,000.

L.C.C. New Dwellings. — The London County Council have approved the expenditure of £51,500 for the erection of five blocks of dwellings on the Webber Row area, Southwark. Tenders amounting to £13,919 have also been accepted for the erection of twenty-eight first-class, eight second-class and twenty-four third-class cottages on the Tottenham estate.

"Parliament Chambers," a block of offices and business premises facing Church House, Great Smith Street, Westminster, is now being completed from designs by Messrs. Palgrave & Co. The entrance halls are panelled with Irish green and black Devonshire marbles, and the steps are of white Sicilian marble. Messrs. L. Whitehead & Co. are the builders, and Mr. Farrell is the clerk of works.

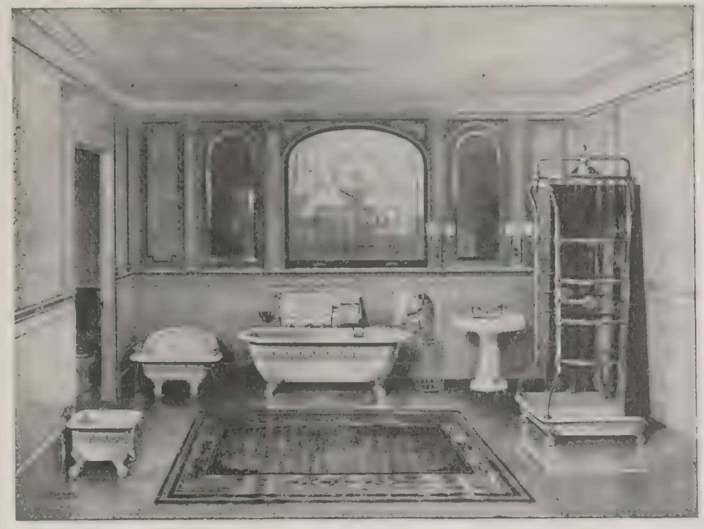
The Admiralty Buildings.—In reply to a question, Lord Balcarres stated in the House of Commons last week that the first contract for these works was commenced in December, 1889. The contract for the third extension building now in progress is to be completed on May 1st, 1906. The expenditure on the buildings (including architects' commission) has been £413,647. There have been several successive contracts; that now running, for the superstructure of Block III. and alteration of the old Admiralty, is held by Messrs. Holloway Brothers. The penalty for delay is £100 per week.

Asylum Extension.—A wing to accommodate forty-five patients is to be added to the combination asylum at Hoddington.

The Exhibition of Works in Wood and Woodcarving will be opened by Lord Avebury at the Carpenters' Hall on Monday next, June 19th, at 3 p.m.

A Reproduction of the Hall of Darius at Persepolis, one-eighth the size of the original, has been carried out for Mr. J. Bland Sutton at his house in Brook Street, W. The room is 40ft. square.

Messrs. R. Waygood & Co., Ltd., have declared a dividend of 9 per cent. for the year on their ordinary shares, carrying forward £3,389. Including £6,074 brought forward from last year, the company made a profit of £29,339 during the year ending March 31st last.



A MODERN BATHROOM BY THE STANDARD SANITARY MANUFACTURING COMPANY.

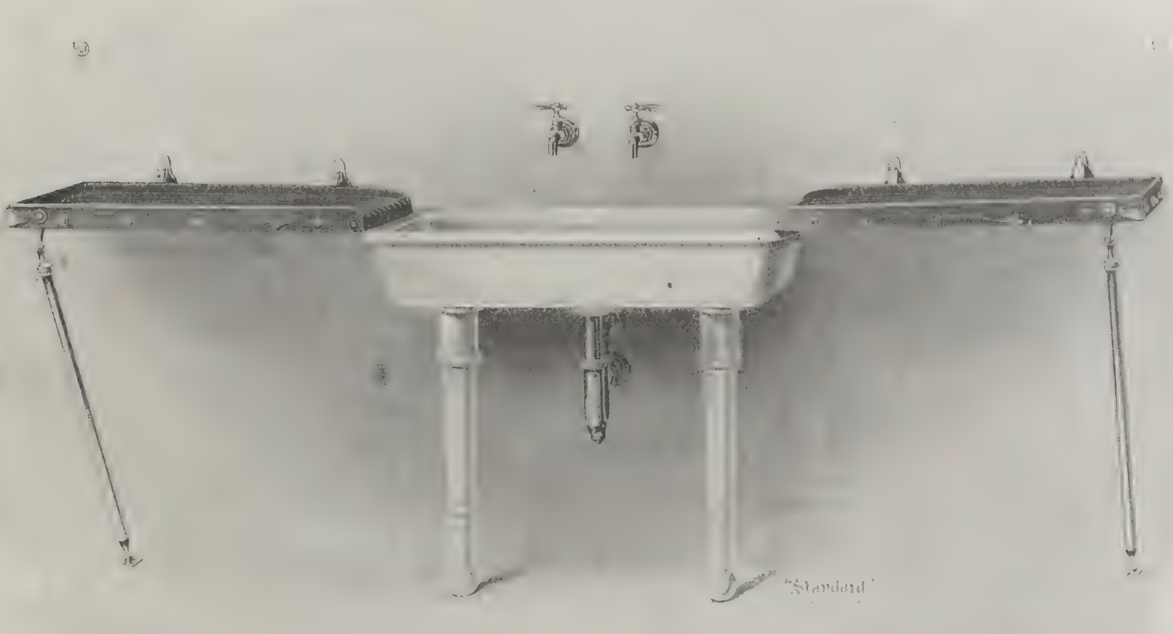
MODERN SANITARY FITTINGS.

THE Standard Sanitary Manufacturing Co., of 22, Holborn Viaduct, have brought out a large catalogue of their sanitary appliances. This is distinctly superior to any other catalogue of its class we have yet seen. It is printed on thick art paper and illustrated with a large number of photographs, coloured plates and drawings. Two illustrations from the catalogue are given on this page. These show how excellently they illustrate all the details. The catalogue comprises 484 pages, and is well bound. The Standard Sanitary Manufacturing Co. is the largest firm in the United States manufacturing this class of goods, and they have five factories at Allegheny, Louisville, New Brighton and Detroit. During the short time they have been established in London they have built up a large and rapidly-growing trade throughout the country.

A distinguishing feature of American sanitary work is the finish of the goods and the neatness of every detail, to which most careful attention is paid. "Standard" sanitary ware is of the very best type. It is not manufactured in porcelain, as might be supposed from its appearance, but is of cast-iron coated with a special porcelain enamel. The ratio of expansion, elasticity and contraction of both the enamel and the iron is the same, thus preventing the slightest tendency to craze or crack, a common fault with ordinary enamelled iron, and very often with earthenware also. It is claimed that the "Standard" porcelain enamelled iron is superior to both, and every piece is guaranteed, which cannot be said for most goods of this kind on the market. It is remarkable for a very fine finish; on the largest surfaces there is hardly any unevenness. The enamel is quite hard, smooth and non-absorbent, and does not retain grease or dirt. Its excellence can be judged from the list of uses to which it has been put, which are various enough to try it to the utmost. The firm manufacture the following:—Baths of all kinds, lavatory basins, water-closets, kitchen sinks and slop sinks, urinals, &c.—all in enamel ware. A large number of designs in each class of goods, together with all sorts of "Standard" fittings, such as bath cocks, wastes, towel shelves and rails, clothes hooks, cisterns, &c., are illustrated in the catalogue.

The bathroom is a very important compartment in a house, but it is comparatively only recently that it has received proper treatment. The accompanying illustration shows the fitments of a bathroom suggested by the Standard Sanitary Manufacturing Co. This will be seen to comprise an ordinary long bath, a sitz bath and a foot-bath, all standing away from the wall and above the floor, a pedestal lavatory basin, and shower and needle baths. Shower baths, though not very generally used, are becoming more popular, as this form of bathing is without doubt one of the most pleasant and exhilarating: hence modern hotels and apartments are being equipped with showers, and specifications for the better-class residences now generally include them. The illustration above also shows other little fittings, such as towel racks, towel baskets, &c. Kitchen sanitation is of equal importance, and in this connection we draw attention to the accompanying illustration of a "Standard" porcelain enamel sink with draining-boards having hinges which allow them to be folded against the wall.

In this catalogue one point architects should specially note is that the sizes of all goods are carefully given, as it is very useful in planning to be able to know the space required and whether a corner can be utilized advantageously. We may mention that this firm supplied all the baths to the new Midland Hotel at Manchester. For the benefit of architects and their clients two model bathrooms have been fitted up at the firm's showrooms, 22, Holborn Viaduct, E.C.



KITCHEN SINK, WITH FOLDING DRAINING-BOARDS BY THE STANDARD SANITARY MANUFACTURING COMPANY.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.

Makers: E. NEWTON & Co., 63, Aldermanbury, London, E.C.

Advertising Notes.

Bunch your efforts. Strike early, often, and everlastingly, but be sure you are putting every blow in the same spot. Sheet lightning is showy, but it never sets a house on fire. It is the compact, concentrated forked brand that moves things.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ADVERTISER desires ENGAGEMENT in Architect and Surveyor's, Auctioneer's, or Contractor's Offices. ARMY CONTRACTS.

SALE OF SURPLUS BOILERS, DISTILLING APPARATUS, DYNAMOS, AND OTHER PLANT AT BERMUDA, BARBADOS, ST. HELENA, AND WOOLWICH.

The Secretary of State for War is prepared to receive Tenders for the purchase of surplus Boilers, Distilling Apparatus, Dynamos, and other plant now lying at Bermuda, Barbados, St. Helena, and Woolwich, most of which is in first-rate condition, some lots being unused.

Forms of Tender, giving full description of the plant, particulars as to condition of the several lots and terms of contract, may be obtained on application to the undermentioned Office.

The Tenders are to be delivered at the War Office, Pall Mall, London, S.W., by TWELVE o'clock noon on 1st September, 1905.

War Office,
Pall Mall, S.W. 3rd June, 1905.

HERTFORDSHIRE COUNTY COUNCIL.

NEW PETTY SESSIONAL COURT AND TECHNICAL SCHOOL, CHESHUNT.

The Joint Committee for purposes of Police are prepared to receive TENDERS for the erection and completion of a new Petty Sessional Court and Technical School, Cheshunt.

Persons desirous of Tendering for the work may see the drawings, specification, agreement, &c., at the County Surveyor's Office, Hatfield, on and after Tuesday, June 13th, 1905, between the hours of TEN a.m. and FOUR p.m., except on Saturday, when they will be on view from TEN a.m. to ONE p.m.

A copy of the Schedule of Works and prices (quantities), and a form of Tender can be obtained at the County Surveyor's Office upon payment of Two Guineas, which sum will be returned to the tenderer upon receipt of a bonâ fide Tender and the documents which have been supplied to him.

Sealed Tenders endorsed "Tender for Petty Sessional Court, Cheshunt," must be delivered to the undersigned at his Offices, not later than 5 p.m., Monday, June 26th, 1905.

Such security for the due execution of the works as the Council may require must be given by the Contractor.

The lowest or any Tender will not necessarily be accepted.

URBAN A. SMITH,
County Surveyor.

County Surveyor's Offices,
Hatfield,
9th June, 1905.

6, Great New Street, Fetter Lane, E.C.

SUBSCRIPTION, POST FREE, 10/10 PER ANNUM,

or of any Newsagent or Bookstall, 2d. weekly.

Subscription Abroad, 17s. 4d. Post Free.

If you are not already a Subscriber, it will more than repay the small outlay to become one, and thus keep yourself posted in what is doing in the Architectural and Building World.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Tipperary.—Accepted for the erection of six houses on the estate of the Right Hon. Lord Barrymore. Messrs. W. H. Hill & Son, architects, 28, South Mall, Cork:—

M. Kirby, Tipperary	£1,725

Woodford.—Accepted for the erection of a detached house. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, E.C.:—

T. Osborn & Sons	£1,268

The new North Pier at Seaham Harbour is now completed, with the exception of the lighthouse. It is 1,383ft. long. The south pier, which is 878ft. long, will also be completed soon.

Newcastle Slaughter-houses.—It is proposed to erect twenty-one new slaughter-houses at the Newcastle cattle markets. The majority will be 18ft. square. The building will be constructed with red pressed bricks outside, lined inside with white glazed bricks. The estimated cost of the scheme is £3,166.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

June 21, 1905. Vol. 21, No. 541. 6, Great New Street, Fetter Lane, E.C.

Summary.

Sir Aston Webb was presented with the Royal Gold Medal on Monday evening at the Institute. (Page 345.)

The cornice on the new Gaiety Hotel is the largest in London. The chief rooms of the building are the restaurant, the ballroom, the Adam banqueting hall, the masonic temple and the two buffets, one on the Strand, the other on Aldwych. The main kitchens are in the basement, but there is also a kitchen on the top floor. (Page 341.)

MM. Coquelin and Binet propose "a theatre for the people" in Paris without corridors and passages. The auditorium would communicate through a single vast quadrangle with the street. (Page 346.)

The Waldorf Theatre on Aldwych is the last to be built in London under present regulations with three tiers. It is also the second theatre in London—"His Majesty's" being the first—to have a stage with no rake. There is, on the other hand, a very steep rake in the stalls—as much as 5ft. in twenty rows. (Page 340.)

Controversy about the new flying buttresses to York Minster continues. Mr. Bodley's point is that the roof is pushing out the clearstory walls, and critics neither disprove the existence of this outward thrust nor do they suggest how it is to be met. (Page 347.)

The special drawing which has been prepared clearly shows how the proposed new Royal Infirmary at Glasgow will overshadow the cathedral. A protest is being made against the proposal, on two grounds—that the existing building by Robert Adam will be needlessly demolished, and that the site is not suitable. (Page 346.)

Mr. James Mansergh, the well-known engineer, died last week, aged 71. (Page 348.)

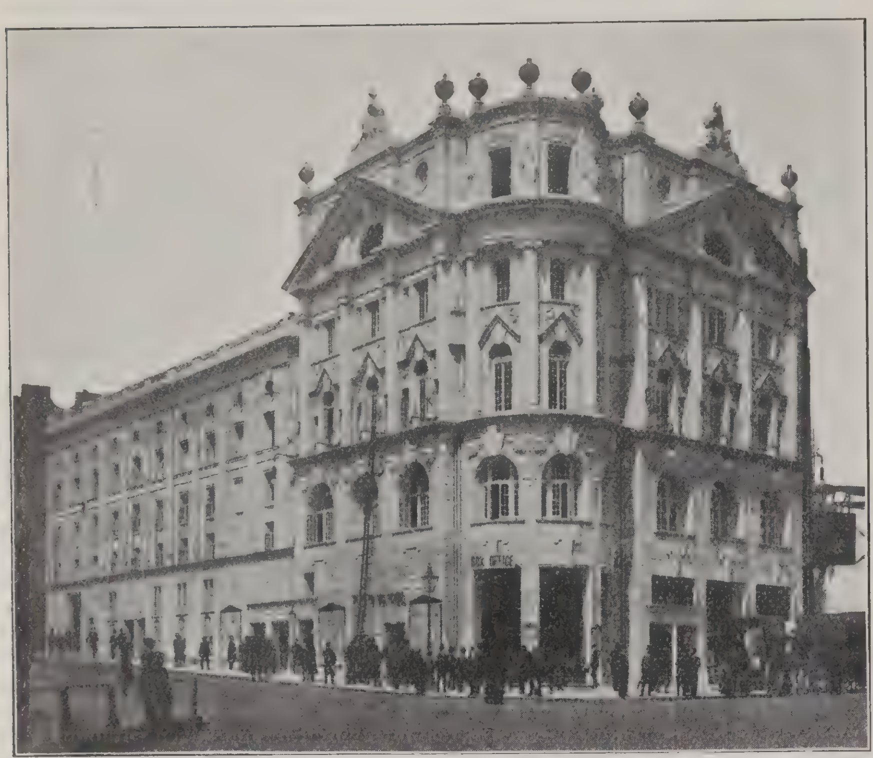
A correspondent adversely criticizes the first-premiated design for Primitive Methodist orphan homes at Harrogate, which he considers is badly planned. (Page 347.)

Mr. W. E. Riley, superintending architect to the London County Council, stated recently before the Select Committee of the House of Commons which is considering the Building Acts Amendment Bill that the Council desired the prevention clauses to be dealt with without delay, but other amendments would be deferred till next session. (Page 352.)

Irregularities in mediæval buildings, such as side walls neither parallel nor straight, pillars unequally spaced, &c., are not due to indifference on the part of the builders but (it is contended) perspective illusions and refinements, similar to those in Greek temples first made known by Mr. Pennethorne and Mr. Penrose about the middle of last century. (Page 349.)

A Carpentry and Joinery Exhibition. An exhibition of works in wood and woodcarving was opened on Monday at the Carpenters' Hall, London Wall, E.C., which is of the greatest interest to all connected with the building trade. It is the sixth exhibition held under the auspices of the Worshipful Company of Carpenters and the Worshipful Company of Joiners, and it will remain open until Saturday, July 1st, from 11.30 a.m. to 9.30 p.m. (Saturdays 6 p.m.). The exhibition is a considerable improvement on those of previous years, and it is apparent that these two City Companies are doing much good to the crafts which they were originally founded to support. In this they are different to some of the other City Companies, who do almost nothing but eat. A number of prizes are offered by the two abovenamed Companies to artificers and others for models made with their own hands, and this year it is noticeable that exhibits come from all parts of the country, not being confined mostly to London, as in former years. In the Constructive Carpentry division models are shown of all ordinary work; there are six classes into which the models are divided—(1) a queen-post trussed roof of 35ft. span; (2) a hammer-beam roof of 50ft. span; (3) bridge centering for a trussed bridge of 40ft. span for temporary railway traffic, and framed centering for bridges, railway arches, squint arches, niches and concrete domes; (4) shoring and needling to a London terrace house five storeys in height and 30ft. frontage, the ground-floor of which is to be converted into a shop; (5) gantries or staging for carrying a derrick or steam crane; (6) framed trustle for elevated railroad 30ft. high. The competitive conditions for this division were that the greatest amount of strength at the smallest expense of labour and material should be the object; yet it is noticeable in almost every case that the common fault of models, of not realizing scale, is apparent. It is doubtful if models are of much instructive value in reference to carpentry. Practical knowledge can only be gained by executing work full size. These models show generally that the craftsmen have failed to appreciate the primary condition of carpentry—that the timbers shall not be of extravagant size and that they shall be weakened as little as possible by cutting away. It is noticeable in a number of these models that the bearing timbers are cut away, whereas the subsidiary members are not cut. For instance in model No. 2, Class I., the purlin is notched instead of the common rafter, and in No. 5 the principal is notched, whereas it would have been better to notch the purlin, for the tendency is for a truss to heel over: and any slipping of the purlin could be met by nailing a cleat under it. The models for hammer-beam roofs are, on the whole, commendable. The first prize is awarded to a design which is thoroughly praiseworthy. It is very cleanly done and direct bearings are given without recourse to wedging. The same faults of want of appreciation of scale and practical conditions are apparent in the models in Division II. in framed timber for verandahs, cricket pavilions, temporary stands, domes, cupolas, steeples, groining and small framed houses; and likewise in Division III., which deals with staircases, window frames, sashes and casements, &c. Division IV. is devoted to furniture, and Divisions V., VI. and VIII. to woodcarving. The latter include a number of exhibits that show proper appreciation of the material and are of artistic design, but many of the exhibits are rough. However, the exhibition as a whole is deserving of attention by architects and craftsmen, the models showing much thought and often suggesting improvements on traditional methods.

Wesleyan Church House Competition. One of the most important recent competitions has been that for the new hall and connexional offices which are to be built for the Wesleyan Methodists on the site of the Westminster Aquarium. As already announced in our columns, the successful architects are Messrs. Lanchester & Rickards, some particulars of whose design were given on page 338 of our issue for last week. In the present issue we are able to publish the perspective, elevations, sections and plans of the selected design, which will be studied with great interest. We are also able to give two of the other designs (eight in all) submitted. It will be generally admitted that the selected design groups well together and is very compact in plan. It is a question, however, whether the large dome is not rather too flat, and the cutting of it by the balustrade at the base of the lantern only increases this appearance of flatness. The total height of the dome will be 170ft. and the twin towers 140ft. In the interior, of course, the chief feature is the great hall, which is on the first floor, and will seat 1,401 people on the floor and 1,154 in the galleries—2,555 in all. The details of the accommodation are best seen by examining the plans.



THE WALDORF THEATRE, ALDWYCH, LONDON. W. G. R. SPRAGUE, ARCHITECT.

TWO NEW BUILDINGS ON ALDWYCH.

WE illustrate in this issue the new Waldorf Theatre and the Gaiety Hotel, facing each other across Aldwych, the crescent thoroughfare at the bottom end of the new street from Holborn to the Strand.

The erection of the Waldorf Theatre has already been recorded in our pages by a special series of photographs (see the issue for April 5th last), and in presenting the accompanying views of the interior we complete our record of the building.

The Waldorf Theatre has been built from the designs of Mr. W. G. R. Sprague by the building department of Messrs. Waring & Gillow, Ltd., who also have carried out the decorations and were responsible for the stage construction and mechanism. The theatre has a frontage of about 70ft. to Aldwych and a return elevation of 166ft. to Catherine Street; it commands a view of the Strand, and has a Classic elevation in white Portland stone, surmounted by vases and allegorical groups.

Entering from the corner of Aldwych into a marble vestibule (see p. 345), and thence up a short flight of marble steps, one proceeds to the grand crush-room. The dress circle is reached by a marble staircase terminating in a semicircular foyer, from which the tier is entered. From this foyer the staircase continues up to the grand saloon. The auditorium is capable of holding upwards of 1,790 persons, the dimensions from curtain line to the back of the auditorium being 69ft., between the side walls 50ft., and the proscenium opening 31ft. by 29ft.

This is the last theatre to be built in London under present regulations with three tiers. It is also the second theatre in London —" His Majesty's" being the first—to have a stage with no rake. There is, on the other hand, a very steep rake in the stalls, as much as 5ft. in twenty rows. As the stage is not more than 39ft. deep, it will not be suitable for very elaborate spectacular productions.

The theatre has four private boxes, the whole of the area being occupied by stalls, the dress circle on the first tier, balcony on the second, and amphitheatre and gallery on the third. Ample refreshment accommodation is provided for all parts of the house.

The decorative scheme of the interior is a bold and broad treatment of the Louis XIV. style, the characteristic richness of which is carried out without any suggestion of weakening by the employment of minute or over-elaborate ornament. The walls of the crush-room and main staircase are covered in alternate stripes of dove-coloured and *brèche violet* marble, divided with panels of the latter, after the manner adopted in many of the Genoese churches, and marble pilasters with gilt capitals; the balustrade of the staircase is a wrought-iron copy of one of Baren's famous designs. On the first-tier level is the refreshment salon, a fine example of delicate and carefully studied period work in cream and gold. In the auditorium the colour scheme is *Rose du Barry*, which is relieved by the cream and richly-gilt circle fronts and a touch of green in the French tapestries which are used for the upholstery of the stalls and dress circle; a rather more sombre and qualifying note being struck in the brown French walnut of the seat frames.

One of the notable features is a circular ceiling in modelled plaster with finely-gilt centrepiece and outer border, and a boldly treated picture sweeping round between the two, painted after the style of Le Brun and reproducing a good deal of his effect. Attention may be drawn to the *bas relievo* modelling of the tympanum which surmounts the proscenium, representing Apollo in his

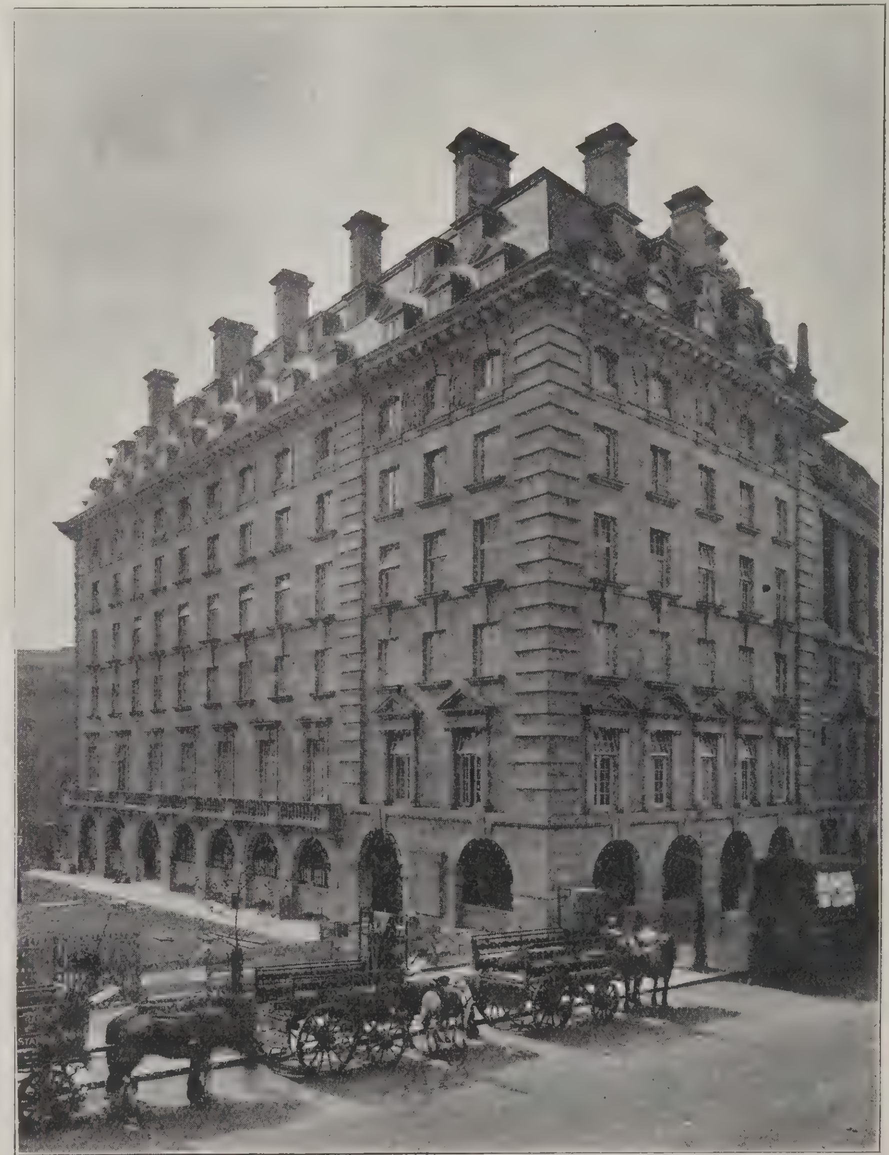


Photo: S. B. Bolas & Co., 68, Oxford Street, W.

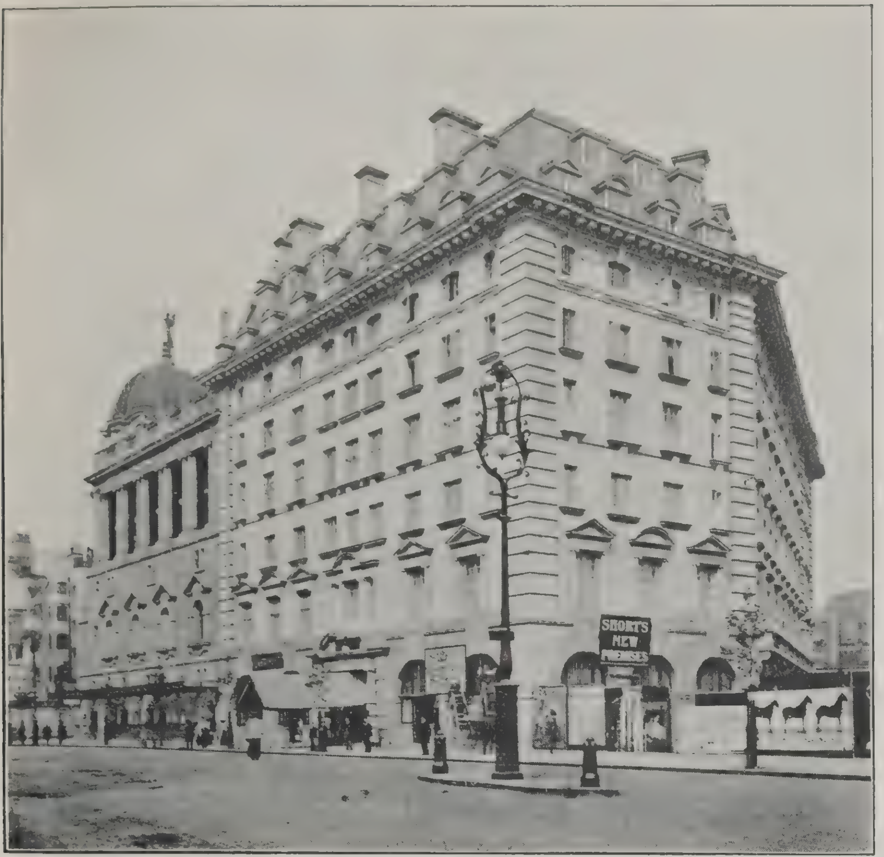
THE GAIETY HOTEL, FROM ALDWYCH. ERNEST RUNTZ AND FORD AND R. NORMAN SHAW, R.A., ARCHITECTS.



GAIETY HOTEL: STRAND FRONT.

chariot drawn by four spirited horses, attended by goddesses, cupids, &c. A deep cornice in the Louis XIV. style runs round the theatre and constitutes a feature, giving an unusual but rather welcome rigidity of line over the proscenium opening and the boxes. The proscenium opening and the dress and upper circles are supported with pilasters of *fleur de pèche* marble with gilt capitals; and between the smaller pilasters on the dress circle and stall levels the novel treatment of lofty mirrors reaching to the cornice has been adopted. The general character of the interior is one of rich and bold beauty, with the Louis XIV. feeling scrupulously maintained.

The heating, hot-water supply, ventilating arrangements, fire hydrants and fireproof curtain have all been carried out by Messrs. Strode & Co., of 48, Osnaburgh Street, Regent's Park, N.W.

The heating is on the low-pressure hot-water system, radiators being fixed in various parts of the auditorium and corridors in recesses formed to prevent the radiators projecting beyond the face of the walls. A separate boiler is provided for the hot-water supply to all the lavatories, and also for warming the dressing-rooms.

Eleven of Strode's special hydrant valves are fixed in various parts of the building, these also being recessed into the walls so as not to cause obstruction in the corridors, &c. With each valve is supplied a 60ft. length of hose and hose-fitting, all mounted on polished boards recessed into walls ready for immediate use. Twenty-seven fire buckets filled with water are also available in various parts of the building, and on the stage is provided various firemen's equipment.

The fireproof curtain is constructed to the London County Council's latest requirements and rules, which have become far more stringent since the disastrous fire at Chicago, the asbestos cloth being severely tested before being passed. The curtain is covered with this cloth on both sides, and lined between with silicate cotton packed about 2ins. thick throughout, about 2 tons of this silicate cotton being used altogether.

The curtain can be instantaneously released either from the stage itself or from the stage exit, and will fall in 15 seconds, entirely cutting off the stage from the auditorium. Messrs. Strode & Co. have a special concussion tube which enables the curtain to fall silently and without jar or shock to the stage. At the same time that the curtain is released a water sprinkler is opened which throws a sheet of water from ceiling to stage. The curtain is raised by a winch in the flies.

The steel construction for the theatre was executed by Messrs. Smith Walker & Co., and the electric lighting by Messrs. Blackburn, Starling & Co., Ltd., of Hanley.

The Gaiety Hotel.

The Gaiety Restaurant and Hotel forms the eastern half of the block on the famous Strand "island," with "Short's" wine-house at one corner on the ground floor. The Gaiety Theatre, at the opposite end, was opened in October, 1903. In the design of the whole building the Florentine period of the Italian Renaissance was adopted on the suggestion of Mr. Norman Shaw, R.A., who has been associated with Messrs. Ernest Runtz & Ford, the architects. The bold masses simply fenestrated, and surmounted by the interesting carved frieze by Mr. Hibbert Binney, cannot fail to arrest the attention of passers-by. The whole of the façades are executed in Portland stone. The cornice, fixed at a height of 80ft., is the largest in London. Above it is a two-storey mansard roof of steel and concrete.

The main entrance from the Strand leads to a hall 57ft. by 21ft., panelled in mahogany, with a modelled frieze ivoried over, the

THE GAIETY RESTAURANT. ERNEST RUNTZ AND FORD, ARCHITECTS.

ceiling also being richly modelled. On the left is the grand staircase, with a stained-glass window on the half-landing (by Messrs. E. J. Prest & Co., of Haverstock Hill). At the further end of the main entrance hall is the restaurant, 60ft. by 40ft., with balcony around. It is lighted by semicircular headed windows on the ground floor and on the balcony level by French casements. The walls are panelled in white and the doorways carried out in mahogany. The carpet and hangings are red. The popular tip-up Gaiety stall seats are again in evidence, as also the alcove treatment around the walls, thus affording facilities for a degree of privacy somewhat unique in the restaurant world. On the balcony level, at the northern end, is a space for the orchestra, and on the south a spacious lounge, from which numerous public and private rooms are approached.

Above the restaurant is the ball-room, decorated in heliotrope, white and yellow, and similarly treated with a balcony around. The floor is of oak, on springs.

To the left of the main entrance on the Strand is a large buffet, 36ft. by 26ft., decorated in the Georgian style, with polished mahogany moulded, panelled and carved wainscot, and decorative plaster panels above with swags of fruit and flowers. Also on the ground floor, but on the Aldwych front, is another buffet, based on a Dutch model. This is 44ft. by 22ft., and panelled throughout in bass wood stained green, with Dutch tiles and ornamental pewter-work between the frames.

On the mezzanine floor is the Adam banqueting hall. This is 45ft. long and 30ft. wide, carried out entirely in the style of the period which gives its title. The colour scheme here is white and green. Adjoining, on the Strand front, are three private dining-rooms, named respectively after Nelly Farren, Kate Vaughan and Fred Leslie.

On the first floor is the masonic temple and banqueting hall, with the tiler's room between. The masonic temple is based on Byzantine work and has been decorated by Mr. Neatby. It is 45ft in length, 27ft. in height and 26ft. in width, with an apsidal end and barrel roof over, supported on sixteen Sienna scagliola marble columns, hung with curtains between. The semi-dome and the semicircular end above the organ are decorated with emblematical paintings, the angel figures representing "The Star of the East," The Spirit of the West," The Spirit of the South," and, as background, a starry sky and the Tree of Life bearing bursting pomegranates. The prevailing colour scheme is a rich blue, with pearl velvet in the draperies. The banqueting hall adjoining the tiler's room is 34ft. long, 31ft. wide and 27ft. high. This is carried out entirely in Greek detail, the colour scheme being terra-cotta, red and white.

On the second floor are three private dining-rooms and two suites; and on the third, fourth and fifth floors numerous suites of residential chambers, each self-contained: these consist of entrance hall or lobby, bedroom, sitting-room, bathroom and lavatory. The decorations are varied, being in the Dutch, Queen Anne, Adam, Art Nouveau and Louis XVI. styles.

On the sixth floor are kitchen, staff dormitories and various offices. The main kitchen is in the basement, where also is the grill or joint room, 60ft. long, 40ft. wide and 17ft. high, panelled in white enamelled wood, with a green and gold frieze over, carpeted and upholstered in a green tint, and fitted with tip-up seats.

The furnishing and decorations of the hotel and the electrical fittings have been carried out by Messrs. J. Shoolbred & Co., Ltd., and the steelwork by Messrs. Matthew T. Shaw & Co., Ltd., of 81, Cannon Street, E.C., who had some unusual difficulties to face by reason of the requirements of shallow floors showing no beams; in such cases the engineers designed special forms of framed trussed girders extending in depth through three floors. The consulting engineers were Messrs. Barry & Higham, of 15, Great George Street, S.W.

Electric Lighting.

The electric-light installation consists approximately of 3,000 lamps. Five main circuits have been brought into the building, four of which are provided with change-over switches, connected to the ordinary network and theatre mains of the Charing Cross and City Electric Supply Co., Ltd., while the fifth circuit is connected to the mains of the Metropolitan Electric Supply Co., and supplies about 300 lamps in the public portions of the building, as well as the "police lighting" as required under the L.C.C. regulations. The whole of the wiring is in heavy steel conduit, and all fuses are of the enclosed cartridge type. One of the features of the installation is the use of the new type Hart "Diamond" switches and flush plugs. These are let into the wall flush with the paper.

In addition to the lighting, services have been run throughout for the numerous motors to electric lifts and ventilating fans. An electric heating service has also been provided, for keeping dishes hot, heating coffee, tea, &c., this equipment being by the Reliable Electric Heating and Cooking Co.

Fire Alarms.

On each floor of the hotel are there fire-alarm pushes, communicating with a loud

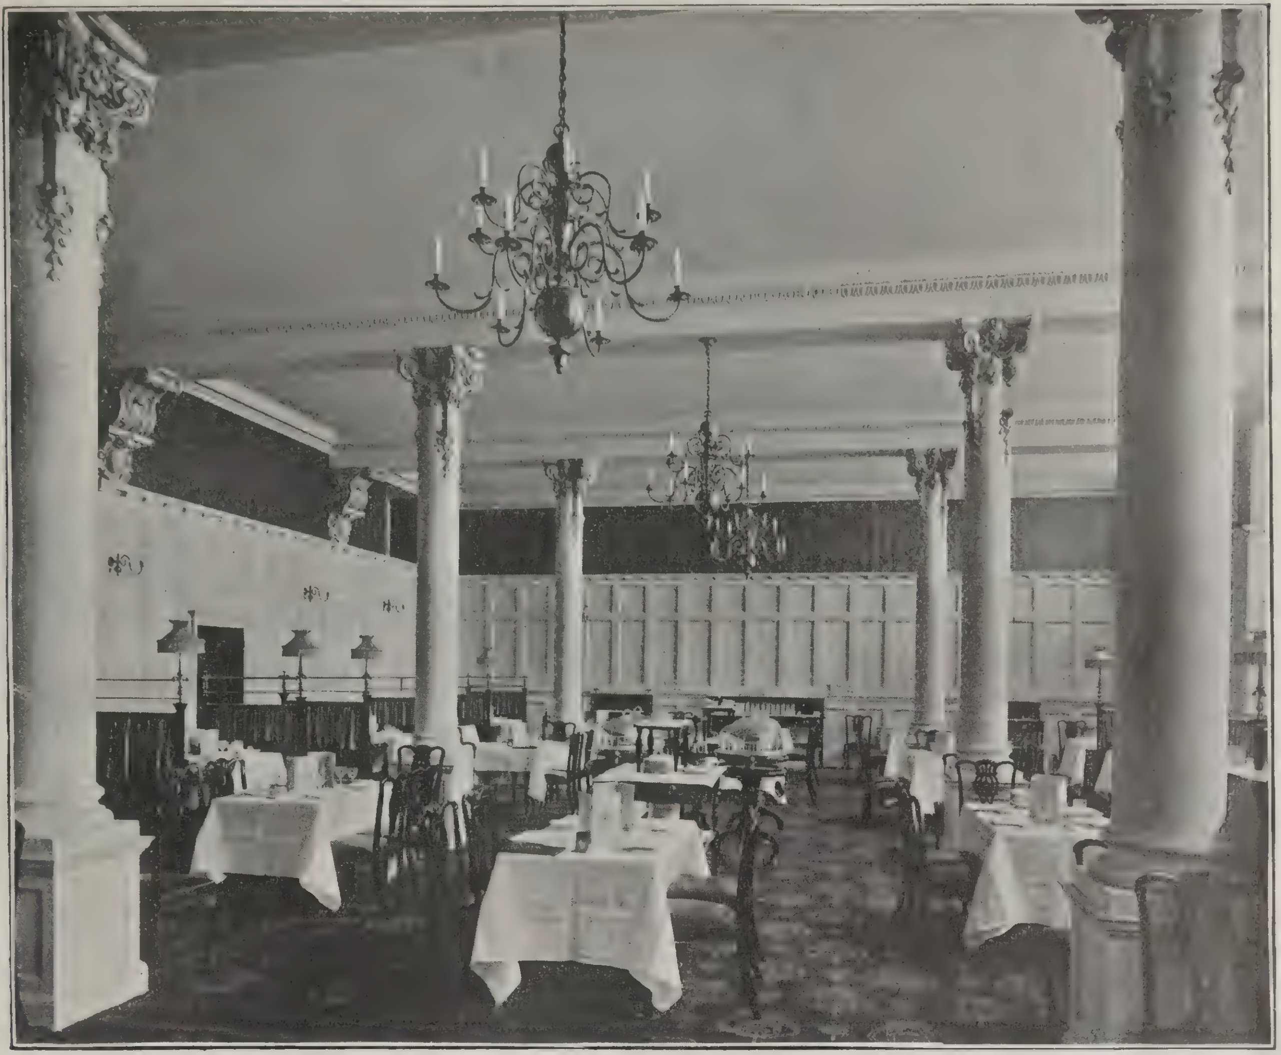

Photo: S. B. Bolas & Co., 68, Oxford Street, W.

JOINT ROOM GAIETY HOTEL. ERNEST RUNTZ AND FORD, ARCHITECTS.

gong in each service room on every floor and in the manager's office, and at the same time indicating which floor the alarm came from, so that men specially drilled can proceed immediately to the point of outbreak. All these alarms are lighted at night by a small red lamp, so that their position is at once evident. Telephones are provided throughout the building.

Ventilation.

The ventilation is on two separate schemes, *i.e.*, plenum and extraction. For the former, air is drawn through a revolving filter screen, by which it is purified and humidified, being afterwards cooled or warmed according to the season of the year. The extraction system consists of two fans near roof level. One of these is connected with the kitchen by a series of large ducts and hoods, and the other is connected to the various rooms. The whole of this work—electric lighting, heating, ventilation, telephones and fire-alarms—has been carried out by Messrs. Shoolbred to the specification of the consulting engineer, Mr. Adrian Collins, A.M.I.C.E.

Fire Hydrants

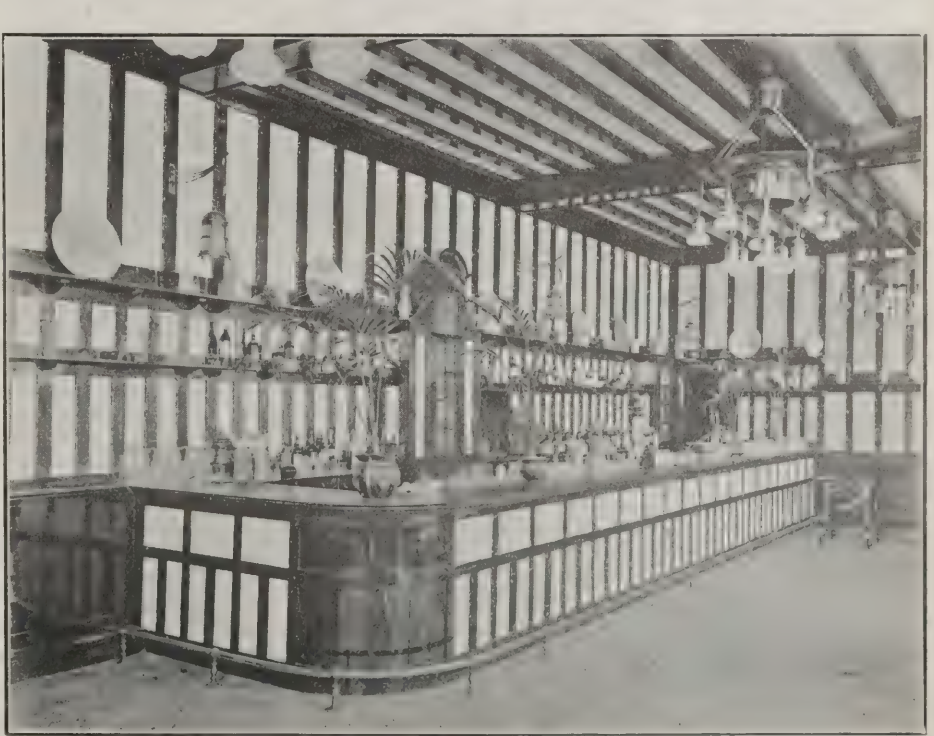
have been installed by Messrs. Strode & Co., of 48, Osnaburgh Street, N.W., two hydrant mains with valves being fitted on each floor (twenty-seven in all). Hose pipe and nozzles are attached to the valves ready for immediate use. Messrs. Strode have also provided and fixed the two large steam-boilers for heating, cooking and hot-water supply. The ventilation of the boiler-room is effected through a shaft 3ft. wide and 60ft. long, fitted with an electric blower.

The heating apparatus for the building is on the low-pressure steam system, with automatic regulators.

The engineering work has been carried out by Messrs. Rosser & Russell, Ltd., of 22, Charing Cross.

In the kitchens are fittings by Messrs. James Slater & Co., of High Holborn; the "Central" stores and hot closets having been supplied by Mr. A. Ceresa, of 12, Westminster Bridge Road.

Refrigerating plant has been installed by Messrs. L. Lumley & Co., Ltd., of 1, America Square, E.C., the cold room being insulated with silicate cotton, the walls and ceiling



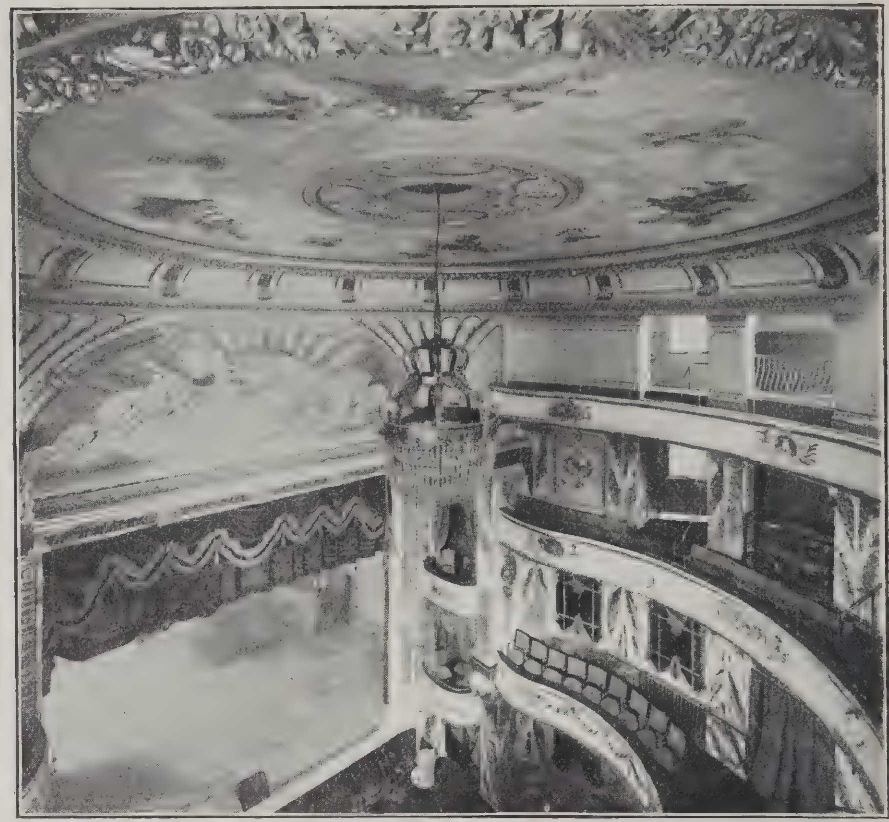
GAIETY HOTEL: THE DUTCH BUFFET.

being finished with white enamel and the floor asphalted. The room is cooled by a large stack of iron pipes, through which cold brine is pumped continuously. Double-doors, forming an air-lock, prevent the admission of warm air. The larders are also thoroughly insulated, the walls being covered with white enamelled metal and fitted with plate-glass sliding doors. By these means quantities of meat, poultry, game, &c., can be kept in a perfectly fresh condition however sultry the weather may be.

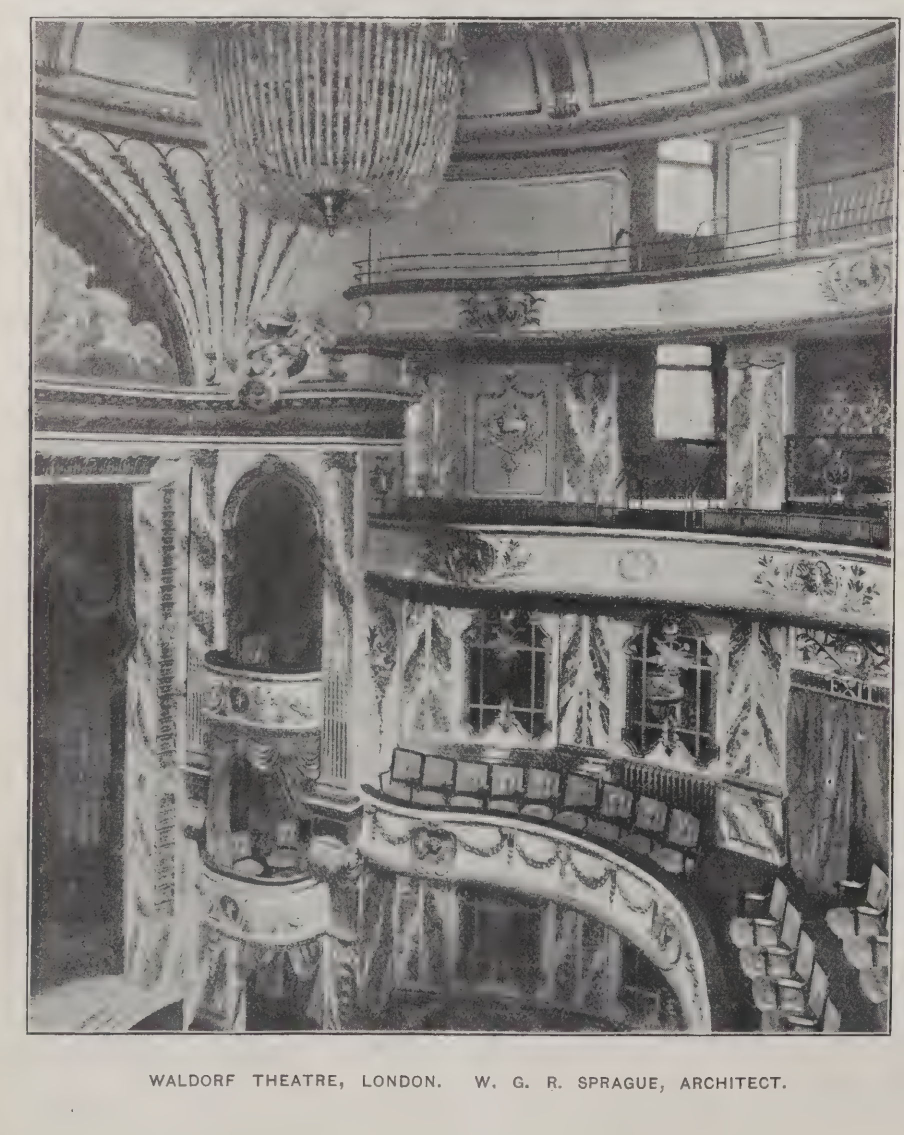
The Electric Lift Service has been provided and fixed by Messrs. R. Waygood & Co., Ltd. There are two passenger lifts—a large one in the main entrance hall to carry seven passengers and attendant (the cage of this lift is of mahogany and was designed by the architects), and one of a plainer type in the staircase at the back entrance, to carry four persons and attendant. There is also a goods lift running from the basement to the sixth floor, as well as electric service lifts, some arranged to work from the top kitchen and others from the kitchen in the basement: these lifts are fitted with special automatic push-button control, so that they can be dispatched from the kitchen to any floor and there stopped automatically, being afterwards caused to return when finished with. Hand-power lifts—including a large one for lowering barrels into the cellar—are also provided.

The sanitary appliances, baths, &c., are of the most approved and modern type, by Messrs. Doulton & Co., Ltd., and Messrs. J. Tylor & Co., Ltd., of London.

The contractor for the building was Mr. James Carmichael, of Wandsworth, the contractor's foreman Mr. Mackintosh, and the clerk of works Mr. Lett.



WALDORF THEATRE.



WALDORF THEATRE, LONDON. W. G. R. SPRAGUE, ARCHITECT.

OUR PLATES.

THE medical school and nurses' home of University College Hospital is the outcome of the generous gift made last year by Sir Donald Currie. The Gower Street end of the building and most of the University Street frontage will be occupied by the school proper, which will consist of large laboratories, theatres, &c. The Huntley Street end is devoted to the nurses' home, in which there will be accommodation for seventy-four nurses. Between the school and the nurses' home there is a house for eight students engaged in obstetric work. The principal elevations are intended to be in Portland stone and red brick. Mr. Paul Waterhouse is the architect.

The staircase hall at the house on Shillingford Hill, Berks, was carried out by the builders, Messrs. Brasher & Son, of Wallingford. The panelling is in wainscot oak, the walls above it and the cornice and ceiling being in plaster. The chimney-piece, which was designed by the architect, Mr. George Hornblower, was executed and carved by Messrs. Shuffrey & Co., in wainscot oak, with marble surround to the fireplace opening.

Law Cases.

Dunfermline Landscape Garden.—In the Scottish Court of Session recently Lord Dundas ordered proof in the action by Mr. T. H. Mawson, garden architect, Windermere, against the Dunfermline Carnegie Trustees. Mr. Mawson claims £3,101 for professional services in connection with his preparation of a scheme for laying-out Pittencrieff Park and Glen. The defence is that plaintiff was employed to scheme a landscape garden, and that he exceeded his instructions by preparing a scheme which included the construction of tramways and boulevards and the re-housing of a large proportion of the population of the town. His own estimate of the cost of this scheme was £110,437.

R.I.B.A.

Presentation of the Royal Gold Medal.

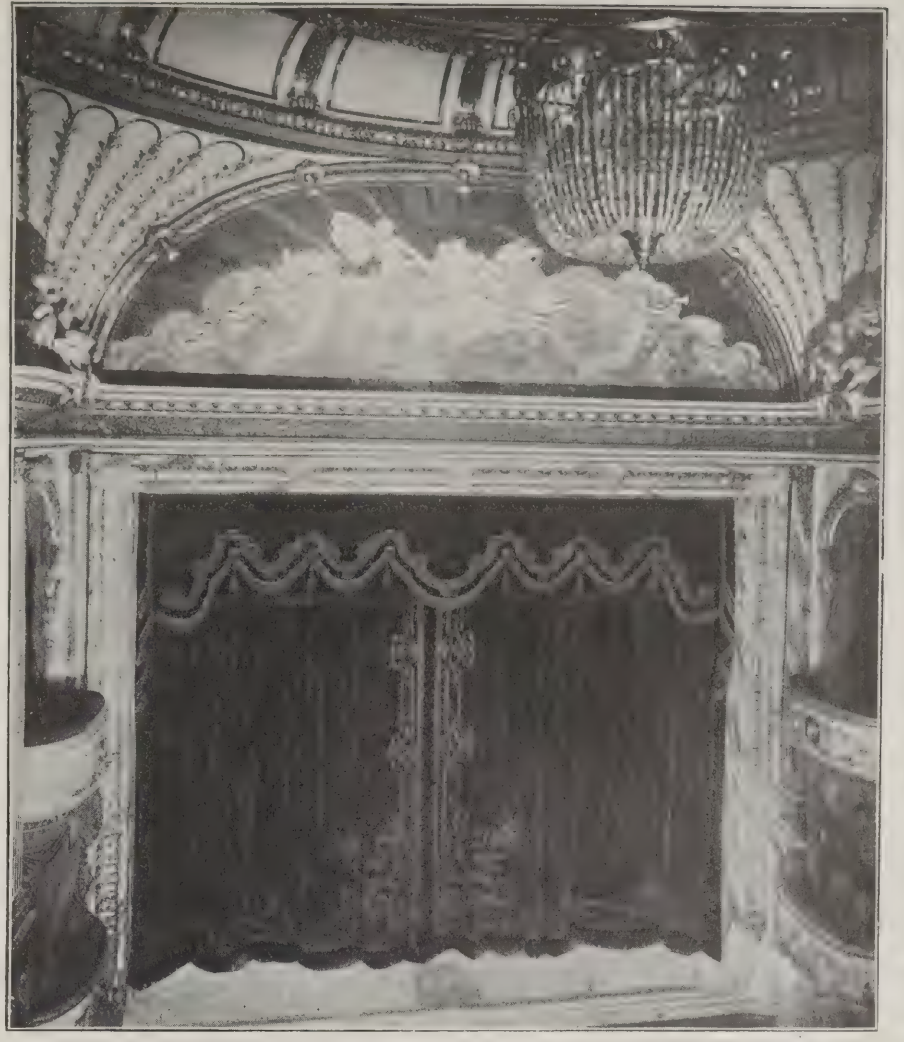
THE concluding meeting of the session of the Royal Institute of British Architects was held at 9, Conduit Street, W., on Monday evening, the president, Mr. John Belcher, A.R.A., in the chair. The chief object of the meeting was the presentation of the Royal Gold Medal to Sir Aston Webb, R.A.

Mr. Belcher remarked of Sir Aston Webb that the very year after he was articled to Mr. Banks (of Banks & Barry) – that is, some thirty eight years ago—he became a member of the Architectural Association, and from that time onward continued to serve the Association in one capacity or another, until finally in 1884 he was elected its president.

In 1874—that is, the year after he won the Pugin Studentship—he joined the Institute as an Associate, was elected a Fellow in 1883, served as member of Council, hon. secretary, and vice-president, and finally became president in 1902.

"His peculiar distinction—and I might say peculiar good fortune, too—lies in the large number of important public buildings that have been entrusted to him. Many of these have been won by sheer weight of merit shown in competition. Amongst such are to be included the Victoria Courts at Birmingham, the Metropolitan Life Assurance Society's offices in Moorgate Street, and the Christ's Hospital Schools at Horsham, all carried out in partnership with Mr. Ingress Bell.

"Our present interest, however, centres in the great works committed to him in London, viz., the completion of the Victoria and Albert Museum and the National Monument to Queen Victoria, both of them won in competition; also the Royal College of Science opposite the Imperial Institute, and additions to the Admiralty Buildings at the east end of the Mall, both of which he received by direct commission.



WALDORF THEATRE: THE PROSCENIUM.

"The Admiralty entrusted to him the Britannia Royal Naval College at Dartmouth. In conjunction with Mr. T. M. Deane, he built the College of Science Government Offices in Dublin. He and Mr. Bell together are responsible for the Royal United Service Institution adjoining the Banqueting House, Whitehall, the new University of Birmingham now in course of erection, and for certain additions to Caius College, Cambridge.

"Then he has done a good deal in the way of churches, both restoring and building. The most important and most interesting of all these is the restoration of St. Bartholomew-the-Great, in Smithfield, between the years 1880 and 1890. He has restored three churches in Worcester; Burford Church, Herefordshire, and Witley in Surrey. He has built St. George's, Worcester; the French Protestant Church and Schools in Soho, and churches in North Wales.

"Then there are various domestic works; mansions for Sir Offley Wakeman, near Shrewsbury; Sir Augustus Webster, at Hildon, Hants; and many others. The Flour Mills and Granaries for Messrs. Mumford are amongst his most successful buildings in this kind."

Sir Alma Tadema, R.A., and Mr. Alfred East, R.A., congratulated the recipient and spoke of the high appreciation in which he was held by his brother artists and architects.

Sir Aston Webb, in replying, acknowledged the help he had received in his work from his partner Mr. Ingress Bell, Messrs. Corderoy & Selby, his surveyors for thirty years, the builders, clerks of works, and craftsmen who had been engaged upon his works.

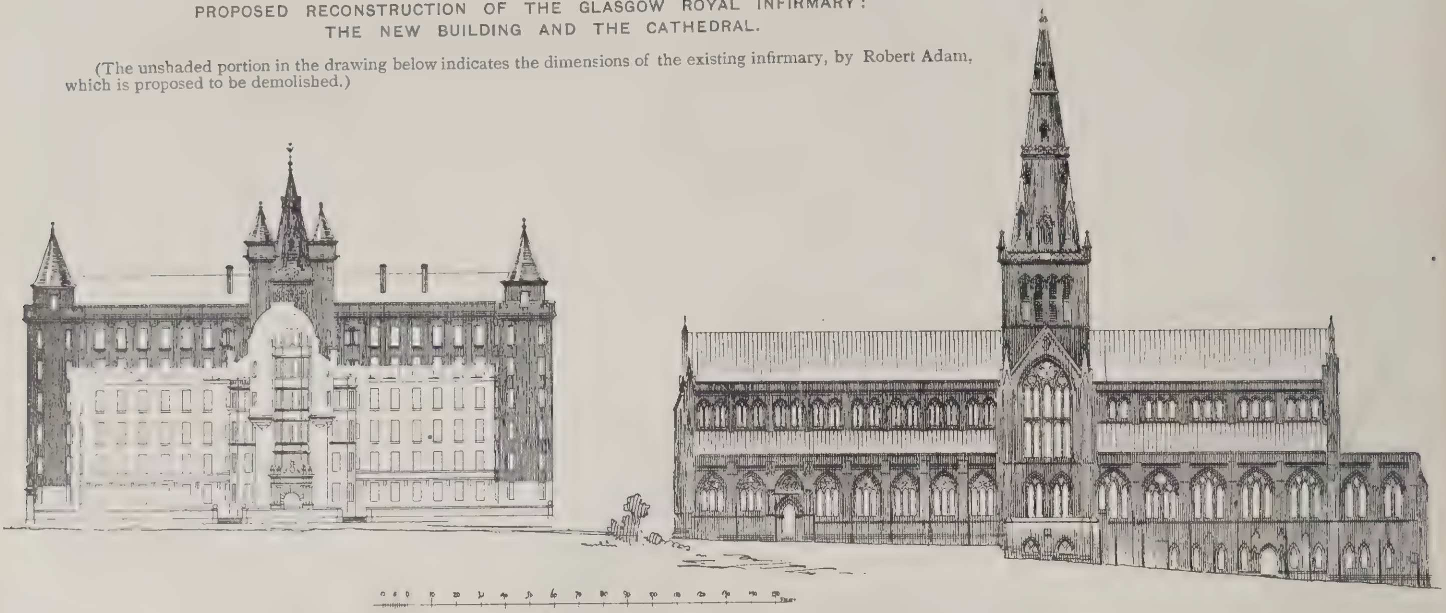
In referring to the conditions of architecture at the present time, he considered much progress had been made and much improvement—a closing up of the ranks, a desire to pick up the strain of English Renaissance where it was last left, giving it a distinct flavour of our times, making tradition our servant rather than our master, so that while we endeavoured to make our buildings as beautiful as they could, they were determined at the same time to build surely and reasonably; to make the necessities of the building develop the design, and not to be content until they had met all modern requirements with a fitting architectural exterior and interior, not ignoring what had gone before but eschewing whatever appeared to be evil and holding fast only to the good. That, he verily believed, to be the tendency of the present day. He had always been an optimist in the work of his brother architects, and was so still.

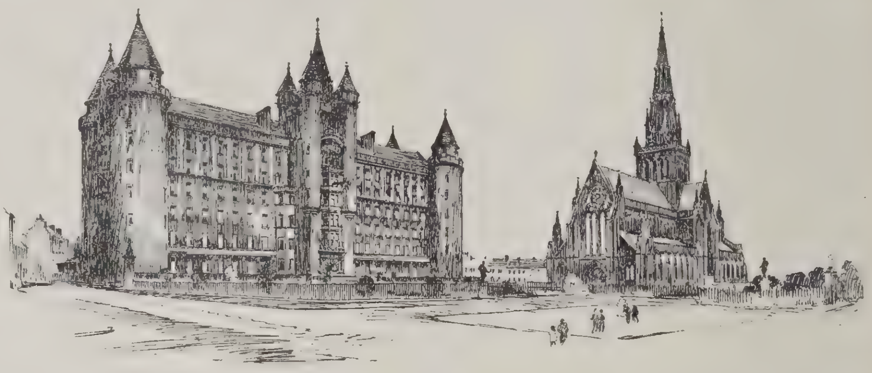
After the presentation of the medal the portrait of Sir William Emerson (by Mr. J. J. Shannon, A.R.A.) was presented to the Institute by Mr. T. E. Collcutt, F.R.I.B.A.

WALDORF THEATRE: THE ENTRANCE HALL. W. G. R. SPRAGUE, ARCHITECT.

PROPOSED RECONSTRUCTION OF THE GLASGOW ROYAL INFIRMARY:
THE NEW BUILDING AND THE CATHEDRAL.

(The unshaded portion in the drawing below indicates the dimensions of the existing infirmary, by Robert Adam, which is proposed to be demolished.)





GLASGOW ROYAL INFIRMARY.

Protest against the Proposed Reconstruction.

THE Glasgow Royal Infirmary competition has been one of the most unsatisfactory which has been held in recent years. To begin with, it is now pretty generally admitted that there should have been no competition for an infirmary on this site, which is practically in the centre of a city having a population of nearly one million. The majority of the medical profession admit that long before this building could be completed and occupied the scheme would be recognized as a hopelessly retrograde proceeding, perpetuating indefinitely a grave and costly blunder. As Dr. James Finlayson, chairman of the house committee of the infirmary, says: "That 660 sick persons should be piled up in six flats, with a dense population of the living on one hand and of the dead on the other, and with chemical and other works in the near vicinity, is a plan against which, as a physician, I must protest." The Manchester Infirmary has been frequently instanced as a precedent, but we now know that the common-sense of the citizens of Manchester has triumphed over the enthusiasm of those wedded to plans of tall buildings similar to the one adopted by the Jubilee "executive" in Glasgow.

The Jubilee Memorial block is the one which faces Cathedral Square. For it £90,000 has been received, but in order to complete the scheme a further £170,000 will be required to carry out these "discredited plans," and this money is about to be appealed for.

Readers of this Journal will remember how the award of the assessor of the competition, Sir Rowand Anderson, was set aside, and how the committee, for no apparent reason, accepted the plans of another architect not in the premiated list.

But in addition to the plea of a number that the present infirmary ought merely to be put in a state of thorough efficiency as an emergency hospital, and that a new building ought to be erected outside the city, there are the architectural objections to which the Glasgow Institute of Architects, the Art Club and the Archæological Society have drawn attention, namely, that the work of Robert Adam will be destroyed, and that in its place will be erected an immense block, which, being taller and standing on higher ground than the cathedral, will greatly injure the appearance of this very fine mediæval building.

We publish the drawings showing what is proposed, in the hope that the committee will yet see the folly of their way and in the interest of architecture and of humanity have the courage to admit their error.

Restoration of Culross Abbey.—During the operations in connection with the restoration of Culross Abbey many beautiful specimens of ancient architecture have been brought to light. In the south transept, which is believed to date from the early part of the thirteenth century, a tomb has been discovered under the arch in the aisle which is thought to be that of Roger de Quency, Earl of Winchester, who died in 1264. In the north transept the Argyll tomb has been discovered, but will not be further interfered with except in the presence of experts.

A Paris Theatre.—In the architectural department of the Exhibition of French Artists—the old Salon—in the Grand Palais, Paris, plans are shown of two projects for providing "a theatre of the people." The one, by MM. Coquelin and Binet, is that of a modern fire-resisting building without corridors and passages, the auditorium communicating through a single vast quadrangle directly with the street; from the inner end of this quadrangle thirteen flights of steps lead to the different sections of the auditorium—orchestra stalls, dress circles, amphitheatre and galleries. Seating is provided for 3,000. The second plan is for constructing an open-air amphitheatre on the site of the former palace of the Tuileries, but as yet it is little more than a suggestion favoured by a small group of architects, artists and musicians.

A new Assembly Hall at Exeter, for the Devon County Council, has been erected at a cost of about £8,000. The architects were Messrs. Harbottle & Sons, of Exeter, and the contractors Messrs. Dart & Francis, of Crediton. The heating and ventilating has been carried out by Messrs. Ashwell & Nesbit, of Leicester, and the electric light has been installed by Messrs. Wippell, Brothers & Row, of Exeter. Mr. Simpson was the clerk of works.

Junior Institution of Engineers. — The summer meeting this year is to be of a special character, in celebration of the Society's coming of age. It will open on Monday morning, June 26th, when the Lord Mayor and the Sheriffs will receive the members at the Guildhall and addresses will be made. In the afternoon there will be a special visit of inspection at St. Paul's Cathedral, under the guidance of the Archdeacon of London and the consulting architect, Mr. Somers Clarke. On Tuesday Woolwich Arsenal will be visited, and a reception given in the evening at the Royal United Service Institution, Whitehall. For Wednesday visits have been arranged to the Royal Mint, Messrs. Yarrow's works at Poplar, the North London Railway works at Bow, the Greenwich generating station of the London County Council tramways (where the engines are in course of erection) and to the New Cross Depôt. On the following day an excursion to Chatham will take place, and on Friday visits to Messrs. Doulton's potteries and to the Neasden power-house of the Metropolitan Railway, the afternoon and evening being spent at Earl's Court.

Correspondence.

Competition for Primitive Methodist Orphan Homes, Harrogate.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Having carefully examined the designs sent in for this competition, I desire to make a few remarks about those placed first and second by the assessor, in the hope that some competitor may confirm or correct my conclusions. My first impression, after looking over the twenty-five or thirty sets of plans, was that there were at least a dozen much superior to and more practical than those selected.

First-premiated Design.—The disposition of the buildings on the site is about the worst in the room, for the following reasons:—(1) The only view from the site is towards the south-east, over Pannal Ash Road, and this design shows the view blocked by the master's house and gardener's lodge. (2) The "homes" are placed at right angles to Pannal Ash Road in two rows facing each other, one block thereby obstructing the view of the other. (3) The only windows of the principal living-rooms of each house, being at the ends of the blocks, face and look right into the only windows of the living-rooms of the adjoining block, and the distance between the two bay windows, which face one another, is only 3 yds. or 4 yds.; hence the occupants of one block will be able to see right into and all over the living-rooms of the next block. (4) One-half of the living-room windows look directly into the back out-offices of the adjoining block and face the north-east. (5) The space between the two rows of homes (which are so close together that they practically form a street) is shown to be laid out as ornamental gardens, which is almost useless, besides being expensive, while the playfields are at the two extreme corners of the site—not at all convenient if the boys and girls are to have separate playfields; besides, the position is not good for supervision.

My objections to the planning of the homes are:—(1) There is no pantry accommodation: only a small closet under the front staircase, to gain access to which it is necessary to cross the front hall. There should be at least five times the pantry and store accommodation, and it should adjoin the kitchen and scullery, and not be in the front hall. (2) There is no separate bathroom, the bath being placed in the same room (12ft. by 7ft. 6ins.) as the lavatories—a most objectionable feature, for obvious reasons. (3) There is no space at all either inside or outside for boot-cleaning and similar work, which is usually done by the children. Everything of this kind will have to be done in the small scullery. (4) There is no clothes'-room upstairs; only a small closet not large enough for a two-room cottage, and there is no inside w.c. for emergency use. I have some similar notes on the master's house and lodge plans, but leave these for the present.

The get-up of the drawings is excellent; indeed, I have rarely seen such effective pictures. The cost, however, is altogether exceeded. The stipulated sum was £1,000, and I am informed that at 6d. per ft. cube the first-premiated design comes to £1,950.

As to the design placed second, I need only say that the author puts the lodge at the entrance and the master's house at the very farthest part of the site, so that in order to gain access to it one has to pass all the homes. The estimate is £1,150—and too low at that.

It will no doubt be stated that all these defects can and will be remedied, but to my mind the competition is most unsatisfactory.—Yours truly, "HARLOW MOOR."

YORK MINSTER.

The Question of the Flying Buttresses.

THE proposal of Mr. Bodley to put flying buttresses on the south side of York Minster nave, referred to in our last issue, is still the subject of controversy. Mr. John H. Fearnley writes in the "Times" in support of Mr. Bodley, and asks Mr. Thackeray Turner why he assumes that no flying buttresses previously existed, and how he accounts for the "springs" which exist at the tops of the aisle buttresses and the rough broken masonry of the clearstory walls showing where the old flying buttresses were once joined. "Does he think that the old builders would have left such glaring excrescences on the building had they abandoned their intention of erecting flying buttresses, when it would have been such an easy matter to have removed these excrescences?"

Mr. Richard Hankin answers the question as to the existence of flying buttresses. He says: "It is quite certain that when Drake wrote his History of York (published 1736) they were not in existence then, because he remarks on their absence. The theory advanced by Willis in 1846 is the one which best explains the facts of the case. The builders intended to erect a stone vault, and made their arrangements accordingly. Buttresses with heavy pinnacles were erected at the south side (the explanation of this being that the building of the nave was begun on the south); toothings were left in the clearstory walls in order that the flying buttresses might be connected; and, in the interior, the vaulting shafts were carried up to the top of the clearstory walls. The width of the nave seems to have effectually frightened the builders, and, instead of carrying out their original intention, they contented themselves with putting on a roof of wood, which was groined and painted to look like stone. The explanation of this unusual deception most probably is that everything was arranged for a stone roof, and that a hammer-beam or other wooden roof could not be put on without considerable alteration to the clearstory walls. The flying buttresses had not been erected, and with a wooden roof they would not be necessary. As Mr. Turner observes, their erection to-day will take from, instead of adding to, the strength of the building.

"On historical grounds their erection is still more to be condemned. York Minster is an historic document, illustrating in an admirable manner the changes which have taken place in architecture and the spirit in which the Gothic workman did his work. . . The mediæval builders were intensely practical. . . It is this practical spirit which the absence of flying buttresses on York Minster illustrates. Buttresses were not needed; therefore they were not erected, in spite of the arrangements that had been made.

"From an artistic point of view the new work is also to be regretted. The range of clearstory windows on the north side of the nave, unbroken by any pinnacles, is the finest feature the Minster possesses. The erection of buttresses and pinnacles will inevitably break this up, and instead of a range of windows there will be a number of single windows divided from each other by a modern pinnacle and buttress."

Mr. Hankin is strong on the "practical spirit," but we fail to see where it applies in respect of a sham stone vault constructed of timber. Mr. Bodley's point is that the roof is pushing out the clearstory walls, and critics neither disprove the existence of this outward thrust nor do they suggest how it is to be met. It is not practicable to talk of erecting an open trussed roof in place of the sham vaulted one, and as a choice of evils the flying buttresses certainly seem the best solution.

Keystones.

A new Salt-water Swimming-bath at Rhyl has been erected in Sussex Street. It is the regulation polo size, 75ft by 30ft., and contains 75,000 gallons.

Houses of Historical Interest.—Memorial tablets are to be placed on 64, Duncan Terrace, Islington, once the residence of Charles Lamb; and on 31, Baker Street, W., once the residence of Edward Bulwer Lytton.

New Bradford Hospitals.—The Local Government Board have authorized the erection by the Bradford Guardians of children's and maternity hospitals and homes for the poor at Daisyhill, at a total cost of £21,700.

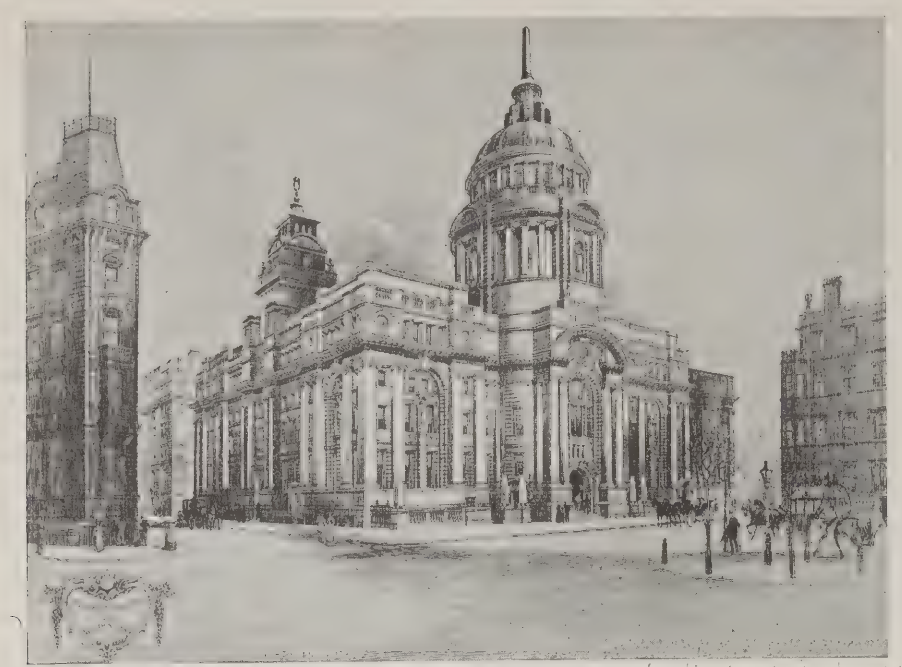
Renovating a Bridge.—Scottish architects are interested in the renovation work of the old stone bridge over the River Eden, near St. Andrews. This bridge dates from the fifteenth century, and careful rebuilding of certain portions is necessary to preserve the structure.

Screen at Aldenham Church, Herts.—We are informed by the architects (Sir Arthur Blomfield & Sons) that this screen, illustrated in our issue for June 7th, was carried out by Messrs. Cornish & Gaymer, of North Walsham, not by Messrs. J. Thompson & Co., of Peterborough, as stated. Messrs. Cornish & Gaymer also executed the screen at Swaffham Prior Church, illustrated in the same issue.

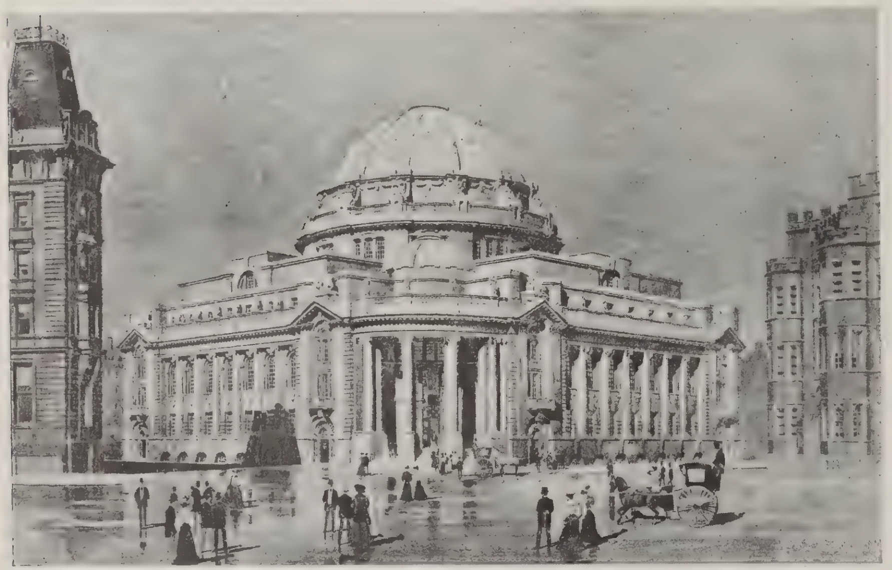
Derwent Valley Waterworks Scheme.—Good progress is being made with this scheme, the object of which is to supply Leicester, Derby, Sheffield, Nottingham and a few smaller towns with water. The complete scheme provides for the construction of five reservoirs, which will impound 11,000,000,000 gallons of water. The total cost of the works, including filter-beds, aqueducts and pipe lines, will be about £7,000,000 sterling.

Registration and the R.I.B.A. Elections.—At a meeting of the Devon and Exeter Architectural Society held on June 10th Mr. B. Priestley Shires, F.R.I.B.A., president, expressed regret that the R.I.B.A. elections had gone dead against the registrationists, but he still hoped the new council of the Royal Institute would earnestly discover some means for the uplifting of the profession, especially for provincial members, who felt the importance of registration perhaps more than their town brethren.

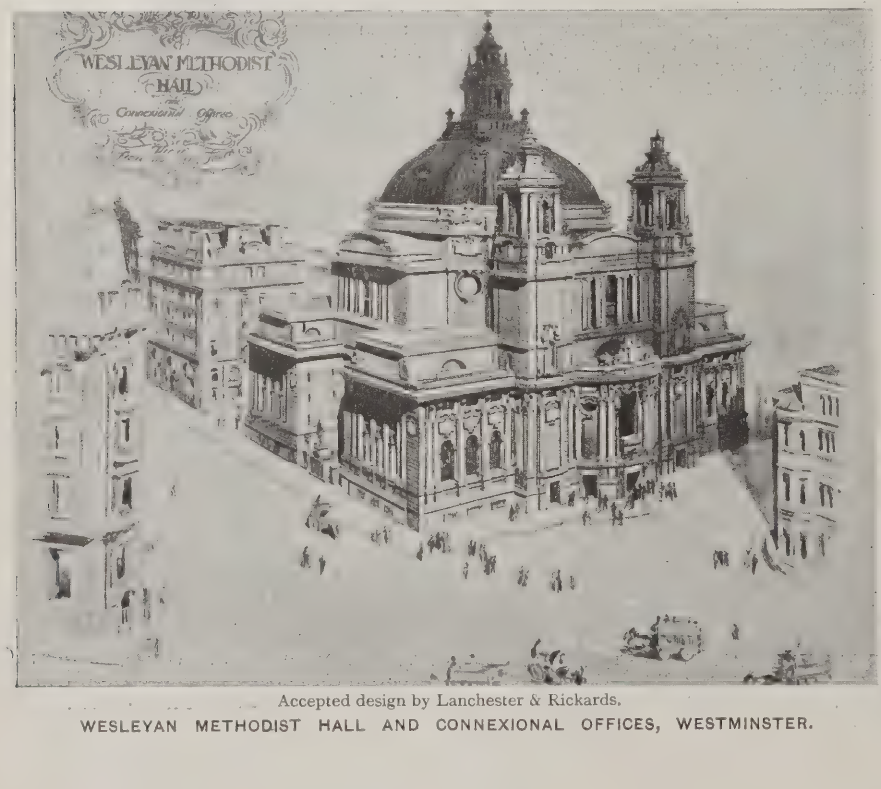
Visit to a Brickworks.—The students of the architectural class at the Gloucester Municipal School of Art recently paid a visit to the new brickworks at Cinderford, where they were received by Mr. Sampson, the general manager. The ground has three distinct clays—(1) the surface clay which makes what is known as Ruabon bricks, (2) a shale which burns a salmon colour and is specially suitable for engineering work, (3) a fireclay. The brickworks are equipped with "Whittaker" semi-plastic plant, capable of turning out from 90,000 to 100,000 bricks in an ordinary working day. The rubbish from the coal-pit adjoining is utilized. First the shale is dumped into a revolving pan, through the perforated bottom of which it falls when ground, and is then automatically taken through the plant, coming out on the other side as finished bricks. The students were informed that the Great Western Railway had tested the bricks and found that the crushing power was no less than 620 tons to the square foot. The company use down-draught kilns, each containing 20,000 bricks, and they intend to add a glazing plant, as the clays have been found admirably adapted for this purpose.



Design by Waddington, Son & Dunkerley.



Design by Crouch & Butler.



Accepted design by Lanchester & Rickards.

WESLEYAN METHODIST HALL AND CONNEXIONAL OFFICES, WESTMINSTER.

Competitions.

Swindon School Competition. — Messrs. Nicholls & Stockwell, of Winchester, are the successful architects for a new school in Ferndale Road, Swindon.

Bristol School Competition. — Seventeen designs were submitted in the competition for a three-department school at Rose Green, Bristol, to accommodate 1,190 children. The selected design is by Messrs. Herbert J. Jones & Son, of Bristol.

Sheffield Housing Scheme.—Mr. E. M. Gibbs, the assessor, has made the following awards in the competition among local architects for twenty dwelling-houses for the Sheffield Corporation at High Wincobank :—1st, Mr. H. L. Paterson ; 2nd, Mr. W. Spencer Smith. Twenty designs were received.

Obituary.

Mr. Patrick Crawley, builder, of Doncaster, was found dead in bed on Tuesday last week.

Mr. James Haugh, a well-known building contractor in the Stewartry of Kirkcudbright, died recently at Castle Douglas, aged 62.

Mr. J. Mansergh, the well-known engineer, died last week, aged 71. He was much connected with railway and water works. In the early 'nineties he became adviser to the Birmingham Water Committee, and his great scheme for the conveyance of water from the Elan Valley to Birmingham was brought to a successful conclusion last July, when the King opened the Welsh works. He was engaged by a number of municipalities in schemes of water-supply and sewage-disposal, and acquired world-wide renown as an authority on these subjects. In 1899 he went out at the request of the Victorian Government to report upon the drainage of Melbourne and district, and also visited Ceylon, Toronto and other places in North and South America, and the Malay Peninsula, for similar purposes. In 1900 Mr. Mansergh was president of the Institute of Civil Engineers. He was also a Fellow of the Royal Society.

DIRECT ELECTION TO FELLOWSHIP, R.I.B.A.

IN reply to the memorials addressed to the Institute by Associates at Leeds and members in practice at Sheffield protesting against the nomination by the council of candidates for Fellowship who have not passed the examination for admission as Associates, the secretary (Mr. W. J. Locke) recalls the fact that at the Institute meeting held on February 29th, 1904, a resolution was passed that "during the intervening period every architect eligible under the Charter for election who desires to join the Institute as a Fellow should be encouraged to do so." Mr. Locke then adds : "If the council rejected candidates whom they found not only eligible under the Charter, but eligible by their executed works for admission as Fellows, on the ground that they had not passed the examination, they would be acting contrary to the mandate given to them by the general body of the Institute. The reason which led to this resolution of the general body was that it was not fair or politic to call suddenly on architects between thirty and forty years of age, in the full tide of busy practice, to pass an examination under penalty of being excluded for ever from the Institute. I may add that the same principle was adopted before examination for admission to the Associate class was made compulsory in 1882."

Prof. Beresford Pite has been appointed director of architectural instruction and lecturer on architectural subjects at the L.C.C. School of Building at Brixton.

A BUILDING ACT OF 240 YEARS AGO.

AT a time when the amendment of the London Building Acts is so much to the fore, it is opportune to turn to the enactment for the rebuilding of the City of London after the Great Fire. Some particulars are given in the "Land Agents' Record" for June 3rd.

"To the end that all builders may the better know how to provide and fit their materials for their several buildings" it was ordained that there should be "four sorts of buildings and no more." First, those fronting by-lanes, which should be two storeys high, besides cellars and garrets; secondly, those "fronting streets and lanes of note and the river of Thames," three storeys high, besides cellars, &c.; thirdly, those fronting "high and principal streets," four storeys high, besides cellars and garrets; and fourthly, "mansion houses for citizens or other persons of extraordinary quality, not fronting either of the three former ways. And the roofs of each of the said first three sorts of houses respectively shall be uniform."

The Lord Mayor and his colleagues were to decide which should be by-lanes, which lanes of note and which high streets.

Of the Building with Brick.

"As the building with brick" was "not only more comely and durable but also more safe against future perils of fire," all buildings were to be constructed externally of brick or stone, or substantial oak timber, "for the conveniency of shops. Doors, brest summers and window frames to be sufficiently discharged of the burthen of the fabrick by arch work of brick or stone, either strait or circular." Party-walls and piers, set out equally on each builder's ground, were to be built by the first beginner and paid for by the other, to the full moiety of the charges, with interest at the rate of 6 per cent. per annum, the alderman of the ward to decide disputes.

Cellars were to be "6 foot and a half high (if the springs of water hinder not)," first storeys 9ft. to 10ft., second storeys 10ft. to 10ft. 6ins., and third storeys 9ft.

The brickwork of the third-class houses was to be 2½ bricks to the first floor, 1½ bricks to the garret floor, and above that one brick, party-walls being of nearly the same respective thicknesses.

How Disputes were to be Settled.

All rebuilding was to be done within three years, under penalty of forfeiture of the site, and in order that builders should receive due encouragement two judges of the King's Bench, "in case of combination or unreasonable exaction by brick makers, tile makers and lime burners," were to call upon such a number of those tradesmen as they saw fit and *in conference with them*, if present (or otherwise in their absence), assess such reasonable prices for materials and carriage "as may *equally* respect the honest profit of the said brick makers, &c., and the necessity and conveniency of the builder." And in order that no artificer, workman or labourer might "make the common calamity a pretence to extort unreasonable or excessive wages," the justices of the King's Bench might, on the complaint of the Lord Mayor, from time to time limit, rate and appoint the wages of such artificers, &c., by the day, week or otherwise, or "by the great, by the foot, yard, rod or perch, or for any other quantity," the said rates and prices to bind all persons concerned, one month's imprisonment being the penalty for any breach of the rule. Foreigners or strangers were free to work with citizens and after seven years might claim the freedom of the city.

Differences between builders "about stopping lights, windows, water courses or gutters" were settled by the alderman of the ward or his deputy. "Sewers, drains and vaults" were under the direction of the Lord Mayor, who could also prohibit trades which he should judge "noisom or perilous in respect of fire," and remove conduits and like erections which interfered with that "openness of the streets which conduceth much to the advancement of trade."

The Act ends with a schedule of proportions and scantlings for storeys, walls and timbers, making ample provision for sound walling and timberwork, with "scantlings for sawn timber and laths, usually brought out of the West Country," and for sewers, 3ft. wide by 5ft. high, with side walls one brick and a half thick, arches one brick on end, and bottom paved plain. All roofs, window frames, cellar floors and tile pins were to be of oak, and "no joists to lie less than 8ins. into the wall, and to be laid in loam."

And so the Act goes on, dealing sanely, effectively and equitably with a very serious situation. There is no record of its having been opposed on party grounds, and nothing is heard of those who might conceivably have conscientious objections to the demolition of their property for the public good. It only appears that, under this Act, improvements were made which would now, in similar circumstances, be the subject of enquiry by Royal Commissions for many years, would be delayed by strikes, be made almost impossible by corners in materials, and be subject to regulations "for the better prevention of fire or otherwise" which would certainly not conduce to the "gracefulness" of the new buildings.

ILLUSIONS AND REFINEMENTS IN MEDIAEVAL ARCHITECTURE.

WRITING to the "Scotsman" in reference to the exhibition of Mr. Goodyear's collection of "architectural refinements" which is to be held in August at the Scottish National Portrait Gallery, Edinburgh, as announced on p. 308 of our issue for May 31st, Mr. Thomas Ross says:-

"It has been long known to students of mediæval architecture that great irregularity exists in the disposition of the parts in buildings of that period, that the side walls are often neither parallel nor straight, that cross walls are not at right angles, that pillars are spaced at unequal distances apart, and that arches which might be expected to rise to the same levels are irregular. Inequalities such as these have usually been attributed to indifference on the part of the mediæval architects to small details. . . . But lately it has been contended that these irregularities are perspective illusions and refinements. During the last thirty or forty years a very systematic and scientific examination has been made of the early Christian churches in Italy by Prof. W. H. Goodyear and his assistants for the Brooklyn Institute Survey. The investigations have excited considerable public interest, not only from this being the first attempt to explain these phenomena, but from the fact that they are shown to be the results of well-studied refinements on the parts of mediæval builders carrying out the traditions of the Greek architects coming down through Byzantium. These refinements existing in the Greek temples were first made known by Mr. Pennethorne and Mr. Penrose about the middle of last century, and are now universally admitted to be great principles in the design of those buildings, although previously believed to have no special meaning, as in the present instances of the bends and curves of mediæval churches. . . .

"The exhibition of Mr. Goodyear's drawings may prove to be not without a local interest to us in Scotland, in view of the many peculiarities that are known to exist in our cathedrals and abbey churches. There are the deflection southwards of the choir of St Giles' from the line of the nave; the deviation of the line of Dunblane from the line of its older tower; the leaning outwards of the west end of Paisley Abbey; and the sweep of the side walls of Kirkwall, the bend of some of its horizontal lines, and the rise of its floor. There are the great entasis of the tower of Iona, with its west window leaning northwards, the curious irregularity of the west front of Dunkeld, and many other examples which need not be cited here."

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Party-walls.

LONDON.—BELGRAVIA writes: "What steps must be taken to recover the value of an external wall agreed (verbally) to be used and paid for (and now used) as a party-wall, but in regard to which no award was drawn up, nor any correspondence? The party-wall notice was served by the building owner."

Under the London Building Act, 1894, a written account should have been delivered to the adjoining owner within one month of completion (section 96), giving "particulars and expenses of the work." If the adjoining owner makes no complaint within another month (section 97), it is to be assumed that he accepts the situation, and the building owner may recover the amount as an ordinary debt (section 98). I am of opinion that if a proper account has been rendered and demand made for payment, you will be able to recover the amount, even though the strict procedure of the Act has not been complied with. It will probably be necessary to give formal proof of the verbal agreement as to the party character of the wall.

F. S. I.

Sketching at Christchurch Priory; Buildings to Measure around Bournemouth.

THORNTON HEATH.—E. E. H. writes: "To whom should I write for permission to sketch and photograph at Christchurch Priory Church; also what interesting buildings are there within eight miles of Bournemouth?"

Apply to the Rev. Zachary Nash, M.A., Christchurch Vicarage. There are very few buildings of any architectural interest in the vicinity of Bournemouth. Sopley Church, Wimborne Minster and the parish church at Swanage are all worth visiting. St. Peter's Church, Bournemouth, by the late G. E. Street, is a beautiful example of modern Gothic.

L. S. R.

Drainage of Slab and Sink in Fish Shop.

JEDBERGH.—SUBSCRIBER writes: "I send sketches (not reproduced) showing an arrangement of a marble slab and sink for a fish shop. Which is the best way to drain the two? Are the traps liable to syphonage?"

Neither of the arrangements shown would in practice be found satisfactory. In most fish shops there is a straight down-pipe from both slab and cleaning sink discharging over a gulley in the floor: but this is not a good arrangement. A better way is to have straight down-pipes delivering into an open channel which discharges over the gulley outside; this channel would be washed out daily with the rest of the floor. If an open channel is undesirable it can be covered with a removable grating. The traps in the arrangements shown, apart from the risk of syphonage, would be easily choked and the pipes themselves would speedily become foul.

Builders' Notes.

Messrs. R. J. Nicholson & Co., of 26, Cannon Street, Manchester, have been appointed sole agents in Manchester and district for Messrs. Joseph Richmond & Co.'s lifts and cranes.

Boiler Explosions. — The twenty-second report of the Board of Trade, just issued, states that during the twelve months ended June 30th, 1904, nineteen persons were killed and forty-five injured by boiler explosions. This is below the average. As in past years, neglect was the primary cause.

Charge of Address.—Messrs. Wailes, Dove & Co., Ltd., sole manufacturers of patent "Bitumastic" enamels, have moved to new offices at 10 and 11, Lime Street, E.C. (exactly opposite No. 35, where they have been for the past fifteen years). New telephone number: 174 Avenue.

Protection and the Granite Trade.—At the annual meeting of the Shap Granite Co., at Penrith, the directors attributed the falling off in the volume and profits of the company's business to increasing competition in all departments. Unless some system could be devised for protecting the interests of the British granite quarries it was certain that many would have to be closed.

The Sand-Blast Process for Cleaning Stone and Brickwork is being conducted on a commercial basis by Messrs. Farnham, Ltd., of Victoria Street, S.W. The blast is produced by an air compressor, either fixed or portable, and is conveyed to an atomizer which picks up the sand; this is then carried through a hose and projected through a nozzle against the surface to be cleansed. The compressor is driven by an electric or petrol motor. A preservative process employed by the firm consists in injecting liquid paraffin wax into the stone or brickwork.

Edinburgh Decorative Trades' Exhibition.—At a gathering held by the executive committee of the recent exhibition of the decorative trades in Edinburgh, Councillor W. W. Macfarlane, president of the National Association of Master Painters in Scotland and of the Edinburgh and Leith Master-Painters' Association, was presented with a solid silver rose bowl by the local association as a memento. Councillor Macfarlane expressed the hope that the example set by the decorative trades would be followed by other trades, as such exhibitions tended to advance the highest interests of the various crafts, besides being a source of profit to the promoters, pleasure to the public, and good comradeship to the members.

L.B.A. (Amendment) Bill: Mr. Riley cross-examined.—The London County Council have agreed to modify clauses 96 and 97 of the Building Acts Amendment Bill, having reference to high buildings, and the requirements will not apply to new or old dwelling-houses occupied by not more than one family. Mr. W. E. Riley, architect to the Council, stated recently before the Select Committee of the House of Commons that in 208 of the principal streets of London he had found 1,136 buildings of between 50ft. and 60ft. in height and 298 over that height. It had been found impracticable to issue by-laws in respect to buildings over 60ft. high under the Act of 1894. The Council had carefully considered the clauses in relation to means of escape from and prevention of fire, and attaching special importance to means of escape; they also desired that the prevention clauses should be dealt with without delay, but other amendments of the Building Acts would be deferred till next session. The chairman asked whether the prevention clauses would be pressed now or withdrawn for inclusion in next year's Bill. Mr. Fitzgerald, K.C., explained that the intention was that the district surveyor should send a list of buildings to which the Act would apply, and it would rest with the County Council to set the Act in motion or not. They might serve a notice, but the ordinary course would be for the Council to send a surveyor to examine the building, and, on receipt of his report, if additional means of escape were considered necessary, notice would be served. Unless the Council saw reason for it, the owner would not be required to send in plans.

New Companies.

Sand-Blast and Ceramique Co., Ltd., 3 & 4, Howard Buildings, Central Street, E.C. Capital: £1,000.

Sculptures, Ltd., Grosvenor Mansions, 82, Victoria Street, S.W. Capital: £50,000.

M. H. Redhead and Co., Ltd., timber merchants, Cyprus Road, Marsh Lane, Bootle, near Liverpool. Capital: £1,500.

Alexander Liggat & Co., sanitary engineers and brass-founders, Caledonian Brass Works, Barrhead. Capital: £8,000.

Baltic House, Leadenhall Street, E.C., has just been completed for the City Offices Co. The elevations are of Portland stone and granite. The entrance, corridors and staircase are of various kinds of marble, with mosaic floors. The numerous offices are provided with every modern convenience, and most of them have fumed oak joinery and fittings. The architects were Messrs. Gordon & Gunton, and the builders Messrs. Patman & Fotheringham, Ltd., of 100 and 102, Theobald's Road, W.C., and Liverpool Road, N.

MANCHESTER SOCIETY OF ARCHITECTS.

On June 3rd the members of this Society visited Norbury Church, Derbyshire, a very interesting and unusual church. Originally there seems to have been a Norman nave, to which was added a fourteenth-century chancel, and on the south side a tower. Later, in Perpendicular times, the nave was rebuilt with a north aisle, and the spaces on each side of the tower were occupied by chapels; the latter are low, and the result is a charming example of grouping both outside and inside. The glory of the church, however, is its magnificent stained glass, the colour of the fourteenth-century glass in the north and south windows of the chancel being very delightful. The east window is rather a jumble of bits of fifteenth-century glass from the nave, good in themselves, but not forming one design. The red-brick Marton House adjoining the church well deserves notice.

An Elizabethan Mansion.

Wootton Lodge was next visited, by kind permission of Col. B. C. P. Heywood, who entertained the members to luncheon and devoted the afternoon to showing them round the house and its beautiful gardens. The house is an excellent example of a stately Elizabethan mansion, with very beautiful natural surroundings. The entrance front is particularly fine; two low buildings, stables, &c., mark the angles of the enclosed forecourt, through which an elliptical drive leads to a great flight of steps rising to the main entrance porch: this is carried up to the parapet and is enriched with heraldic carving: on either side are long windows four storeys high, with great mullion and tremoine windows: while just visible around the corner on either flank are similarly lofty circular bays. The front is surrounded by a balustrade. The gardens are very pleasing, with terraces and broad flights of stone steps and a most unexpected little "frond garden" on the top of a crag behind the house.

A Museum of Arts and Crafts.

On June 8th the Society visited the Manchester Arts and Crafts Museum, attached to the School of Art. Brief comments on the principal objects of an architectural character were made by Prof. S. H. Capper and Mr. P. E. Corbett; and the headmaster, Mr. R. Glazier, gave a most interesting account of some of the handicrafts represented in the museum, notably of glass and pottery.

A new General Post-Office at Buxton is being erected in Station Road. Mr. W. Pott, of H.M. Board of Works, is the architect, and Messrs. Dennis Gill & Sons, of Doncaster, are the contractors.

Advertising Notes.

Success is honest reality and worth. Just as surely as the world spots a counterfeit, so surely does it recognise the genuine. Recognition may be a little tardy, but it will come. Be vigorous, bold, and sure, but don't bluff.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARCHITECT and SURVEYOR'S ASSISTANT (23), 7 years' general experience, working drawings, specifications, quantities, levelling, surveying, &c. First-class testimonials. Certificates, Honours Building Construction, Architecture, &c. — Box 1166, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT and SURVEYOR'S ASSISTANT DISENGAGED. Twelve years' good general experience, quick and accurate draughtsman. Working and detail drawings, designs, surveys, specifications. Splendid testimonials.. Salary moderate—A. R., Hazlemere, Rusham Road, Egham, Surrey. 1162

ARCHITECT and SURVEYOR'S ASSISTANT desires ENGAGEMENT; 12 years' experience in all branches of the profession, including Specifications, Quantities, Surveying, Levelling, &c.—Apply Box 1180, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S and SURVEYOR'S JUNIOR ASSISTANT (21) requires ENGAGEMENT. Working and detail drawings; good references: moderate salary.—Box No. 1191, BUILDERS' JOURNAL Office, 6, Great New Street, London. E.C.

ARCHITECT'S ASSISTANT DISENGAGED. 7 years' good experience (24). Good construction, details, surveying and levelling, &c.; fair knowledge quantities. Moderate salary; good references. —F. G. R., 63, Pagoda Avenue, Richmond. 1175

ARCHITECT and SURVEYOR'S ASSISTANT desires ENGAGEMENT; age 23; 6 years' London and Provincial experience, design, working and detail drawings, specifications, surveying, and levelling, &c.; neat draughtsman; excellent testimonials, moderate salary. — Reply Box 1198, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECTURAL ASSISTANT (26) wants POSITION in architect's (or engineer's) office. Seven years' experience. Working drawings and details, surveying, perspectives, etc.—A. E. P., 35, Carpenter Road, Edgbaston, Birmingham. 1189

ARCHITECT'S CLERK (22) seeks EMPLOYMENT. Good tracer; assist in surveying. 7 years' experience. Good ref.—C. L., 11, Herries Street, Queen's Park, London, W. 1165

ARCHITECT'S DRAUGHTSMAN wants SITUATION in office or works; eight years' experience; north preferred; 35s. salary.—Box 1164, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S JUNIOR ASSISTANT (22) requires ENGAGEMENT in London. Salary 25s. Working and detail drawings. Measuring old work. Knowledge of surveying, &c. Good references.—E. J. C., "Beaconsfield," Kew Green, Surrey. 1176

BUILDER'S ASSISTANT desires ENGAGEMENT. Well up in accounts, prime cost, measuring, and usual office routine. Assist estimating and quantities.—F. J. L., 53, Maidstone Road, Chatham. 1167

BUILDER'S CLERK, experienced, double entry book-keeping, time sheets, correspondence and general routine. Plans, &c. Town or country. Moderate salary.—E. W. H., 11, Archibald Road, Tufnell Park, N. 1177

BUILDER'S CLERK (26) requires SITUATION; estimating, quantities, drawing; moderate salary.—H. D., 3, Mildmay Road, Romford. 1169

BUILDER'S, &c. CLERK OF WORKS ASSISTANT (22); drawing, tracing, knowledge quantities and details; 4½ years in architect's office; certificates, building construction, advanced, 1st freehand, &c.—H. M. N., Thorncroft, Farnham, Surrey. 1187

To Contributors.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

Contracts Open.

E. R.

ARMY CONTRACTS.

SALE OF SURPLUS BOILERS, DISTILLING APPARATUS, DYNAMOS, AND OTHER PLANT AT BERMUDA, BARBADOS, ST. HELENA, AND WOOLWICH.

The Secretary of State for War is prepared to receive Tenders for the purchase of surplus Boilers, Distilling Apparatus, Dynamos, and other plant now lying at Bermuda, Barbados, St. Helena, and Woolwich, most of which is in first-rate condition, some lots being unused.

Forms of Tender, giving full description of the plant, particulars as to condition of the several lots and terms of contract, may be obtained on application to the undermentioned Office.

The Tenders are to be delivered at the War Office, Pall Mall, London, S.W., by TWELVE o'clock noon on 1st September, 1905.

War Office,
Pall Mall, S.W.
3rd June, 1905.

HERTFORDSHIRE COUNTY COUNCIL.

NEW PETTY SESSIONAL COURT AND TECHNICAL SCHOOL, CHESHUNT.

The Joint Committee for purposes of Police are prepared to receive TENDERS for the erection and completion of a new Petty Sessional Court and Technical School, Cheshunt.

Persons desirous of Tendering for the work may see the drawings, specification, agreement, &c., at the County Surveyor's Office, Hatfield, on and after Tuesday, June 13th, 1905, between the hours of TEN a.m. and FOUR p.m., except on Saturday, when they will be on view from TEN a.m. to ONE p.m.

A copy of the Schedule of Works and prices (quantities), and a form of Tender can be obtained at the County Surveyor's Office upon payment of Two Guineas, which sum will be returned to the tenderer upon receipt of a bonâ fide Tender and the documents which have been supplied to him.

Sealed Tenders endorsed "Tender for Petty Sessional Court, Cheshunt," must be delivered to the undersigned at his Offices, not later than 5 p.m., Monday, June 26th, 1905.

Such security for the due execution of the works as the Council may require must be given by the Contractor.

The lowest or any Tender will not necessarily be accepted.

URBAN A. SMITH,
County Surveyor.

County Surveyor's Offices,
Hatfield,
9th June, 1905.

6, Great New Street, Fetter Lane, E.C.

SUBSCRIPTION, POST FREE, 10/10 PER ANNUM,

or of any Newsagent or Bookstall, 2d. weekly.

Subscription Abroad, 17s. 4d. Post Free.

If you are not already a Subscriber, it will more than repay the small outlay to become one, and thus keep yourself posted in what is doing in the Architectural and Building World.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.
2. The charge of one penny will be made for each additional word.
3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.
4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.
5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.
2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.
3. Correspondents are particularly requested to be as brief as possible.
4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.
2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

FIXED LIQUID CHINESE INK.

	Each.
1. Liquid Chinese Ink for Draughtsmen (The favourite *Encre de Chine liquide*)	-/10
2. Do. do. in Sixpenny bottles........	-/6
3. Do. do. small bottles, special quality	-/4
4. Do. do. extra large bottles, do.	1/3

THE "PICTOR" DRAWING INKS.

1-oz. Bottles, full size, with Filler.

Waterproof Indian Ink.

The **Black** "Pictor" Ink is warranted pure Carbon Ink, suitable for all drawings. Its depth of colour is unrivalled; it flows freely, and dries quickly.

The **Coloured** "Pictor" Inks are all strong and brilliant, of pure hues, free flowing, and are absolutely waterproof.

The "Pictor" Inks are supplied in 12 colours (all in 1-oz. bottles), viz.:—

No. 215.

1. Black.
2. Blue.
3. Vermilion.
4. Brick Red.
5. Green.
6. Violet.
7. Orange.
8. Scarlet.
9. Brown.
10. Carmine.
11. Yellow.
12. Indigo.

10d. per bottle.

N.B.—When diluting the "Pictor" Inks, *only use distilled water.*

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT,
6, Great New Street, Fetter Lane, E.C.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

June 28, 1905. Vol. 21, No. 542. 6, Great New Street, Fetter Lane, E.C

Summary.

Mr. Edwin T. Hall thinks that the best position for a sanatorium is the southern slope of a gentle hill and near its summit, with tree shelter on its north, east and west. The subsoil should be sand or gravel. (Page 366.)

There is a sufficient thickness of gravel underlying the peat on which Winchester Cathedral was raised to enable the east end to be underpinned and repair the alarming subsidence of the south side that has occurred. (Page 364.)

For more than thirty years concrete houses have been built in Germany, but the condensation of moisture on the walls has resulted in bringing them into disfavour. Not only is the use of wallpapers or other hangings made impossible (streams of water being visible—even on distempered walls—when gas is lighted or when several people are in a room) but dampness in buildings is one of the most potent sources of ill-health. (Page 354.)

In the opinion of Mr. Charles W. Russell, the eminent American architect, the sky-scraper has come to stay, and he suggests that a solution of the difficult problem of treating architecturally a flat wall pierced with windows at equal intervals might be obtained by the application of coloured materials, omitting large projections, but with a handsome sky-line. (Page 358.)

An elaborate series of experiments have been carried out by Professor Lilly in order to determine a reliable formula for the calculation of the strength of columns, but for the present he is of the opinion that it is better to use the well-known Rankine-Gordon formula until more experimental data have been obtained. (Page 359.)

Mr. D. M. Row advocates the low-pressure hot-water system of heating in which temperature is secured and maintained by calorifiers through which the water constantly circulates as the only one affording an absolutely good and healthy atmosphere for breathing purposes. (Page 366.)

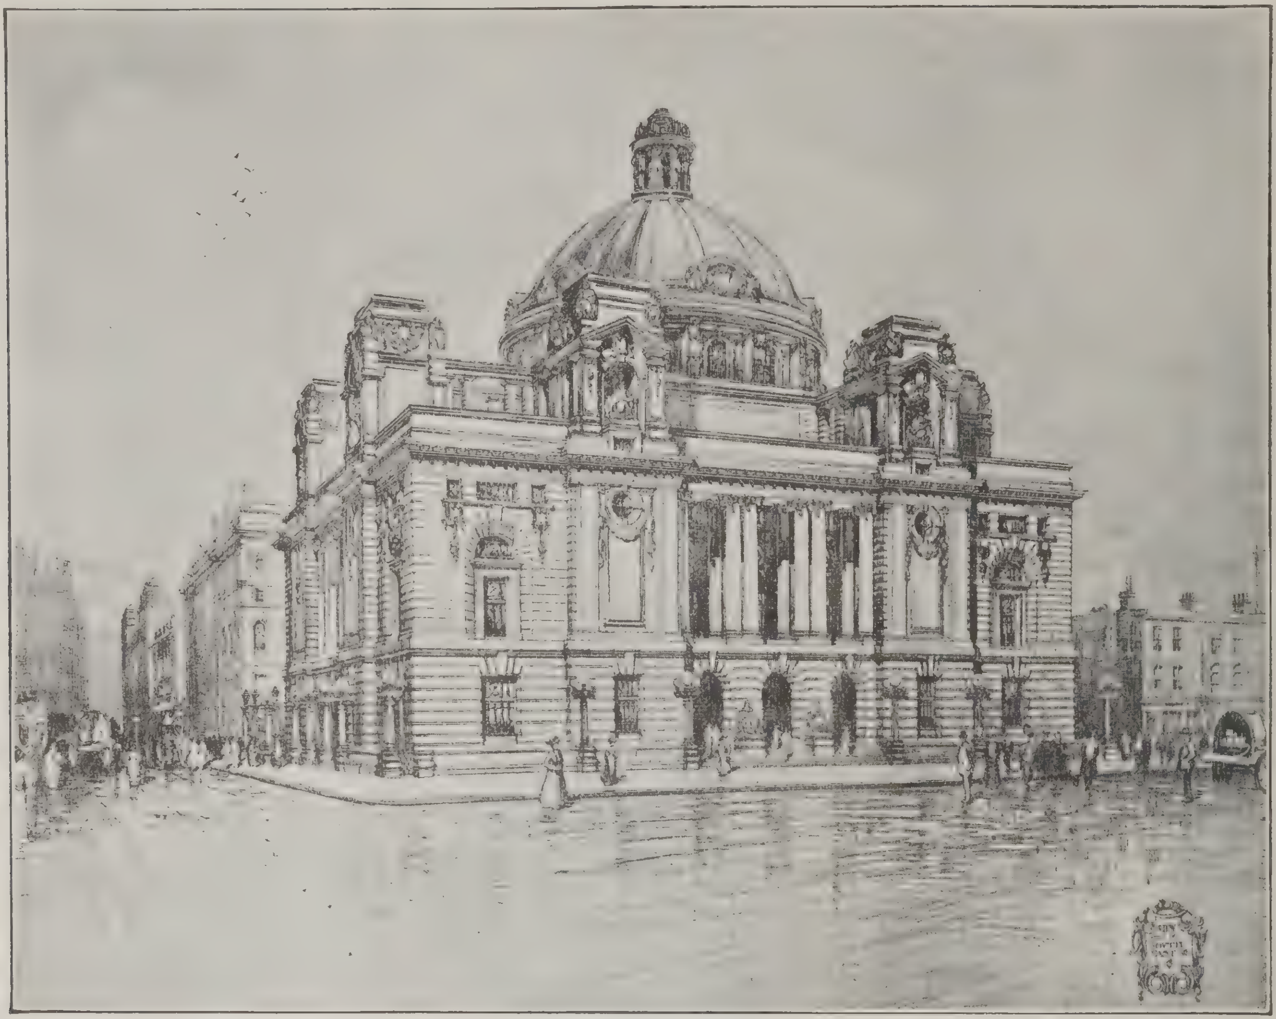
Models of buildings are generally made of wood, yellow pine being principally used, as it is easiest to work, and with the aid of a circular saw the angles and joints can be fixed and set up perfectly true. (Page 365.)

In all systems of heating by radiators the walls of a room are cooler than the air, and consequently become rapidly covered with dust and dirt. An open fire, on the other hand, warms the walls, and therefore does not cause the walls to become so dirty. The repulsion of dust from a warmer to a cooler surface is seen on plastered partitions and ceilings where the lines of timber framing or joists are shown by the dust collected between on the cooler plaster. (Page 357).

Preserving London Antiquities. Mr. Emslie J. Horniman, late Chairman of the London County Council Historical Records and Library Sub-Committee, has written to the "Times" in reference to the agitation for a museum for preserving some of the features of London which would otherwise disappear. The Guildhall Museum, it is true, preserves a number of interesting objects, but it is crowded. A number of the free libraries also have interesting collections of prints, books, &c. Mr. Horniman states that when the new County Hall is built proper accommodation will, no doubt, be provided for a museum such as is suggested, and that the London County Council have already accumulated a number of objects which would form an interesting collection. There is stored away at the present moment a good deal of carved woodwork, balusters, chimney-pieces, plaster ceilings and cornices, lead cisterns, ironwork, &c., preserved at the mere cost of removal. At Spring Gardens there is also a good collection of prints, maps, books, &c., dealing with London topography, besides many records and Court rolls. Not only are all objects preserved that can be, but drawings and photographs are taken of everything of interest before houses are pulled down by the Council, and as far as possible the same is done for buildings belonging to private owners, and a record kept of any archæological discovery.

Sketching. The present season is one of holidays, when much sketching is done. Students are too often inclined to sketch any detail that strikes their fancy without any thought as to the possible utility of the record afterwards. Of course the study of the picturesque and the beautiful is of advantage as a training up to a certain point, but an architect's aim is a different one from that of the painter, and it is open to doubt whether considerable skill in draughtsmanship is an advantage to the architect. It is certain that in the past the designers of great monuments of architecture had very little ability in this direction, and in the times of the Renaissance there were eminent painter-architects whose work more often than not suffered from their facility in draughtsmanship which led them to excesses in the direction of perpetrating features which were not constructive. We see the same tendency nowadays in the productions of the L'Art Nouveau School, when curved forms are employed to obtain picturesque effects, contrary to the functions of the building, the materials and constructive science. An architect's sketches should record the constructive means by which any particular effect is obtained, and should not have pictorial value only. Far too often sketches are made of portions of old buildings which are afterwards copied into buildings where they lose all their charm from the fact that they lose their association and logical fitness. The student should study in all its bearings any piece of work that he desires to sketch; that is, he should study the site, the conditions which led to the adoption of its plan or form and its relation to the rest of the building or to its surroundings; the construction from the historical standpoint of the training and knowledge of the builders and the means at their disposal; the features of design which betray tradition, seeking out the sources of these as a collateral study; the materials, and from where they were obtained, their uses and the effect of the weather. It would be better to study one building thoroughly and never get further than one sketch (indeed, never produce one at all) than make a large number of sketches unintelligently. The knowledge gained of construction and architectural design is the thing. In short, what should be studied is the evolution of the building.

King's College Hospital: A Criticism. Readers of the "Hospital" will have noticed the very well-informed criticisms of hospital designs which appear from time to time in its pages. In the issue for June 17th there is one in reference to the King's College Hospital Competition which we think is of sufficient general interest to quote. Our contemporary says: "It would be easy to criticize in detail Mr. Pite's plan as well as, for the matter of that, all the rest of the plans; but it must be admitted that the competitors had an almost impossible task set them in trying to plan the whole of the vast accommodation required on an inadequate site. Mr. Pite has produced a plan which in our judgment has only one serious competitor in Messrs. Douglas & Paterson; but if the work is to be carried through the whole scheme ought to be entirely remodelled, and either the accommodation reduced or more land acquired. Probably the latter alternative is the right one; and we believe the question of acquiring a separate site for the out-patient department has already been before the Removal Committee. With the out-patient department removed to another site the administration block could be remodelled and the narrow interior courts, which could never receive sufficient light and air, could be either omitted altogether or so remodelled as to be unobjectionable; more suitable sites could be found for the students' hostel and the houses for the medical superintendent and secretary than the edge of the slope of a deep railway cutting."



DESIGN FOR WESLEYAN HALL AND CONNEXIONAL OFFICES, WESTMINSTER. BY C. E. MALLOWS AND A. W. S. CROSS.

DAMPNESS OF CONCRETE STRUCTURES.

CONCRETE is not impervious to water, as often supposed, though trowelling of the face, so as bring the cement to the surface, will do much to keep out water. It is, however, little appreciated how absorptive the material is of moisture and how it condenses moisture from the air. This latter is one of the great objections to concrete houses and has prevented their wide adoption. For more than thirty years concrete houses have been built in Germany, but the condensation of moisture on the walls has resulted in bringing them into disfavour. Not only is the use of wallpapers or other hangings made impossible (streams of water being visible—even on distempered walls—when gas is lighted or when several people are in a room) but dampness in buildings is one of the most potent sources of ill-health.

With a solid concrete wall there is not much to be done, but the hollow concrete block is claimed to overcome the difficulty. It is not clear that either brick or stone is impervious to moisture: consequently special precautions are taken to exclude dampness; but most makers of concrete blocks assert that the hollow space in the blocks attracts, by the process of capillarity, such moisture as is absorbed by the block, or that the air in the space dries the moisture before it can penetrate into the interior. They depend entirely upon the hollow space to exclude moisture. We shall deal with this fallacy later, but first we will consider the waterproofing of concrete as ordinarily understood.

Effect on Stability.

From the point of view of stability it is important to waterproof concrete. In ordinary building construction sufficient attention is not given to the waterproofing of concrete foundation walls. Buildings are often to be seen constructed in a clay subsoil and the cellar and lower foundation walls put in without any attempt being made to apply a damp-proof course or vertical damp proofing, or to supply suitable drainage to carry off the ground water.

Soakage of Water.

In both masonry and concrete structures where there is any danger of soakage of water the waterproofing will probably extend the life of the structure. A recent examination of concrete abutments, retaining walls, &c., built some years ago, disclosed the fact that water was soaking through the mass in several places, particularly along the parting planes where the work was not carried on continuously. This condition is frequently observed in concrete construction, and can be entirely prevented if the back of the structure is thoroughly waterproofed with bitumen.

It is now the practice on a number of American railroads to thoroughly waterproof all arches, abutments, retaining walls, &c. The method generally employed is to use as a first coat bitumen diluted with naphtha, applied as a paint to the concrete after the mass is perfectly dry, and then to cover the surface with a bituminous mastic composed of 1 part of bitumen to 4 of sand; this to be smoothed off with hot smoothing irons and thoroughly tamped and pressed into place. If the filling over the arch is ordinary gravel or dirt, no other work will be necessary, but if it is filled with broken stone or stone chips it is better to cover the surface of the bitumen with washed roofing gravel so that the broken stone may not cut or damage the bitumen surface.

There are various other methods employed in waterproofing concrete surfaces with bitumen, such as the use of felt impregnated with and embedded in the bitumen. Another form is a thin sheet of lead between bitumenized sheets of felt, the latter to protect the former. It is very difficult to make hot bitumen adhere to a concrete surface, however dry the same may be, unless it is heated by artificial means. Hot bitumen laid on ordinary dry concrete will not adhere, and can be rolled up like a rug after it has cooled. Some success may be obtained by applying hot bitumen direct to concrete surfaces after the same have been dried and heated with hot sand, but the use of bitumen diluted with naphtha applied as a painting or swabbing coat is preferable. It does not require any special expert knowledge of its application.

For metallic structures exposed to the direct rays of the sun the bitumen should not flow under 212 degs. Fahr., and should not become brittle at 15 degs. Fahr. below zero when spread thin on glass. For stone, brick or concrete structures underground, such as arches, abutments, retaining walls, foundation walls of buildings, subways, &c., a flow point of 185 degs. Fahr. and a brittle point of zero Fahr. will be required. The bitumen covering should not perceptibly indent when at a temperature of 130 degs. Fahr. under a load at the rate of 15 lbs. per sq. in.; and it should remain ductile at a temperature of 15 degs. Fahr. below zero on metal structures and at zero Fahr. on stone, brick or concrete structures under ground.

Applying the Bitumen.

Before applying bitumen to a metal surface it is imperative that the metal be cleaned of all rust, loose scale and dirt; and if previously coated with oil this must be burned off with benzine or by other suitable means. The metal surface must be warm to cause the bitumen to stick to it, and the warming is best accomplished by covering it with heated sand, which should be swept back as the hot bitumen is applied. When waterproofing masonry or concrete structures, if the surface cannot be made dry and warm it should be first coated with a bitumen paint made of bitumen diluted with naphtha. This is particularly necessary for vertical surfaces.

The bitumen should be heated in a suitable kettle to a temperature not exceeding 450 degs. Fahr. If this is exceeded it may result in "pitching" the asphalt. Before the "pitching" point is reached the vapour from the kettle is of a bluish tinge, which changes to a yellowish tinge after the danger point is passed. If this occurs the material should be tempered by the addition of fresh bitumen. The bitumen has been cooked sufficiently when a piece of wood can be put in and withdrawn without the bitumen clinging to it.

The first coat should consist of a thin layer poured from buckets on the prepared surface and thoroughly mopped over. The second coat should consist of a mixture of clean sand or screenings, free from earthy admixture, previously heated and dried, the mixture being in the proportion of 1 of bitumen to 3 or 4 of sand or screenings by volume; this should be thoroughly mixed in the kettle and then spread out on the surface with warm smoothing irons, such as are used in laying asphalt streets. The finishing coat should consist of pure hot bitumen spread thinly and evenly over the entire surface, and then sprinkled with washed fine gravel, sand or stone screenings, to harden the top. The thickness of the coating will depend on the character of the work, and may vary from ¾in. to 2ins.

Bitumen Concrete.

Where a quantity of bituminous concrete is required, such as in steel trough floors on bridges, a concrete should be made in the proportion of 1 part bitumen, 2 parts sand and 3 parts limestone screenings, thoroughly mixed and rammed into place with tamping irons on the first coat of pure bitumen with which the metal was originally covered. At all drainage holes large-sized stones should be carefully packed by hand to ensure perfect drainage.

It may not be out of place in discussing the question of waterproofing to call attention to the necessity for provisions for drainage in all concrete and masonry structures. This has not been given as much attention as it should receive. Whether waterproofing material is applied or not, the question of thoroughly draining the structure is of the greatest importance.

Why Concrete Blocks are Damp.

The reasons why a building of concrete blocks is damp are:—

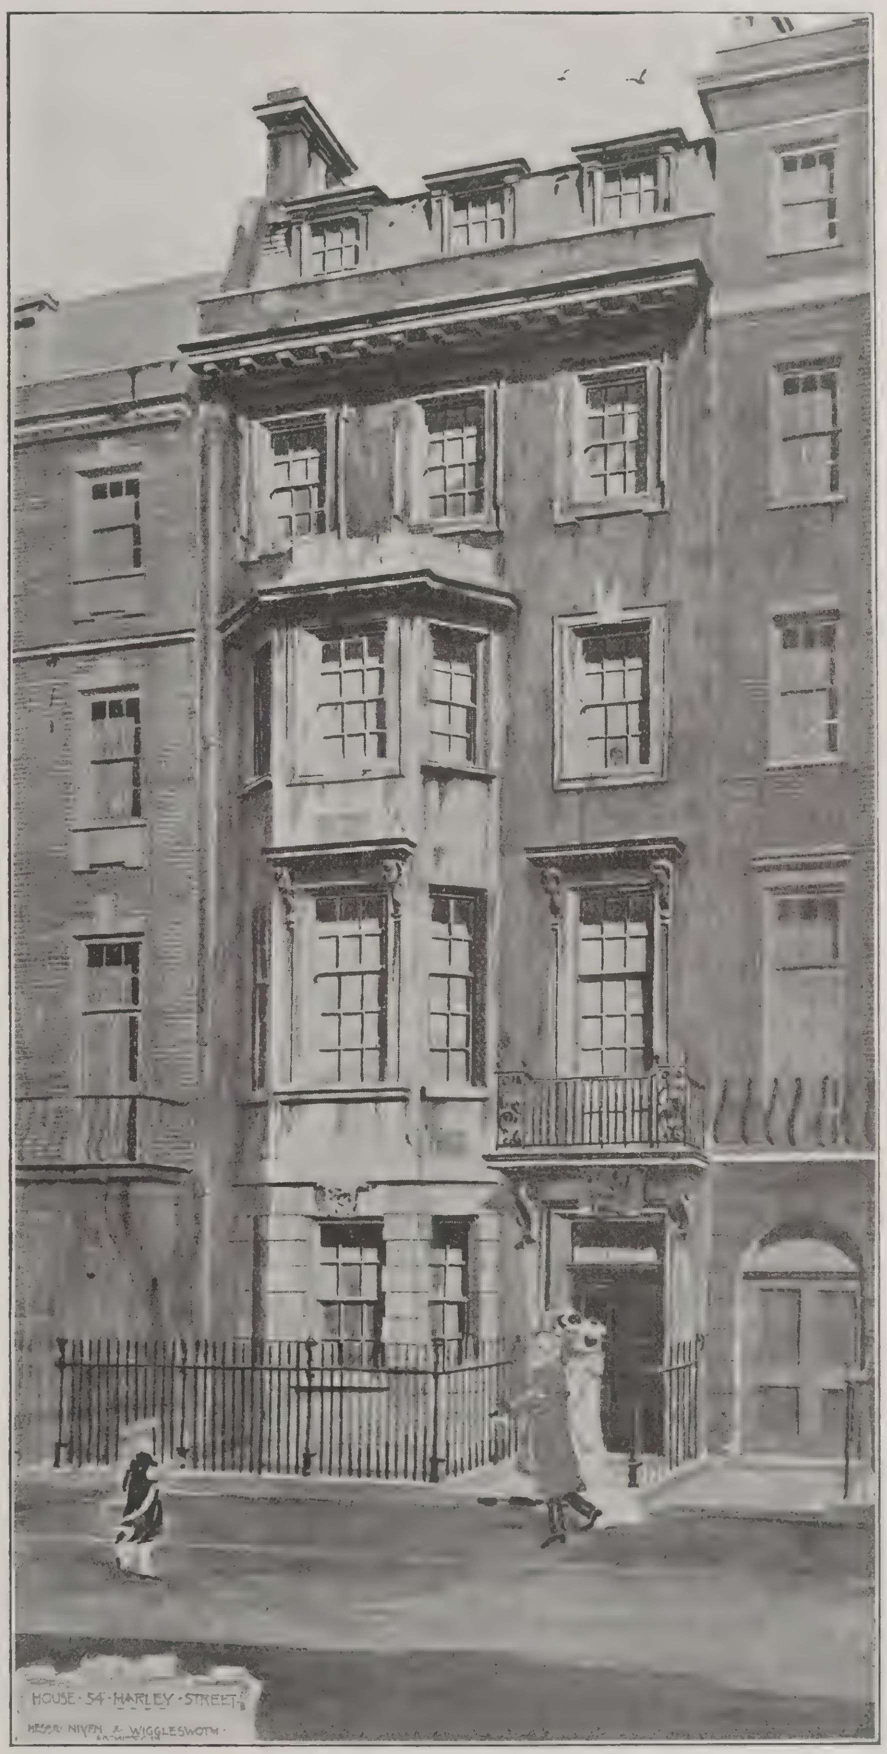
(1) Concrete, whether rich in cement or compressed by hydraulic pressure, will absorb more or less moisture. The porosity is not eliminated but merely diminished.

(2) The hollow space, not being continuous, does not prove a barrier to the penetration of moisture, as it will travel through the solid portions of the block. With the exception of those blocks in which there are double air spaces, the hollow space does not entirely isolate the inner from the outer face of the block. Double air spaces accomplish this, but a single air space in order to do so must run from end to end, which means practically erecting two walls and creating a continuous air space between them. This system of erecting parallel walls has been for the most part abandoned, because a given amount of material will not produce as strong a building as when it is used in the form of hollow blocks.

(3) Air in the hollow space is not dry air, but, on the contrary, becomes damp in a short time, thus destroying whatever efficacy the air space might have. The theory is that dry air confined will not conduct heat or cold. On the other hand, if the air is damp it will conduct readily. From this it must be deduced that the single air space in a block is of little value as an insulator because it fails to completely exclude moisture. The double air space in a cement block may prevent dampness resulting from direct penetration, but as an insulator it fails because the air contained in the spaces becomes damp and consequently conducts heavily. If moisture is attracted to the hollow space by the process of capillarity, then damp air is the result.

Condensation.

Dampness in buildings results either from direct penetration of moisture through porous bodies, caused by rain beating on the outer face of the wall, or from the walls absorbing atmospheric moisture, or from warm air striking the cold wall and condensing. Water is always present in the



This house, for a doctor, has been carried out in Portland stone by Messrs. Prestige & Co., builders, London, to the design of Messrs. Niven & Wigglesworth, architects. The drawing is exhibited at this year's Academy.

atmosphere. Water is soluble in air, and when dissolved in it is as invisible as the air itself. When the proportion of water is greater than the air can dissolve, the atmosphere is said to be damp; when the air can dissolve all the water the atmosphere is called dry, notwithstanding that it still contains water. The proportion of water soluble in air increases with the temperature of the air. When air nearly saturated with water is cooled, some of the water is precipitated. During the heat of a warm day the atmosphere may be clear, bright and apparently dry, although it may contain as much water as the air is capable of dissolving at that period. Whenever such air is cooled, as, for instance, at sunset, it becomes unable to hold as much water as during the heat of day, and some of the water is discharged, becoming dew, mist, or even rain, according to the degree and rapidity of the cooling process.

Tests.

Tests have shown that the water absorbed in five hours by six different blocks amounted to so much that the penetration of moisture to the inner face of the block was a certainty. The conclusion from these tests was that some method of waterproofing was a necessity. The tests demonstrated the fact that the hollow space in the block merely minimizes the amount of dampness without excluding it absolutely. The opinion has been expressed that making impervious blocks by the addition of sand is almost an impossibility for many reasons, one of which is that no positive formula can be given owing to the different sands and aggregates and different fineness of cements requiring different proportions, from which we must conclude that ideal conditions are required which are almost impossible to obtain.

To make the Blocks Impervious.

To insulate and damp-proof a building constructed of concrete blocks they should be made impervious to moisture. If this is done, not only is moisture prevented from entering a block but the air contained in the cells of the block is protected against pressure from the outside. Thus the block is constantly filled with air confined in small cells, which is acknowledged to be an excellent non-conductor; consequently, the insulating power of cement and sand mixed in the form of concrete is maintained at its highest point of efficiency, and, assisted by an air space containing dry air, a building easily kept cool in summer and warm in winter must result.

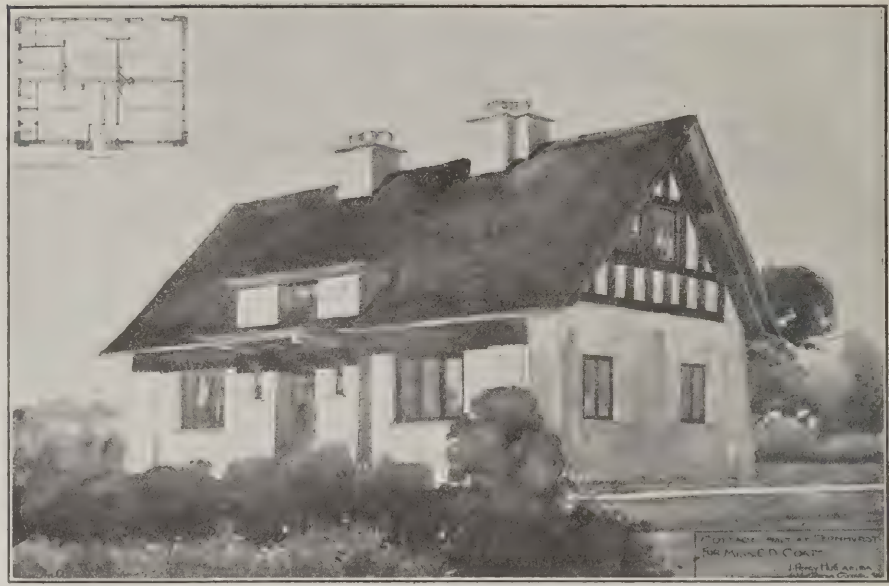
The simplest method would seem to be to apply a waterproofing liquid that will fill the pores of the stone and render them impervious to moisture. At the same time it must neither injure the ingredients of the block or discolour the surface. It must not be affected by frost nor be drawn to the surface and evaporated by the heat of the sun. Various chemical compounds have been recommended and are being used by makers of concrete blocks, but in applying a waterproof coat care must be taken not to affect the strength of or otherwise injure the block.

A process that has been adopted is to make the concrete blocks with alum water and a solution of Castile soap in water, but this process is held in disfavour.

The only material that is insoluble in water that will resist chemical action and at the same time will not injuriously affect concrete is paraffin. The chief drawback to paraffin is that it requires mechanical means to apply which would so increase the expense of blockmaking as to be practically prohibited.

The problem still awaits solution.

A new Institute for St. David's, Exeter, is being erected from designs by Mr. Harbottle Reed, architect, of Exeter. Messrs. Ham & Passmore are the contractors.



OUR PLATES.

ASHURST HOUSE has recently been built for Miss E. D. Coats at Fernhurst, Sussex. The building is of brick covered with rough-cast. The ground-floor windows have plain stone dressings, the upper portion being half-timbered. The roofs are covered with red tiles, and the whole of the woodwork, except half-timbering, is painted a green colour. Internally the house is treated in a simple manner, with the exception of the hall and staircase, which are in oak; the walls and ceilings being finished in square framed-panelling and the floor laid with narrow oak boards. The vestibule is also panelled in oak to a height of 6ft. 6ins. A complete electric-lighting plant has been installed, the accumulators being of sufficient capacity to supply both house and stables for about a week under ordinary conditions without necessitating the running of the dynamo. The engine-house is situated out of view about halfway between the house and stables. The automatic motor-driven pump, which supplies the main tanks of both house and stables, is also fixed here, the source of supply being a deep well some little distance away. Telephones and bells have been installed throughout. The whole of the work, including the hydraulic portion, has been carried out by Messrs. A. V. Gifkins & Co., 68, Victoria Street, S.W. The general contractors for house and stables were Messrs. W. Pattinson & Sons, 50, Parliament Street, S.W., and Ruskington, Lincs., and the architect was Mr. J. Percy Hall, A.R.I.B.A., of 6, Victoria Grove, Kensington. The cottage illustrated on this page contains the laundry on the ground floor, and is built of brick, rough-casted, the roof being covered with red tiles. The contractor was Mr. Yorke Bicknell, of Fernhurst.

The new entrance to Bailbrook House, Bath, is a refined piece of work. A drawing of it is hung in this year's Royal Academy Exhibition.

St. Mark's, Venice.—As the outcome of Mr. Reginald Blomfield's letter to the "Times" (see p. 313 of our issue for June 7th) a memorial has been drawn up by the Society for the Protection of Ancient Buildings expressing the opinion that the substitution of modern reproductions for old carving, the removal of mosaics to the tribunes or piers supporting the central cupola, and more particularly the taking up and levelling of the old floor of St. Mark's, would not in any way whatever contribute to the security of the building, whereas such works would destroy what have been for centuries its characteristic features.—The piled foundation for the new Campanile is now finished and work is proceeding with the erection around of a wall 10ft. thick, built of large stones from Istria and Muggia. Very patient research is being made with regard to the rebuilding of Sansovino's loggetta, though the actual work of rebuilding will not be begun for some years to come.

HEATING AND DUST.[*]

By Prof. W. F. BARRETT, F.R.S., M.I.E.E.

ALL heating appliances depend upon the transference of heat from some source to the parts of the building it is intended to warm. This transfer can be effected in three ways: by the slow process of conduction, by the quicker process of convection, or by the swift process of radiation. In the case of hot-water pipes all three processes are at work, the heat is conducted through the iron pipes, which warm the room both by radiation and convection. In the case of an open fire, radiation is practically the only agent by which the heat is distributed to the persons in and to the walls of the room. As the air is almost as transparent to radiant heat as it is to light, the air of a room cannot be warmed by radiation, and hence our domestic open fire-grates warm the rom indirectly by heating the floor, walls and furniture, and these absorbing the radiant heat warm the adjacent air by convection. This latter process consists in the transfer of heat by moving masses of the warmed air or other fluid, the motive force being gravity, the colder denser air displacing the lighter warm air. These currents are the means by which all fluids are heated, as both gases and liquids are very bad conductors of heat.

Radiators cause Walls to become Dirty.

In all systems of heating by radiators the air is warmed; the walls of the room are therefore cooler than the air, and it is a matter of common observation that when this is the case the walls become rapidly covered with dust and dirt. On the other hand, when the room is warmed by a open fire the air is not heated by the radiation from the fire, but the walls are, and it is the warm walls which warm the room. When this is the case—the air being cooler than the walls—much less dust and smoke are deposited on the walls, which therefore remain cleaner much longer than in a room which is heated by warm air. This is notably seen in the difference between the wallpapers in a room heated by an open fire and a room heated by a stove; in this latter case the wallpapers become rapidly disfigured and dirty by an unsightly deposition of dust. Many are under the impression that this is due to the dust and dirt caused by the stove or the leakage of smoke through the joints in the stove pipes, but that this is not the cause is seen from the fact that gas stoves give rise to precisely similar dirtying of the walls as coke stoves, and so do systems of heating by hot air. In fact, everyone must have noticed the upward stream of dust and dirt that attaches itself to the wall in the immediate neighbourhood of a radiator, whether that radiator be warmed by hot water, steam or gas. So great and so constant is this disfigurement that it has been urged as an objection to the use of radiators and heating by hot-water pipes; and in some cases the radiators are placed in the middle of a room or far from the walls to get rid of this annoyance. The same thing may be noticed where hot-water pipes run along the wall; near the pipes this wall gets blackened.

Clearly it cannot be due to any dust created by the radiators, for they are perfectly clean surfaces. It is, therefore, a matter of some importance to try and ascertain the cause and thus, if possible, remedy this defect in the use of all radiators. For this purpose we must turn to physics, and the investigations of Aitken in Scotland and Lodge in England on the phenomena of the deposition of dust have in recent years given us the solution.

Many years ago Professor Tyndall noticed that when dusty air was strongly illuminated by a sunbeam or by the electric light there rose from the summit of any heated body placed within the dusty air a stream of dust-free air. This was rendered apparent by its not scattering the light; and hence a fine black stream was seen rising up from the hot body. Anyone can see this by heating a wire or rod of metal and putting it in a glass vessel filled with smoke; upon brilliantly illuminating the smoke a sharp black line will be seen above the hot line or rod. Tyndall, Frankland and Lord Rayleigh have given different explanations of this experiment, but none were satisfactory. Professor, now Sir, Oliver Lodge and his demonstrator, Mr. J. W. Clark, took up the matter, and made numerous experiments. Almost simultaneously Mr. Aitken in Scotland began working at the matter and arrived at much the same explanation as Professor Lodge.

The general result of all these experiments showed that the invariable tendency of fine dust particles is to be

Driven away from Warm Surfaces

and to deposit themselves on any neighbouring cold surface. The dust free stream of air rising from a hot body is caused by the warm body being surrounded by a dust-free coating of air, and the ascending current of warm air carries this dust-free layer with it, giving rise to the dark stream line seen above the warm body.

Many striking experiments were made by Mr. Aitken to show the tendency of dust to leave a warm surface and attach itself to a cooler surface. Thus if two mirrors, one hot and the other cold, are fixed face to face near to each other and placed for a few minutes in a vessel filled with a dense cloud of dust, formed by burning a little magnesium wire within the vessel, it will be found when the mirrors are removed that the warm mirror is perfectly clean whilst the cold one is coated over with magnesia dust. Or if two glass rods, one cold and the other hot, are dipped into some hot magnesia powder and then taken out, the warm rod will be found to come out quite clean but the cold rod is thickly coated with powder.

Effects on Partitions and Ceilings.

But the most interesting illustration of the repulsion of dust from a warmer to a cooler surface is seen on partitions of timber-framing plastered and plastered ceilings. Wherever the wood framing or joists occur the wall is clean, whereas the rest of the surface is darkened by adherent dust. In fact, the wall or ceiling appears to become transparent—showing the wooden studs through the plaster. This is due to the fact that the wood, being a bad conductor of heat, remains warmer than the adjacent plaster, and hence the dust leaves the part where the wood is beneath and attaches to the cooler plaster.

Repulsive Force of Heat.

It looks as if the old idea of a repulsive force produced by heat was, after all, correct. In fact, if we heat in a crucible any fine incombustible powder such as magnesia or silica, we shall see the particles of the powder become self-repellant and mobile like a liquid. Heat, we know, does lessen the cohesion of bodies, making a rigid and brittle body like glass become ductile and viscous; it does drive the molecules of bodies further apart, causing a cubic inch of water to become nearly a cubic foot of steam or 273 cub. ft. of air at the freezing-point to become 373 cub. ft. at the boiling-point. But the expansion, and the change of state from solid to liquid and liquid to gas produced by heat, is due to the greater amplitude of vibration, the increased width of the swing, of the molecules of a body, and does not necessarily involve a repulsive force radiated from the hot body, though its kinetic energy is increased by heat.

Here we have a practical means of filtering air from dust: it is only necessary to have two concentric tubes, the inner one conveying steam and the outer one kept cold; any dusty air passed between the hot and cold tube will deposit its dust on the inner surface of the cold tube, and much finer dust or germs can be so deposited than can be stopped by filtering through ordinary screens.

Fog.

Mr. Aitken has shown that every drop of rain has a nucleus of some sort—usually a dust particle. In fact, the case with which vapour condenses to fog is a test of the presence of numerous smoke or dust particles: if there are few dust particles in the atmosphere the vapour forms a mist or fine rain, and the purity of mountain air no doubt explains the mountain mists so frequent in the Highlands. Were there no nuclei at all condensation would not occur. This discovery led Mr. Aitken in 1893 to devise a pocket dust-counter. The air in a small vessel is first rendered dustless and exhausted by a simple device, and then a sample of the air to be tested is admitted. This is chilled by partial exhaustion and the condensed vapour falls down on to a plate in tiny droplets, each drop having a dust nucleus. By counting these drops in any small area, the number of dust particles in a given volume of air is found. Thus in the purest mountain air about 250 dust particles per cubic centimetre were found. In clear country air 500, whilst in London and Paris, the number of solid particles varied from 80,000 to 210,000 per cubic centimetre. I think Mr. Aitken's ingenious little instrument should be in the hands of every engineer so as to test the value of the screens used to filter the air admitted to buildings.

Atmosphere polluted by Dust.

The following are some of the conclusions arrived at by Mr. Aitken:—

(1) The earth's atmosphere is greatly polluted with dust produced by human agency.

(2) This dust is carried to considerable elevations by the hot air rising over cities and from the sun-heated areas of the earth's surface and by winds driving the dusty air up the slopes of hills.

(3) The transparency of the air depends on the number of dust particles in it and on its humidity. The less dust and the drier it is the more transparent it is. . . . Water apart from dust does not seem to affect its transparency.

(4) Haze is generally produced by dust; if the air be dry the vapour has little effect, the density of the haze depending chiefly on the number of dust particles present.

(5) The dust particles in the air have vapour condensed on them, though the air itself may not be saturated.

(6) The amount of vapour condensed on the dust in unsaturated air depends on the humidity of the air. The higher the humidity the greater the moisture held by the dust particles when the air is not saturated.

(7) The amount of dust in the atmosphere of pure country districts varies with the velocity and the direction of the wind. Fall of wind is accompanied by an increase in dust. Winds blowing from populous districts generally bring dusty air.

Clearing Air by Electricity.

There is another way of ridding the air of dust which has been the subject of a good deal of experiment by Sir Oliver Lodge—that is, the discharge of electricity from a point. Even a small electric machine can quickly clear a large bell jar of a cloud of smoke or dust by discharging its electricity from a point in the bell jar. Possibly at some future date the atmosphere of smoky and foggy towns may be rendered clear by continuous and powerful electric discharges. The coating of dust over the leads of electric wires is often noticed, especially in the flexible wires which suspend incandescent electric lamps. This is simply an effect of electric attraction on the dust in the air.

[*] Summary of a paper read at the summer meeting of the Institution of Heating and Ventilating Engineers on June 20th.

FINANCING BUILDING SCHEMES IN THE STATES.*

By **CHARLES W. RUSSELL.**

THE methods of financing building schemes vary in different places. In New York many schemes have been adopted for a while, to give place at length to other methods. For example, when apartment houses were first introduced they became very popular. Then what was known as the co-operative apartment-house scheme was invented. The promoters would get the refusal of a piece of land, have plans drawn, and organize a company of people who wanted homes. The plan was to give the owner of a certain amount of stock a perpetual lease of an apartment (very similar to the custom in Venice of different floors in a building belonging to different owners). A great many large apartment houses were built on this scheme, but after one notable instance, in which the mortgage was foreclosed and the stockholders wiped out, the method was abandoned.

Leasehold Property not Favoured.

Formerly much of New York City was built on leasehold property, and many of the finest stores are on leased land. But now very little is on leasehold, and it is almost impossible to finance a large proposition in New York if the fee of land is not included. This is not the case in Chicago, where many very large and high buildings are on leased ground.

Speculative Houses.

Most of the dwellings in the large cities of the world have been built by operators building rows of similar houses and selling them separately. This form of operation appeals to a large number. Men of small capital can start in a small way, and by investing their profits in more houses often build whole neighbourhoods. They are usually successful during rising markets. Of course, houses reproduced a number of times can be built more cheaply than separate houses.

The plan of finance is often to employ an "architect" to make the plans of one house. A loan is then procured, and the different sub-contractors are induced to wait for their final payments until some of the houses are sold. But there are many builders who build very good houses to sell in New York, and a large number of fireproof residences have been built and sold, and not a few have fetched between 100,000 and 200,000 dols. each in the last few years. There are very few private residences built at present on Manhattan Island, apartment houses being the vogue.

Loans.

In the financing of a building scheme the promoter has usually to provide the difference between the amount of money that can be borrowed on the enterprise and the cost of it. The permanent loan is usually made by a financial institution on a conservative basis, lending only 50 or 60 per cent. of the value of the enterprise at a low rate of interest. If the conservative institutions decide for certain reasons not to lend money there is very little promoting done until they wish to lend again. Of course, there is a great deal of money lent by private individuals, but their loans are generally of smaller amounts. There are institutions which make a business of lending and selling the mortgages to private individuals. Thus, the financial institutions have the first claim on most enterprises. They decide whether there will be an active business or not. If they are desirous of lending, there are always operators who are anxious to promote enterprises.

Builders who Finance.

As the size of operations in the United States has increased to enormous proportions, so have construction companies been formed with very large capital. Some of these have increased their scope until now they will underwrite the mortgage, assist in financing the whole operation, and erect the building. This class of operation is almost exclusively confined to central and staple property.

To Avoid Loss by Forced Sale of Valuable Land.

A popular mode of procedure for men who wish to operate in real estate is to form a company, usually called a realty company, and for each particular building scheme a subsidiary company is formed by the parent company, which method, under the laws of the State of New York, eliminates the element of personal liability of the stockholders.

There is a large field for these realty companies, managed on conservative lines, and they are of great advantage to people who are forced to improve their property. It may be that their buildings are too poor to compete with new neighbours, or too old, or that they have been destroyed by fire, &c., or for other reasons. For example, a man has a piece of property in a business centre which he is forced to sell or improve, and which is appraised at, say, 1,000,000 dols.; it does not carry itself, and there is not a ready sale for it at that price. A realty company might make the following proposition, viz.:—To erect on it a building costing, say, 1,000,000 dols.; to pay him for his land 600,000 dols. in cash and 400,000 dols. in second mortgage bonds of the company. The realty company would borrow from a financial institution, say, 600,000 dols. on the land, and, say, 500,000 dols. on the building as it progresses. After paying the owner 600,000 dols., they would have 500,000 dols. in cash for the building, and the stockholders would have to put in the balance, 500,000 dols., and own the equity. In some instances the company issues no second mortgage bonds, but only stock.

There are many men who are forced to sell or improve their property, and while they have not the means to improve it themselves, they would prefer to keep an interest in it to selling it altogether, and they also feel that the experts in the realty company know better than they what the nature of the improvement should be. Perhaps the owners are not in this country, or perhaps they are not in a position to wish to take much trouble in posting themselves as to the requirements. Some proposition like the above, in which they retain stock, naturally appeals to them. Of course, if the realty company puts in very little cash, it may prove a poor operation for the owner of the land, as he is taking most of the risk and had better get most of the profits.

Stocks and Shares.

The financing of large building schemes has been tried on very much the same lines as railroads are financed, that is, issuing bonds and stock in shares of, say, 100 dols. each. Also large schemes have been carried out in Boston, I am told, by selling only stock in small shares without the property being bonded, and again other large schemes have been successfully carried out by selling first mortgage bonds in small amounts; the stock in such an instance representing no payment in cash, but professing to represent the earning power over expenses. These methods have not been popular in New York.

Real estate has increased so much in value in large cities that it would not be possible for most men to invest in it if it were not through these companies. While formerly only the rich were able to participate in large enterprises, now, through the large corporations, the people can be interested in all the great enterprises of the country.

Building Societies.

Building loan schemes in great numbers have been started for persons who wish to build homes. Under their plan the tenant gets the property upon the payment of a very small equity. He then, in lieu of rent, may pay off each month a small portion of the mortgage, in addition to the carrying charges.

Cost and Time to Finish.

The questions How much will a building cost? and When will it be finished? are of the greatest importance to the financier. These questions depend largely upon the labour conditions, on which subject the architect and his client—the owner—are not usually given a chance to be heard, although the owner is the greatest sufferer from strikes and lock-outs: his interest account is going on all the while, and he has very much more at stake than the builder.

A company that could give a guarantee to finish a building at a certain time for a certain amount of money would indeed facilitate any building scheme. Let us hope that this may soon be the case.

The Architect's Part.

It is not the province of the architect to formulate the financial scheme or to place the securities of the project He may be called upon to design a new building, introducing features which will make it superior to its competitors. He is usually expected to prepare preliminary plans, specifications, and to give an estimate of the cost of building, carrying charges and operating expenses in the shortest possible time. He should theoretically not put in anything that is not of use. He should at the same time make his building pleasing to the public, without adding necessarily to the cost.

Conditions of the Problem.

Assume, for instance, that it is proposed to finance the construction of a high office building in some great centre. To ensure a good income the requirements above the first and second storey would probably be to have as many windows as possible, not too large to be easily operated and yet as large as practicable.

Each window would be separated from each other window, preferably by masonry, as it is advisable to have as little steel as possible exposed to the elements, but steel thoroughly covered with cement masonry is supposed not to deteriorate.

Projections over adjoining property should be dispensed with to avoid legal complications. Many title-guarantee companies discriminate against such encroachment.

A large cornice is a disadvantage to windows under it.

Therefore, the requirements which confront the architect are a flat wall pierced with windows at equal intervals,

Like a Waffle Iron,

and not even relieved by a large projection. Although this is a very difficult proposition, it is certainly a very interesting one.

The high building is essentially American. It is a new proposition and requires more originality to solve than a problem where some historic example from the Old World may be taken as a prototype. And the skyscraper has come to stay—of that there is no doubt whatever.

Would it not seem as if these requirements might best be met by the application of colours? If someone would use bright-coloured terra-cotta, for example, omitting large projections, but with a handsome skyline, and so make a beautiful building, he would indeed deserve the thanks of the community.

The Egyptian, Greek, Roman, Romanesque and Gothic architects all felt the want of colour, and used it, and although colour had perhaps better not be suggested by an architect until he is quite sure that he will be employed, it seems to be a subject for serious consideration.

---

* Paper read at the 38th Annual Convention of the American Institute of Architects.

THE STRENGTH OF COLUMNS.*

By Prof. W. E. LILLY, M.I.M.E.

THE design of a column of a given length to carry a given load involves the determination of the area and radius of gyration of its cross-section, and thus indirectly of its thickness. The formulæ in general use do not take into consideration the ratio to be adopted between these quantities, it being left to the designer to assume empirically some values which seem most suitable under the circumstances. Considered from a theoretical point of view, there is for every column of given length and load a definite area and radius of gyration for the most economical cross-section, and any departure from these involves waste of material. For instance, take the case of a hollow mild-steel column of circular cross-section, if the diameter is large and the thickness small the column fails by wrinkling of the sides of the column or by secondary flexure; if the diameter is small and the thickness great, it fails by primary flexure or bending; hence there is some diameter and thickness which will give the most economical result. The experiments contained in this paper were carried out with a view of determining experimentally the conditions under which failure takes place either by primary or secondary flexure, and to obtain indirectly some definite information as to the values of the areas and radii of gyration of the economic cross-sections.

For this purpose it was decided to test a number of mild-steel tubes similar to those now so generally used in cycle construction, and of as nearly as possible a uniform quality throughout. A consignment of these was obtained, of which the following table gives particulars of the diameters and gauges of the tubes that were tested:—

External Diameter.	Thickness, Standard Wire Gauge.					
inch.						
$\frac{3}{8}$	16	17	18	19	20	22
$\frac{7}{16}$	16	17	18	19	21	22
$\frac{1}{2}$	17	18	19	20		
$\frac{5}{8}$	18	19	20			
$\frac{3}{4}$	18	19				
$\frac{7}{8}$	18	19				
1	18	19				

The experiments were carried out in the engineering laboratory of Trinity College, Dublin, on a 10-ton Wicksteed testing machine of the vertical type. Unfortunately, owing to the small size of the machine, it was impossible to make the experiments as complete as the author could have wished; it was decided for this reason to limit the investigation for the present to round-ended columns with a view of in the near future continuing the experiments on columns with fixed ends, when a machine of larger size will be available.

The tubes were prepared for testing in the following manner. The dimensions of the tube having been ascertained, measured lengths were cut off; these were then trued up in the lathe to ensure straightness, the ends at the same time being faced off square. Hard steel round-ended pins with square shoulders were fitted to the ends of the tubes as shown on Fig. 1 (see next page); they were then ready for testing.

The mode of testing was to place the tube vertically in the testing machine, the round ends bearing on steel discs as shown on Fig. 1, the surfaces being very slightly concave to enable the specimen to be easily adjusted. The test was then carried out in the usual manner and the load producing failure noted.

The number of experiments carried out

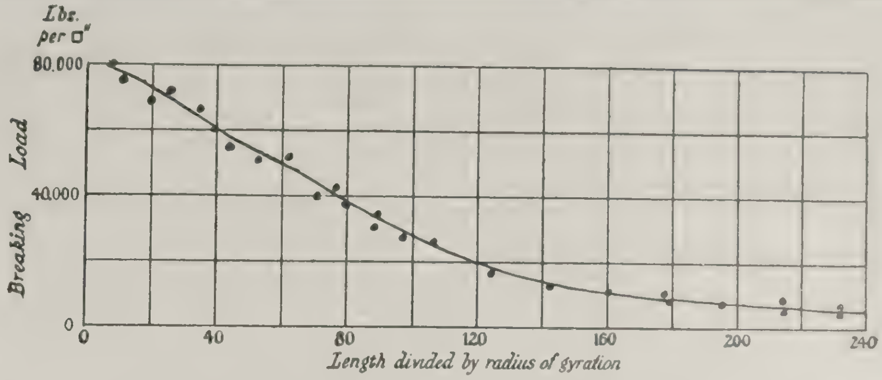

FIG. 2.—Diameter, $d = \frac{3}{8}$in. Standard Wire Gauge, $g = 16$. Area of cross section, $A = 0·063$ sq. in. Radius of gyration, $\rho = 0·11$. Thickness of tube, $t = 0·17d$. $(\rho/t)^2 = 3$.

* A paper read last week before the Liège meeting of the Institution of Mechanical Engineers.

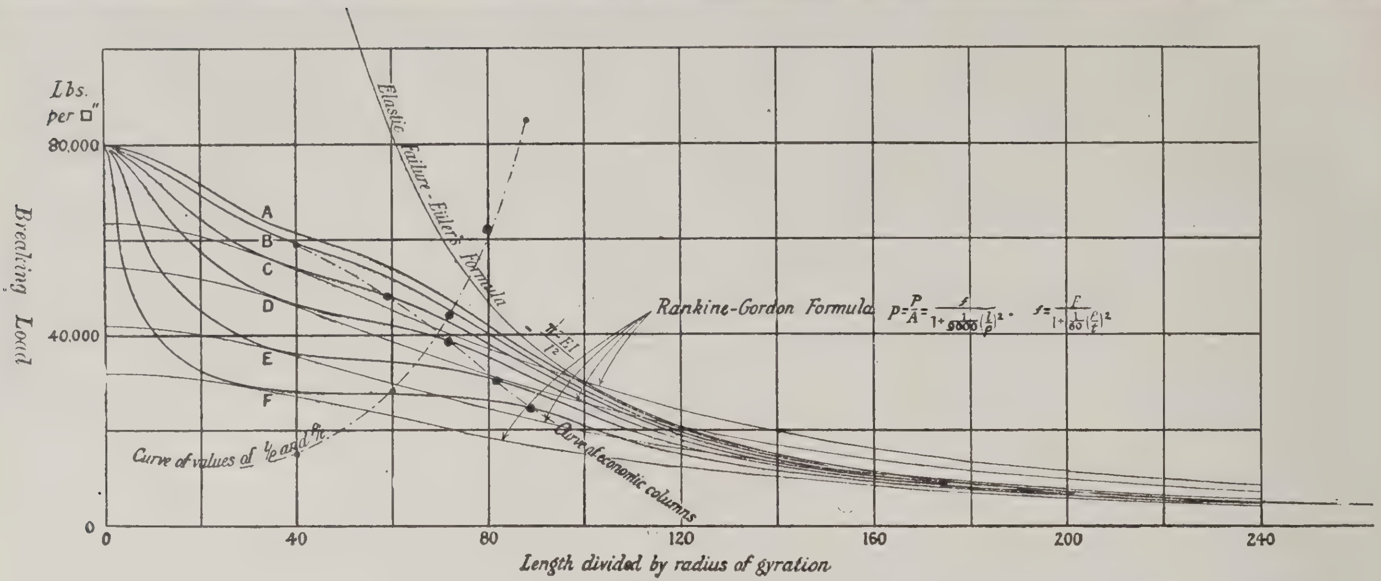

FIG. 9.—DIAGRAM DEDUCED FROM EXPERIMENTS ON MILD STEEL TUBES SHOWING THE INFLUENCE OF THICKNESS IN DETERMINING THEIR FAILURE.

on various lengths of tubing exceeded eight hundred; of these only a selection is given, on Figs. 2-8 (preceding page), which bear more directly on the investigation.

The author considers that no useful purpose would be served by giving more of the results of these experiments in detail. As was to be expected, owing to the variations that occurred in the quality of the material, some difference was shown in a few cases from the results as given, more especially on the short lengths tested. The results of these were averaged, giving a close approximation to the curves of the tubes shown on Figs. 2–10. The data given on the diagrams, Figs. 2–8, refer to the individual tubes tested. On the base line, values of l, the length, divided by ρ, the radius of gyration, are plotted, the breaking load for these values being plotted vertically. The numerical values of the diameter = d, standard wire gauge = g, area of cross-section = A, radius of gyration = ρ, and the thickness = t of the tube are given on each diagram respectively. The curves on Fig. 9 show the influence of the thickness in determining the load which produces failure; they have been deduced from the curves shown on Figs. 2-8, the diameter and thickness of the tube being varied and the area of the cross-section kept constant, the uppermost curve of the series being for the limiting case when the tube becomes a solid bar. If now the curves on Fig. 9 be plotted with the base line representing length and the breaking load for these values vertically, a series of curves is obtained as shown on Fig. 10; from the inspection of these the influence of the diameter and thickness upon the length is very clearly shown, and from this it will be seen that the economic ratio of the diameter and thickness for a given cross-section depends upon the length of the column.

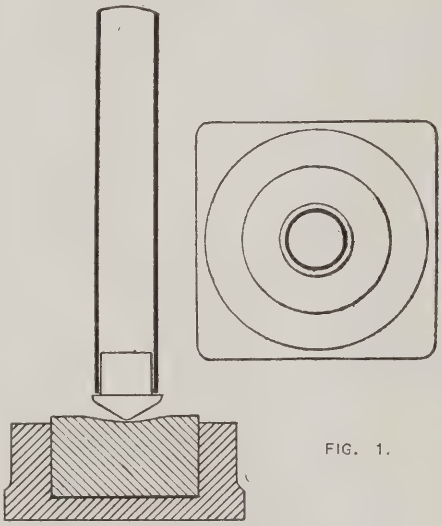

FIG. 1.

TUBE READY FOR TESTING, FITTED WITH HARD STEEL PIN AND BEARING ON STEEL DISC.

The breaking strength to tension of several specimens cut from the tubes under test was determined, giving results which varied from 62,000 to 85,000 lbs. per sq. in.; the average of these tests was nearly 72,000 lbs. per sq. in.

The determination of the strength to compression of the mild-steel tubing, that is, the strength of very short specimens, was a matter of some difficulty, owing to the bulging and upsetting of the specimens when thick and to the wrinkling or doubling up of the specimens when thin; the average of the breaking strengths to compression was 80,000 lbs. per sq. in. This value has been adopted throughout in plotting the curves on Figs. 9 and 10.

Experiments were also made for the determination of Young's modulus of elasticity, giving an average value of 30,000,000 lbs. per sq. in.; this value has been adopted throughout in plotting the curves on Figs. 9 and 10.

The following phenomena were observed during the carrying out of the tests. That for all columns there is a certain value of l/ρ beyond which the failure is sensibly due to elastic bending, the load producing failure varying inversely as the square of the length; that as the value of ρ/t increased, the value of l/ρ increased for the load producing failure by elastic bending: the curves on Fig. 9 show this. When the failure of the column takes place by secondary flexure for a large range of the length, there is little variation in the breaking load. Hodgkinson in his experiments on wrought-iron columns has previously remarked on this.

As the load approached the breaking load there was on the short lengths a decided yielding of the tube before failure.

Before proceeding to the discussion of the results of the experiments as given on the diagrams, some of the formulæ in general

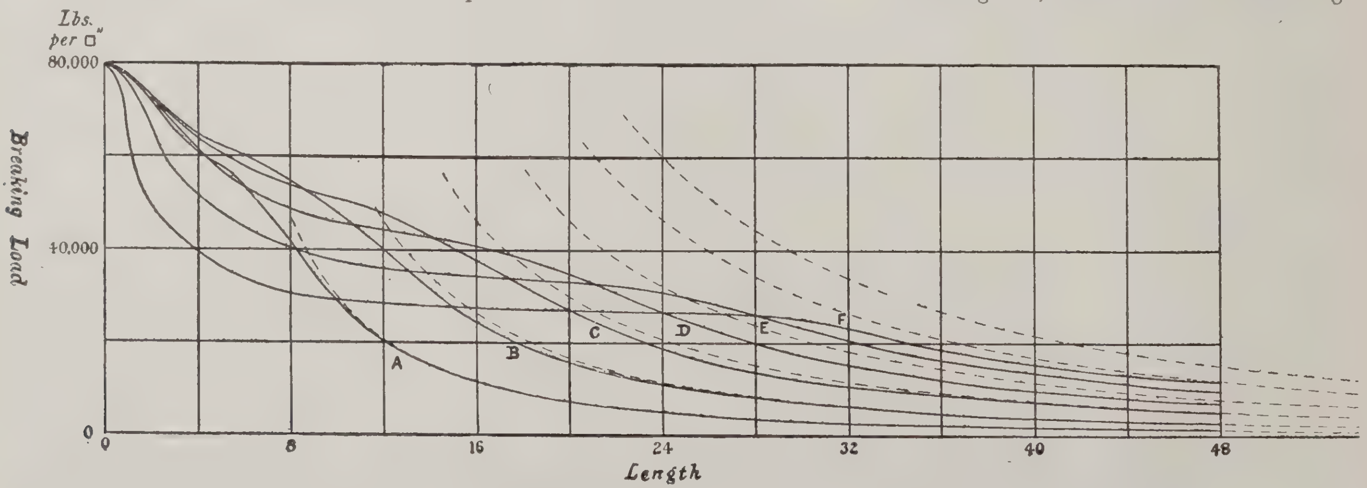

FIG. 10.—DIAGRAM DEDUCED FROM THE EXPERIMENTS ON MILD STEEL TUBES SHOWING THE EFFECT OF VARYING LENGTH, DIAMETER AND THICKNESS ON THEIR FAILURE, THE AREA OF THE CROSS-SECTION BEING CONSTANT.

use for the design of columns will be examined; of these Eüler's and the Rankine-Gordon formulæ are the most important.

Eüler's formula[*]:—

$$P = \frac{\pi^2 EI}{l^2},$$

where P = the load on the column, E = Young's modulus of elasticity, I = moment of inertia of the cross-section, l = length of column.

This formula, derived by Eüler from the theory of elasticity, is only applicable to columns which fail by elastic bending, that is, to long columns. For practical columns with the usual ratio of l/ρ it fails to give the breaking load. As will be seen from the tests of the tubes on Figs. 2-8, it applies with a fair degree of accuracy to long columns, the influence of the ratio ρ/t causing but little variation in the strength. The experiments of Christie[†] on long columns lead to a similar conclusion.

Rankine-Gordon formula[‡]:—

$$P = \frac{fA}{1 + c\left(\frac{l}{\rho}\right)^2},$$

where f = about two-thirds the compressive strength of the material, for wrought-iron = 36,000 lbs.; A = area of the cross-section; $c = \frac{1}{9000}$ for columns with round ends, $= \frac{1}{36000}$ for columns with fixed ends; l = length of column; ρ = radius of gyration of the cross-section.

This formula gives approximately the breaking load for both short and long columns, the value of f and c being determined from experiments. For short columns the strength depends mostly on f, the strength of the material, the value of $c\,(l/\rho)^2$ being small, and for long columns the strength depends on elastic bending, that is, the term $c\,(l/\rho)^2$ involving the modulus of elasticity.

The formula takes no account of the ratio ρ/t, nor does it in any way point out the most economical values of l/ρ to be used, the ratios adopted in practice being the result of experience.

On the diagram (Fig. 9) the breaking load for the tubes calculated from Eüler's formula is shown: for values of $l/\rho > 120$ for the solid bar to values of $l/\rho > 240$ for the thinnest tubing the failure is sensibly elastic and the experiments are practically in accordance with the values as calculated. In all cases of long columns some elastic deflection was apparent before failure; the columns were then in a state of equilibrium, and it was not till the deflections exceeded a certain amount that collapse took place.

It has already been remarked that the curves shown on Fig. 9 were for purposes of comparison drawn so as to refer to tubes of constant cross-section. The manner of deducing these curves from the curves on Figs. 2-8 was as follows:—The Rankine-Gordon formula was used in the form

$$p = \frac{P}{A} = \frac{f}{1 + \frac{1}{9000}\left(\frac{l}{\rho}\right)^2}.$$

By giving suitable values to f curves similar to those shown on Fig. 9 were obtained. From a critical examination of these curves it was evident that the value of f depended on the failure of the tube by secondary flexure. Now the experiments show that this secondary flexure does not depend on the length of the column but only on the thickness and the radius of gyration.

To determine by analysis from the mathematical theory of elasticity the variation of the strength in terms of these quantities is a complex problem which has not hitherto been solved. It was therefore attacked by an induction process from the experiments. From the inspection of the values obtained it was evident that the load producing failure was less when the diameter was varied and the thickness constant, and greater when the thickness was varied and the mean diameter constant, showing that the strength depended in some way on the ratio ρ/t; by plotting values of ρ/t and the breaking load the following formula was obtained:—

$$f = \frac{F}{1 + k\left(\frac{\rho}{t}\right)^2}$$

where F = the strength of the material to compression, k = a constant for mild steel $= \frac{1}{60}$.

When ρ/t approaches the limiting value of 0·5 for the solid bar the value of f is sensibly equal to F. This formula closely gives the required values and appears to be of the correct form, for it shows that the probable value of f, if deduced from the mathematical theory of elasticity, would be of the form

$$f = B\left(\frac{t}{\rho}\right)^2,$$

B being some constant depending on Young's modulus of elasticity.

Substituting for f in the Rankine-Gordon formula, it now takes the form

$$p = \frac{P}{A} = \frac{F}{\left\{1 + k\left(\frac{\rho}{t}\right)^2\right\}\left\{1 + c\left(\frac{l}{\rho}\right)^2\right\}}.$$

Putting $k = \frac{1}{60}$ and $c = \frac{1}{9000}$ for columns with round ends,

$$p = \frac{P}{A} = \frac{F}{\left\{1 + \frac{1}{60}\left(\frac{\rho}{t}\right)^2\right\}\left\{1 + \frac{1}{9000}\left(\frac{l}{\rho}\right)^2\right\}}.$$

This formula was used to determine the curves shown on Fig 9, the value of F used being 72,000 lbs. per sq. in., which may be considered as being sensibly the strength to compression of the material.

These curves having been determined, the remaining curves, showing the actual failure of the columns, were plotted from the curves on Figs. 2-8. They relate to tubes of the following sizes and of constant cross-section of 0·12 sq. in.

Particulars of tubes shown by Figs. 9 and 10.

External Diameter.	Internal Diameter.	t	ρ	Reference to Curves.
inch.	inch.			
1	0·92	0·04	0·34	F
0·875	0·78	0·048	0·3	E
0·75	0·636	0·57	0·25	D
0·625	0·481	0·072	0·2	C
0·5	0·3	0·1	0·15	B
0·4	0	0·2	0·1	A

The curves shown on Fig. 10 were derived from the curves on Fig. 9, as already described. The diagram (Fig. 9) thus obtained may be used for mild-steel columns with round ends having the same ratio of l/ρ and ρ/t.

The formula takes into consideration both the primary and secondary flexure of the column. Since the column can fail in either of these two ways, it will be of maximum strength when the strength to primary flexure is equal to that for secondary flexure. Now the diagrams show the variation of ρ/t with the length for a constant cross-section, and the question at once arises if the ratio between these quantities can be put in a simple form so as to be of practical use.

On Fig. 9 the economic values of l/ρ and ρ/t were plotted from the curves on Fig. 10 giving the dotted curve as shown; this curve may be considered approximately to be a parabola, having the equation

$$\left(\frac{l}{\rho}\right)^2 = 1000\left(\frac{\rho}{t} - 0·5\right).$$

For the usual values of l/ρ in practice the term 0·5 can be omitted, giving the simplified form

$$\rho^3 = \frac{1}{1000}l^2 t. \quad . \quad . \quad (1)$$

This equation applies to the column of hollow circular cross-section; for columns of other cross-sections the contant $\frac{1}{1000}$ requires to be slightly modified.

Let A be the area of the cross-section, d the mean diameter of the column; then $\pi dt = A$ approximately. Also $\rho = \frac{d}{\sqrt{8}}$; hence $t = \frac{A}{8·9\rho}$ approximately. Substituting in the previous equation—

$$\rho^2 = \frac{\sqrt{A}}{94}l$$

for hollow circular columns and for other cross-sections

$$\rho^2 = \frac{\sqrt{A}l}{h}, \quad . \quad . \quad (2)$$

h being a constant depending on the value of ρ/t of the cross-section required.

This equation shows that ρ varies as $\sqrt{l}$ if the area of the cross-section is constant. Now A represents the area of the cross-section, and is supposed to be known; to determine it, values of p and l/ρ for the economic section were plotted, giving the curve as shown on Fig. 9, the equation of which is approximately—

$$p = \frac{P}{A} = \frac{F}{1 + \frac{1}{3500}\left(\frac{l}{\rho}\right)^2}. \quad . \quad (3)$$

By substitution for A from equation (2) a cubic is obtained giving the value of ρ in terms of P and l and the constants; this equation does not admit of easy solution, and it is better to proceed by a tentative method. Assume a probable value of l/ρ for the column, usually about sixty to ninety for the ordinary run of columns, and solving equation (3), the value obtained is

$$A = 2 \text{ to } 3\frac{P}{F},$$

where P is the load on the column and F the breaking strength to compression of the material; this must be divided by the factor of safety for the practical column, giving

$$A = 2 \text{ to } 3\left(\frac{PS}{F}\right),$$

where S = the factor of safety.

Substituting for A in equation (2) the economic values of ρ can be immediately determined.

The dimensions of the column having been thus ascertained, the value of the safe loads P can be checked by the general formula, owing to the curves of the formula not coinciding with the curves of the actual failure of the columns; the value obtained will in general be less than P, an error on the side of safety.

The experimental work on columns hitherto carried out has been incomplete, owing to the limited range of the experiments; this has led to considerable diversity of opinion, more especially by American observers, as to the value of the constants that should be used in the Rankine-Gordon formula. This is to be expected in view of the results of this investigation, many of the experiments being made on columns of different proportions, the results varied giving different values for the constants in each case.

The general formula applies to columns of mild steel and wrought-iron. The constants for wrought-iron given by Rankine are f = 36,000 lbs. and $c = \frac{1}{9000}$ for columns with round ends. Assuming the strength of the wrought-iron to compression to be 24 to 25 tons per sq. in., this formula gives a value of d/t of about 16 and for ρ/t of 5·5 to 6. Now these constants were derived from Hodgkinson's experiments on columns, of which the average ratio of d/t was approximately 16; hence the formula may be looked upon as being confirmed by these experiments. For the ordinary ratios of ρ/t in practice the Rankine-Gordon formula gives fair results; it does not, however, apply with the same accuracy to solid bars or columns in which the ratio of ρ/t is large; this will be evident from the inspection of the curves in Fig. 9, one of these for which $f = 42{,}000$ lbs. gives good average values, the remaining curves giving values which are either too high or too low respectively for values of l/ρ, at which failure takes place by elastic bending. This discrepancy arises from the fact that in the formula p varies directly with f, that is, the load which a column will carry is supposed to be proportional to the strength of the material; this is not true for long columns, it is the modulus of elasticity which governs its strength, and it is the constant c which involves this quantity. Now there is not much difference between the modulus of elasticity of wrought-iron and mild steel, hence the load which produces elastic failure will not differ much for either material. The experiments of Christie and others confirm this. It has already been remarked that Eüler's formula is sensibly true for long struts; granting this, it would be more logical to assume that

---

[*] A proof of this formula is given in Rankine's "Applied Mechanics."

[†] Proceedings, American Society of Civil Engineers, 1884.

[‡] A proof of this formula is given in Rankine's "Civil Engineering."

$$\frac{\pi^2 EI}{l^2} = \frac{fA}{1 + c\left(\frac{l}{\rho}\right)^2}$$

for some particular value of l/ρ, in which the failure takes place by elastic bending; this gives

$$c = \left\{\frac{f}{\pi^2 E} - \left(\frac{\rho}{l}\right)^2\right\}$$
$$= \left(\frac{f}{\pi^2 E} - m\right),$$

where m is some particular value of l/ρ. If this is done, fairly accurate values for the curves shown in Fig. 9 can be determined from the equation

$$p = \frac{fA}{1 + \left(\frac{f}{\pi^2 E} - m\right)\left(\frac{l-a}{\rho}\right)^2},$$

when m and a are constants and the value of

$$f = \frac{F}{1 + k\left(\frac{\rho}{l}\right)^2}.$$

For the present the author is of the opinion that it is better to use the more well-known form of the Rankine-Gordon formula already given until more experimental data has been obtained for the determination of the constants in the above formulæ.

In the literature of the subject referred to at the end of this paper various formulæ are given for determining the strength of columns, none of which take into consideration the economic values of the radius of gyration and thickness for a given length; tested by the direct appeal to experiment, this investigation shows that the values obtained from their use can only apply to comparatively few cases.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Stamping Agreements.

Z. writes: "How long does an agreement stand good without being stamped at the time of signing? Can it be sent to Somerset House and stamped at any time after signature? I signed a contract which the architect said he would get stamped at Somerset House; but I do not believe he has done so. Will that contract stand good if he has not had it stamped?"

An agreement which requires to be stamped must be stamped within fourteen or thirty days of the date of execution, *i.e.*, signing, &c. But if not stamped within this time the Somerset House officials would probably remit most of the penalty if properly approached with a reasonable explanation of the delay or omission. An agreement cannot be used in evidence at a trial unless it is stamped. It can be stamped at the trial on payment of about £11. The architect would be liable for damages if his negligence was the cause of the agreement not being stamped, and provided that he is *employed* under the contract. S. P. J. M.

Sawing Contract.

LINTON.—X. writes: "What would be the best working arrangements and payments for a sawing contract? I have large steam plant adapted for cutting up trees of any size, and it is my intention to find all necessary plant and fuel, the sawyer to find all labour at his own risk. It would not be constant employment, but about two or three times a year—say a month at a time."

Your best plan is to charge a rental of so much per week for the use of your plant. If you will say what is the size of your engine and machine, and what the plant consists of, and whether you supply a driver, I should be pleased to name a rate for your guidance.

M. POWIS BALE.

Clerks of Works under Government.

NEWCASTLE.—TYNE writes: "Where can I get particulars of the examination for clerks of works under Government? What are the subjects, and which are the best books to study?"

Appointments under Government as clerks of works are mostly obtained in open competition, for which certain fees are required. In some appointments it is necessary that the applicant should have had previous experience as a clerk of works. "The Civil Service Year-book," to be obtained through any bookseller, gives all necessary information as to qualifications, fees, &c. Competitions are advertised in the papers, and competitors can obtain information relative thereto on application to the Civil Service Commissioners. As to books, you should consult our "Book List," which gives the names of useful books on the various subjects.

Sketching at Wollaton Hall, Woodsome Hall and Bolsover Castle.

OLDHAM.—LANCASHIRE writes: "To whom should I apply for permission to measure at Wollaton Hall, Nottingham; Woodsome Hall, Huddersfield, and Bolsover Castle, Derbyshire? Have any drawings of these buildings been published?"

Wollaton Hall belongs to Baron Middleton and Woodsome Hall to the Earl of Dartmouth, to whom (or their agents) you should apply for permission to sketch. Bolsover Castle belongs to his Grace the Duke of Portland, and you should apply to his agent, Mr. F. J. Turner, Mansfield Woodhouse, Mansfield. Drawings of Bolsover Castle were published in the Architectural Association Sketch-Book in 1902, Vol. VI., and of Woodsome Hall in 1882, Vol. II. L. G. R.

Buildings to Measure in Northamptonshire and at Aberystwyth.

COVENTRY.—P. A. P. writes: "I propose spending two weeks on a sketching tour in Northamptonshire. Which are the best places to visit? I wish to make a measured drawing of a subject such as a porch."

You will find plenty of material for sketching in the Nene Valley between Northampton and Kettering, both of Gothic and Early Renaissance work. Gotch's book on the Renaissance should be referred to, and a selection made for your measured drawing after visiting some of the places. There are many interesting Decorated churches in this neighbourhood, and the following are worthy of attention:— Earls Barton, Seagrove, Doddington, Moulton, Dallington, Strixton, Wilby. L. G. R.

ABERYSTWYTH.—H. S. writes: "Is there anything in this town suitable to measure for the R.I.B.A. intermediate examination?"

There is not likely to be anything of any great architectural interest in this neighbourhood. Write to the secretary of the Cardiff, South Wales and Monmouthshire Society, Mr. Edgar G. C. Down, 31, High Street, Cardiff, for information. L. G. R.

A Building Transaction.

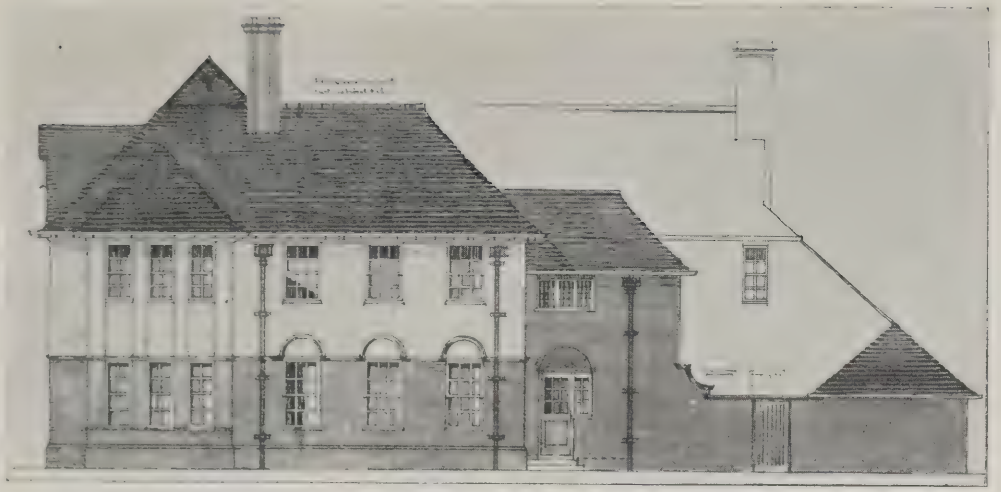
CARNARVON.—LL. writes: "A has leased to B 1,500 sq. yds., upon which B has built eight houses and sold five of them. It is now found that B took possession of 1,690 sq. yds.: that is 190 sq. yds. more than was leased to him. What is A's remedy?"

A has a great number of remedies against B and the five purchasers: (*a*) he can treat B and his purchasers as trespassers on the 190 yds. not sold to them; (*b*) he can retake possession of all or any building on the said 190 yds. The said purchasers have no more right there than B. But they can make it uncomfortable for B for breach of warranty of title, &c. However, if B only made an innocent mistake, A should place the matter before him reasonably and make him pay a fair price or rent for the extra 190 yds. A can confidently place the matter in the hands of a solicitor if B does not pay such price on demand. S. P. J. M.

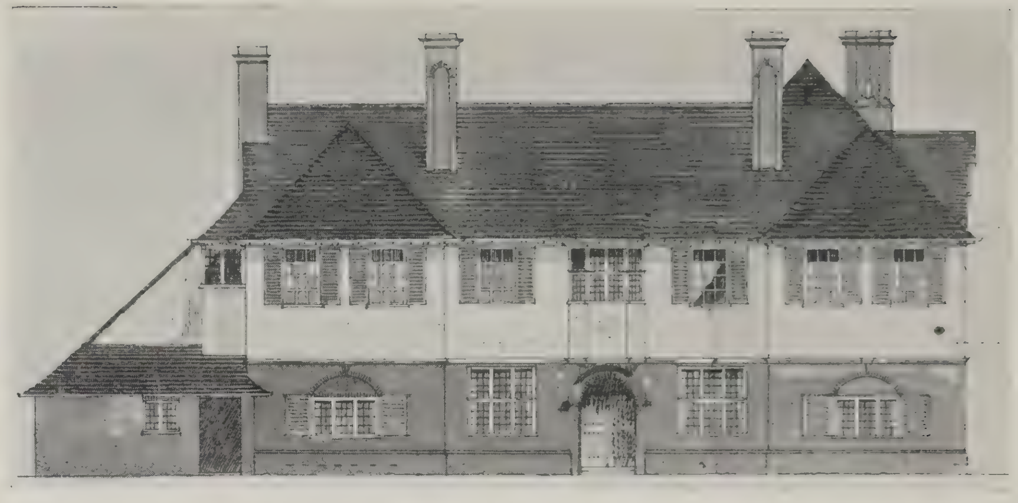
Indentures.

LANCS.—ENQUIRER writes: "I began serving my articles with an architect when fourteen years of age, completing them five years latter. There is a clause in the indenture which states that during my life I shall neither practice in nor within five-miles radius of that town. The indenture was also signed by my father. Is this indenture binding?"

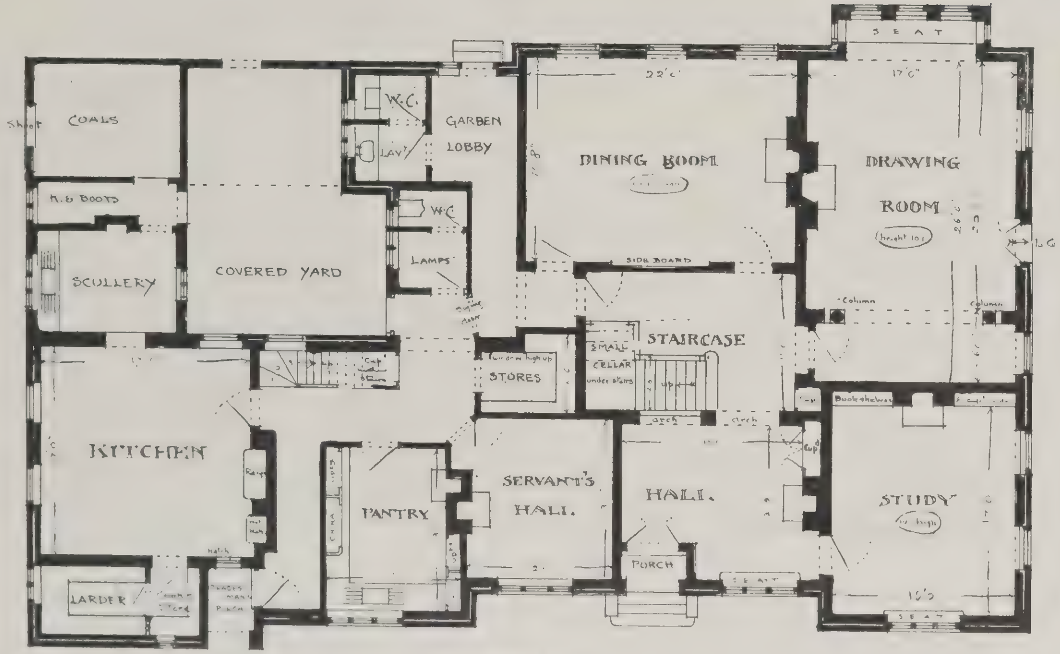
We do not think the indenture is binding. Such an agreement is only binding if made by a person himself after coming of age and for some consideration.



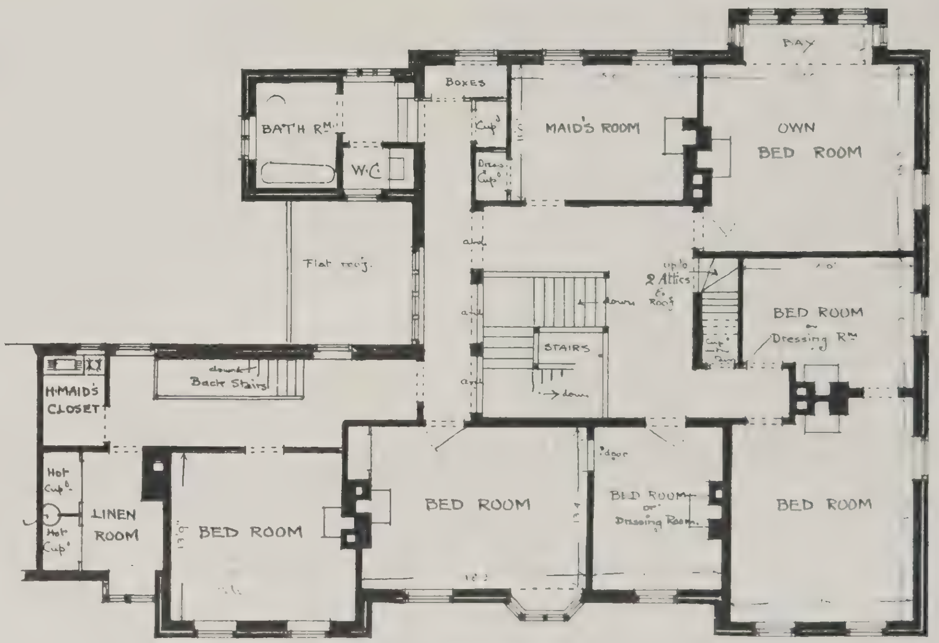
East Elevation.



West Elevation.



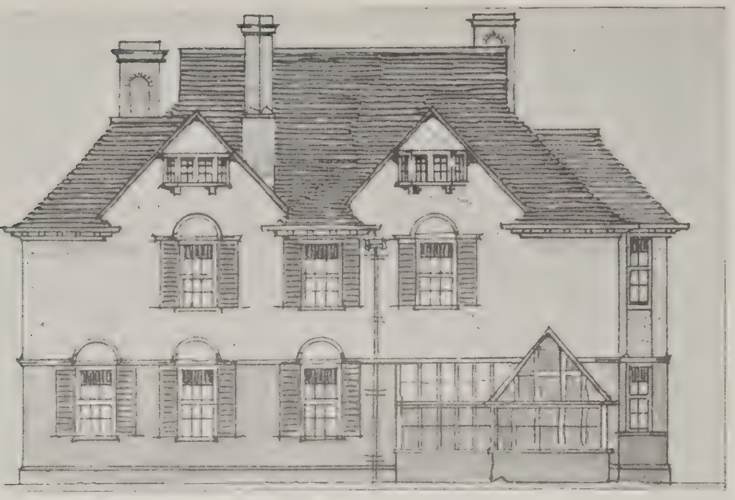
Ground floor Plan.



First floor Plan.

PROPOSED HOUSE ON SHAWFORD DOWNS, NEAR WINCHESTER. ARTHUR C. MARTIN, ARCHITECT.

The materials proposed for this house are brick walls, rough cast on first floor, with a heavy moulding separating the two, and roof of hand-made tiles from Bishop's Waltham. There is a beautiful view to the east which largely influenced the planning The house has been designed to cost about £2,800, for which sum it si hoped to include a certain amount of panelling and a good staircase.



PROPOSED HOUSE ON SHAWFORD DOWNS, NEAR WINCHESTER: SOUTH ELEVATION.
ARTHUR C. MARTIN, ARCHITECT.

Keystones.

A new Thoroughfare connecting Nunhead and Peckham with Brockley is to be made at a cost of £26,500.

Additions to Brixton Hill Prison.—The Prison Commissioners have decided to add about 160 extra cells to the remand prison on Brixton Hill, at a cost of £16,000.

At Windsor Castle, on the East Terrace, an ornamental flight of stone steps has been constructed from the battlemented and gravelled promenade to the beautiful lawn and Palace "slopes."

Shoreditch Town Hall, which was damaged by fire in August last, when the interior of the council-chamber and the whole of the roof were destroyed, is about to undergo restoration at a cost of £20,000. Mr. A. W. S. Cross is the architect for the work.

A Scottish Boys' Home.—The recent army and naval display in Edinburgh brought a large sum of money to the building fund of the Soldiers and Sailors Boys' Home for Scotland. The architect for the work is Mr. Campbell, of Glasgow, but as yet the plans have not been definitely decided upon.

Sir John Wolfe Barry, K.C.B., F.R.S., has been elected to succeed the late Mr. James Mansergh, F.R.S., past-president of the Institution of Civil Engineers, as chairman of the Engineering Standards Committee, which post Mr. Mansergh had occupied since the formation of the Committee in 1901.

The Technolexicon of the Society of German Engineers.—In the compilation of this universal technical dictionary for translation purposes (in English, German and French), commenced in 1901, about 2,000 firms and individuals collaborators at home and abroad are assisting. The editor-in-chief (Dr. Hubert Jansen) will be pleased to give any information about the work. His address is Dorotheenstrasse, 49 Berlin (N.W. 7).

Usher Hall, Edinburgh.—The latest plan in connection with this building show that the dome will be dispensed with, thereby effecting a saving of £4,208. By this rearrangement the seating accommodation will be 4,000. Sir Aston Webb, Dr. Cowen and the city architect (Mr. Morham) have sent in their reports to the committee. The length of the hall will be reduced and the side galleries made narrower. A new front elevation has been prepared by the city architect and approved by the committee. According to the lowest tenders received the total cost of the hall, without the dome and exclusive of the organ, will be £130,620. This is more than the sum left by Mr. Usher.

Bow Bells are to be rehung.

A new Facade to Naples Cathedral has been completed at a cost of £260,000, and a further sum of about £16,000 is required for the towers of the building.

The Society of British Sculptors, formed about a year ago, will, it is hoped, hold its first exhibition next year. The society includes many well-known sculptors, both in and out of the Academy, and the exhibition should therefore be of great interest.

An International Building Congress at Liege is to be held from September 14th to 20th at the Universal Exhibition. The subscription to attend banquet, meetings, &c., with copies of reports and papers, is 25 francs. The secretary is M. Van Ophen, 5, Grand Place, Brussels.

For new Council Schools at Gloucester, in Derby Road, the plans prepared for the Education Committee of the city by Mr. J. Fletcher Trew, M.S.A., County Chambers, Gloucester, have been passed by the Board of Education. The schools will accommodate 700 boys and girls and 900 infants.

An Attractive Golf Clubhouse has just been completed at Cardross from designs by Mr. Alex McTurk, architect, of Helensburgh, at a cost of about £2,000. It is a two-storey brick building with freestone facings, and has on the upper storey a balcony opening from the dining-room. Cyprus wood is largely used.

The Lady Architect.—Miss McClelland recently gave an address on "A Cottage for £150" before the Women's Institute associated with the Garden City undertaking at Letchworth. Miss McClelland is the designer of one of several cottages which are being built there, the cost of the labour and materials employed in each case not to exceed £150. She strongly advocated the use of concrete.

A new Baptist School-Chapel at Shirehampton, near Bristol, has been erected from designs by Mr. B. Wakefield, architect, of 45, Nicholas Street, Bristol. Local Kingsweston stone, in "snail-creep" work left with quarry face, has been used for the external walls with Box Ground Bath-stone dressings, the walls being lined internally with brickwork and the roofs tiled. Accommodation is provided for a mixed congregation of about 300. The floor is of pitch-pine wood blocks laid on concrete, and the chapel is seated with patent "Latimer" seating. The total cost of the work was £2,044. Messrs. G. Bliss & Son, of Portishead, were the contractors. A hot-air heating system has been installed by Messrs. Haden & Son, of Trowbridge.

A Smallpox Hospital is to be erected for Harwich. It will be of corrugated iron, by Messrs. Spiers & Co., of Glasgow.

An Ancient Lincolnshire Church.—A movement is on foot at Marton, near Gainsborough, for restoring the ancient fabric of St. Margaret's Church, one of the most ancient in the county, and one of the few remaining churches with a Saxon tower. The church was last refitted in 1868.

The Ancient Parish Church of St. Bartholomew, Bayton, near Cleobury Mortimer, has been thoroughly restored and enlarged by the addition of a chancel. In the course of restoration a Norman doorway and two windows of the fifteenth or sixteenth century were found. The architect for the work was Mr. J. Oldrid Scott.

Additions to the Peebles Hotel-Hydropathic are to be made. Mr. James Miller, architect, of Glasgow, has prepared plans for an annexe showing forty-four bedrooms. Building work will be begun in October. Plans have also been prepared for a new building connected with the Hydropathic containing a complete system of electric and medicated baths. Improved recreation and billiard-rooms have also been designed.

Loughborough new Water Scheme.—The scheme to supply Loughborough with water, at a cost of over £100,000, has now reached an advanced stage. At the narrowest point of the Blackbrook Valley a solid mass of masonry, rising in some places to 40ft., stretches from hill to hill, and excavations have been made 60ft. below the surface of the brook. When completed the water in the reservoir will cover more than 100 acres of land, and upwards of 500,000,000 gallons will eventually be held up.

Wakefield Architect's Narrow Escape.—Mr. Arthur Fawcett, a well-known Wakefield architect and surveyor, recently made an extraordinary attempt on his life. When his clerk went to the office about 9 o'clock he found the door of Mr. Fawcett's private room locked, and a strong smell of gas emanating therefrom. He obtained assistance and the door was forced open, when Mr. Fawcett was discovered sitting before his desk in an unconscious and exhausted condition. In his clasped hands was a tube affixed to one of the gas jets in the room. Artificial respiration was resorted to, and in the course of an hour Mr. Fawcett was brought round sufficiently to enable him to be removed to the Clayton Hospital. Mr. Fawcett had plugged his nostrils with cotton wool, and had fastened a rug and a towel in front of the fireplace. Fortunately, however, the aperture had not been entirely covered, and the cotton wool had fallen out of the nostrils; and to these facts, no doubt, Mr. Fawcett owes his life. He had also pinned on the door a slip of paper containing the words, "Don't strike a light. Mr. Fawcett lost his wife a few years ago, and has been depressed since.

Winchester Cathedral Subsidence.—Regarding the serious subsidence of the south side of the east end of Winchester Cathedral, as already reported in our columns, Mr. T. G. Jackson, the diocesan architect, and Mr. Colson, the cathedral architect, are now satisfied that there is a sufficient thickness of gravel underlying the peat on which the building was raised to enable underpinning to be carried out, and an expert engineer is to be called in with regard to the execution of this work. Briefly, what has happened is that the streams flowing beneath the cathedral have gradually sapped the foundations on the south side, which consequently has sunk. This has thrown the arching out of equilibrium, and everything tends to make the damage worse, the weight of the roof and walls, for instance, combining to press the south wall outwards. The pressure of the displaced masonry has been so great in some places that the solid limestone has flexed like wood without breaking. The groining in the crypt has sunk so badly as to necessitate extensive shoring with timber baulks. It is thought that there will have to be a complete underpinning of the south side of the east end; buttresses erected along the walls to prevent bulging and collapse; as well as massive ties fastened through the walls to keep them together.

Bradford Town Hall Extension.—The foundation-stone of the Bradford Town Hall extension will be laid on July 28th.

Gaiety Hotel.—We regret that in describing the kitchen fitments by Mr. A. Ceresa at this hotel on p. 343 of our issue for last week "central stores" was printed instead of "central stoves."

Change of Address.—Mr. Geoffry Lucas, architect, has changed his London and country addresses to 16, Hart Street, Bloomsbury Square, London, W.C., and 23, Brand Street, Hitchin, Herts.

The Dundee Institute of Architecture held its annual meeting last week, when the awards gained throughout the year were distributed. The prize for measured drawings was awarded to Mr. D. A. Ogilvy, while the work of Mr. R. J. Thomson was commended. Mr. J. E. Robinson was the prize-winner for the drawing of a design for a cemetery chapel, while for measured drawings for pupils only Mr. E. B. Haxton was successful. The following office-bearers were elected for the ensuing session:—President, Mr. P. H. Thoms; vice-president, Mr. J. D. Mills; council, Mr. Leslie Ower, Mr. William Gauldie, Mr. Alex. Neilson and Mr. R. P. Smart; hon. secretary, Mr. David L. Allan, 41, Reform Street, and hon. treasurer Mr. Charles G. Soutar.

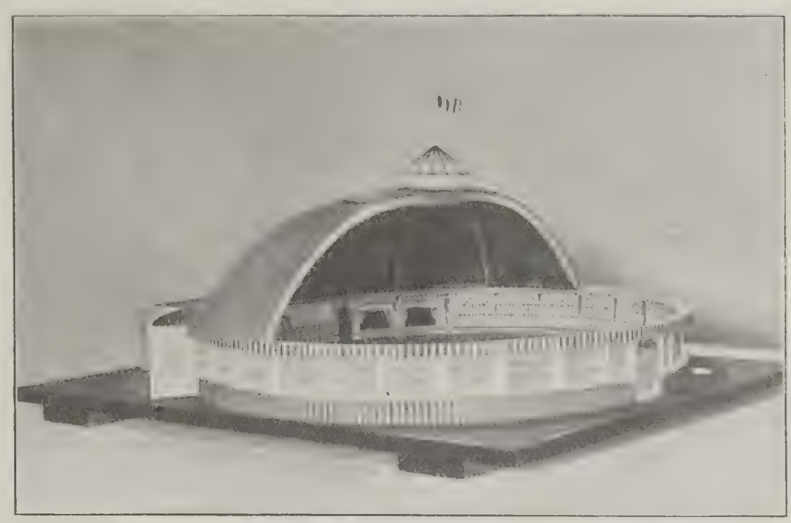
THE "AULD BRIG" OF AYR.

How it could be preserved without Rebuilding.

MR. THACKERAY TURNER, as secretary to the Society for the Protection of Ancient Buildings, has written a letter to the town clerk of Ayr stating that the committee of his Society has carefully considered the various reports which have been made upon the structural condition of the Auld Brig of Ayr, and has had the advice of a member, who is an engineer, upon the recommendations contained therein.

The committee sincerely regrets that the town council should have come to the conclusion that the bridge must be rebuilt, for it is convinced that it is possible to make the bridge structurally secure without rebuilding, in the following manner:—

The old mortar of the arches has been dissolved by water that has been allowed to leak through it, and the arches have therefore moved and lost their shape, throwing undue strain on parts of the arch stones and making them open at other parts, the distortion being increased by the haunches being overloaded. This could, the committee believes, be corrected by raking out the perished mortar, filling the joints with good cement-mortar, and driving slate wedges into the cement. If the undue weight on the haunches were then removed, the arch would take a new bearing and would be quite safe. The mortar in the piers is also perished and dissolved. This could in all probability be remedied in the same way as the barrage across the Nile was repaired, by drilling holes into the piers and forcing cement grout into them under pressure. The grout would find its way among the sand and stones and fill all vacancies and thus bind the whole firmly together. Although it is not likely that the piers would thus be turned into masses of concrete, enough would be done to make them secure. The success or otherwise of this treatment would be easily shown by the quantity of grout forced into the masonry.



MODEL OF RIDING SCHOOL.

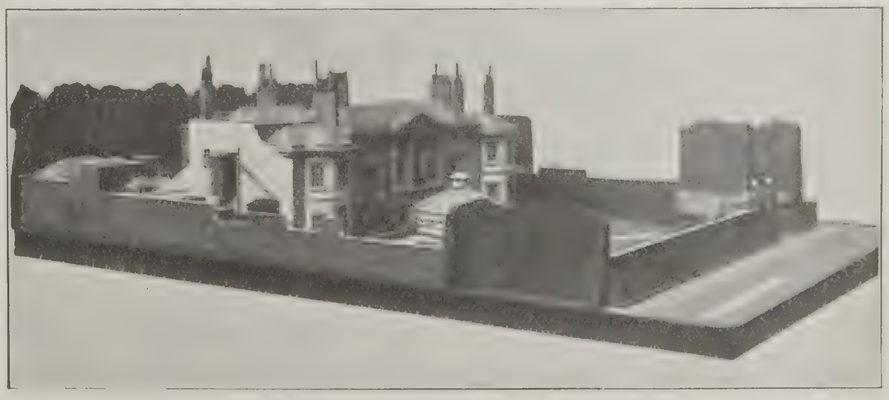
With regard to the foundations of the piers, the committee does not see that underpinning is essential. There has been some settlement of the piers such as would be expected with a clay foundation actually higher than the bed of the river, but it has not been excessive, nor is there apparently any reason to think it is increasing. All that appears to be necessary is to prevent scour round the piers and to prevent the clay foundation from squeezing under their weight into the lower bed of the river. The committee ventures to think that these ends could be gained by driving sheet-piling round each of the piers, dredging a trench 5ft. or 6ft. deep across the stream above and below the bridge, and filling with stones large enough to resist the scour of the stream, and then covering the bed between the trenches with similar stones. The letter adds that the bridge, so rendered safe for many years to come, would be Burns's Auld Brig of Ayr, whereas a new bridge would merely mark the site where the Auld Brig had been.

MODELS OF BUILDINGS.

MODELS of buildings are generally made of wood, yellow pine being principally used, as it is easiest to work, and with the aid of a circular saw the angles and joints can be fixed and set up perfectly true. The plans should be set out to the desired scale, then the main walls should be built up with wood varying from $\frac{1}{2}$in. to $\frac{1}{4}$in. thick, according to the scale of the model, gluing and fixing the angles with needle points. If the thickness of the brickwork should be required to be shown at the reveals, &c., wood or cardboard should then be fixed on the front, cutting back the door and window openings, &c. Bristol board can be used for the window frames, and a good effect of glass is obtained by cutting out the window squares, and fixing either thin gelatine or celluloid behind same, leaving either open so as to see through, or pasting black paper on the back. When the main walls of the house are fixed up and set, the roof and chimneys can then be finished off. It is advisable to make the chimneys with wood, pasting cartridge around same; this also applies to the roof; and if anyone is making a large number of models, roof lines can be ruled or printed on the cartridge beforehand. All projections, such as mouldings, window sills and cornices, should be made in either wood or cardboard, as the case requires, and glued on. It is advisable to have models for exhibitions covered with drawing paper, as they can then be coloured up effectually with water colours, but models for law cases, &c., can be left in the plain wood and coloured in different tints with distemper. When the ground surrounding the building is flat, it can be worked with wood or cardboard, but if it requires to be uneven, such as sloping paths or roadways, &c., plaster-of-Paris will need to be used, first making the original in clay, and then having it cast.

Model-making at first appears to be easy for an architect or engineer to accomplish, but unless one has had a large experience, and proper tools and materials are available, it is always advisable to place the work in the hands of a practical man, such as Mr. John B. Thorp, of the London Drawing and Tracing Office, 98, Gray's Inn Road, by whom the two models illustrated on this page were made: the one of the Riding School was made principally in cardboard, as, the walls and roof being curved, it was found easiest and quickest to work in this material; the roof principals were cut out of thin wood, so as to make a solid base for fixing the cardboard to. The model of the residence in Curzon Street, Mayfair, was made almost entirely of wood as described above.

It may be mentioned that Mr. Thorp has had more than twenty years' experience of model-making, having executed some hundreds of models for architects and surveyors.



MODEL OF RESIDENCE IN MAYFAIR.

LOW-PRESSURE HOT-WATER HEATING.

THE Institution of Heating and Ventilating Engineers is holding its summer meeting at Bristol this week. Yesterday a general meeting was held, at which Mr. D. M. Row read a paper on "Steam Economy in connection with the Heating Trade," the argument being in favour of the low-pressure hot-water system, in which temperature is secured and maintained by calorifiers through which the water constantly circulates. Mr. Row said this system was the only one affording an absolutely good and healthy atmosphere for breathing purposes, and should be adopted in all cases, especially in institutions for the aged and infirm.

Separate calorifiers should be used for the hot-water supply and for warming, so that the latter service might be entirely shut down when not required, though the former be required continuously all the year round. A suitable size steam main was provided, with branch services into each pavilion, the condensation similarly turned into a common main, and all eventually returned to the boiler. The low-pressure hot-water system might also be worked by fired boilers, but where steam was available, and in all cases where separate pavilions had to be dealt with, the application of calorifiers was more economical and advantageous in every way than separate fired boilers.

An important point in economy in connection with a calorifier system was the proper regulation and control of the steam supply. This should be governed automatically, as without a reliable automatic control there must either be considerable waste of time and trouble, in continually shutting down and re-adjusting the steam valves according to requirements, or (and this nearly always existed) a considerable waste of steam and water through valves being left open, and the water boiling away through air pipes when not required. This was obviously extravagant and wrong in principle, and there were many instances on record where the adoption of an automatic steam control had resulted in saving hundreds of pounds.

Aerating Swimming Baths.

Another subject referred to by Mr. Row was the circulating, re-filtering and aërating and re-heating of the water of swimming baths by which the temperature was maintained and the water rendered fit for use for a longer period. Here there was a double economy, as instead of running, say, 60,000 gallons to waste, re-filling the bath and heating this amount up again from cold by live steam, the same water was used over and over again and the exhaust steam from the circulating pump was utilized for re-heating. The water was drawn from the deep end of the bath and delivered to an aërator. From this the water was distributed and fell over a series of perforated plates dropping from one to the other through the atmosphere into a tank beneath. It then passed to the filter, and the filtered water in turn passed through the re-heater and finally back to the bath, entering at the shallow end. Thus the whole of the water was treated, and the operation might go on continually without interfering with the bathers. In re-heating, the exhaust steam might of course be supplemented with live steam if found necessary.

SANATORIA FOR CONSUMPTIVES.

IN the recent discussion on this subject at the Royal Sanitary Institute Mr. Edwin T. Hall said that the best position for a sanatorium was the southern slope of a gentle hill and near its summit, with tree shelter on its north, east and west. The subsoil should be sand or gravel. In any case it must be a naturally well-drained site, otherwise it would be cold, unsuitable and liable to become saturated with water. An absolutely pure water-supply was pre-eminently necessary. Sewage-disposal was of equally great importance. If there were no public sewer at hand the best alternative was a simple system of filtration and precipitation, aided by chemical infusion, into meadow land. Mr. Hall had made an extended tour amongst German sanitoria, and he had found this latter system in satisfactory use at Falkenstein. But at other sanitoria in Germany the disposal of sewage was not satisfactory. Another important matter was the location of the nurses, who should be housed off the premises. It was imperative that in all cases the wards should be made bright and cheerful, or the patient's recovery would be retarded. He did not agree with economy at the expense of efficiency, nor in temporary buildings, which were generally in the long run only an additional expense.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
June 29	London, S.W.—Repairs, &c., to Library	Lambeth Borough Council	H. Edwards, 346 Kennington Road, S.W.
,, 29	Barnet—Church House	Trustees	J. C. Traylen, 16 Broad Street, Stamford.
,, 29	Abertillery—Alteration at Chapel	———	R. L. Roberts, Abercarn.
,, 29	Drogheda, Ireland—Residence	Guardians	Y. Dowdall, Clerk, Workhouse, Drogheda.
,, 29	Croydon—Town Hall, &c.	Council	G. F. Carter, Town Hall, Croydon.
,, 30	Weston-super-Mare—Classrooms, &c.	Education Committee	Head Teacher, Welton Council Schools, Midsomer Norton.
,, 30	Torquay—Carnegie Library	Town Council	F. S. Hex, Town Hall, Torquay.
,, 30	Cupar-Fife, N.B.—Additions to Barony	———	D. Storrar, Cupar Fife.
,, 30	Wimborne, Minster—Church House	———	W. J. Fletcher, Wimborne.
,, 30	Holbeton, near Plymouth—Dwelling-house	———	G. B. Perrott, Ringsbridge.
,, 30	Willesden—Repairs to School	Education Committee	G. E. T. Lawrence, 22 Buckingham Street, Adelphi.
July 1	Prestwick, Ayr—Twelve Houses	C. W. Andrew	A. L. Mercer, Ayr.
,, 1	Truro—Wood Block Floor	Education Committee	S. Hill, Redruth.
,, 1	Rutbin, Denbigh—Alterations to Schools	Education Committee	W. D. Wiles, 15 Well Street, Ruthin.
,, 1	Wales, near Kiveton Park—Vicarage	———	Rev. C. Ellis, Wales, near Kiveton Park.
,, 1	Glasgow—Extension of Convenience	Corporation	Office of Public Works, City Chambers, 64 Cochrane Street, Glasgow.
,, 1	Bristol—Four Workmen's Dwellings	Streets Committee	T. H. Yabbicom, 63 Queen Square, Bristol.
,, 3	Glasgow—Sub-station	Corporation	W. W. Lackie, 75 Waterloo Street, Glasgow.
,, 3	Widnes—Repairs to House	———	J. S. Sinclair, Borough Surveyor, Widnes.
,, 3	Tipton—Alterations to Schools	Education Committee	A. Long, 21 New Street, West Bromwich.
,, 3	Brompton, near Northallerton—Extension of Mills	W. J. Pattison	T. Winn & Sons, 92 Albion Street, Leeds.
,, 3	Burnham, Bucks—New Rooms, &c., at School	Managers	Burnham Mixed School.
,, 3	Glasgow—Sub-stations	Corporation	W. W. Lackie, 75 Waterloo Street, Glasgow.
,, 3	Rhydsaddler, near Ponterwyd—Stone Bridge	Rural District Council	H. Hughes, 8 Market Street, Aberystwyth.
,, 3	Teignmouth—Hospital, &c.	Urban District Council	G. F. Gettings, Town Hall, Teignmouth.
,, 4	London—Converting House into Dressing-rooms, &c.	London County Council	Superintending Architect's Department, 15 Pall Mall East, S.W.
,, 4	Willesden—Cottage	District Council	O. C. Robson, Public Offices, Dyne Road, Kilburn, N.W.
,, 4	Helen's Bay, co. Down—Villa	Mr. G. F. Shanks	Hobart & Heron, 124 Scottish Provident Buildings, Belfast.
,, 5	Eccles—Forty-six Semi-detached Houses	Corporation	E. Parkes, Town Hall, Eccles.
,, 5	London, S,E.—Additions to Southwark County Court	Commissioners	H.M. Office of Works, Storey's Gate, S.W.
,, 5	Bristol—New Schools	Education Committee	W. B. Wood, 12 Queen Street, Gloucester.
,, 5	Prestwick, Ayr—Six Pairs of Semi-detached Cottages	Wyllie & Co.	A. L. Mercer, Ayr.
,, 6	Gainsborough—School	Education Committee	Scorer & Gamble, Bank Street Chambers, Lincoln.
,, 10	Sudbury—Sanitary Annexes	Guardians	Workhouse, Sudbury.
,, 11	Bethnal Green—Chimney Shaft	Council	Borough Engineer, Town Hall, Bethnal Green, N.E.
,, 12	London, N,W.—Vaccine Station	Commissioners	J. B. Westcott, H.M. Office of Works, Storey's Gate, S.W.
,, 13	Omagh, Ireland—Gallery	———	Omagh District Asylum.
,, 15	South Brent, Devon—Alteration to School	Education Committee	S. Brent, Council School.
Aug. 1	Buckingham—New Royal Latin School	Governors	Town Hall, Buckingham.
No date	Westcliff-on-Sea—Temporary Church	———	W. Gale-Hasleham, Roseneath, Palmerston Road, Westcliff-on-Sea.
	ENGINEERING:		
June 29	Elgin—Reservoir	———	John Wittet, Architect, Elgin.

,, 5	Naas, Ireland—Meters	Rural District Council	F. Bergin, 36 Westmoreland Street, Dublin.
,, 6	Hexham—Sewerage, &c., Works	Rural District Council	J. E. Parker, Post Office Chambers, Newcastle-on-Tyne.

Builders' Notes.

Dublin Building Trade Dispute: Arbitration agreed to.—The Dublin Bricklayers' Society and the master-builders have agreed to Alderman Cotton being appointed as arbitrator to settle the dispute between them.

Scottish Building Trades' Exhibition.—Mr. H. Greville Montgomery, of the International Building Trades' Exhibition, writes stating that he has no connection whatever with a Scottish building trades' exhibition which is being undertaken owing to "the encouragement given by the increasing success of the London enterprise."

London Building Acts (Amendment) Bill.—In giving evidence recently before the Select Committee of the House of Commons considering this measure Captain Hamilton, Chief Officer of the London Fire Brigade, stated that shop roofs should be made of fire-resisting materials and windows in the roof should not occupy more than a tenth of the whole. Supposing all the clauses of the Bill passed, there would be no special arrangements required for buildings under 25ft. in height, and houses from 25ft. to 50ft. in height would be required to have parapets and access to the roof. In buildings over 50ft. in height there should be means of escape from each floor. The provision requiring that wells of lifts should be constructed of fireproof material would not come into force for seven years. The danger from lifts in case of an outbreak of fire was very great. Much mischief arose from windows in adjoining buildings, and when windows were opposite at a distance of 15ft. a provision in the Bill required the use of fire-resisting glazing in new buildings. On all these points he had advised the Council that precautions were urgently required.

Law Cases.

A Quantity Surveyor's Fees.—In the Lord Mayor's Court in the city of London Mr. Earl, architect and quantity surveyor, recently sued Mr. Griffin, of Coleman Street, also an architect, who was employed by one Brown in connection with the building of the Whitfield Institute, for £88, the balance of an account for services rendered. The plaintiff said that he was employed by the defendant to carry out certain quantity surveying work. He had been paid a sum of £7 on account of the moneys due to him, and had given I O U's. Upon applying for the balance in February last, the defendant said he had no money, and that he was afraid to ask his employer for any as he did not want to offend him. The defence was that the plaintiff was employed on the terms that he was not to be paid until the defendant had been paid. Upon receiving the £7 the plaintiff gave not a receipt on account, but I O U's. A counterclaim was raised by the defendant for damages for the detention of certain documents. The plaintiff, it was alleged, had broken the contract by not completing the work and by refusing to deliver the work he had done. The plaintiff was not entitled to recover his fees because at that time he (defendant) had not received them from his employer. A verdict was entered for the defendant on the claim and on the counterclaim for the return of the documents, or £1 damages and for £7 money lent.

Ancient Lights.—The case of *W. Neal* v. *W. H. & T. J. Horniman & Co.* recently came before the Common Serjeant in the Lord Mayor's Court in the city of London. The plaintiff, a restaurant proprietor, of 8, Wormwood Street, claimed damages for injury caused to his business by reason of the defendants carrying a building opposite to a greater height than it was before. The defendants' premises were opposite to those of the plaintiff, who held his on a fourteen years' lease, of which seven years and a quarter were unexpired. The width between the two houses was 24ft. 11ins. In December, 1904, the defendants were rebuilding their premises, No. 27, Wormwood Street, and a portion was carried to 20ft. higher than before. This, it was said, made the plaintiff's premises darker, and so injured his business. The premises had the protection of "ancient lights." For the defence it was denied that the alteration had resulted in any diminution of light. It was stated that the actual height by which the wall had been raised was 16ft. The jury found for the plaintiff, and awarded him £15.

Coming Events.

Wednesday June 28.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Half-yearly Meeting of Directors at 8 p.m.

SOCIETY OF ARTS.—One hundred and fifty-first Annual Meeting. Election of Officers and new members, 4 p.m.

CHURCH CRAFTS LEAGUE (Church House, Dean's Yard, S.W.)—Meeting at 8 p.m.

Thursday, June 29.

SOCIETY OF ANTIQUARIES.—Meeting at 8.30 p.m.

INSTITUTE OF SANITARY ENGINEERS.—Visit to the Works of Messrs. Doulton & Co. at Lambeth, at 2.30 p.m.

Saturday, July 1.

ARCHITECTURAL ASSOCIATION. — Fourth Summer Visit to Audley End. Leave Liverpool Street, 1.23 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Inchcolm

Monday, July 3rd.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—General Meeting to discuss amendments to the Regulations for Architectural Competitions, at 8 p.m.

Tuesday, July 4.

SOCIETY OF ARTS.—Conversazione in the Gardens of the Royal Botanic Society, Inner Circle, Regent's Park, W., from 9 p.m. to 12 p.m.

All the material used in the Framing of these Doors is put together as shown here.

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Company's Showrooms, 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE will be sent free on application to Dept. B.,

In various Designs

From 35/- to £10.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece.

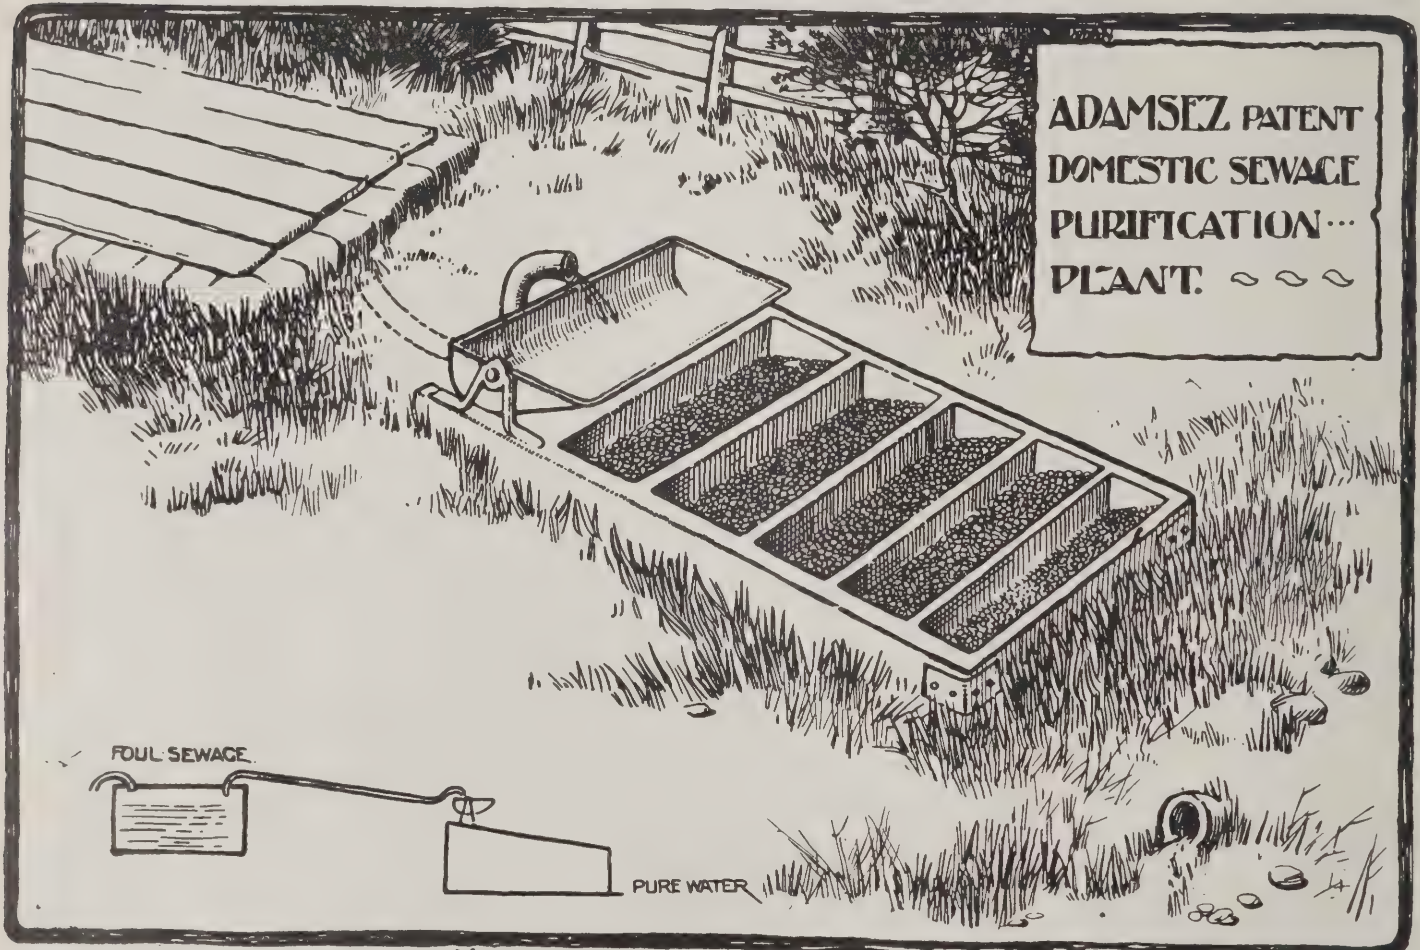
The GILMOUR DOOR COMPANY, Ltd.,

53, Berners Street, London, W.

ALSO VARIOUS AGENCIES THROUGHOUT THE PROVINCES.

PURIFY SEWAGE

See S. H. Adams', A.M.I.C.E., Local Government Board's Rules on Sewage Purification. Published by The St. Bride's Press. Price 2/6 . . . .



ADAMSEZ PATENT DOMESTIC SEWAGE PURIFICATION PLANT.
FOUL SEWAGE
PURE WATER

The most simple and economical sewage purification plant extant. Write "Adamsez, Ltd.," Manufacturing Sanitary Engineers, Scotswood-on-Tyne. London Showrooms: 5 & 7, Old Queen Street, Westminster, S.W.

Telephone, No. 1011 HOLBORN. Manager—JOHN B. THORP. Telegrams: "DIVIDITORE," LONDON.

SPECIAL NOTICE.

We would call our readers' special attention to the following letter which was received by us on Monday, the 26th inst.:—

June 23, 1905.

In THE BUILDERS' JOURNAL for the last week in May I noticed an advertisement of a fountain pen. On May 30th I forwarded a postal order for one of these pens to the advertisers, Messrs. Newton & Co., 63, Aldermanbury, E.C. I have since heard nothing from them. On June 8th I wrote to them asking if they had received my letter—no answer whatever. Again on June 19th, I wrote—still no answer.

This morning I have the two last letters returned by the General Post Office as "Undeliverable," but I notice that the letter with money in it was deliverable.

I don't know what this means, but I see that the advertisement still appears, and the address is the same as the one which is unfindable. As I can't get a letter through to the advertisers, I should like to know if you have any other address to which I can write to these people, or could I in any way communicate with them through you? I enclose stamped and addressed envelope, and shall be much obliged to you if you will answer this at your earliest convenience.

We greatly regret to hear of this occurrence, and our enquiries at their address lead us to conclude that Messrs. Newton & Co. have disappeared. We should be glad if any other of our readers who have had unsatisfactory dealings with this firm would communicate with us, as we shall be pleased to send them any information we may receive from the authorities with whom we have communicated.

Educational.

R.I.B.A., SOCIETY OF ARCHITECTS AND CIVIL SERVICE TECHNICAL EXAMINATIONS, preparation by correspondence or residence. 29 first places.—G. A. T. MIDDLETON, 19, Craven Street, Strand.

QUANTITIES.—A course of Correspondence Lectures in this subject (on the London system) is now ready. Also Lectures in Estimating.—For particulars apply Box 632, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

R.I.B.A. EXAMS.—Personal and Correspondence tuition; courses of any duration. Apply for syllabus to Mr. A. G. BOND, B.A. Oxon., A.R.I.B.A., 115, Gower Street, London, W.C. (late Howgate and Bond).

STRUCTURAL STEELWORK

Correspondence Classes specially for Architects, Assistants, Surveyors, Builders, and Draughtsmen, by the MIDLAND ENGINEERING BUREAU, STRAND, DERBY. Specialists in American and Continental Construction. Thorough Tuition. Send for descriptive booklet J., and read opinions of past students, and press notices, &c.

THE ARCHITECTURAL ASSOCIATION SKETCH BOOK.

First quarterly part of new volume just issued. Published by subscription at One guinea per annum (72 plates 18 in. by 13½ in.), containing reproductions of some of the finest specimens of measured drawings and sketches. Sample plates and subscription form may be obtained post free on application to the Secretary, at 18, Tufton Street, Westminster.

HENRY TANNER, Jr., } Hon. Secs.
A. MARYON WATSON, }

To Contributors.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

Contracts Open.

BRENTFORD URBAN DISTRICT COUNCIL.

CONTRACTS FOR PAVING WORKS.

The Council are prepared to receive TENDERS for:—

(a) The LAYING of about 4,145 square yards of CREOSOTED FIR WOOD BLOCK PAVING in the streets called Half Acre and Boston Road (main roads), beside tramway track, together with the necessary kerbing, &c., and

(b) The FORMATION and PAVING of a FOOTPATH on the west side of the street called Half Acre, with Patent Victoria Stone Paving, together with the necessary kerbing, channelling, &c.

Forms of Tender (on which alone Tenders will be received) may be obtained, and the plans, specifications, and conditions inspected at the office of Mr. NOWELL PARR, C.E., the Engineer and Surveyor to the Council, Clifden House, Boston Road, Brentford, between the hours of TEN a.m. and FIVE p.m. (except Saturdays).

Tenders to be delivered (sealed) at the CLERK'S office, 209, High Street, Brentford, on or before TUESDAY, the 4th day of JULY next, not later than TWELVE o'clock noon, marked "Tender for Wood Paving," or "Tender for Footpath," as the case may be.

The Council do not bind themselves to accept the lowest or any Tender, and the person whose Tender is accepted will be required to pay not less than the trade union rate of wages current in the district, and to employ local labour as far as possible in carrying out the work.

By Order,
STEPHEN WOODBRIDGE,
Clerk.

Brentford,
June 20th, 1905.

BOROUGH OF BETHNAL GREEN.

TO BUILDERS AND CONTRACTORS.

The Council invite TENDERS for the ERECTION of a BRICK CHIMNEY SHAFT 60 feet high.

Plans and specification can be seen upon application to the BOROUGH ENGINEER between the hours of TEN a.m. and FOUR p.m., and copies of the bills of quantities and form of Tender obtained upon payment of £2 2s., which will be returned upon receipt of a bonâ fide Tender.

The Contractor must pay such rate of wages and observe such hours of labour as are recognised by the trade unions in the locality where the work is done.

Tenders, sealed and marked "Chimney Shaft," are to be delivered with the bills of quantities fully priced out to the undersigned not later than TWELVE NOON on TUESDAY, the 11th of JULY, 1905.

The Council does not bind itself to accept the lowest or any Tender.

By Order,
ROBERT VOSS,
Town Clerk.

Town Hall,
Bethnal Green, N.E.
21 June, 1905.

BOROUGH OF TORQUAY.

CARNEGIE LIBRARY.

The Torquay Town Council invite TENDERS for the ERECTION of the above-mentioned BUILDING.

Contractors desirous of submitting Tenders can obtain bills of quantities and form of Tender on application to the undersigned, accompanied by a deposit fee of Five guineas, which will be returned on receipt of a bonâ fide Tender.

All applications must be made before the 30th JUNE, 1905.

The Council do not bind themselves to accept the lowest or any Tender.

FREDK. S. HEX,
Town Clerk.

Town Hall, Torquay,
June 19th, 1905.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

**5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.**

(*Continued on p.* xviii.)

ROOFING SLATES:

Velinheli, Penrhyn, and Westmoreland.

SLATE SLAB GOODS:

Both Plain and Enamelled.

ALFRED CARTER & CO., LIVERPOOL.

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

Sample and Shadecard on application to
Sissons Brothers & Co., Ltd., Hull.
London Office—199B Boro' High Street, S.E.

CAUTION—See the name Hall's Distemper on all tins; refuse imitations, which are inferior.
